## TABLE OF CONTENTS

<b>1 GENERAL DESCRIPTION .....</b>	<b>28</b>
<b>2 FEATURES .....</b>	<b>31</b>
2.1 M251/M252 Series Features .....	31
2.2 M254/M256/M258 Features.....	46
<b>3 PARTS INFORMATION .....</b>	<b>59</b>
3.1 Package Type .....	59
3.2 M251/M252/M254/M256/M258 Series Selection Guide.....	60
3.2.1 M251 Base Series (M251Fx / M251Ex / M251Zx) .....	60
3.2.2 M251 Base Series (M251Lx) .....	61
3.2.3 M251 Base Series (M251Sx).....	62
3.2.4 M251 Base Series (M251Kx).....	63
3.2.5 M252 USB Series (M252Fx / M252Ex / M252Zx) .....	64
3.2.6 M252 USB Series (M252Lx).....	65
3.2.7 M252 USB Series (M252Sx).....	66
3.2.8 M252 USB Series (M252Kx).....	67
3.2.9 M254 LCD Series .....	68
3.2.10 M256 LCD + Touch Series .....	69
3.2.11 M258 LCD + Touch + USB Series .....	70
3.2.12 Naming Rule.....	71
3.3 M251/M252/M254/M256/M258 Series Feature Comparison Table .....	72
<b>4 PIN CONFIGURATION .....</b>	<b>76</b>
4.1 Pin Configuration .....	76
4.1.1 M251 Series Pin Diagram .....	76
4.1.2 M251 Series Multi-function Pin Diagram.....	82
4.1.3 M252 Series Pin Diagram .....	121
4.1.4 M252 Series Multi-function Pin Diagram.....	127
4.1.5 M254 Series Pin Diagram .....	166
4.1.6 M254 Series Multi-function Pin Diagram.....	171
4.1.7 M256 Series Pin Diagram .....	198
4.1.8 M256 Series Multi-function Pin Diagram.....	203
4.1.9 M258 Series Pin Diagram .....	225
4.1.10 M258 Series Multi-function Pin Diagram.....	228
4.2 Pin Mapping .....	253
4.3 Pin Functional Description .....	262
<b>5 BLOCK DIAGRAM.....</b>	<b>276</b>
5.1 M251/M252 Block Diagram.....	276
5.2 M254/256/M258 Block Diagram.....	277

<b>6</b>	<b>FUNCTIONAL DESCRIPTION.....</b>	<b>278</b>
6.1	Arm® Cortex®-M23 Core.....	278
6.2	System Manager.....	280
6.2.1	Overview.....	280
6.2.2	System Reset.....	280
6.2.3	System Power Distribution.....	286
6.2.4	Power Modes and Wake-up Sources.....	286
6.2.5	Chip Bus Matrix.....	291
6.2.6	System Memory Map.....	291
6.2.7	SRAM Memory Organization.....	294
6.2.8	IRC Auto Trim.....	295
6.2.9	UART0_TXD/USC0_DAT0 Modulation with PWM.....	295
6.2.10	Register Map.....	296
6.2.11	Register Description.....	298
6.2.12	System Timer (SysTick).....	345
6.2.13	Nested Vectored Interrupt Controller (NVIC).....	351
6.2.14	System Control Register.....	372
6.3	Clock Controller.....	381
6.3.1	Overview.....	381
6.3.2	Clock Generator.....	384
6.3.3	System Clock and SysTick Clock.....	386
6.3.4	Peripherals Clock.....	387
6.3.5	Power-down Mode Clock.....	388
6.3.6	Clock Output.....	388
6.3.7	USB Clock Source.....	389
6.3.8	Register Map.....	390
6.3.9	Register Description.....	391
6.4	Flash Memory Controller (FMC).....	428
6.4.1	Overview.....	428
6.4.2	Features.....	428
6.4.3	Block Diagram.....	428
6.4.4	Functional Description.....	430
6.4.5	Register Map.....	455
6.4.6	Register Description.....	456
6.5	General Purpose I/O (GPIO).....	476
6.5.1	Overview.....	476
6.5.2	Features.....	476
6.5.3	Block Diagram.....	477
6.5.4	Basic Configuration.....	478
6.5.5	Functional Description.....	478
6.5.6	Register Map.....	482

6.5.7 Register Description.....	485
6.6 PDMA Controller (PDMA).....	501
6.6.1 Overview.....	501
6.6.2 Features.....	501
6.6.3 Block Diagram.....	502
6.6.4 Basic Configuration .....	502
6.6.5 Functional Description .....	502
6.6.6 Register Map.....	509
6.6.7 Register Description.....	512
6.7 Timer Controller (TMR).....	543
6.7.1 Overview.....	543
6.7.2 Features.....	543
6.7.3 Block Diagram.....	544
6.7.4 Basic Configuration .....	548
6.7.5 Timer Functional Description .....	549
6.7.6 PWM Functional Description .....	556
6.7.7 Register Map.....	565
6.7.8 Register Description.....	568
6.8 Watchdog Timer (WDT).....	597
6.8.1 Overview.....	597
6.8.2 Features.....	597
6.8.3 Block Diagram.....	597
6.8.4 Basic Configuration .....	597
6.8.5 Functional Description .....	598
6.8.6 Register Map.....	600
6.8.7 Register Description.....	601
6.9 Window Watchdog Timer (WWDT).....	605
6.9.1 Overview.....	605
6.9.2 Features.....	605
6.9.3 Block Diagram.....	605
6.9.4 Basic Configuration .....	605
6.9.5 Functional Description .....	606
6.9.6 Register Map.....	610
6.9.7 Register Description.....	611
6.10 Real Time Clock (RTC).....	616
6.10.1 Overview.....	616
6.10.2 Features.....	616
6.10.3 Block Diagram.....	618
6.10.4 Basic Configuration .....	618
6.10.5 Functional Description .....	618
6.10.6 Register Map.....	624

6.10.7	Register Description.....	625
6.11	Basic PWM Generator and Capture Timer (BPWM).....	651
6.11.1	Overview.....	651
6.11.2	Features.....	651
6.11.3	Block Diagram.....	652
6.11.4	Basic Configuration .....	654
6.11.5	Functional Description .....	655
6.11.6	Register Map.....	670
6.11.7	Register Description.....	673
6.12	PWM Generator and Capture Timer (PWM) .....	706
6.12.1	Overview.....	706
6.12.2	Features.....	706
6.12.3	Block Diagram.....	707
6.12.4	Basic Configuration .....	711
6.12.5	Functional Description .....	712
6.12.6	Register Map.....	733
6.12.7	Register Description.....	737
6.13	UART Interface Controller (UART).....	787
6.13.1	Overview.....	787
6.13.2	Features.....	787
6.13.3	Block Diagram.....	789
6.13.4	Basic Configuration .....	791
6.13.5	Functional Description .....	792
6.13.6	Register Map.....	816
6.13.7	Register Description.....	818
6.14	Smart Card Host Interface (SC) .....	854
6.14.1	Overview.....	854
6.14.2	Features.....	854
6.14.3	Block Diagram.....	854
6.14.4	Basic Configuration .....	856
6.14.5	Functional Description .....	856
6.14.6	Register Map.....	868
6.14.7	Register Description.....	869
6.15	Serial Peripheral Interface (SPI).....	894
6.15.1	Overview.....	894
6.15.2	Features.....	894
6.15.3	Block Diagram.....	897
6.15.4	Basic Configuration .....	897
6.15.5	Functional Description .....	898
6.15.6	Timing Diagram.....	916
6.15.7	Programming Examples .....	918

6.15.8	Register Map.....	921
6.15.9	Register Description.....	922
6.16	Quad Serial Peripheral Interface (QSPI).....	943
6.16.1	Overview.....	943
6.16.2	Features.....	943
6.16.3	Block Diagram.....	943
6.16.4	Basic Configuration.....	944
6.16.5	Functional Description.....	945
6.16.6	Timing Diagram.....	961
6.16.7	Programming Examples.....	963
6.16.8	Register Map.....	966
6.16.9	Register Description.....	967
6.17	I <sup>2</sup> C Serial Interface Controller (I <sup>2</sup> C).....	981
6.17.1	Overview.....	981
6.17.2	Features.....	981
6.17.3	Block Diagram.....	982
6.17.4	Basic Configuration.....	982
6.17.5	Functional Description.....	982
6.17.6	Register Map.....	1005
6.17.7	Register Description.....	1005
6.18	USCI - Universal Serial Control Interface Controller (USCI).....	1028
6.18.1	Overview.....	1028
6.18.2	Features.....	1028
6.18.3	Block Diagram.....	1028
6.18.4	Functional Description.....	1028
6.19	USCI – UART Mode.....	1039
6.19.1	Overview.....	1039
6.19.2	Features.....	1039
6.19.3	Block Diagram.....	1040
6.19.4	Basic Configuration.....	1041
6.19.5	Functional Description.....	1041
6.19.6	Register Map.....	1050
6.19.7	Register Description.....	1051
6.20	USCI - SPI Mode.....	1074
6.20.1	Overview.....	1074
6.20.2	Features.....	1074
6.20.3	Block Diagram.....	1075
6.20.4	Basic Configuration.....	1075
6.20.5	Functional Description.....	1076
6.20.6	Register Map.....	1088
6.20.7	Register Description.....	1089

6.21	USCI - I <sup>2</sup> C Mode .....	1113
6.21.1	Overview .....	1113
6.21.2	Features .....	1113
6.21.3	Block Diagram .....	1114
6.21.4	Basic Configuration .....	1114
6.21.5	Functional Description .....	1115
6.21.6	Register Map .....	1133
6.21.7	Register Description .....	1134
6.22	Programmable Serial IO (PSIO) .....	1153
6.22.1	Overview .....	1153
6.22.2	Features .....	1153
6.22.3	Block Diagram .....	1154
6.22.4	Basic Configuration .....	1155
6.22.5	Data Rate Limitation .....	1155
6.22.6	Functional Description .....	1157
6.22.7	Programing Flow .....	1168
6.22.8	Register Map .....	1188
6.22.9	Register Description .....	1189
6.23	External Bus Interface (EBI) .....	1225
6.23.1	Overview .....	1225
6.23.2	Features .....	1225
6.23.3	Block Diagram .....	1226
6.23.4	Basic Configuration .....	1226
6.23.5	Functional Description .....	1226
6.23.6	Register Map .....	1235
6.23.7	Register Description .....	1236
6.24	USB 2.0 Full-Speed Device Controller (USBD) .....	1240
6.24.1	Overview .....	1240
6.24.2	Features .....	1240
6.24.3	Block Diagram .....	1242
6.24.4	Basic Configuration .....	1242
6.24.5	Functional Description .....	1242
6.24.6	Register Map .....	1249
6.24.7	Register Description .....	1252
6.25	Cryptographic Accelerator (CRYPTO) .....	1279
6.25.1	Overview .....	1279
6.25.2	Features .....	1279
6.25.3	Block Diagram .....	1279
6.25.4	Basic Configuration .....	1279
6.25.5	Functional Description .....	1279
6.25.6	Register Map .....	1288

6.25.7	Register Description.....	1289
6.26	CRC Controller (CRC) .....	1303
6.26.1	Overview.....	1303
6.26.2	Features.....	1303
6.26.3	Block Diagram.....	1303
6.26.4	Basic Configuration .....	1303
6.26.5	Functional Description .....	1304
6.26.6	Register Map.....	1306
6.26.7	Register Description.....	1307
6.27	Enhanced 12-bit Analog-to-Digital Converter (EADC).....	1312
6.27.1	Overview.....	1312
6.27.2	Features.....	1312
6.27.3	Block Diagram.....	1314
6.27.4	Basic Configuration .....	1314
6.27.5	Functional Description .....	1314
6.27.6	Register Map.....	1328
6.27.7	Register Description.....	1331
6.28	LCD Controller .....	1361
6.28.1	Overview.....	1361
6.28.2	Features.....	1361
6.28.3	Block Diagram.....	1362
6.28.4	Basic Configuration .....	1362
6.28.5	Functional Description .....	1365
6.28.6	Register Map.....	1382
6.28.7	Register Description.....	1383
6.29	Digital to Analog Converter (DAC) .....	1397
6.29.1	Overview.....	1397
6.29.2	Features.....	1397
6.29.3	Block Diagram.....	1399
6.29.4	Basic Configuration .....	1399
6.29.5	Functional Description .....	1400
6.29.6	Register Map.....	1405
6.29.7	Register Description.....	1406
6.30	Analog Comparator Controller (ACMP).....	1420
6.30.1	Overview.....	1420
6.30.2	Features.....	1420
6.30.3	Block Diagram.....	1421
6.30.4	Basic Configuration .....	1421
6.30.5	Functional Description .....	1421
6.30.6	Register Map.....	1427
6.30.7	Register Description.....	1428

6.31	OP Amplifier (OPA).....	1435
6.31.1	Overview.....	1435
6.31.2	Features.....	1435
6.31.3	Block Diagram.....	1435
6.31.4	Basic Configuration.....	1435
6.31.5	Functional Description.....	1435
6.31.6	Register Map.....	1437
6.31.7	Register Description.....	1438
6.32	Peripherals Interconnection.....	1442
6.32.1	Overview.....	1442
6.32.2	Peripherals Interconnect Matrix table.....	1442
6.32.3	Functional Description.....	1442
7	APPLICATION CIRCUIT.....	1447
7.1	Power Supply Scheme.....	1447
7.2	Peripheral Application Scheme.....	1448
8	ELECTRICAL CHARACTERISTICS.....	1449
9	PACKAGE DIMENSIONS.....	1450
9.1	TSSOP20 (4.4x6.5x0.9 mm <sup>3</sup> ).....	1450
9.2	TSSOP28 (4.4x9.7x1.0 mm <sup>3</sup> ).....	1451
9.3	QFN 33L (5x5x0.8 mm <sup>3</sup> ).....	1452
9.4	LQFP 44L (10x10x1.4 mm <sup>3</sup> Footprint 2.0 mm).....	1454
9.5	LQFP 48L (7x7x1.4 mm <sup>3</sup> Footprint 2.0 mm).....	1455
9.6	LQFP 64L (7x7x1.4 mm <sup>3</sup> Footprint 2.0 mm).....	1456
9.7	LQFP 80L (14x14x1.4 mm <sup>3</sup> Footprint 2.0 mm).....	1457
9.8	LQFP 128L (14x14x1.4 mm <sup>3</sup> Footprint 2.0 mm).....	1458
10	ABBREVIATIONS.....	1459
10.1	Abbreviations.....	1459
11	REVISION HISTORY.....	1461

## 1 GENERAL DESCRIPTION

The NuMicro® M251/M252/M254/M256/M258 series is a low-power microcontroller platform based on Arm® Cortex®-M23 core for Armv8-M architecture. It runs up to 48 MHz with 32 ~ 256 Kbytes embedded Flash memory and 8 ~ 32 Kbytes embedded SRAM, 4 Kbytes Flash loader memory (LDROM) for In-System Programming (ISP). The 32-bit low-power microcontrollers supports wide supply voltage from 1.75V ~ 5.5V and operating temperature range from -40° C ~ +105° C.

### **Low-power Technology for IoT application**

The NuMicro® M251/M252/M254/M256/M258 series behaves low power consumption in Normal Run mode 138µA/ MHz at 48 MHz, Idle mode 60µA/ MHz, Power-down mode 2.5µA (RTC on, RAM retention), Power-down mode 1.7µA (RTC off, RAM retention) and Deep Power-down mode. The NuMicro® M251/M252/M254/M256/M258 series integrates RTC with independent V<sub>BAT</sub> voltage source pin to support low power mode with main power off and V<sub>BAT</sub> only. Its low power, wide supply voltage and fast wake-up features make it suitable for battery-powered IoT applications.

### **Programmable Serial Interface (PSIO)**

The NuMicro® M251/M252 series provides up to 8-channel Nuvoton proprietary interface, named as “Programmable Serial I/O” (PSIO), which is capable of generating specific waveform to emulate arbitrary serial communication protocols to connect with specific peripherals by PSIO hardware engine. PSIO can be treated as extension of popular serial communication standard (UART, SPI, I<sup>2</sup>C, etc.), niche serial communication standard and proprietary protocol (SPI-like protocol for LED-lighting application, etc.). This PSIO hardware engine can simulate comprehensive serial communication protocol with low CPU loading, low control complexity and high timing precision at the same time. High elasticity and flexibility makes PSIO a powerful and useful interface while connecting to diverse peripherals.

### **Voltage Adjustable Interface (VAI) - Support 2<sup>nd</sup> I/O voltage without level-shifter**

The NuMicro® M251/M252 series integrates Voltage Adjustable Interface (VAI), up to 6 I/O pins to support the 2<sup>nd</sup> I/O voltage from 1.65V ~ 5.5V to save level shifter components while connecting to external devices. These 6 I/O pins can be configured as UART/SPI/ I<sup>2</sup>C bus by software setting.

### **eExecute-Only-Memory (XOM) - Protect the intelligent property of developers**

The NuMicro® M251/M252/M254/M256/M258 series provides 1-region programable eExecute-Only-Memory (XOM) to secure critical program code. A tamper detection pin is implemented to avoid malicious damage from hacker. The 96-bit Unique Identification (UID) and 128-bit Unique Customer Identification (UCID) are used to enhance the product security.

