NAU8820 Low Power 24-bit Stereo Audio Codec with High Current Outputs

GENERAL DESCRIPTION

The NAU8820 is a low power, high quality CODEC for portable applications. In addition to precision 24-bit stereo ADCs and DACs, this device integrates a broad range of additional functions to simplify implementation of complete audio system solutions. The NAU8820 includes drivers for headphones, and differential or stereo line outputs, and integrates preamps for stereo differential microphones, significantly reducing external components.

Advanced on-chip digital signal processing includes a 5-band equalizer, a 3-D audio enhancer, a mixed-signal automatic level control for the microphone or line input through the ADC, and a digital limiter function for the playback path. Additional digital filtering options are available in the ADC path, to simplify implementation of specific application requirements such as 'wind noise reduction'. The digital interface can operate as either a master or a slave. Additionally, an internal fractional PLL is available to generate accurately any desired audio sample rate clock for the CODEC, using any commonly available system clock from 8MHz to 33MHz and no external parts.

The NAU8820 operates with analog supply voltages from 2.5V to 3.6V, while the digital core can operate as low as 1.65V to conserve power. The two high current auxiliary line outputs can operate using separate supply rails for increased output capability and design flexibility, and may be used for cap-less headphone drive. Internal register controls enable flexible power saving modes by powering down sub-sections of the chip under software control.

The NAU8820 is specified for operation from -40°C to +85°C.

FEATURES

- DAC: 94dB SNR and -84dB THD ("A" weighted)
- ADC: 90dB SNR and -80dB THD ("A" weighted)
- Integrated head-phone driver: 40 mW into 16Ω
- Integrated programmable microphone amplifier
- Integrated line input and high current line output
- On-chip PLL
- Integrated DSP with specific functions:
 - 5-band equalizer
 - 3-D audio enhancement
 - Automatic level control
 - Audio level limiter
 - Multiple filtering options

- Standard audio interfaces: PCM and I²S
- Serial control interfaces with read/write capability
- Supports audio sample rates from 8kHz to 48kHz

Applications

- Personal Media Players
- Smartphones
- Personal Navigation Devices
- Portable Game Players
- Camcorders
- Digital Still Cameras
- Portable TVs
- Stereo Bluetooth Headsets

Pinout

26	VDDSPK	Supply	AUXOUT Line/Speaker Pre-amp Driver Analog Power
			Supply
27	VREF	Reference	Decoupling for Midrail Reference Voltage
28	VSSA	Supply	Analog Ground
29	RHP	Analog Output	Headphone Positive Output / Line Output Right
30	LHP	Analog Output	Headphone Negative Output / Line Output Left
31	VDDA	Supply	Analog Power Supply
32	MICBIAS	Analog Output	Microphone Bias

Notes

1. The 32-QFN package includes a bulk ground connection pad on the underside of the chip. This bulk ground should be thermally tied to the PCB as much as possible, and electrically tied to the analog ground (VSSA, pin 28).

- 2. Unused analog input pins should be left as no-connection.
- 3. Unused digital input pins should be tied to ground.
- 4. Pins designated as NC (Not Internally Connected) should be left as no-connection

Notes

- 1. Full Scale is relative to the magnitude of VDDA and can be calculated as FS = VDDA/3.3.
- 2. Distortion is measured in the standard way as the combined quantity of distortion products plus noise. The signal level for distortion measurements is at 3dB below full scale, unless otherwise noted.
- 3. With default register settings, SPKVDD should be 1.5xVDDA (but not exceeding maximum recommended operating voltage) to optimize available dynamic range in the AUXOUT1 and AUXOUT2 line output stages. Output DC bias level is optimized for SPKVDD = 5.0Vdc (boost mode) and VDDA = 3.3Vdc.
- 4. Time values scale proportionally with MCLK. Complete descriptions and definitions for these values are contained in the detailed descriptions of the ALC functionality.

Absolute Maximum Ratings

Condition	Min	Max	Units
VDDB, VDDC, VDDA supply voltages	-0.3	+3.61	V
VDDSPK supply voltage (default register configuration)	-0.3	+5.80	V
VDDSPK supply voltage (optional low voltage configuration)	-0.3	+3.61	V
Core Digital Input Voltage range	VSSD – 0.3	VDDC + 0.30	V
Buffer Digital Input Voltage range	VSSD – 0.3	VDDB + 0.30	V
Analog Input Voltage range	VSSA – 0.3	VDDA + 0.30	v
Industrial operating temperature	-40	+85	°C
Storage temperature range	-65	+150	°C

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely influence product reliability and result in failures not covered by warranty.

Operating Conditions

Condition	Symbol	Min	Typical	Max	Units
Digital supply range (Core)	VDDC	1.65		3.60	V
Digital supply range (Buffer)	VDDB	1.65		3.60	V
Analog supply range	VDDA	2.50		3.60	V
Speaker supply (SPKBST=0)	VDDSPK	2.50		5.50	V
Speaker supply (SPKBST=1)	VDDSPK	2.50		5.50	v
Ground	VSSD VSSA VSSSPK		0		v

1. VDDA must be \geq VDDC.

2. VDDB must be \geq VDDC.

1 General Description

The NAU8820 is a stereo device with identical left and right channels that share common support elements. The left and right channels are identical, except for the mixing options and gain options available for each of the two auxiliary outputs.