### **COM/SEG LCD Driver**

An 8 x 44, 6 x 46, 4 x 48 COM/SEG LCD is available on the M254/M256/M258 series. The COM/SEG LCD driver built-in charge-pump function to support 3V to 5V LCD panel, with selectable bias voltage (1/2, 1/3, 1/4) and duty (1/4, 1/6, 1/8). The feature makes it suitable for Handheld devices that need high display quality in the outdoor environment to provide constant contrast ratio.

### **Capacitive Touch Sensing Function**

The M256/M258 series supports up to 24 independent capacitive touch key sensing function with single-scan or programmable periodic key-scans modes; it also provides high noise resistance in harsh requirement and easy-to-use calibration tool regarding to development and mass production phase.

## **Crystal-less USB 2.0 full speed device interface**

The M252/M258 series supports a crystal-less USB 2.0 full speed device that can generate precise frequency required by USB protocol without the need of external crystal to reduce the BOM cost and PCB size.

The NuMicro® M258 series supports USB Battery Charging Detection v1.2 (BC1.2) profile to realize faster charging function via USB port, suitable for rechargeable battery powered devices.

## **Rich Pheripherals for comprehensive product application scenarios**

The NuMicro® M251/M252/M254/M256/M258 series is equipped with plenty of peripherals such as Timers, Watchdog Timers, RTC, PDMA, External Bus Interface (EBI), UART, Universal Serial Control Interface (USCI), QSPI, SPI/ I<sup>2</sup>S, I<sup>2</sup>C, ISO-7816-3, GPIOs, up to 24 channels of PWM, makes it highly suitable for connecting comprehensive external modules and LED lighting control. The NuMicro® M252 series integrates high performance analog front-end circuit blocks, such as 16 channels of 12-bit 730 KSPS ADC, 12-bit 1 MSPS DAC, analog comparator, operational amplifier, temperature sensor, low voltage reset (LVR) and brown-out detector (BOD) to enhance product performance, reduce external components and form factor simultaneously.

The NuMicro® M251/M252 series provides TSSOP20 (4.4mm x 6.5mm), TSSOP28 (4.4mmx9.7mm), QFN33 (5mm x 5mm), LQFP48 (7mm x 7mm), LQFP64 (7mm x 7mm) and LQFP128 (14mm x 14mm).

The NuMicro® M254/M256/M258 series provides LQFP44 (10mm x 10mm), LQFP64 (7mm x 7mm), LQFP80 (14mm x 14mm) and LQFP128 (14mm x 14mm).

Nuvoton NuMaker M251/M252/M254/M256/M258 evaluation boards and Nu-Link debugger are available for evaluation and product development. 3rd Party IDEs such as Keil® MDK, IAR EWARM and Eclipse IDE with GNU GCC compilers, are also supported.

USCI\*: supports UART, SPI or I<sup>2</sup>C

Table 1-1 NuMicro® M251/M252/M254/M256/M258 Series Key Features Support Table

The NuMicro® M251/M252 series is suitable for a wide range of applications such as:

- Smart Home / Smart Home Appliance
- Industrial Control / Industrial Automation
- Smart City
- IoT Device
- Security Alarm System
- Electronic Payments
- Communication Modules
- Portable Wireless Data Collector
- Smart Door Lock
- Handheld Medical Device
- GPS Location Tracker
- Electronic Shelf Labels (ESL)

The NuMicro® M254/M256/M258 series is suitable for a wide range of applications such as:

- Handheld Devices
- Thermostat with Smart LCD Display and Touch Key
- Smart Home Appliance
- Industrial Control / Industrial Automation
- Temperature/Humidity Logger

## 2 FEATURES

### 2.1 M251/M252 Series Features

<b>Core and System</b>	
<b>Arm® Cortex®-M23 without TrustZone®</b>	<ul style="list-style-type: none"> <li>• Arm® Cortex®-M23 core, running up to 48 MHz when <math>V_{DD} = 1.75V \sim 5.5V</math></li> <li>• Built-in PMSAv8 Memory Protection Unit (MPU)</li> <li>• Built-in Nested Vectored Interrupt Controller (NVIC)</li> <li>• 32-bit Single-cycle hardware multiplier and 32-bit 17-cycle hardware divider</li> <li>• 24-bit system tick timer</li> <li>• Supports Programmable and maskable interrupt</li> <li>• Supports Low Power Sleep mode by WFI and WFE instructions</li> <li>• Supports single cycle I/O access</li> <li>• Supports XOM feature with 1 region</li> </ul>
<b>Low power mode and current</b>	<ul style="list-style-type: none"> <li>• Low Power mode: <ul style="list-style-type: none"> <li>– Idle mode</li> </ul> </li> <li>• Power-down mode (PD): <ul style="list-style-type: none"> <li>– Fast Wake-up Power-down mode (FWPD)</li> <li>– Deep Power-down mode (DPD)</li> </ul> </li> </ul>
<b>Wake-up source and wakeup time</b>	<ul style="list-style-type: none"> <li>• EINT, USCI, RTC, WDT, I<sup>2</sup>C, Timer, UART, BOD, LVR, POR, GPIO, USB, ACMP, Debug interface, NMI and Reset pin from Power-down mode or Fast Wake-up Power-down mode</li> <li>• RTC, Wake-up Timer, LVR, Wake-up pins, Tamper from Deep Power-down mode</li> </ul>
<b>Power supply and low voltage detect</b>	<ul style="list-style-type: none"> <li>• Built-in LDO for wide operating voltage from 1.75V to 5.5V</li> <li>• Core power voltage: 1.5V</li> <li>• Brown-out detector <ul style="list-style-type: none"> <li>– With 7 levels: 4.4V/3.7V/3.0V/2.7V/2.4V/2.0V/1.8V</li> <li>– Supports Brown-out Interrupt and Reset option</li> </ul> </li> <li>• Low Voltage Reset <ul style="list-style-type: none"> <li>– Threshold voltage levels: 1.55V</li> </ul> </li> </ul>
<b>Cyclic Redundancy Calculation Unit</b>	<ul style="list-style-type: none"> <li>• Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32</li> <li>• Programmable order reverse setting for input data and CRC checksum</li> <li>• Programmable 1's complement setting for input data and CRC</li> </ul>

	<ul style="list-style-type: none"> <li>checksum</li> <li>Supports 8-/16-/32-bit of data width</li> <li>Programmable seed value</li> <li>8-bit write mode: 1-AHB clock cycle operation</li> <li>16-bit write mode: 2-AHB clock cycle operation</li> <li>32-bit write mode: 4-AHB clock cycle operation</li> <li>Supports using PDMA to write data to perform CRC operation</li> </ul>
<b>Voltage Adjustable Interface</b>	<ul style="list-style-type: none"> <li>Supports up to 6 VAI pins</li> <li>User Configurable 1.65V ~ 5.5V I/O Interface with a dedicated power input (V<sub>DDIO</sub>)</li> <li>Supports UART0~1, SPI0~1, I2C0~1, USCI2 and SC0 interface</li> </ul>

	<ul style="list-style-type: none"> <li>• Basic and Scatter-Gather Transfer modes</li> <li>• Each channel supports circular buffer management using Scatter-Gather Transfer mode</li> <li>• Two types of priorities modes: Fixed-priority and Round-robin modes</li> <li>• Transfer data width of 8, 16, and 32 bits</li> <li>• Single and burst transfer type</li> <li>• Source and destination address can be increment or fixed</li> <li>• PDMA transfer count up to 65536</li> <li>• Request source form software, PSIO, SPI/I<sup>2</sup>S, UART, USCI, EADC, DAC, PWM capture event or TIMER</li> </ul>
--	--

## Clocks

### Clock Source

- Built-in 4.032 MHz internal high speed RC oscillator (MIRC) for system operation
- Built-in 48 MHz internal high speed RC oscillator (HIRC) for system operation
- Built-in 38.4 kHz internal low speed RC oscillator (LIRC) for Watchdog Timer and wake-up operation.
- Built-in 4~32 MHz external high speed crystal oscillator (HXT) for precise timing operation
- Built-in 32.768 kHz external low speed crystal oscillator (LXT) for RTC function and low-power system operation
- Supports one PLL up to 100 MHz for high performance system operation, sourced from HIRC and HXT
- Supports clock on-the-fly switch
- Supports clock failure detection for high/low speed external crystal oscillator
- HXT clock frequency accuracy detector
- Supports exception (NMI) generated once a clock failure detected
- Supports divided clock output

## Timers

### TIMER mode

### 32-bit Timer

- 4 sets of 32-bit timers with 24-bit up counters and 8-bit prescale counters
- Independent clock source for each timer
- One-shot, Periodic, Toggle and Continuous Counting operation modes
- Event counting function to count the event from external pin
- Input capture function to capture or reset counter value

- External capture pin event for interval measurement
- External capture pin event to reset 24-bit up counter
- Chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated
- Timer interrupt flag or external capture interrupt flag to trigger BPWM, PWM, EADC, DAC and PDMA
- Internal capture triggered source from ACMP output
- Inter-Timer trigger capture mode

#### PWM mode

- 16-bit compare register and period register
- Double buffer for period register and compare register
- Supports inverse in PWM output
- PWM interrupt wake-up from system Power-down mode

#### BPWM

- Supports maximum clock frequency up to 96 MHz
- Each module provides 6 output channels
- Supports independent mode for BPWM output/Capture input channel
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution BPWM counter, each module providing 1 BPWM counter:
  - Up, down or up/down counter operation type
- Supports mask function and tri-state enable for each BPWM pin
- Supports interrupt on the following events:
  - BPWM counter match 0, period value or compared value
- Supports trigger ADC on the following events:
  - BPWM counter match 0, period value or compared value
- Capture Function Features
  - Up to 12 capture input channels with 16-bit resolution
  - Supports rising or falling capture condition
  - Supports input rising/falling capture interrupt
  - Supports rising/falling capture with counter reload option

#### PWM

- Supports maximum clock frequency up to 96 MHz
- Up to two PWM modules; each module provides 6 output channels.
- Supports independent mode for PWM output/Capture input channel
- Supports complementary mode for 3 complementary paired PWM output channels:

	<ul style="list-style-type: none"> <li>- Dead-time insertion with 12-bit resolution</li> <li>- Two compared values during one period</li> <li>• Supports 12-bit prescaler from 1 to 4096</li> <li>• Supports 16-bit resolution PWM counter: <ul style="list-style-type: none"> <li>- Up, down or up/down counter operation type</li> </ul> </li> <li>• Supports mask function and tri-state enable for each PWM pin</li> <li>• Supports brake function: <ul style="list-style-type: none"> <li>- Brake source from pin and system safety events (clock failed, Brown-out detection and CPU lockup)</li> <li>- Noise filter for brake source from pin</li> <li>- Edge detect brake source to control brake state until brake interrupt cleared</li> <li>- Level detect brake source to auto recover function after brake condition removed</li> </ul> </li> <li>• Supports interrupt on the following events: <ul style="list-style-type: none"> <li>- PWM counter match 0, period value or compared value</li> <li>- Brake condition happened</li> </ul> </li> <li>• Supports trigger ADC on the following events: <ul style="list-style-type: none"> <li>- PWM counter match 0, period value or compared value</li> </ul> </li> <li>• Capture Function Features: <ul style="list-style-type: none"> <li>- Up to 12 capture input channels with 16-bit resolution</li> <li>- Supports rising or falling capture condition</li> <li>- Supports input rising/falling capture interrupt</li> <li>- Supports rising/falling capture with counter reload option</li> <li>- Supports PDMA transfer function for all PWM channels</li> </ul> </li> </ul>
<b>Watchdog</b>	<ul style="list-style-type: none"> <li>• 20-bit free running up counter for WDT time-out interval</li> <li>• Clock sources from LIRC (default), HCLK/2048 or LXT</li> <li>• 9 selectable time-out period from 488us ~ 32 sec</li> <li>• Able to wake up from Power-down or Idle mode</li> <li>• Interrupt or reset selectable on watchdog time-out</li> <li>• Selectable WDT reset delay period, including 1026, 130, 18 or 3 WDT_CLK reset delay period</li> <li>• Force WDT enabled after chip power on or reset</li> <li>• WDT time-out wake-up function only if WDT clock source is selected as LIRC or LXT</li> </ul>
<b>Window Watchdog</b>	<ul style="list-style-type: none"> <li>• Clock sources from HCLK/2048 (default) or LIRC</li> <li>• Window set by 6-bit down counter with 11-bit prescaler</li> </ul>

	<ul style="list-style-type: none"> <li>• WWDT counter suspends in Idle/Power-down mode</li> <li>• Supports Interrupt</li> </ul>
RTC	<ul style="list-style-type: none"> <li>• Supports external power pin <math>V_{BAT}</math></li> <li>• Software compensation by setting frequency compensate register (FCR), compensated clock accuracy reaches <math>\pm 5\text{ppm}</math> within 5 seconds</li> <li>• RTC counter (second, minute, hour) and calendar counter (day, month, year)</li> <li>• Alarm registers (second, minute, hour, day, month, year)</li> <li>• Selectable 12-hour or 24-hour mode</li> <li>• Automatic leap year recognition</li> <li>• Day of the Week counter</li> <li>• Daylight Saving Time software control</li> <li>• Periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 or 1 second</li> <li>• 1 Hz clock output for RTC calibration</li> <li>• Wake-up from idle mode and Power-down mode</li> <li>• 32 kHz oscillator gain control</li> <li>• RTC Time Tick and Alarm Match interrupt</li> </ul>
Tamper	<ul style="list-style-type: none"> <li>• 20 bytes spare registers and 1 tamper pin to clear the content of these spare registers</li> <li>• Selectable spare register erase function</li> <li>• Supports Timestamp function</li> </ul>
<b>Analog Interfaces</b>	
EADC	<ul style="list-style-type: none"> <li>• Conversion results held in up to 19 data registers with valid and overrun indicators</li> <li>• Analog input voltage: <math>0 \sim V_{REF}</math> (Max to <math>AV_{DD}</math>)</li> <li>• Reference voltage from <math>V_{REF}</math> pin, <math>AV_{DD}</math> or internal <math>V_{REF}</math></li> <li>• 12-bit resolution and 10-bit accuracy guaranteed</li> <li>• Up to 16 single-end analog external input channels</li> <li>• Supports 3 internal channels: <ul style="list-style-type: none"> <li>– Band-gap VBG output or Internal voltage reference</li> <li>– Temperature sensor input</li> <li>– <math>V_{BAT}</math> voltage measure (<math>V_{BAT}/4</math>)</li> </ul> </li> <li>• Four ADC interrupts (ADINT0~3) with individual interrupt vector addresses</li> <li>• ADC clock frequency up to 16 MHz</li> </ul>

- Up to 730 KSPS conversion rate
- Configurable ADC internal sampling time
- Up to 19 sample modules:
  - Each of sample module 0~15 is configurable for ADC converter channel
  - EADC\_CH0~15 and trigger source
  - Configurable PDMA
  - Configured resolution for 12-bit or 16-bit result
  - Supports Left-adjusted result
  - Averaging and oversampling ( $2^n$  times,  $n=0\sim8$ ) to support up to 16-bit result
  - Sample module 16~18 is fixed for ADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and battery power ( $V_{BAT}/4$ ).
  - Configurable sampling time for each sample module.
  - Conversion results held in 19 data registers with valid and overrun indicators
- Supports digital comparator to monitor conversion result that can be under or over the compare register setting
- Generates an interrupt when conversion result matches the compare register setting
- Internal reference voltage source:
  - 1.536V, 2.048V, 2.560V, 3.072V, or 4.096V
- An A/D conversion can be started by:
  - Write 1 to SWTRGn (EADC\_SWTRG[n],  $n = 0\sim18$ )
  - External pin EADC0\_ST
  - Timer0~3 overflow pulse triggers
  - ADINT0/1 interrupt EOC (End of conversion) pulse triggers
  - PWM triggers
  - BPWM triggers
- Supports PDMA transfer
- Auto turn on/off ADC power in Power-down or operation mode with wait state

#### DAC

- Up to one 12-bit 1 MSPS voltage type DAC
- Analog output voltage:  $0\sim V_{REF}$  ( $AV_{DD}$ )
- Supports 8-bit and 12-bit mode
- Rail to rail settle time 6 $\mu$ s
- Reference voltage selects from internal reference voltage,  $AV_{DD}$  or  $V_{REF}$  pin

	<ul style="list-style-type: none"> <li>• Max. output voltage <math>AV_{DD} - 0.2V</math> in buffer mode</li> <li>• Conversion started by software enable, Timer interrupt flag(TIF) or PDMA trigger</li> <li>• Voltage output buffer mode and bypass voltage output buffer mode</li> <li>• Supports PDMA mode</li> </ul>
<b>Analog Comparator (ACMP)</b>	<ul style="list-style-type: none"> <li>• Up to two rail-to-rail analog comparators</li> <li>• 4 multiplexed I/O pins at positive node</li> <li>• Negative node: <ul style="list-style-type: none"> <li>– One I/O pin</li> <li>– Band-gap (VBG)</li> <li>– DAC0 output</li> <li>– Comparator Reference Voltage (CRV)</li> </ul> </li> <li>• Programmable propagation speed and low power consumption</li> <li>• Interrupts generated when compare results change (Interrupt event condition programmable)</li> <li>• Supports Power-down Wake-up</li> <li>• Supports triggers for break events and cycle-by-cycle control for PWM</li> <li>• Supports window compare mode and window latch mode</li> <li>• Supports programmable hysteresis window: <ul style="list-style-type: none"> <li>– 0 mV, 10 mV, 20 mV or 30 mV</li> </ul> </li> </ul>
<b>OPA</b>	<ul style="list-style-type: none"> <li>• Analog input voltage: <math>0 \sim AV_{DD}</math>.</li> <li>• Up to 1 operational amplifier</li> <li>• Supports to use schmitt trigger buffer output for simple comparator function</li> <li>• Supports schmitt trigger buffer output interrupts</li> </ul>
<b>Internal Reference Voltage</b>	<ul style="list-style-type: none"> <li>• Internal reference voltage select: 1.536V, 2.048V, 2.560V, 3.072V, 4.096V for EADC, DAC and CRV (comparator reference voltage) reference voltage</li> </ul>
<b>Communication Interfaces</b>	
<b>UART</b>	<ul style="list-style-type: none"> <li>• Supports up to 3 UARTs: UART0, UART1 and UART2</li> <li>• UART baud rate clock from LXT(32.768 kHz) with 9600bps in Power-down mode</li> <li>• Baud rate up to 10 Mbps</li> <li>• Full-duplex asynchronous communications</li> <li>• Supports one-wire half-duplex communications</li> </ul>

- 
- Separates receive and transmit 16/16 bytes FIFO
  - Programmable receiver buffer trigger level
  - Hardware auto-flow control (CTS and RTS)
  - IrDA (SIR) function:
    - Supports 3/16 bit duration for normal mode
  - RS-485 9-bit mode and direction control
  - UART0 supports LIN function:
    - LIN master/slave mode
    - Programmable break generation function for transmitter
    - Break detection function for receiver
  - Programmable baud-rate generator up to 1/16 system clock
  - 8-bit receiver FIFO time-out detection function
  - Programmable transmitting data delay time between the last stop and the next start bit
  - Auto-Baud Rate measurement and baud rate compensation function
  - Break error, frame error, parity error and receive/transmit FIFO overflow detection function
  - Supports RS-485 mode:
    - RS-485 9-bit mode
    - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
    - nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function in Power-down mode.
    - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
  - Fully programmable serial-interface:
    - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
    - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
    - Programmable stop bit, 1, 1.5, or 2 stop bit generation
  - Supports PDMA mode
- 

#### Smart card mode

#### Smart Card Interface

- ISO 7816-3 T = 0, T = 1 compliant
  - EMV2000 compliant
  - One ISO 7816-3 port
  - Separates receive/transmit 4 byte entry FIFO for data payloads
  - Programmable transmission clock frequency
-

- 
- Programmable receiver buffer trigger level
  - Programmable guard time selection (11 ETU ~ 267 ETU)
  - One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
  - Supports auto direct / inverse convention function
  - Supports transmitter and receiver error retry and error number limiting function
  - Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
  - Supports hardware warm reset sequence process
  - Supports hardware deactivation sequence process
  - Supports hardware auto deactivation sequence when the card removal is detected

#### UART mode

- Full duplex, asynchronous communications
  - Separates receiving / transmitting 4 bytes entry FIFO for data payloads
  - Supports programmable baud rate generator
  - Supports programmable receiver buffer trigger level
  - Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion
  - Programmable even, odd or no parity bit generation and detection
  - Programmable stop bit, 1- or 2- stop bit generation
- 

#### SPI

- 
- Supports Master or Slave mode operation
  - Master and slave mode up to 25 MHz (when chip works at  $V_{DD} = 3.0 \sim 5.5V$ )
  - Supports 2-bit Transfer mode
  - Supports Dual and Quad I/O Transfer mode
  - Configurable bit length of a transaction word from 8 to 32-bit
  - Provides separate 8-level depth transmit and receive FIFO buffers
  - Supports MSB first or LSB first transfer sequence
  - Supports Byte Reorder function
  - Supports Byte or Word Suspend mode
  - Supports PDMA transfer
  - Supports 3-Wire, no slave selection signal, bi-direction interface
  - Supports one data channel half-duplex transfer
  - Supports receive-only mode
-

**I<sup>2</sup>C**

- Up to 2 sets of I<sup>2</sup>C devices
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- 7-bit and 10-bit addressing mode
- Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
- Supports 14-bit time-out counter requesting the I<sup>2</sup>C interrupt if the I<sup>2</sup>C bus hangs up and timer-out counter overflows
- Programmable clocks allow versatile rate control
- Multiple address recognition (four slave address with mask option)
- Supports setup/hold time programmable
- Supports SMBus and PMBus
- Multi-address Power-down wake-up function
- Supports PDMA transfer

**SPI Mode**

**SPI/I<sup>2</sup>S**

- Up to 1 set of SPI controller
- Master or Slave mode operation
- Configurable bit length of a transfer word from 8 to 32-bit
- Provides separate 4-level of 32-bit (or 8-level of 16-bit) transmit and receive FIFO buffers which depended on SPI setting of data width
- MSB first or LSB first transfer sequence
- Supports byte reorder function
- Byte or Word Suspend mode
- Master and slave mode up to 25 MHz (V<sub>DD</sub> = 3.0V ~5.5V)
- Supports one data channel half-duplex transfer
- Supports receive-only mode
- Supports PDMA transfer

**I<sup>2</sup>S Mode**

- Up to 1 set of I<sup>2</sup>S by SPI controllers

**Universal Serial Control  
Interface (USCI)**

- Interface with external audio CODEC
- Supports Master and Slave mode
- Capable of handling 8-, 16-, 24- and 32-bit word sizes
- Mono and stereo audio data
- PCM mode A, PCM mode B, I<sup>2</sup>S and MSB justified data format
- Each provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
- Generates interrupt requests when buffer levels cross a programmable boundary
- Each supports two PDMA requests, one for transmitting and the other for receiving

- Up to 3 sets of USCI: USCI0, USCI1 and USCI2
- Supports UART, SPI and I<sup>2</sup>C function
- Single byte TX and RX buffer mode

**USCI\_UART**

- One transmit buffer and two receive buffer for data payload
- Hardware auto flow control function and programmable flow control trigger level
- Programmable baud-rate generator
- Supports 9-bit data transfer
- Baud rate detection by built-in capture event of baud rate generator
- Supports Wake-up function (Data and nCTS Wakeup Only)
- Supports PDMA transfer

**USCI\_SPI**

- Master or Slave mode operation
- Configurable bit length of a transfer word from 4 to 16-bit
- One transmit buffer and two receive buffer for data payload
- MSB first or LSB first transfer sequence
- Word suspend function
- Supports PDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface
- Wake-up function: input slave select transition
- Supports one data channel half-duplex transfer

**USCI\_I2C**

- Full master and slave device capability
- 7-bit/10-bit addressing mode

	<ul style="list-style-type: none"> <li>• Communication in Standard mode (100 kbps), Fast mode (up to 400 kbps) and Fast mode plus (1 Mbps)</li> <li>• Multi-master bus</li> <li>• One transmit buffer and two receive buffer for data payload</li> <li>• 10-bit bus time out capability</li> <li>• Supports Bus monitor mode</li> <li>• Wake-up by data toggle or address match in Power-down mode</li> <li>• Multiple address recognition</li> <li>• Setup/hold time programmable</li> </ul>
<b>External Bus Interface (EBI)</b>	<ul style="list-style-type: none"> <li>• Supports up to three memory banks</li> <li>• Supports dedicated external chip select pin with polarity control for each bank</li> <li>• Accessible space up to 1 Mbytes for each bank</li> <li>• Byte write in 16-bit data width mode</li> <li>• Address/Data multiplexed and separate mode</li> <li>• Timing parameters individual adjustment for each memory block</li> <li>• Supports LCD interface i80 mode</li> <li>• Supports Continuous Data Access mode</li> <li>• Supports PDMA mode</li> </ul>
<b>GPIO</b>	<ul style="list-style-type: none"> <li>• Four I/O modes: <ul style="list-style-type: none"> <li>– Quasi bi-direction</li> <li>– Push-Pull output</li> <li>– Open-Drain output</li> <li>– Input only with high impendence</li> </ul> </li> <li>• TTL/Schmitt trigger input selectable</li> <li>• I/O pin configured as interrupt source with edge/level trigger setting</li> <li>• Independent pull-up/pull-down control</li> <li>• High driver and high sink current I/O (up to 16 mA at 5V, 25°C)</li> <li>• Minimum I/O Speed <ul style="list-style-type: none"> <li>– 25 MHz when <math>V_{DD} = 2.7 \sim 5.5 \text{ V}</math> (<math>-40^{\circ}\text{C} \sim +105^{\circ}\text{C}</math>, <math>CL=30p</math>, high skew rate enabled)</li> <li>– 10 MHz when <math>V_{DD} = 1.75 \sim 5.5 \text{ V}</math> (<math>-40^{\circ}\text{C} \sim +105^{\circ}\text{C}</math>, <math>CL=30p</math>, high skew rate enabled)</li> </ul> </li> <li>• Software selectable slew rate control</li> <li>• Supports wake-up function</li> </ul>

- 
- Supports I/O de-bounce with LIRC at power down
  - I/O configurations of multi-function pin are controlled by module or MFOS register settings.
- 

**PSIO**

- Supports up to 8 PSIO pins, from PSIO pin0 to PSIO pin7
- Supports 6 clock source selections: HXT, LXT, HIRC, LIRC, PLL, or PCLK1
- Supports one clock divider, which can be divided from 1 to 255
- Supports slot controller for timing sequence control
  - Supports 4 slot controllers, 8 slots in each slot controller
  - Supports counting from 1 PSIO clock to 15 PSIO clocks in each slot
  - Supports 3 slot repeat modes:
    - ◆ Normal repeat mode
    - ◆ Normal repeat mode with infinity loops
    - ◆ Whole repeat mode
  - Supports 4 slot trigger conditions:
    - ◆ Triggered by software
    - ◆ Triggered by falling edge
    - ◆ Triggered by rising edge
    - ◆ Triggered by rising edge or falling edge
- Supports PSIO PIN for pin state control
- Supports 8 check points to connect with slots in each pin
- Supports 8 check point actions in each check point
- Supports 7 kinds of check point action to setting:
  - Output high
  - Output low
  - Output data
  - Output toggle
  - Input data
  - Input status
  - Input status update
- Supports 4 I/O modes: input, output, open-drain, and quasi
- Supports switch I/O mode in different check points
- Supports 4 kinds of Interrupt trigger conditions:
  - Two sets of configurable slot interrupt controllers
  - Mismatch interrupt when PSIO is enabled with PDMA
  - Transfer Error interrupt

## 2.2 M254/M256/M258 Features

Core and System	
Arm® Cortex®-M23 without TrustZone®	<ul style="list-style-type: none"> <li>• Arm® Cortex®-M23 processor, running up to 48 MHz when <math>V_{DD} = 1.75V \sim 5.5V</math></li> <li>• Built-in PMSAv8 Memory Protection Unit (MPU)</li> <li>• Built-in Nested Vectored Interrupt Controller (NVIC)</li> <li>• 32-bit Single-cycle hardware multiplier and 32-bit 17-cycle hardware divider</li> <li>• 24-bit system tick timer</li> <li>• Supports Programmable and maskable interrupt</li> <li>• Supports Low Power Sleep mode by WFI and WFE instructions</li> <li>• Supports single cycle I/O access</li> <li>• Supports XOM feature with 1 region</li> </ul>
Low power mode and current	<ul style="list-style-type: none"> <li>• Low Power mode: <ul style="list-style-type: none"> <li>– Idle mode</li> </ul> </li> <li>• Power-down mode (PD) <ul style="list-style-type: none"> <li>– Fast Wake-up Power-down mode (FWPD)</li> <li>– Deep Power-down mode (DPD)</li> </ul> </li> </ul>
Wake-up source and wakeup time	<ul style="list-style-type: none"> <li>• EINT, Touch key, USCI, RTC, WDT, I<sup>2</sup>C, Timer, UART, BOD, LVR, POR, GPIO, USB, ACMP, Debug interface, NMI and Reset pin from Power-down mode or Fast Wake-up Power-down mode</li> <li>• RTC, Wake-up Timer, LVR, Wake-up pins, Tamper, from Deep Power-down mode</li> </ul>
Power supply and low voltage detect	<ul style="list-style-type: none"> <li>• Built-in LDO for wide operating voltage from 1.75V to 5.5V</li> <li>• Core power voltage: 1.5V</li> <li>• Brown-out detector <ul style="list-style-type: none"> <li>– With 7 levels: 4.4V/3.7V/3.0V/2.7V/2.4V/2.0V/1.8V</li> <li>– Supports Brown-out Interrupt and Reset option</li> </ul> </li> <li>• Low Voltage Reset <ul style="list-style-type: none"> <li>– Threshold voltage levels: 1.55V</li> </ul> </li> </ul>
Cyclic Redundancy Calculation Unit	<ul style="list-style-type: none"> <li>• Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32</li> <li>• Programmable order reverse setting for input data and CRC checksum</li> <li>• Programmable 1's complement setting for input data and CRC checksum.</li> <li>• Supports 8-/16-/32-bit of data width</li> </ul>

	<ul style="list-style-type: none"> <li>• Programmable seed value</li> <li>• 8-bit write mode: 1-AHB clock cycle operation</li> <li>• 16-bit write mode: 2-AHB clock cycle operation</li> <li>• 32-bit write mode: 4-AHB clock cycle operation</li> <li>• Supports using PDMA to write data to perform CRC operation</li> </ul>
<b>Security</b>	<ul style="list-style-type: none"> <li>• 96-bit Unique ID (UID)</li> <li>• 128-bit Unique Customer ID (UCID)</li> <li>• AES-128, 192, 256</li> </ul>
<b>Memories</b>	
<b>Flash</b>	<ul style="list-style-type: none"> <li>• Up to 256 KB application ROM (APROM)</li> <li>• 4 KB Flash for user program loader (LDROM)</li> <li>• Up to 48 MHz with zero wait state for consecutive address read access</li> <li>• 12 bytes User Configuration Block to control system initiation.</li> <li>• 512B page erase for all embedded Flash</li> <li>• 32-bit and multi-word Flash programming function</li> <li>• Supports In-System-Programming (ISP), In-Application-Programming (IAP) update embedded Flash memory</li> <li>• Supports CRC-32 checksum calculation function</li> <li>• Supports Flash all one verification function (hardware can check page erase verify)</li> <li>• Hardware external read protection of whole Flash memory by Security Lock Bit</li> <li>• Supports XOM feature with 1 region</li> </ul>
<b>SRAM</b>	<ul style="list-style-type: none"> <li>• Up to 32 KB embedded SRAM</li> <li>• Supports byte-, half-word- and word-access</li> <li>• Supports PDMA mode</li> </ul>
<b>Peripheral DMA (PDMA)</b>	<ul style="list-style-type: none"> <li>• Up to 8 independent configurable channels for automatic data transfer between memories and peripherals</li> <li>• Channel 0, 1 support time-out function</li> <li>• Basic and Scatter-Gather Transfer modes</li> <li>• Each channel supports circular buffer management using Scatter-Gather Transfer mode</li> <li>• Two types of priorities modes: Fixed-priority and Round-robin modes</li> <li>• Transfer data width of 8, 16, and 32 bits</li> </ul>

	<ul style="list-style-type: none"> <li>• Single and burst transfer type</li> <li>• Source and destination address can be increment or fixed</li> <li>• PDMA transfer count up to 65536</li> <li>• Request source can be form software, SPI/I<sup>2</sup>S, I<sup>2</sup>C, UART, USCI, EADC, DACand TIMER</li> </ul>
<b>Clocks</b>	
<b>Clock Source</b>	<ul style="list-style-type: none"> <li>• Built-in 4.032 MHz internal high speed RC oscillator (MIRC) for system operation</li> <li>• Built-in 48 MHz internal high speed RC oscillator (HIRC) for system operation</li> <li>• Built-in 38.4 kHz internal low speed RC oscillator (LIRC) for Watchdog Timer and wake-up operation.</li> <li>• Built-in 4~32 MHz external high speed crystal oscillator (HXT) for precise timing operation</li> <li>• Built-in 32.768 kHz external low speed crystal oscillator (LXT) for RTC function and low-power system operation</li> <li>• Supports clock on-the-fly switch</li> <li>• Supports clock failure detection for high/low speed external crystal oscillator</li> <li>• HXT clock frequency accuracy detector</li> <li>• Supports exception (NMI) generated once a clock failure detected</li> <li>• Supports divided clock output</li> </ul>
<b>Timers</b>	
<b>32-bit Timer</b>	<p><b>TIMER mode</b></p> <ul style="list-style-type: none"> <li>• 4 sets of 32-bit timers with 24-bit up counters and 8-bit prescale counters</li> <li>• Independent clock source for each timer</li> <li>• One-shot, Periodic, Toggle and Continuous Counting operation modes</li> <li>• Event counting function to count the event from external pin</li> <li>• Input capture function to capture or reset counter value</li> <li>• External capture pin event for interval measurement.</li> <li>• External capture pin event to reset 24-bit up counter.</li> <li>• Chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated</li> <li>• Timer interrupt flag or external capture interrupt flag to trigger BPWM, EADC, DAC and PDMA.</li> <li>• Internal capture triggered source from ACMP output.</li> <li>• Inter-Timer trigger capture mode</li> </ul>

	<b>PWM mode</b> <ul style="list-style-type: none"> <li>• 16-bit compare register and period register</li> <li>• Double buffer for period register and compare register</li> <li>• Supports inverse in PWM output</li> <li>• PWM interrupt wake-up from system Power-down mode</li> </ul>
<b>BPWM</b>	<ul style="list-style-type: none"> <li>• Each module provides 6 output channels</li> <li>• Supports independent mode for BPWM output/Capture input channel</li> <li>• Supports 12-bit prescaler from 1 to 4096</li> <li>• Supports 16-bit resolution BPWM counter, each module provides 1 BPWM counter <ul style="list-style-type: none"> <li>– Up, down or up/down counter operation type</li> </ul> </li> <li>• Supports mask function and tri-state enable for each BPWM pin</li> <li>• Supports interrupt on the following events: <ul style="list-style-type: none"> <li>– BPWM counter match 0, period value or compared value</li> </ul> </li> <li>• Supports trigger ADC on the following events: <ul style="list-style-type: none"> <li>– BPWM counter match 0, period value or compared value</li> </ul> </li> <li>• Capture Function Features <ul style="list-style-type: none"> <li>– Up to 12 capture input channels with 16-bit resolution</li> <li>– Supports rising or falling capture condition</li> <li>– Supports input rising/falling capture interrupt</li> <li>– Supports rising/falling capture with counter reload option</li> </ul> </li> </ul>
<b>Watchdog</b>	<ul style="list-style-type: none"> <li>• 20-bit free running up counter for WDT time-out interval</li> <li>• Clock sources from LIRC (default), HCLK/2048 or LXT</li> <li>• 9 selectable time-out period from 488us ~ 32 sec</li> <li>• Able to wake up from Power-down or Idle mode</li> <li>• Interrupt or reset selectable on watchdog time-out</li> <li>• Selectable WDT reset delay period, including 1026, 130, 18 or 3 WDT_CLK reset delay period</li> <li>• Force WDT enabled after chip power on or reset.</li> <li>• WDT time-out wake-up function only if WDT clock source is selected as LIRC or LXT</li> </ul>
<b>Window Watchdog</b>	<ul style="list-style-type: none"> <li>• Clock sources from HCLK/2048 (default) or LIRC</li> <li>• Window set by 6-bit down counter with 11-bit prescaler</li> <li>• WWDT counter suspends in Idle/Power-down mode</li> <li>• Supports Interrupt</li> </ul>

## RTC

- Supports external power pin  $V_{BAT}$
- Software compensation by setting frequency compensate register (FCR), compensated clock accuracy reaches  $\pm 5\text{ppm}$  within 5 seconds
- RTC counter (second, minute, hour) and calendar counter (day, month, year)
- Alarm registers (second, minute, hour, day, month, year)
- Selectable 12-hour or 24-hour mode
- Automatic leap year recognition
- Day of the Week counter
- Daylight Saving Time software control
- Periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 or 1 second
- 1 Hz clock output for RTC calibration
- Wake-up from idle mode and Power-down mode
- 32 kHz oscillator gain control
- RTC Time Tick and Alarm Match interrupt

## Analog Interfaces

## EADC

- Conversion results held in up to 7 data registers with valid and overrun indicators
- Analog input voltage:  $0 \sim V_{REF}$  (Max to  $AV_{DD}$ )
- Reference voltage from  $V_{REF}$  pin,  $AV_{DD}$  or internal  $V_{REF}$
- 12-bit resolution and 10-bit accuracy guaranteed
- Up to 16 single-end analog external input channels
- Supports 3 internal channels:
  - Band-gap VBG output or Internal voltage reference
  - Temperature sensor input
  - $V_{BAT}$  voltage measure ( $V_{BAT}/4$ )
- Four ADC interrupts (ADINT0~3) with individual interrupt vector addresses
- ADC clock frequency up to 16 MHz
- Up to 730 KSPS conversion rate
- Configurable ADC internal sampling time
- Up to 7 sample modules:
  - Each of sample module 0~3 is configurable for ADC converter channel
  - EADC\_CH0~15 and trigger source

	<ul style="list-style-type: none"> <li>- Configurable PDMA</li> <li>- Configured resolution for 12-bit or 16-bit result</li> <li>- Supports Left-adjusted result</li> <li>- Averaging and oversampling (<math>2^n</math> times, <math>n=0\sim8</math>) to support up to 16-bit result</li> <li>- Sample module 16~18 is fixed for ADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and battery power (<math>V_{BAT}/4</math>).</li> <li>- Configurable sampling time for each sample module</li> <li>- Conversion results held in 19 data registers with valid and overrun indicators</li> <li>• Supports digital comparator to monitor conversion result that can be under or over the compare register setting</li> <li>• Generates an interrupt when conversion result matches the compare register setting</li> <li>• Internal reference voltage source: <ul style="list-style-type: none"> <li>- 1.536V, 2.048V, 2.560V, 3.072V, or 4.096V</li> </ul> </li> <li>• An A/D conversion can be started by: <ul style="list-style-type: none"> <li>- Write 1 to SWTRGn (EADC_SWTRG[n], <math>n = 0\sim18</math>)</li> <li>- External pin EADC0_ST</li> <li>- Timer0~3 overflow pulse triggers</li> <li>- ADINT0/1 interrupt EOC (End of conversion) pulse triggers</li> <li>- BPWM triggers</li> </ul> </li> <li>• Supports PDMA transfer</li> <li>• Auto turn on/off ADC power at power down or operation mode with wait state</li> </ul>
DAC	<ul style="list-style-type: none"> <li>• Up to two 12-bit 1 MSPS voltage type DAC</li> <li>• Analog output voltage: <math>0\sim V_{REF}</math> (<math>AV_{DD}</math>)</li> <li>• Supports 8-bit and 12-bit mode</li> <li>• Rail to rail settle time 6<math>\mu</math>s</li> <li>• Reference voltage selects from internal reference voltage, <math>AV_{DD}</math> or <math>V_{REF}</math> pin</li> <li>• Max. output voltage <math>AV_{DD} - 0.2V</math> at buffer mode</li> <li>• Conversion started by software enable, Timer interrupt flag (TIF) or PDMA trigger</li> <li>• Voltage output buffer mode and bypass voltage output buffer mode</li> <li>• Supports PDMA mode</li> </ul>
Analog Comparator	<ul style="list-style-type: none"> <li>• Up to two rail-to-rail analog comparators</li> </ul>

<b>(ACMP)</b>	<ul style="list-style-type: none"> <li>• 4 multiplexed I/O pins at positive node</li> <li>• Negative node: <ul style="list-style-type: none"> <li>– One I/O pin</li> <li>– Band-gap (VBG)</li> <li>– DAC0 output</li> <li>– Comparator Reference Voltage (CRV)</li> </ul> </li> <li>• Programmable propagation speed and low power consumption</li> <li>• Interrupts generated when compare results change (Interrupt event condition programmable)</li> <li>• Supports Power-down Wake-up</li> <li>• Supports triggers for break events and cycle-by-cycle control for PWM</li> <li>• Supports window compare mode and window latch mode</li> <li>• Supports programmable hysteresis window: <ul style="list-style-type: none"> <li>– 0 mV, 10 mV, 20 mV or 30 mV</li> </ul> </li> </ul>
<b>Internal Reference Voltage</b>	<ul style="list-style-type: none"> <li>• Internal reference voltage select: 1.536V, 2.048V, 2.560V, 3.072V, 4.096V for EADC, DAC and CRV (comparator reference voltage) reference voltage</li> </ul>
<b>Capacitive Touch</b>	<ul style="list-style-type: none"> <li>• Supports up to 24 touch keys</li> <li>• Supports flexible reference channel setting, at least 1 reference channel needed</li> <li>• Programmable sensitivity levels for each channel</li> <li>• Programmable scanning speed for different applications</li> <li>• Supports any touch key wake-up for low-power applications</li> <li>• Supports single key-scan and programmable periodic key-scan</li> <li>• Programmable interrupt options for key-scan complete with or without threshold control</li> <li>• Supports independent reference capacitor bank (RefCB) registers for each channels</li> <li>• Supports Timer0~3 time-out interrupt signal(TIF) to trigger touch key scan</li> </ul>
<b>COM/SEG LCD</b>	<ul style="list-style-type: none"> <li>• Supports the following COM/SEG configurations: <ul style="list-style-type: none"> <li>– Up to 352 dots (8-COM x 44-SEG)</li> <li>– Up to 276 dots (6-COM x 46-SEG)</li> <li>– Up to 192 dots (4-COM x 48-SEG)</li> </ul> </li> <li>• Supports maximum 8 COM driving pins, multiplexed with GPIO pins</li> <li>• Supports maximum 48 SEG driving pins, multiplexed with GPIO</li> </ul>

	pins
	<ul style="list-style-type: none"> <li>• Supports 3 bias voltage levels 1/2, 1/3, and 1/4</li> <li>• Supports 8 duty ratios 1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, and 1/8</li> <li>• Supports clock frequency divider from 0 to 1023 to configure the LCD operating frequency</li> <li>• Configurable frame counting event interrupt period</li> <li>• Supports LCD blinking display controlled by frame counting event</li> <li>• Supports LCD frame end interrupt</li> <li>• LCD keeps display or blinking even if in Power-down mode when LCD clock source is selected as LIRC or LXT</li> <li>• Supports both type A and type B driving waveforms</li> <li>• Programmable Charge Pump output voltage <math>V_{LCD}</math> from 3.0V ~ 5.2V</li> <li>• Selectable <math>V_{LCD}</math> source from Charge Pump output or external pin</li> <li>• Programmable buffer enable selection to enhance COM and SEG driving capability</li> <li>• With internal resistive series network to generate reference voltage for COM and SEG voltage</li> <li>• With big resistor series network to save power and small resistor series network to drive COM and SEG directly by software selection.</li> <li>• LCD panel loading detect feature</li> </ul>

### Communication Interfaces

UART	<ul style="list-style-type: none"> <li>• Supports up to 4 UARTs: UART0, UART1, UART2 and UART3</li> <li>• UART baud rate clock from LXT(32.768 kHz) with 9600bps in Power-down mode</li> <li>• Baud rate up to 10 Mbps</li> <li>• Full-duplex asynchronous communications</li> <li>• Supports one-wire half-duplex communications</li> <li>• Separates receive and transmit 16/16 bytes FIFO</li> <li>• Programmable receiver buffer trigger level</li> <li>• Hardware auto-flow control (CTS and RTS)</li> <li>• IrDA (SIR) function: <ul style="list-style-type: none"> <li>– Supports 3/16 bit duration for normal mode</li> </ul> </li> <li>• RS-485 9-bit mode and direction control</li> <li>• UART0 supports LIN function: <ul style="list-style-type: none"> <li>– LIN master/slave mode</li> <li>– Programmable break generation function for transmitter</li> </ul> </li> </ul>
------	---

- 
- Break detection function for receiver
  - Programmable baud-rate generator up to 1/16 system clock
  - 8-bit receiver FIFO time-out detection function
  - Programmable transmitting data delay time between the last stop and the next start bit
  - Auto-Baud Rate measurement and baud rate compensation function
  - Break error, frame error, parity error and receive/transmit FIFO overflow detection function
  - Supports RS-485 mode:
    - RS-485 9-bit mode
    - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
    - nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function in Power-down mode.
    - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
  - Fully programmable serial-interface:
    - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
    - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
    - Programmable stop bit, 1, 1.5, or 2 stop bit generation
  - Supports PDMA mode
- 

#### Smart card mode

#### Smart Card Interface

- ISO 7816-3 T = 0, T = 1 compliant
- EMV2000 compliant
- One ISO 7816-3 port
- Separates receive/transmit 4 byte entry FIFO for data payloads
- Programmable transmission clock frequency
- Programmable receiver buffer trigger level
- Programmable guard time selection (11 ETU ~ 267 ETU)
- One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
- Supports auto direct / inverse convention function
- Supports transmitter and receiver error retry and error number limiting function
- Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
- Supports hardware warm reset sequence process

	<ul style="list-style-type: none"> <li>• Supports hardware deactivation sequence process</li> <li>• Supports hardware auto deactivation sequence when the card removal is detected</li> </ul>
	<b>UART mode</b> <ul style="list-style-type: none"> <li>• Full duplex, asynchronous communications</li> <li>• Separates receiving / transmitting 4 bytes entry FIFO for data payloads</li> <li>• Supports programmable baud rate generator</li> <li>• Supports programmable receiver buffer trigger level</li> <li>• Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion</li> <li>• Programmable even, odd or no parity bit generation and detection</li> <li>• Programmable stop bit, 1- or 2- stop bit generation</li> </ul>
SPI	<ul style="list-style-type: none"> <li>• Supports Master or Slave mode operation</li> <li>• Master and slave mode up to 25 MHz (when chip works at <math>V_{DD} = 3.0 \sim 5.5V</math>)</li> <li>• Supports 2-bit Transfer mode</li> <li>• Supports Dual and Quad I/O Transfer mode</li> <li>• Configurable bit length of a transaction word from 8 to 32-bit</li> <li>• Provides separate 8-level depth transmit and receive FIFO buffers</li> <li>• Supports MSB first or LSB first transfer sequence</li> <li>• Supports Byte Reorder function</li> <li>• Supports Byte or Word Suspend mode</li> <li>• Supports PDMA transfer</li> <li>• Supports 3-Wire, no slave selection signal, bi-direction interface</li> <li>• Supports one data channel half-duplex transfer</li> <li>• Supports receive-only mode</li> </ul>
I <sup>2</sup> C	<ul style="list-style-type: none"> <li>• Up to 2 sets of I<sup>2</sup>C devices</li> <li>• Master/Slave mode</li> <li>• Bidirectional data transfer between masters and slaves</li> <li>• Multi-master bus (no central master)</li> <li>• 7-bit and 10-bit addressing mode</li> <li>• Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)</li> <li>• Arbitration between simultaneously transmitting masters without corruption of serial data on the bus</li> <li>• Serial clock synchronization allows devices with different bit rates</li> </ul>

---

to communicate via one serial bus

- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
  - Supports 14-bit time-out counter requesting the I<sup>2</sup>C interrupt if the I<sup>2</sup>C bus hangs up and timer-out counter overflows
  - Programmable clocks allow versatile rate control
  - Multiple address recognition (four slave address with mask option)
  - Supports setup/hold time programmable
  - Supports SMBus and PMBus
  - Multi-address Power-down wake-up function
  - Supports PDMA transfer
- 

#### SPI Mode

- Up to 2 sets of SPI controllers
- Master or Slave mode operation
- Configurable bit length of a transfer word from 8 to 32-bit
- Provides separate 4-level of 32-bit (or 8-level of 16-bit) transmit and receive FIFO buffers which depended on SPI setting of data width
- MSB first or LSB first transfer sequence
- Supports byte reorder function
- Byte or Word Suspend mode
- Master and slave mode up to 25 MHz ( $V_{DD} = 3.0V \sim 5.5V$ )
- Supports one data channel half-duplex transfer
- Supports receive-only mode
- Supports PDMA transfer

#### SPI/I<sup>2</sup>S

#### I<sup>2</sup>S Mode

- Up to 2 sets of I<sup>2</sup>S by SPI controllers
  - Interface with external audio CODEC
  - Supports Master and Slave mode
  - Capable of handling 8-, 16-, 24- and 32-bit word sizes
  - Mono and stereo audio data
  - PCM mode A, PCM mode B, I<sup>2</sup>S and MSB justified data format
  - Each provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
  - Generates interrupt requests when buffer levels cross a programmable boundary
  - Each supports two PDMA requests, one for transmitting and the other for receiving
-

**Universal Serial Control  
Interface (USCI)**

- Up to 2 sets of USCI
- Supports UART, SPI and I<sup>2</sup>C function
- Single byte TX and RX buffer mode

**USCI\_UART**

- One transmit buffer and two receive buffer for data payload
- Hardware auto flow control function and programmable flow control trigger level
- Programmable baud-rate generator
- Supports 9-bit data transfer
- Baud rate detection by built-in capture event of baud rate generator
- Supports Wake-up function (Data and nCTS Wakeup Only)
- Supports PDMA transfer

**USCI\_SPI**

- Master or Slave mode operation
- Configurable bit length of a transfer word from 4 to 16-bit
- One transmit buffer and two receive buffer for data payload
- MSB first or LSB first transfer sequence
- Word suspend function
- Supports PDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface
- Wake-up function: input slave select transition
- Supports one data channel half-duplex transfer

**USCI\_I2C**

- Full master and slave device capability
- 7-bit/10-bit addressing mode
- Communication in Standard mode (100 kbps), Fast mode (up to 400 kbps) and Fast mode plus (1 Mbps)
- Multi-master bus
- One transmit buffer and two receive buffer for data payload
- 10-bit bus time out capability
- Supports Bus monitor mode
- Wake-up by data toggle or address match in Power-down mode
- Multiple address recognition
- Setup/hold time programmable

**GPIO**

- Four I/O modes:

- 
- Quasi bi-direction
  - Push-Pull output
  - Open-Drain output
  - Input only with high impendence
  - TTL/Schmitt trigger input selectable
  - I/O pin configured as interrupt source with edge/level trigger setting
  - Independent pull-up/pull-down control
  - High driver and high sink current I/O (up to 16 mA at 5V, 25°C)
  - Minimum I/O Speed:
    - 25 MHz when  $V_{DD} = 2.7V \sim 5.5V$  (-40°C ~ +105°C, CL=30p, high skew rate enabled)
    - 10 MHz when  $V_{DD} = 1.75V \sim 5.5V$  (-40°C ~ +105°C, CL=30p, high skew rate enabled)
  - Software selectable slew rate control
  - Supports wake-up function
  - Supports I/O de-bounce with LIRC at power down
  - I/O configurations of multi-function pin are controlled by module or MFOS register settings
  - Supports 5V tolerance except PA8, PA9, PF2, PF3, PF4 and PF5 pins

---

#### Advanced Connectivity

---

##### USB 2.0 Full Speed

- Compliant with USB 2.0 Full-Speed specification
  - Provides 1 interrupt vector with 5 different interrupt events (SOF, NEVWK, VBUSDET, USB and BUS)
  - Suspend function when no bus activity exists for 3 ms
  - Supports 12 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 1024 bytes buffer size
  - Provides remote wake-up capability
  - Start of Frame (SOF) locked clock pulse generation
  - Supports USB 2.0 Link Power Management (LPM)
  - Supports Crystal-less function
  - Supports Battery charging 1.2 (BC1.2)
-

## 3.2 M251/M252/M254/M256/M258 Series Selection Guide

### 3.2.1 M251 Base Series (M251Fx / M251Ex / M251Zx)

PART NUMBER		M251FC2AE	M251EC2AE	M251ZC2AE	M251ZD2AE
Flash (KB)		32	32	32	64
SRAM (KB)		8	8	8	12
LDROM (KB)		4			
PLL ( MHz)		-	-	-	96
LXT		-	-	√	√
I/O		15	23	26	26
32-bit Timer/PWM		4			
PWM		9	11	12	12
BPWM		-	-	-	12
WDT/WWDT		√			
RTC		-	-	√	√
Connectivity	USCI*	1	1	1	2
	UART	2	2	2	3
	QSPI	1			
	SPI /I2S	-	-	-	1
	I <sup>2</sup> C	2			
	SC/UART	1			
	EBI	-			
	PSIO	-	-	-	4
12-bit ADC		7	9	10	10
ACMP		-	-	-	2
DAC		-			
OPA		-			
PDMA		5			
Tamper		-			
VAI		-	-	√	√
V <sub>BAT</sub> pin		-			
Internal V <sub>REF</sub>		-			
Package		TSSOP20	TSSOP28	QFN33	QFN33

USCI\*: supports UART, SPI or I<sup>2</sup>C

## 3.2.2 M251 Base Series (M251Lx)

PART NUMBER		M251LC2AE	M251LD2AE	M251LE3AE	M251LG6AE
Flash (KB)		32	64	128	256
SRAM (KB)		8	12	16	32
LDROM (KB)		4			
PLL ( MHz)		96			
LXT		√			
I/O		41			
32-bit Timer/PWM		4			
PWM		12			
BPWM		12			
WDT/WWDT		√			
RTC		√			
Connectivity	USCI*	2	2	3	3
	UART	3			
	QSPI	1			
	SPI /I2S	1			
	I <sup>2</sup> C	2			
	SC/UART	1			
	EBI	-	-	√	√
	PSIO	4	4	8	8
12-bit ADC		12			
ACMP		2			
DAC		-	-	-	1
OPA		-	-	-	1
PDMA		5	5	8	8
Tamper		-			
VAI		√			
V <sub>BAT</sub> pin		-			
Internal V <sub>REF</sub>		-			
Package		LQFP48			

USCI\*: supports UART, SPI or I<sup>2</sup>C

## 3.2.3 M251 Base Series (M251Sx)

PART NUMBER		M251SC2AE	M251SD2AE	M251SE3AE	M251SG6AE
Flash (KB)		32	64	128	256
SRAM (KB)		8	12	16	32
LDROM (KB)		4			
PLL ( MHz)		96			
LXT		√			
I/O		54	54	53	53
32-bit Timer/PWM		4			
PWM		12			
BPWM		12			
WDT/WWDT		√			
RTC		√			
Connectivity	USCI*	2	2	3	3
	UART	3			
	QSPI	1			
	SPI /I2S	1			
	I <sup>2</sup> C	2

6.15.5.7 FIFO Buffer Operation	SPI Slave 3-Wire mode	●	●	●	●	-	-

6.15.9 Register Description	For slave bit count error: In Slave mode, if the transmit/receive bit count is mismatched with the DWIDTH (SPIx_CTL[12:8]), the uncompleted transaction will be dropped from TX and RX shift registers.	●	●	●	●	-	-
	For slave bit count error: In Slave mode, if the transmit/receive bit count is mismatched with the DWIDTH (SPIx_CTL[12:8]), the uncompleted transaction will be dropped from TX shift register.  When the control register SLVBERX (SPIx_FIFCTL[10]) is disabled and the error event of SPI slave bit count happened, the uncompleted transaction data will be dropped from RX shift registers. When control register SLVBERX (SPIx_FIFCTL[10]) is enabled and error event of SPI slave bit count happened, the uncompleted transaction data will be written from RX shift registers into RX FIFO. The status register SLVBENUM (SPIx_STATUS2[29:24]) indicates the effective bit number of uncompleted RX data when an error event of SPI slave bit count happened.	●	●	●	●	-	-
	Slave 3-wire Mode Enable Bit SLV3WIRE (SPIx_SSCTL[4])	●	●	●	●	-	-
	RX FIFO Write Data Enable Bit When Slave Mode Bit Count Error SLVBERX (SPIx_FIFCTL[10])	●	●	●	●	-	-
	Effective Bit Number of Uncompleted RX Data SLVBENUM (SPIx_STATUS2[29:24])	●	●	●	●	-	-
	I <sup>2</sup> S Clock Divider Number Selection for I <sup>2</sup> S Slave Mode and I <sup>2</sup> S Master Mode I2SSLAVE (SPIx_I2SCLK[25])	●	●	●	●	-	-
	I <sup>2</sup> S Clock Divider Number Selection for I <sup>2</sup> S Mode and SPI Mode I2SMODE (SPIx_I2SCLK[24])	●	●	●	●	-	-
6.19.7 Register Description	USCI Protocol Control Register – UART (UART_PROTCTL) DGE (UART_PROTCTL [30])	●	●	●	-	-	-

4 PIN CONFIGURATION

Users can find pin configuration information in chapter 4 or by using NuTool - PinConfig. The NuTool - PinConfigure contains all NuMicro® Family chip series with all part number, and helps users configure GPIO multi-function correctly and handily.

4.1 Pin Configuration

4.1.1 M251 Series Pin Diagram

4.1.1.1 M251 Series TSSOP 20-Pin Diagram

Corresponding Part Number: M251FC2AE

## 4.3 Pin Functional Description

### M251/M252 Series Pin Functional Description

Group	Pin Name	Type	Description
ACMP0	ACMP0_N	A	Analog comparator 0 negative input pin.
	ACMP0_O	O	Analog comparator 0 output pin.
	ACMP0_P0	A	Analog comparator 0 positive input 0 pin.
	ACMP0_P1	A	Analog comparator 0 positive input 1 pin.
	ACMP0_P2	A	Analog comparator 0 positive input 2 pin.
	ACMP0_P3	A	Analog comparator 0 positive input 3 pin.
	ACMP0_WLAT	I	Analog comparator 0 window latch input pin
ACMP1	ACMP1_N	A	Analog comparator 1 negative input pin.
	ACMP1_O	O	Analog comparator 1 output pin.
	ACMP1_P0	A	Analog comparator 1 positive input 0 pin.
	ACMP1_P1	A	Analog comparator 1 positive input 1 pin.
	ACMP1_P2	A	Analog comparator 1 positive input 2 pin.
	ACMP1_P3	A	Analog comparator 1 positive input 3 pin.
	ACMP1_WLAT	I	Analog comparator 1 window latch input pin
BPWM0	BPWM0_CH0	I/O	BPWM0 channel 0 output/capture input.
	BPWM0_CH1	I/O	BPWM0 channel 1 output/capture input.
	BPWM0_CH2	I/O	BPWM0 channel 2 output/capture input.
	BPWM0_CH3	I/O	BPWM0 channel 3 output/capture input.
	BPWM0_CH4	I/O	BPWM0 channel 4 output/capture input.
	BPWM0_CH5	I/O	BPWM0 channel 5 output/capture input.
BPWM1	BPWM1_CH0	I/O	BPWM1 channel 0 output/capture input.
	BPWM1_CH1	I/O	BPWM1 channel 1 output/capture input.
	BPWM1_CH2	I/O	BPWM1 channel 2 output/capture input.
	BPWM1_CH3	I/O	BPWM1 channel 3 output/capture input.
	BPWM1_CH4	I/O	BPWM1 channel 4 output/capture input.
	BPWM1_CH5	I/O	BPWM1 channel 5 output/capture input.
CLKO	CLKO	O	Clock Out
DAC0	DAC0_OUT	A	DAC0 channel analog output.
	DAC0_ST	I	DAC0 external trigger input.
EADC0	EADC0_CH0	A	EADC0 channel 0 analog input.
	EADC0_CH1	A	EADC0 channel 1 analog input.

Group	Pin Name	Type	Description
	EADC0_CH2	A	EADC0 channel 2 analog input.
	EADC0_CH3	A	EADC0 channel 3 analog input.
	EADC0_CH4	A	EADC0 channel 4 analog input.
	EADC0_CH5	A	EADC0 channel 5 analog input.
	EADC0_CH6	A	EADC0 channel 6 analog input.
	EADC0_CH7	A	EADC0 channel 7 analog input.
	EADC0_CH8	A	EADC0 channel 8 analog input.
	EADC0_CH9	A	EADC0 channel 9 analog input.
	EADC0_CH10	A	EADC0 channel 10 analog input.
	EADC0_CH11	A	EADC0 channel 11 analog input.
	EADC0_CH12	A	EADC0 channel 12 analog input.
	EADC0_CH13	A	EADC0 channel 13 analog input.
	EADC0_CH14	A	EADC0 channel 14 analog input.
	EADC0_CH15	A	EADC0 channel 15 analog input.
	EADC0_ST	I	EADC0 external trigger input.
EBI	EBI_AD0	I/O	EBI address/data bus bit 0.
	EBI_AD1	I/O	EBI address/data bus bit 1.
	EBI_AD2	I/O	EBI address/data bus bit 2.
	EBI_AD3	I/O	EBI address/data bus bit 3.
	EBI_AD4	I/O	EBI address/data bus bit 4.
	EBI_AD5	I/O	EBI address/data bus bit 5.
	EBI_AD6	I/O	EBI address/data bus bit 6.
	EBI_AD7	I/O	EBI address/data bus bit 7.
	EBI_AD8	I/O	EBI address/data bus bit 8.
	EBI_AD9	I/O	EBI address/data bus bit 9.
	EBI_AD10	I/O	EBI address/data bus bit 10.
	EBI_AD11	I/O	EBI address/data bus bit 11.
	EBI_AD12	I/O	EBI address/data bus bit 12.
	EBI_AD13	I/O	EBI address/data bus bit 13.
	EBI_AD14	I/O	EBI address/data bus bit 14.
	EBI_AD15	I/O	EBI address/data bus bit 15.
	EBI_ADR0	O	EBI address bus bit 0.
	EBI_ADR1	O	EBI address bus bit 1.
	EBI_ADR2	O	EBI address bus bit 2.

Group	Pin Name	Type	Description
	EBI_ADR3	O	EBI address bus bit 3.
	EBI_ADR4	O	EBI address bus bit 4.
	EBI_ADR5	O	EBI address bus bit 5.
	EBI_ADR6	O	EBI address bus bit 6.
	EBI_ADR7	O	EBI address bus bit 7.
	EBI_ADR8	O	EBI address bus bit 8.
	EBI_ADR9	O	EBI address bus bit 9.
	EBI_ADR10	O	EBI address bus bit 10.
	EBI_ADR11	O	EBI address bus bit 11.
	EBI_ADR12	O	EBI address bus bit 12.
	EBI_ADR13	O	EBI address bus bit 13.
	EBI_ADR14	O	EBI address bus bit 14.
	EBI_ADR15	O	EBI address bus bit 15.
	EBI_ADR16	O	EBI address bus bit 16.
	EBI_ADR17	O	EBI address bus bit 17.
	EBI_ADR18	O	EBI address bus bit 18.
	EBI_ADR19	O	EBI address bus bit 19.
	EBI_ALE	O	EBI address latch enable output pin.
	EBI_MCLK	O	EBI external clock output pin.
	EBI_nCS0	O	EBI chip select 0 output pin.
	EBI_nCS1	O	EBI chip select 1 output pin.
	EBI_nCS2	O	EBI chip select 2 output pin.
	EBI_nRD	O	EBI read enable output pin.
	EBI_nWR	O	EBI write enable output pin.
	EBI_nWRH	O	EBI high byte write enable output pin
	EBI_nWRL	O	EBI low byte write enable output pin.
GPIO	PA.x-PH.x	I/O	General purpose digital I/O pin.
I2C0	I2C0_SCL	I/O	I2C0 clock pin.
	I2C0_SDA	I/O	I2C0 data input/output pin.
	I2C0_SMBAL	O	I2C0 SMBus SMBALTER pin
	I2C0_SMBUS	O	I2C0 SMBus SMBUS pin (PMBus CONTROL pin)
I2C1	I2C1_SCL	I/O	I2C1 clock pin.
	I2C1_SDA	I/O	I2C1 data input/output pin.
	I2C1_SMBAL	O	I2C1 SMBus SMBALTER pin

Group	Pin Name	Type	Description
	I2C1_SMBSUS	O	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
ICE	ICE_CLK	I/O	Serial wired debugger clock pin <b>Note:</b> It is recommended to use 100 kΩ pull-up resistor on ICE_CLK pin.
	ICE_DAT	I/O	Serial wired debugger data pin <b>Note:</b> It is recommended to use 100 kΩ pull-up resistor on ICE_DAT pin.
	nRESET	I	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state. <b>Note:</b> It is recommended to use 10 kΩ pull-up resistor and 10 uF capacitor on nRESET pin.
INT0	INT0	I	External interrupt 0 input pin.
INT1	INT1	I	External interrupt 1 input pin.
INT3	INT3	I	External interrupt 3 input pin.
INT4	INT4	I	External interrupt 4 input pin.
INT5	INT5	I	External interrupt 5 input pin.
OPA0	OPA0_N	A	Operational amplifier 0 negative input pin.
	OPA0_O	A	Operational amplifier 0 output pin.
	OPA0_P	A	Operational amplifier 0 positive input pin.
PSIO0	PSIO0_CH0	I/O	PSIO 0 channel 0 input/output pin.
	PSIO1_CH0	I/O	PSIO 0 channel 1 input/output pin.
	PSIO2_CH0	I/O	PSIO 0 channel 2 input/output pin.
	PSIO3_CH0	I/O	PSIO 0 channel 3 input/output pin.
	PSIO4_CH0	I/O	PSIO 0 channel 4 input/output pin.
	PSIO5_CH0	I/O	PSIO 0 channel 5 input/output pin.
	PSIO6_CH0	I/O	PSIO 0 channel 6 input/output pin.
	PSIO7_CH0	I/O	PSIO 0 channel 7 input/output pin.
CLKO	CLKO	O	Clock Out
PWM0	PWM0_BRAKE0	I	PWM0 Brake 0 input pin.
	PWM0_BRAKE1	I	PWM0 Brake 1 input pin.
	PWM0_CH0	I/O	PWM0 channel 0 output/capture input.
	PWM0_CH1	I/O	PWM0 channel 1 output/capture input.
	PWM0_CH2	I/O	PWM0 channel 2 output/capture input.
	PWM0_CH3	I/O	PWM0 channel 3 output/capture input.
	PWM0_CH4	I/O	PWM0 channel 4 output/capture input.
	PWM0_CH5	I/O	PWM0 channel 5 output/capture input.
PWM1	PWM1_BRAKE0	I	PWM1 Brake 0 input pin.

Group	Pin Name	Type	Description
	PWM1_BRAKE1	I	PWM1 Brake 1 input pin.
	PWM1_CH0	I/O	PWM1 channel 0 output/capture input.
	PWM1_CH1	I/O	PWM1 channel 1 output/capture input.
	PWM1_CH2	I/O	PWM1 channel 2 output/capture input.
	PWM1_CH3	I/O	PWM1 channel 3 output/capture input.
	PWM1_CH4	I/O	PWM1 channel 4 output/capture input.
	PWM1_CH5	I/O	PWM1 channel 5 output/capture input.
Power	V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	V <sub>SS</sub>	P	Ground pin for digital circuit.
	V <sub>DDIO</sub>	P	Power supply for PA.0~PA.5.
	V <sub>BAT</sub>	P	Power supply by batteries for RTC.
	AV <sub>DD</sub>	P	Power supply for internal analog circuit.
	AV <sub>SS</sub>	P	Ground pin for analog circuit.
	V <sub>REF</sub>	A	ADC reference voltage input. <b>Note:</b> This pin needs to be connected with a 1uF capacitor.
QSPI0	LDO_CAP	A	LDO output pin. <b>Note:</b> This pin needs to be connected with a 1uF capacitor.
	QSPI0_CLK	I/O	Quad SPI0 serial clock pin.
	QSPI0_MISO0	I/O	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	QSPI0_MISO1	I/O	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	QSPI0_MOSI0	I/O	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	QSPI0_MOSI1	I/O	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	QSPI0_SS	I/O	Quad SPI0 slave select pin.
SC0	SC0_CLK	O	Smart Card 0 clock pin.
	SC0_DAT	I/O	Smart Card 0 data pin.
	SC0_PWR	O	Smart Card 0 power pin.
	SC0_RST	O	Smart Card 0 reset pin.
	SC0_nCD	I	Smart Card 0 card detect pin.
SPI0	SPI0_CLK	I/O	SPI0 serial clock pin.
	SPI0_I2SMCLK	I/O	SPI0 I <sup>2</sup> S master clock output pin
	SPI0_MISO	I/O	SPI0 MISO (Master In, Slave Out) pin.
	SPI0_MOSI	I/O	SPI0 MOSI (Master Out, Slave In) pin.
	SPI0_SS	I/O	SPI0 slave select pin.
TAMPER0	TAMPER0	I/O	TAMPER detector loop pin 0.