1.1 Analog Inputs

All inputs, except for the wide range programmable amplifier (PGA), have available analog input gain conditioning of -15dB through +6dB in 3dB steps. All inputs also have individual muting functions with excellent channel isolation and off-isolation from all outputs. All inputs are suitable for full quality, high bandwidth signals.

Each of the left-right stereo channels includes a low noise differential PGA amplifier, programmable for high-gain input. This may be used for a microphone level through line level source. Gain may be set from +35.25db through -12dB at the analog difference-amplifier type programmable amplifier input stage. A separate additional 20dB analog gain is available on this input path, between the PGA output and ADC mixer input. The output of the ADC mixer may be routed to the ADC and/or analog bypass to the analog output sections.

Each channel also has a line level input. This input may be routed to the input PGA, and/or directly to the ADC input mixer.

Each channel has a separate additional auxiliary input. This is a line level input which may be routed the ADC input mixer and/or directly to the analog output mixers.

1.2 Analog Outputs

There are four high current analog audio outputs. These are very flexible outputs that can be used individually or in stereo pairs for a wide range of end uses. However, these outputs are optimized for specific functions and are described in this section using the functional names that are applicable to those optimized functions.

Each output receives its signal source from built-in analog output mixers. These mixers enable a wide range of signal combinations, including muting of all sources. Additionally, each output has a programmable gain function, output mute function, and output disable function.

The RHP and LHP headphone outputs are optimized for driving a stereo pair of headphones, and are powered from the main analog voltage supply rail, VDDA. These outputs may be coupled using traditional DC blocking series capacitors. Alternatively, these may be configured in a no-capacitor DC coupled design using a virtual ground at ¹/₂ VDDA provided by an AUXOUT analog output. Gain of each headphone output can be separately varied in 1dB steps from +6dB through -57dB.

The AUXOUT1 and AUXOUT2 analog outputs can be coupled to a wide range of input signal mixing options, and support two gain choices. Gain may either be unity for 3.3V operation, or 1.5x for 5V operation. The auxiliary outputs are powered from the VDDSPK supply rail and VSSSPK ground return path. The supply rail may be the same as VDDA, or may be a separate voltage up to 5.0Vdc. These separate supply rails enable these outputs to have increased output range and power capabilities, and facilitate system design through enabling power supply and routing separate from VDDA.

<u>Important</u>: For analog outputs depopping purpose, when powering up speakers, headphone, AUXOUTs, certain delays are generated after enabling sequence. However, the delays are created by MCLK and sample rate register. For correct operation, sending I2S signal no earlier than 250ms after speaker or headphone enabled and MCLK appearing.

ADC, DAC, and Digital Signal Processing

Each left and right channel has an independent high quality ADC and DAC associated with it. These are high performance, 24-bit delta-sigma converters that are suitable for a very wide range of applications.

The ADC and DAC functions are each individually supported by powerful analog mixing and routing. The ADC output may be routed to the digital output path and/or to the input of the DAC in a digital passthrough mode. The ADC and DAC blocks are also supported by advanced digital signal processing subsystems that enable a very wide range of programmable signal conditioning and signal optimizing functions. All digital processing is with 24-bit precision, as to minimize processing artifacts and maximize the audio dynamic range supported by the NAU8820.

The ADCs are supported by a wide range, mixed-mode Automatic Level Control (ALC), a high pass filter, and a notch filter. All of these features are optional and highly programmable. The high pass filter function is intended for DC-blocking or low frequency noise reduction, such as to reduce unwanted ambient noise or "wind noise" on a microphone input. The notch filter may be programmed to greatly reduce a specific frequency band or frequency, such as a 50Hz, 60Hz, or 217Hz unwanted noise.

The DACs are supported by a programmable limiter/DRC (Dynamic Range Compressor). This is useful to optimize the output level for various applications and for use with small loudspeakers. This is an optional feature that may be programmed to limit the maximum output level and/or boost an output level that is too small.

Digital signal processing is also provided for a 3D Audio Enhancement function, and for a 5-Band Equalizer. These features are optional, and are programmable over wide ranges. This pair of digital processing features may be applied jointly to either the ADC audio path or to the DAC audio path, but not to both paths simultaneously.

1.3 Voltage Reference and Microphone Bias

Built-in power management includes a high stability voltage reference. This is used as an internal reference, and to generate a high quality, programmable microphone bias supply voltage that is well isolated from the supply rails. This microphone bias supply is suitable for both conventional electret (ECM) type microphone, and to power the newer MEMS all-silicon type microphones.

1.4 Digital Interfaces

Command and control of the device is accomplished using a 2-wire/3-wire/4-wire serial control interface. This is a simple, but highly flexible interface that is compatible with many commonly used command and control serial data protocols and host drivers.

Digital audio input/output data streams are transferred to and from the device separately from command and control. The digital audio data interface supports either I2S or PCM audio data protocols, and is compatible with commonly used industry standard devices that follow either of these two serial data formats.