Group	Pin Name	Type	Description
TM0	TM0	I/O	Timer0 event counter input/toggle output pin.
	TM0_EXT	I/O	Timer0 external capture input/toggle output pin.
TM1	TM1	I/O	Timer1 event counter input/toggle output pin.
	TM1_EXT	I/O	Timer1 external capture input/toggle output pin.
TM2	TM2	I/O	Timer2 event counter input/toggle output pin.
	TM2_EXT	I/O	Timer2 external capture input/toggle output pin.
TM3	TM3	I/O	Timer3 event counter input/toggle output pin.
	TM3_EXT	I/O	Timer3 external capture input/toggle output pin.
UART0	UART0_RXD	I	UART0 data receiver input pin.
	UART0_TXD	O	UART0 data transmitter output pin.
	UART0_nCTS	I	UART0 clear to Send input pin.
	UART0_nRTS	O	UART0 request to Send output pin.
UART1	UART1_RXD	I	UART1 data receiver input pin.
	UART1_TXD	O	UART1 data transmitter output pin.
	UART1_nCTS	I	UART1 clear to Send input pin.
	UART1_nRTS	O	UART1 request to Send output pin.
UART2	UART2_RXD	I	UART2 data receiver input pin.
	UART2_TXD	O	UART2 data transmitter output pin.
	UART2_nCTS	I	UART2 clear to Send input pin.
	UART2_nRTS	O	UART2 request to Send output pin.
	USB_VBUS	P	Power supply from USB host or HUB.
	USB_D-	A	USB differential signal D-.
	USB_D+	A	USB differential signal D+.
	USB_VDD33_CAP	A	Internal power regulator output 3.3V decoupling pin.
USCI0	USCI0_CLK	I/O	USCI0 clock pin.
	USCI0_CTL0	I/O	USCI0 control 0 pin.
	USCI0_CTL1	I/O	USCI0 control 1 pin.
	USCI0_DAT0	I/O	USCI0 data 0 pin.
	USCI0_DAT1	I/O	USCI0 data 1 pin.
USCI1	USCI1_CLK	I/O	USCI1 clock pin.
	USCI1_CTL0	I/O	USCI1 control 0 pin.
	USCI1_CTL1	I/O	USCI1 control 1 pin.
	USCI1_DAT0	I/O	USCI1 data 0 pin.
	USCI1_DAT1	I/O	USCI1 data 1 pin.

Group	Pin Name	Type	Description
USCI2	USCI2_CLK	I/O	USCI2 clock pin.
	USCI2_CTL0	I/O	USCI2 control 0 pin.
	USCI2_CTL1	I/O	USCI2 control 1 pin.
	USCI2_DAT0	I/O	USCI2 data 0 pin.
	USCI2_DAT1	I/O	USCI2 data 1 pin.
X32	X32_IN	I	External 32.768 kHz crystal input pin.
	X32_OUT	O	External 32.768 kHz crystal output pin.
XT1	XT1_IN	I	External high speed crystal input pin.
	XT1_OUT	O	External high speed crystal output pin.

## M254/M256/M258 Series Pin Functional Description

Group	Pin Name	Type	Description
ACMP0	ACMP0_N	A	Analog comparator 0 negative input pin.
	ACMP0_O	O	Analog comparator 0 output pin.
	ACMP0_P0	A	Analog comparator 0 positive input 0 pin.
	ACMP0_P1	A	Analog comparator 0 positive input 1 pin.
	ACMP0_P2	A	Analog comparator 0 positive input 2 pin.
	ACMP0_P3	A	Analog comparator 0 positive input 3 pin.
	ACMP0_WLAT	I	Analog comparator 0 window latch input pin
ACMP1	ACMP1_N	A	Analog comparator 1 negative input pin.
	ACMP1_O	O	Analog comparator 1 output pin.
	ACMP1_P0	A	Analog comparator 1 positive input 0 pin.
	ACMP1_P1	A	Analog comparator 1 positive input 1 pin.
	ACMP1_P2	A	Analog comparator 1 positive input 2 pin.
	ACMP1_P3	A	Analog comparator 1 positive input 3 pin.
	ACMP1_WLAT	I	Analog comparator 1 window latch input pin
BPWM0	BPWM0_CH0	I/O	BPWM0 channel 0 output/capture input.
	BPWM0_CH1	I/O	BPWM0 channel 1 output/capture input.
	BPWM0_CH2	I/O	BPWM0 channel 2 output/capture input.
	BPWM0_CH3	I/O	BPWM0 channel 3 output/capture input.
	BPWM0_CH4	I/O	BPWM0 channel 4 output/capture input.
	BPWM0_CH5	I/O	BPWM0 channel 5 output/capture input.
BPWM1	BPWM1_CH0	I/O	BPWM1 channel 0 output/capture input.
	BPWM1_CH1	I/O	BPWM1 channel 1 output/capture input.
	BPWM1_CH2	I/O	BPWM1 channel 2 output/capture input.
	BPWM1_CH3	I/O	BPWM1 channel 3 output/capture input.
	BPWM1_CH4	I/O	BPWM1 channel 4 output/capture input.
	BPWM1_CH5	I/O	BPWM1 channel 5 output/capture input.
CLKO	CLKO	O	Clock Out
DAC0	DAC0_OUT	A	DAC0 channel analog output.
	DAC0_ST	I	DAC0 external trigger input.
DAC1	DAC1_OUT	A	DAC1 channel analog output.
	DAC1_ST	I	DAC1 external trigger input.
EADC0	EADC0_CH0	A	EADC0 channel 0 analog input.
	EADC0_CH1	A	EADC0 channel 1 analog input.

Group	Pin Name	Type	Description
	EADC0_CH2	A	EADC0 channel 2 analog input.
	EADC0_CH3	A	EADC0 channel 3 analog input.
	EADC0_CH4	A	EADC0 channel 4 analog input.
	EADC0_CH5	A	EADC0 channel 5 analog input.
	EADC0_CH6	A	EADC0 channel 6 analog input.
	EADC0_CH7	A	EADC0 channel 7 analog input.
	EADC0_CH8	A	EADC0 channel 8 analog input.
	EADC0_CH9	A	EADC0 channel 9 analog input.
	EADC0_CH10	A	EADC0 channel 10 analog input.
	EADC0_CH11	A	EADC0 channel 11 analog input.
	EADC0_CH12	A	EADC0 channel 12 analog input.
	EADC0_CH13	A	EADC0 channel 13 analog input.
	EADC0_CH14	A	EADC0 channel 14 analog input.
	EADC0_CH15	A	EADC0 channel 15 analog input.
	EADC0_ST	I	EADC0 external trigger input.
I2C0	I2C0_SCL	I/O	I2C0 clock pin.
	I2C0_SDA	I/O	I2C0 data input/output pin.
	I2C0_SMBAL	O	I2C0 SMBus SMBALTER pin
	I2C0_SMBSUS	O	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
I2C1	I2C1_SCL	I/O	I2C1 clock pin.
	I2C1_SDA	I/O	I2C1 data input/output pin.
	I2C1_SMBAL	O	I2C1 SMBus SMBALTER pin
	I2C1_SMBSUS	O	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
ICE	ICE_CLK	I	Serial wired debugger clock pin. Note: It is recommended to use 100 kΩ pull-up resistor on ICE_CLK pin.
	ICE_DAT	I/O	Serial wired debugger data pin. Note: It is recommended to use 100 kΩ pull-up resistor on ICE_DAT pin.
INT0	INT0	I	External interrupt 0 input pin.
INT1	INT1	I	External interrupt 1 input pin.
INT2	INT2	I	External interrupt 2 input pin.
INT3	INT3	I	External interrupt 3 input pin.
INT4	INT4	I	External interrupt 4 input pin.
INT5	INT5	I	External interrupt 5 input pin.
LCD	LCD_COM0	A	LCD common 0 output pin

Group	Pin Name	Type	Description
	LCD_COM1	A	LCD common 1 output pin
	LCD_COM2	A	LCD common 2 output pin
	LCD_COM3	A	LCD common 3 output pin
	LCD_COM4	A	LCD common 4 output pin
	LCD_COM5	A	LCD common 5 output pin
	LCD_COM6	A	LCD common 6 output pin
	LCD_COM7	A	LCD common 7 output pin
	LCD_SEG0	A	LCD segment 0 output pin
	LCD_SEG1	A	LCD segment 1 output pin
	LCD_SEG2	A	LCD segment 2 output pin
	LCD_SEG3	A	LCD segment 3 output pin
	LCD_SEG4	A	LCD segment 4 output pin
	LCD_SEG5	A	LCD segment 5 output pin
	LCD_SEG6	A	LCD segment 6 output pin
	LCD_SEG7	A	LCD segment 7 output pin
	LCD_SEG8	A	LCD segment 8 output pin
	LCD_SEG9	A	LCD segment 9 output pin
	LCD_SEG10	A	LCD segment 10 output pin
	LCD_SEG11	A	LCD segment 11 output pin
	LCD_SEG12	A	LCD segment 12 output pin
	LCD_SEG13	A	LCD segment 13 output pin
	LCD_SEG14	A	LCD segment 14 output pin
	LCD_SEG15	A	LCD segment 15 output pin
	LCD_SEG16	A	LCD segment 16 output pin
	LCD_SEG17	A	LCD segment 17 output pin
	LCD_SEG18	A	LCD segment 18 output pin
	LCD_SEG19	A	LCD segment 19 output pin
	LCD_SEG20	A	LCD segment 20 output pin
	LCD_SEG21	A	LCD segment 21 output pin
	LCD_SEG22	A	LCD segment 22 output pin
	LCD_SEG23	A	LCD segment 23 output pin
	LCD_SEG24	A	LCD segment 24 output pin
	LCD_SEG25	A	LCD segment 25 output pin
	LCD_SEG26	A	LCD segment 26 output pin

Group	Pin Name	Type	Description
	LCD_SEG27	A	LCD segment 27 output pin
	LCD_SEG28	A	LCD segment 28 output pin
	LCD_SEG29	A	LCD segment 29 output pin
	LCD_SEG30	A	LCD segment 30 output pin
	LCD_SEG31	A	LCD segment 31 output pin
	LCD_SEG32	A	LCD segment 32 output pin
	LCD_SEG33	A	LCD segment 33 output pin
	LCD_SEG34	A	LCD segment 34 output pin
	LCD_SEG35	A	LCD segment 35 output pin
	LCD_SEG36	A	LCD segment 36 output pin
	LCD_SEG37	A	LCD segment 37 output pin
	LCD_SEG38	A	LCD segment 38 output pin
	LCD_SEG39	A	LCD segment 39 output pin
	LCD_SEG40	A	LCD segment 40 output pin
	LCD_SEG41	A	LCD segment 41 output pin
	LCD_SEG42	A	LCD segment 42 output pin
	LCD_SEG43	A	LCD segment 43 output pin
	LCD_SEG44	A	LCD segment 44 output pin
	LCD_SEG45	A	LCD segment 45 output pin
	LCD_SEG46	A	LCD segment 46 output pin
	LCD_SEG47	A	LCD segment 47 output pin
	LCD_V1	A	LCD Unit voltage for charge pump circuit.
	LCD_V2	A	LCD driver biasing voltage.
	LCD_V3	A	LCD driver biasing voltage.
Power	AV <sub>DD</sub>	P	Power supply for internal analog circuit.
	AV <sub>SS</sub>	P	Ground pin for analog circuit.
	LDO_CAP	A	LDO output pin. Note: This pin needs to be connected with a capacitor whose value can be found in General operating conditions table in Datasheet.
	V <sub>BAT</sub>	P	Power supply by batteries for RTC.
	V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	V <sub>LCD</sub>	P	Power supply for LCD.
	V <sub>REF</sub>	A	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
	V <sub>SS</sub>	P	Ground pin for digital circuit.

Group	Pin Name	Type	Description
SC0	SC0_CLK	O	Smart Card 0 clock pin.
	SC0_DAT	I/O	Smart Card 0 data pin.
	SC0_PWR	O	Smart Card 0 power pin.
	SC0_RST	O	Smart Card 0 reset pin.
	SC0_nCD	I	Smart Card 0 card detect pin.
SPI0	SPI0_CLK	I/O	SPI0 serial clock pin.
	SPI0_I2SMCLK	I/O	SPI0 I <sup>2</sup> S master clock output pin
	SPI0_MISO	I/O	SPI0 MISO (Master In, Slave Out) pin.
	SPI0_MOSI	I/O	SPI0 MOSI (Master Out, Slave In) pin.
	SPI0_SS	I/O	SPI0 slave select pin.
SPI1	SPI1_CLK	I/O	SPI1 serial clock pin.
	SPI1_I2SMCLK	I/O	SPI1 I <sup>2</sup> S master clock output pin
	SPI1_MISO	I/O	SPI1 MISO (Master In, Slave Out) pin.
	SPI1_MOSI	I/O	SPI1 MOSI (Master Out, Slave In) pin.
	SPI1_SS	I/O	SPI1 slave select pin.
TK	TK_SE	I/O	Touch key (shielding electrode)
	TK_TK0	I/O	Touch key 0
	TK_TK1	I/O	Touch key 1
	TK_TK2	I/O	Touch key 2
	TK_TK3	I/O	Touch key 3
	TK_TK4	I/O	Touch key 4
	TK_TK5	I/O	Touch key 5
	TK_TK6	I/O	Touch key 6
	TK_TK7	I/O	Touch key 7
	TK_TK8	I/O	Touch key 8
	TK_TK9	I/O	Touch key 9
	TK_TK10	I/O	Touch key 10
	TK_TK11	I/O	Touch key 11
	TK_TK12	I/O	Touch key 12
	TK_TK13	I/O	Touch key 13
	TK_TK14	I/O	Touch key 14
	TK_TK15	I/O	Touch key 15
	TK_TK16	I/O	Touch key 16
	TK_TK17	I/O	Touch key 17

Group	Pin Name	Type	Description
	TK_TK18	I/O	Touch key 18
	TK_TK19	I/O	Touch key 19
	TK_TK20	I/O	Touch key 20
	TK_TK21	I/O	Touch key 21
	TK_TK22	I/O	Touch key 22
	TK_TK23	I/O	Touch key 23
	TK_TK24	I/O	Touch key 24
	TK_TK25	I/O	Touch key 25
TM0	TM0	I/O	Timer0 event counter input/toggle output pin.
	TM0_EXT	I/O	Timer0 external capture input/toggle output pin.
TM1	TM1	I/O	Timer1 event counter input/toggle output pin.
	TM1_EXT	I/O	Timer1 external capture input/toggle output pin.
TM2	TM2	I/O	Timer2 event counter input/toggle output pin.
	TM2_EXT	I/O	Timer2 external capture input/toggle output pin.
TM3	TM3	I/O	Timer3 event counter input/toggle output pin.
	TM3_EXT	I/O	Timer3 external capture input/toggle output pin.
UART0	UART0_RXD	I	UART0 data receiver input pin.
	UART0_TXD	O	UART0 data transmitter output pin.
	UART0_nCTS	I	UART0 clear to Send input pin.
	UART0_nRTS	O	UART0 request to Send output pin.
UART1	UART1_RXD	I	UART1 data receiver input pin.
	UART1_TXD	O	UART1 data transmitter output pin.
	UART1_nCTS	I	UART1 clear to Send input pin.
	UART1_nRTS	O	UART1 request to Send output pin.
UART2	UART2_RXD	I	UART2 data receiver input pin.
	UART2_TXD	O	UART2 data transmitter output pin.
	UART2_nCTS	I	UART2 clear to Send input pin.
	UART2_nRTS	O	UART2 request to Send output pin.
UART3	UART3_RXD	I	UART3 data receiver input pin.
	UART3_TXD	O	UART3 data transmitter output pin.
	UART3_nCTS	I	UART3 clear to Send input pin.
	UART3_nRTS	O	UART3 request to Send output pin.
USB	USB_D+	A	USB differential signal D+.
	USB_D-	A	USB differential signal D-.

Group	Pin Name	Type	Description
	USB_VBUS	P	Power supply from USB host or HUB.
	USB_VDD33_CAP	A	Internal power regulator output 3.3V decoupling pin. Note: This pin needs to be connected with a 1uF capacitor.
USCI0	USCI0_CLK	I/O	USCI0 clock pin.
	USCI0_CTL0	I/O	USCI0 control 0 pin.
	USCI0_CTL1	I/O	USCI0 control 1 pin.
	USCI0_DAT0	I/O	USCI0 data 0 pin.
	USCI0_DAT1	I/O	USCI0 data 1 pin.
USCI1	USCI1_CLK	I/O	USCI1 clock pin.
	USCI1_CTL0	I/O	USCI1 control 0 pin.
	USCI1_CTL1	I/O	USCI1 control 1 pin.
	USCI1_DAT0	I/O	USCI1 data 0 pin.
	USCI1_DAT1	I/O	USCI1 data 1 pin.
X32	X32_IN	I	External 32.768 kHz crystal input pin.
	X32_OUT	O	External 32.768 kHz crystal output pin.
XT1	XT1_IN	I	External 4~24 MHz (high speed) crystal input pin.
	XT1_OUT	O	External 4~24 MHz (high speed) crystal output pin.

## 6 FUNCTIONAL DESCRIPTION

### 6.1 Arm® Cortex®-M23 Core

The Cortex®-M23 processor is a low gate count, two-stage, and highly energy efficient 32-bit RISC processor, which has an AMBA AHB5 interface supporting Arm® TrustZone® technology, a debug access port supporting serial wire debug and single-cycle I/O ports. It has an NVIC component and MPU for memory-protection functionality. The processor also supports Security Extension. The NuMicro® M251/M252/M254/M256/M258 is embedded with Cortex®-M23 processor. Figure 6.1-1 shows the functional controller of the processor.

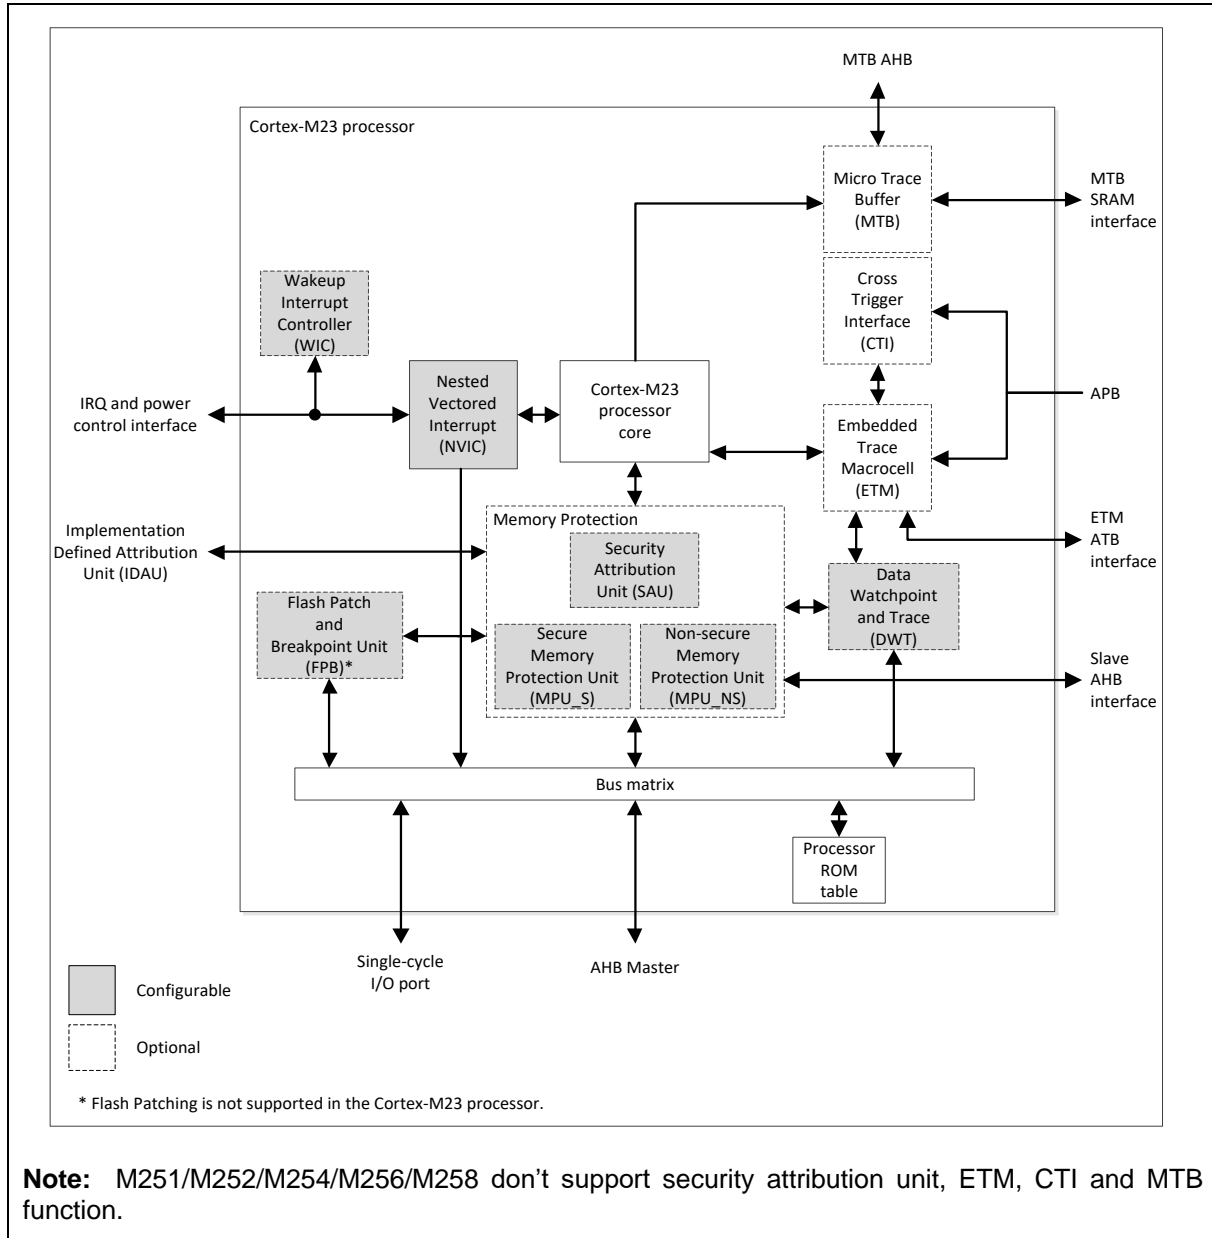

Figure 6.1-1 Cortex®-M23 Block Diagram

## **Cortex®-M23 processor features:**

- Arm®v8-M Baseline architecture.
- Arm®v8-M Baseline Thumb®-2 instruction set that combines high code density with 32-bit performance.
- Support for single-cycle I/O access.
- Power control optimization of system components.
- Integrated sleep modes for low power consumption.
- Optimized code fetching for reduced Flash and ROM power consumption.
- A 32-bit Single cycle Hardware multiplier.
- A 32-bit Hardware divider.
- Deterministic, high-performance interrupt handling for time-critical applications.
- Deterministic instruction cycle timing.
- Support for system level debug authentication.
- Support for Arm® Debug Interface Architecture ADIv5.1 Serial Wire Debug (SWD).
- ETM for instruction trace.
- Separated privileged and unprivileged modes.
- Security Extension supporting a Secure and a Non-secure state.
- Protected Memory System Architecture (PMSAv8) Memory Protection Units (MPUs) for both Secure and Non-secure states.
- Security Attribution Unit (SAU).
- SysTick timers for both Secure and Non-secure states.
- A Nested Vectored Interrupt Controller (NVIC) closely integrated with the processor with up to 240 interrupts.

## 6.2 System Manager

### 6.2.1 Overview

System management includes the following sections:

- System Reset
- System Power Distribution
- SRAM Memory Organization
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control register

### 6.2.2 System Reset

The system reset can be issued by one of the events listed below. These reset event flags can be read from SYS\_RSTSTS register to determine the reset source. Hardware reset sources are from peripheral signals. Software reset can trigger reset through setting control registers.

- Hardware Reset Sources
  - Power-on Reset
  - Low level on the nRESET pin with glitch filter time 24us
  - Watchdog Time-out Reset and Window Watchdog Reset (WDT/WWDT Reset)
  - Low Voltage Reset (LVR)
  - Brown-out Detector Reset (BOD Reset)
  - CPU Lockup Reset
- Software Reset Sources
  - CHIP Reset will reset whole chip by writing 1 to CHIPRST (SYS\_IPRST0[0])
  - MCU Reset to reboot but keeping the booting setting from APROM or LDROM by writing 1 to SYSRESETREQ (AIRCR[2])
  - CPU Reset for Cortex®-M23 core Only by writing 1 to CPURST (SYS\_IPRST0[1])

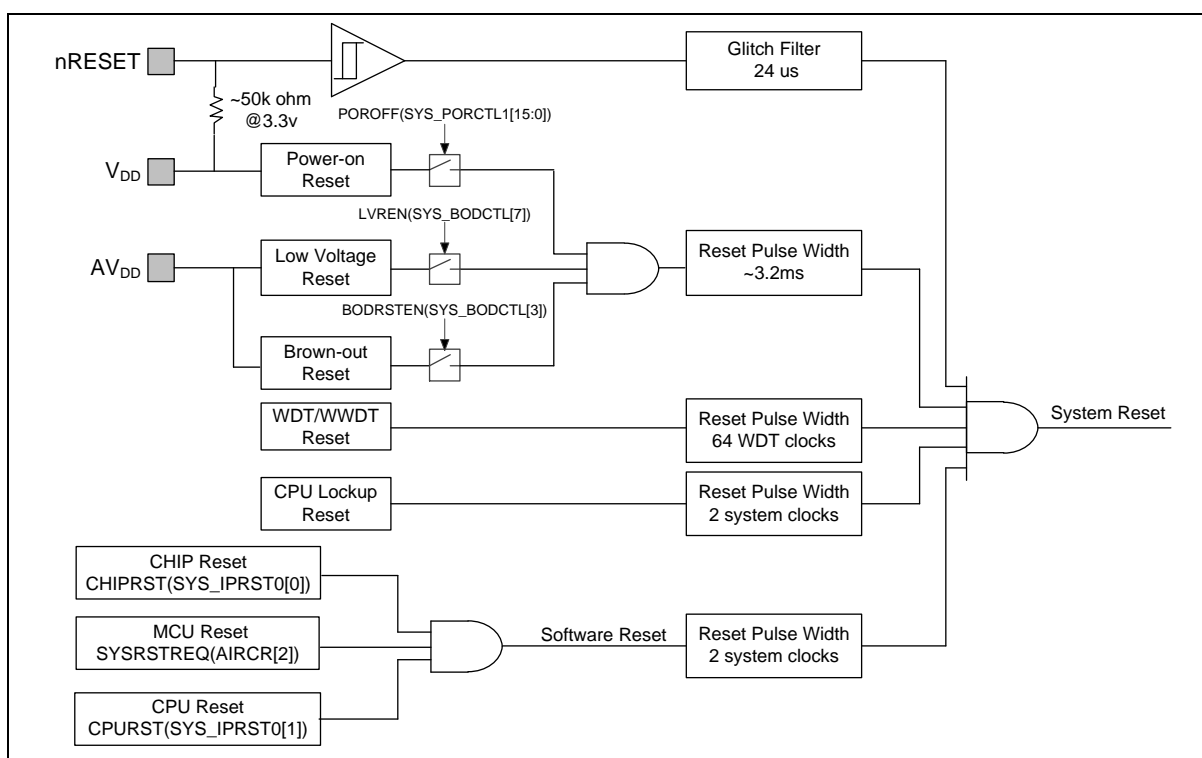

Figure 6.2-1 System Reset Sources

There are a total of 9 reset sources in the NuMicro® family. In general, CPU reset is used to reset Cortex®-M23 only; the other reset sources will reset Cortex®-M23 and all peripherals. However, there are small differences between each reset source and they are listed in Table 6.2-1.

Reset Sources Register	POR	NRESET	WDT	LVR	BOD	Lockup	CHIP	MCU	CPU
SYS_RSTSTS	Bit 0 = 1	Bit 1 = 1	Bit 2 = 1	Bit 3 = 1	Bit 4 = 1	Bit 8 = 1	Bit 0 = 1	Bit 5 = 1	Bit 7 = 1

Other Peripheral Registers	Reset Value								-
FMC Registers	Reset Value								
<b>Note:</b> '-' means that the value of register keeps original setting.									

Table 6.2-1 Reset Value of Registers

#### 6.2.2.1 nRESET Reset

The nRESET reset means to generate a reset signal by pulling low nRESET pin, which is an asynchronous reset input pin and can be used to reset system at any time. When the nRESET voltage is lower than 0.2 V<sub>DD</sub> and the state keeps longer than 24 us (glitch filter), chip will be reset. The nRESET

reset will control the chip in reset state until the nRESET voltage rises above  $0.7 V_{DD}$  and the state keeps longer than 24  $\mu s$  (glitch filter). The PINRF(SYS\_RSTSTS[1]) will be set to 1 if the previous reset source is nRESET reset. Table 6.2-2 shows the nRESET reset waveform.

Figure 6.2-2 nRESET Reset Waveform

#### 6.2.2.2 Power-on Reset (POR)

The Power-on reset (POR) is used to generate a stable system reset signal and forces the system to be reset when power-on to avoid unexpected behavior of MCU. When applying the power to MCU, the POR module will detect the rising voltage and generate reset signal to system until the voltage is ready for MCU operation. At POR reset, the PORF(SYS\_RSTSTS[0]) will be set to 1 to indicate there is a POR reset event. The PORF(SYS\_RSTSTS[0]) bit can be cleared by writing 1 to it. Figure 6.2-3 shows the power-on reset waveform.

Figure 6.2-3 Power-on Reset (POR) Waveform

#### 6.2.2.3 Low Voltage Reset (LVR)

If the Low Voltage Reset function is enabled by setting the Low Voltage Reset Enable Bit LVREN (SYS\_BODCTL[7]) to 1, after 200 $\mu s$  delay, LVR detection circuit will be stable and the LVR function will be active. Then LVR function will detect  $AV_{DD}$  during system operation. When the  $AV_{DD}$  voltage is lower than  $V_{LVR}$  and the state keeps longer than De-glitch time set by LVRDGSEL (SYS\_BODCTL[14:12]), chip will be reset. The LVR reset will control the chip in reset state until the  $AV_{DD}$  voltage rises above  $V_{LVR}$  and the state keeps longer than De-glitch time set by LVRDGSEL (SYS\_BODCTL[14:12]). The default setting of Low Voltage Reset is enabled without De-glitch function. Figure 6.2-4 shows the Low Voltage Reset waveform.

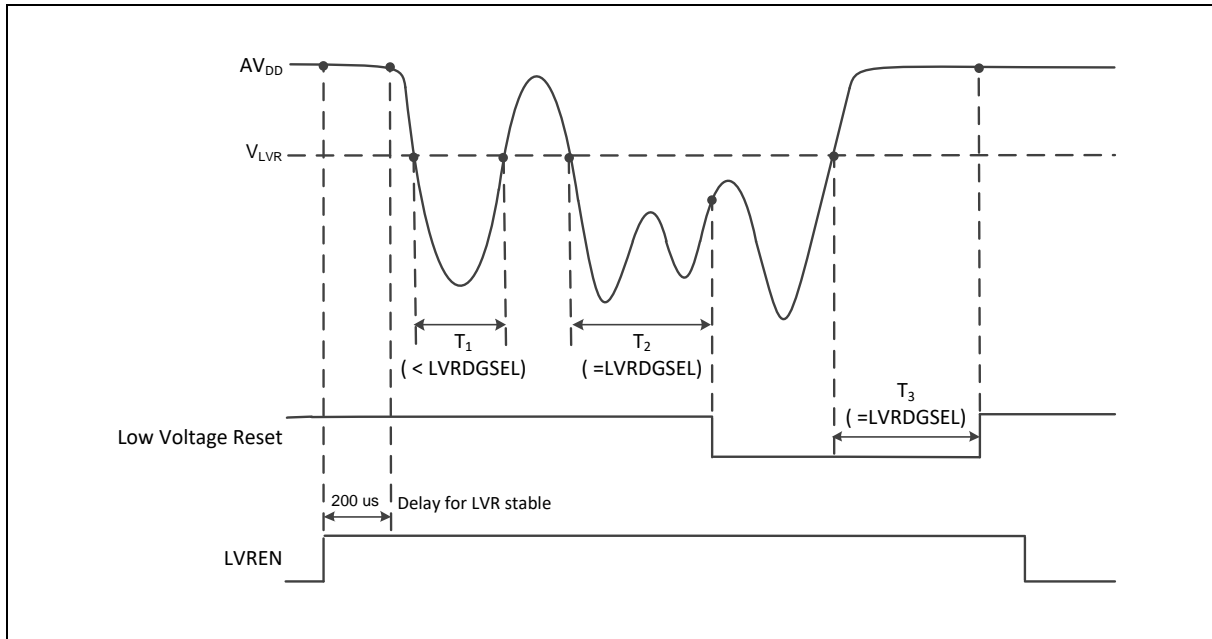

Figure 6.2-4 Low Voltage Reset (LVR) Waveform

#### 6.2.2.4 Brown-out Detector Reset (BOD Reset)

If the Brown-out Detector (BOD) function is enabled by setting the Brown-out Detector Enable Bit BODEN (SYS\_BODCTL[0]), Brown-out Detector function will detect  $AV_{DD}$  during system operation. When the  $AV_{DD}$  voltage is lower than  $V_{BOD}$  which is decided by BODEN and BODVL (SYS\_BODCTL[18:16]) and the state keeps longer than De-glitch time set by BODDGSEL (SYS\_BODCTL[10:8]), chip will be reset. The BOD reset will control the chip in reset state until the  $AV_{DD}$  voltage rises above  $V_{BOD}$  and the state keeps longer than De-glitch time set by BODDGSEL. The default value of BODEN, BODVL and BODRSTEN (SYS\_BODCTL[3]) is set by Flash controller user configuration register CBODEN (CONFIG0 [19]), CBOV (CONFIG0 [23:21]) and CBORST(CONFIG0[20]) respectively. User can determine the initial BOD setting by setting the CONFIG0 register. Figure 6.2-5 shows the Brown-out Detector waveform.

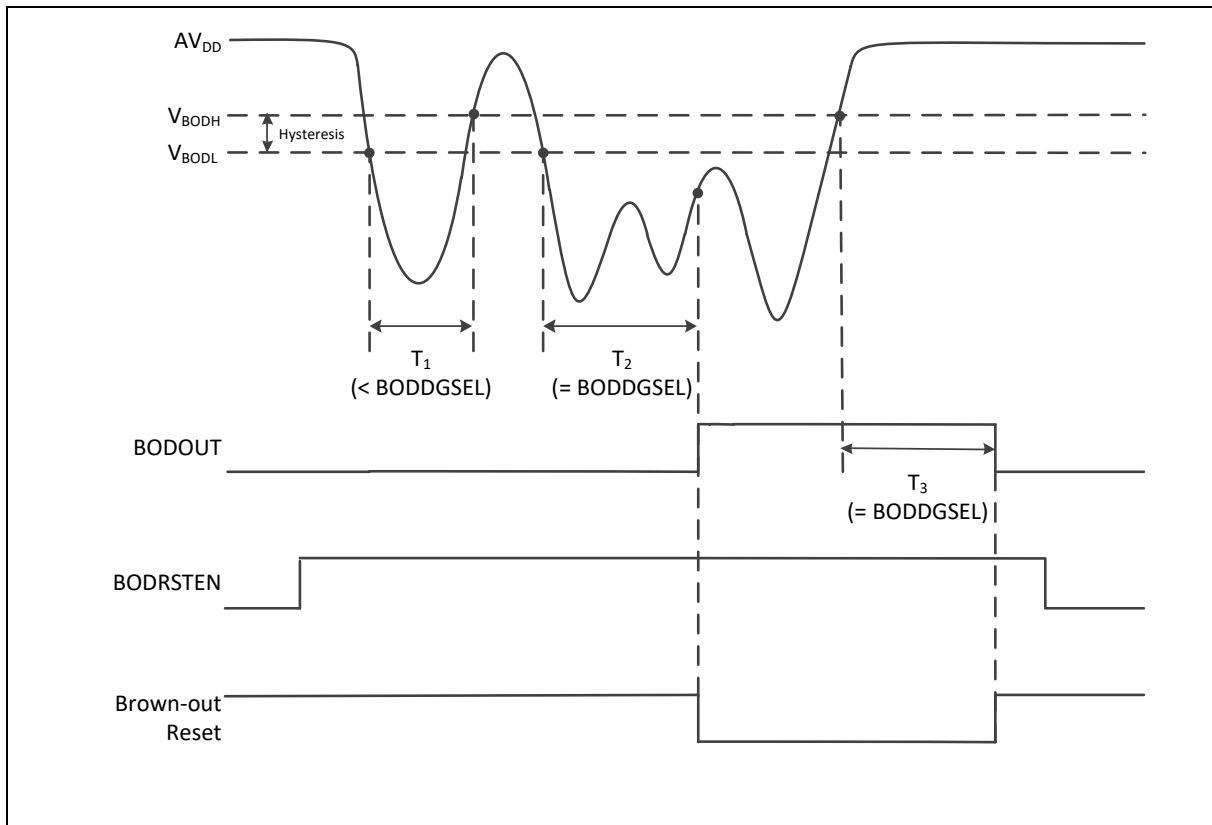

Figure 6.2-5 Brown-out Detector (BOD) Waveform

#### 6.2.2.5 Watchdog Timer Reset (WDT)

In most industrial applications, system reliability is very important. To automatically recover the MCU from failure status is one way to improve system reliability. The watchdog timer(WDT) is widely used to check if the system works fine. If the MCU is crashed or out of control, it may cause the watchdog time-out. User may decide to enable system reset during watchdog time-out to recover the system and take action for the system crash/out-of-control after reset.

Software can check if the reset is caused by watchdog time-out to indicate the previous reset is a watchdog reset and handle the failure of MCU after watchdog time-out reset by checking WDTRF(SYS\_RSTSTS[2]).

#### 6.2.2.6 CPU Lockup Reset

CPU enters lockup status after CPU produces hardfault at hardfault handler and chip gives immediate indication of seriously errant kernel software. This is the result of the CPU being locked because of an unrecoverable exception following the activation of the processor's built in system state protection hardware. When chip enters debug mode, the CPU lockup reset will be ignored.

#### 6.2.2.7 CPU Reset, CHIP Reset and MCU Reset

The CPU Reset means only Cortex®-M23 core is reset and all other peripherals remain the same status after CPU reset. User can set the CPURST(SYS\_IPRST0[1]) to 1 to assert the CPU Reset signal.

The CHIP Reset is same with Power-on Reset. The CPU and all peripherals are reset and BS(FMC\_ISPCTL[1]) bit is automatically reloaded from CONFIG0 setting. User can set the CHIPRST(SYS\_IPRST0[0]) to 1 to assert the CHIP Reset signal.

The MCU Reset is similar with CHIP Reset. The difference is that BS(FMC\_ISPCTL[1]) will not be reloaded from CONFIG0 setting and keep its original software setting for booting from APROM or LDROM. User can set the SYSRESETREQ(AIRCR[2]) to 1 to assert the MCU Reset.

### 6.2.3 System Power Distribution

In this chip, power distribution is divided into four segments:

- Analog power from  $AV_{DD}$  and  $AV_{SS}$  provides the power for analog components operation.
- Digital power from  $V_{DD}$  and  $V_{SS}$  supplies the power to the internal regulator which provides a fixed 1.5V power for digital operation and I/O pins.
- USB transceiver power from  $V_{BUS}$  offers the power for operating the USB transceiver.
- RTC power from regulator uninterrupted power domain provides, the power for RTC and 20 bytes backup registers.

Analog power ( $AV_{DD}$ ) should be the same voltage level of the digital power ( $V_{DD}$ ). Figure 6.2-6 shows the power distribution of the M251/M252/M254/M256/M258 series.

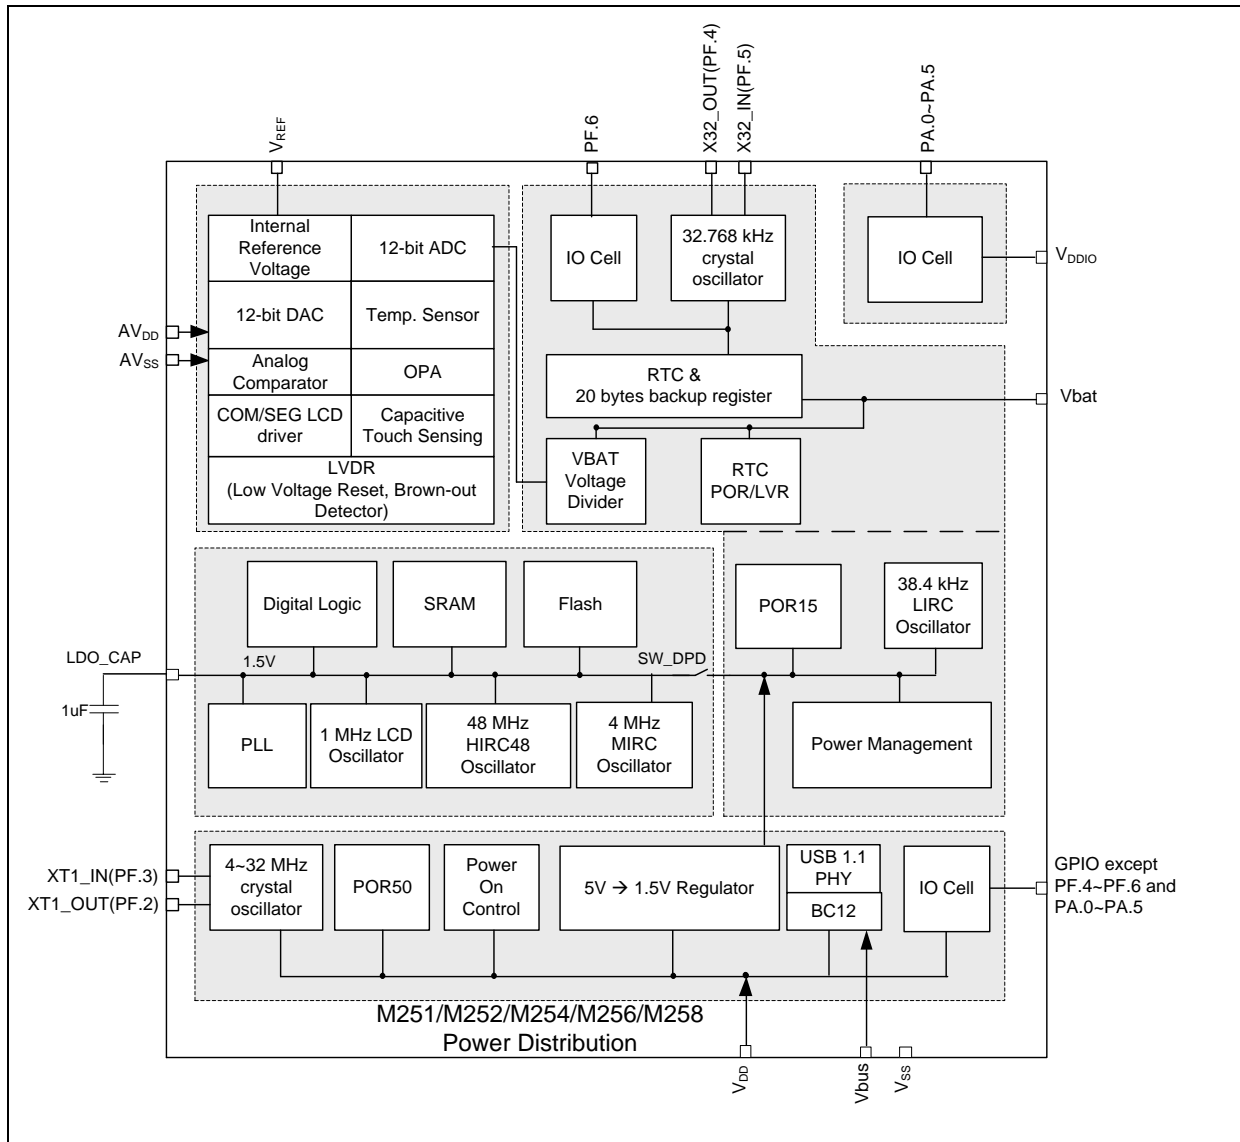

Figure 6.2-6 NuMicro® M251/M252/M254/M256/M258 Series Power Distribution Diagram

### 6.2.4 Power Modes and Wake-up Sources

The M251/M252/M254/M256/M258 series has a power manager unit to support several operating

modes for saving power. Table 6.2-2 lists all power modes in the M251/M252/M254/M256/M258 series.

Mode	CPU Operating Maximum Speed ( MHz)	LDO_CAP(V)	Clock Disable
Normal mode	48	1.5	All clocks are disabled by control register.
Idle mode	CPU enters Sleep mode	1.5	Only CPU clock is disabled.
Power-down mode	CPU enters Deep Sleep mode	1.5	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Fast wake up Power-down mode (FWPD)	CPU enters Sleep mode	1.5	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Deep Power-down mode (DPD)	Power off	1.5	Only LIRC/LXT still enable for RTC function and wake-up timer usage

Table 6.2-2 Power Mode Table

There are different power mode entry settings. Each power mode has different entry setting and leaving condition. Table 6.2-3 shows the entry setting for each power mode. When chip power-on, chip is running ar normal mode. User can enter each mode by setting SLEEPDEEP (SCR[2]), PDEN (CLK\_PWRCTL[7]) and PDMSEL (CLK\_PMUCTL[2:0]) and execute WFI instruction.

Register/Instruction Mode	SLEEPDEEP (SCR[2])	PDEN (CLK_PWRCTL[7])	PDMSEL (CLK_PMUCTL[2:0])	CPU Run WFI Instruction
Normal mode	0	0	0	NO
Idle mode (CPU enters Sleep mode)	0	0	0	YES
Power-down mode (CPU enters Deep Sleep mode)	1	1	0	YES
Fast wake up Power-down mode (FWPD)	1	1	2	YES
Deep Power-down mode (CPU enters Sleep mode)	1	1	6	YES

Table 6.2-3 Power Mode Difference Table

There are several wake-up sources in Idle mode and Power-down mode. Table 6.2-4 lists the available clocks for each power mode.

Power Mode	Normal Mode	Idle Mode	Power-Down Mode
Definition	CPU is in active state	CPU is in sleep state	CPU is in sleep state and all clocks stop except LXT and LIRC. SRAM content retended.
Entry Condition	Chip is in normal mode after system reset released	CPU executes WFI instruction.	CPU sets sleep mode enable and power down enable and executes WFI instruction.
Wake-up Sources	N/A	All interrupts	RTC, WDT, I <sup>2</sup> C, Timer, UART, BOD, GPIO, EINT, USCI,

			USBD and ACMP
Available Clocks	All	All except CPU clock	LXT and LIRC
After Wake-up	N/A	CPU back to normal mode	CPU back to normal mode

Table 6.2-4 Power Mode Difference Table

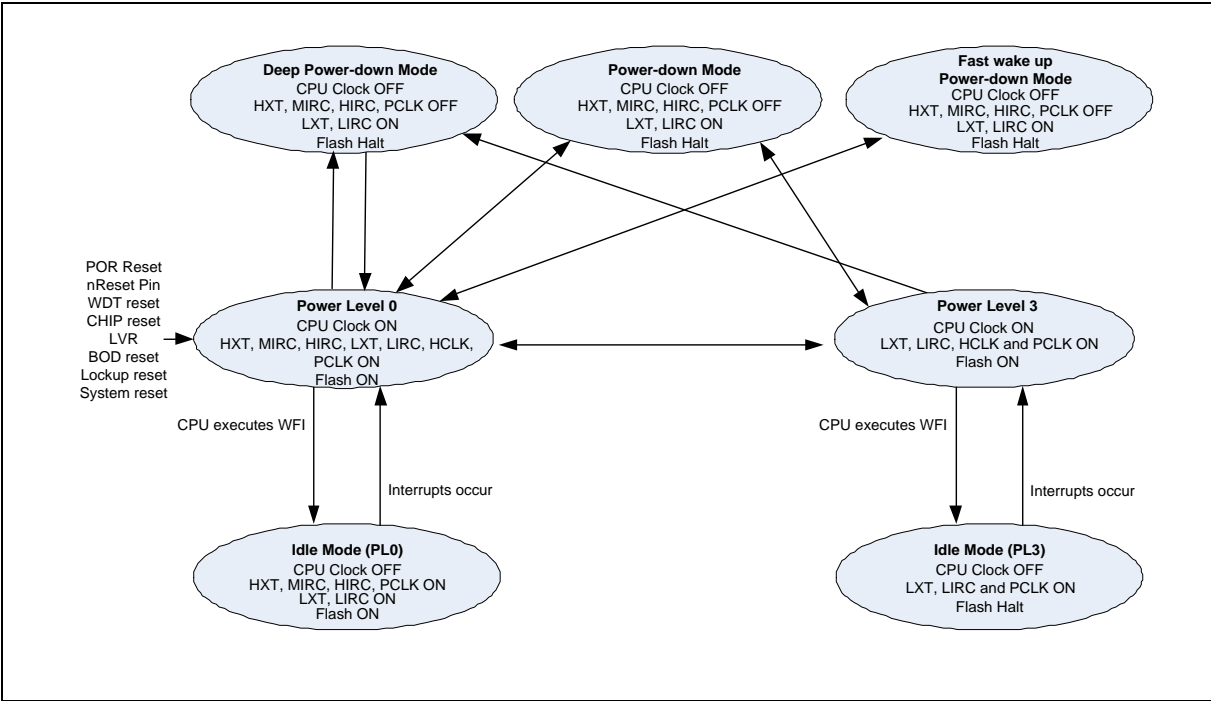

Figure 6.2-7 Power Mode State Machine

	Normal Mode	Idle Mode	Power-Down Mode PD	DPD
HXT (4~32 MHz XTL)	ON	ON	Halt	Halt
MIRC (4 MHz OSC)	ON	ON	ON/OFF <sup>1</sup>	Halt
HIRC48 (48 MHz OSC)	ON	ON	Halt	Halt
LXT (32768 Hz XTL)	ON	ON	ON/OFF <sup>2</sup>	ON/OFF <sup>2</sup>
LIRC (38.4 kHz OSC)	ON	ON	ON/OFF <sup>3</sup>	ON/OFF <sup>3</sup>
OSCLCD (1.2 MHz OSC)	ON	ON	ON/OFF	Halt
PLL	ON/OFF	ON/OFF	Halt	Halt
LDO	ON	ON	ON	OFF

ACMP	ON	ON	Halt	Halt
Touch Key	ON	ON	ON/OFF	OFF
LCD	ON	ON	ON/OFF	OFF

Table 6.2-5 Clocks in Power Modes

Notes:

1. If LCD Charge