1.5 Clock Requirements

The clocking signals required for the audio signal processing, audio data I/O, and control logic may be provided externally, or by optional operation of a built-in PLL (Phase Locked Loop). An external master clock (MCLK) signal must be active for analog audio logic paths to align with control register updates, and is required as the reference clock input for the PLL, if the PLL is used.

The PLL is provided as a low cost, zero external component count optional method to generate required clocks in almost any system. The PLL is a fractional-N divider type design, which enables generating accurate desired audio sample rates derived from a very wide range of commonly available system clocks.

The frequency of the system clock provided as the PLL reference frequency may be any stable frequency in the range between 8MHz and 33MHz. Because the fractional-N multiplication factor is a very high precision 24-bit value, any desired sample rate supported by the NAU8820 can be generated with very high accuracy, typically limited by the accuracy of the external reference frequency. Reference clocks and sample rates outside of these ranges are also possible, but may involve performance tradeoffs and increased design verification.

2 Application Information

2.1 Typical Application Schematic

Figure 2: Schematic with recommended external components for typical application with AC-coupled headphones and stereo electret (ECM) style microphones.

- Note 1: All non-polar capacitors are assumed to be low ESR type parts, such as with MLC construction or similar. If capacitors are not low ESR, additional 0.1ufd and/or 0.01ufd capacitors may be necessary in parallel with the bulk 4.7ufd capacitors on the supply rails.
- Note 2: Load resistors to ground on outputs may be helpful in some applications to insure a DC path for the output capacitors to charge/discharge to the desired levels. If the output load is always present and the output load provides a suitable DC path to ground, then the additional load resistors may not be necessary. If needed, such load resistors are typically a high value, but a value dependent upon the application requirements.
- Note 3: To minimize pops and clicks, large polarized output capacitors should be a low leakage type.
- Note 4: Depending on the microphone device and PGA gain settings, common mode rejection can be improved by choosing the resistors on each node of the microphone such that the impedance presented to any noise on either microphone wire is equal.
- Note 5: Unused analog input pins should be left as no-connection.
- Note 6: Unused digital input pins should be tied to ground.
- Note 7: R15-R18 and C17-C20 are low pass filters to filter glitch; the corner frequency range is from 8MHz to 33Mhz depending on PCB parasitics.

2.2 Power Consumption

The NAU8820 has flexible power management capability which allows sections not being used to be powered down, to draw minimum current in battery-powered applications. The following table shows typical power consumption in different operating conditions. The "off" condition is the initial power-on state with all subsystems powered down, and with no applied clocks.

Mode	Conditions	VDDA = 3V	VDDC = 1.8V	$\frac{\text{VDDB}}{= 3\text{V}}$	Total Power
		mA	mA	mA	mW
OFF		0.008	0.001	0.0003	0.025
Sleep	VREF maintained @ $300k\Omega$, no clocks,	0.008	0.001	0.0003	0.025
	VREF maintained @ 75k Ω , no clocks,	0.014	0.001	0.0003	0.045
	VREF maintained @ $5k\Omega$, no clocks,	0.259	0.001	0.0003	0.781
Stereo	8kHz, 0.9Vrms input signal	6.44	1.07	0.10	21.5
Record	8kHz, 0.9Vrms input signal, PLL on	7.42	1.33	0.10	24.9
Stereo	16Ω HP, 44.1kHz, quiescent	7.25	6.10	0.03	32.8
Playback	16Ω HP, 44.1kHz, quiescent, PLL on	9.77	7.53	0.025	42.9
	16Ω HP, 44.1kHz, 0.6 Vrms sine wave	21.3	6.28	0.015	75.2
	16Ω HP, 44.1kHz, 0.6Vrms sine, PLL on	23.8	7.72	0.015	85.3

Table 1: Typical Power Consumption in Various Application Modes.

2.3 Supply Currents of Specific Blocks

The NAU8820 can be programmed to enable/disable various analog blocks individually, and the current to some of the major blocks can be reduced with minimum impact on performance. The table below shows the change in current consumed with different register settings. Sample rate settings affect current consumption of VDDC supply. Lower sampling rates draw lower current.

Register Dec Hex		Function	Bit	VDDA current increase/		
				Decrease when enabled		
			REFIMP[1:0]	+100μA for 80kΩ and 300kΩ +260μA for 3kΩ

Revision History

VERSION	DATE	PAGE	DESCRIPTION	
A0.0	February, 2008	NA	Preliminary Revision	
A0.6	May 2008	NA	Preliminary Revision	
A0.86	September 2008	NA	Preliminary Revision	
Rev1.0	Mar. 05, 2009	NA	Correct minor errata; minor text improvements	
Rev 1.1	Jan.15, 2014	1	Updated AECQ100 description	
Rev 1.2	March 2016	9	Add Important Notice	
Rev 1.3	June 28, 2016	20	Update package information	
Rev 1.4	July 31 2018	11	Adding low pass filters for I2C pins

Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.

Please note that all data and specifications are subject to change without notice. All the trademarks of products and companies mentioned in this datasheet belong to their respective owners.
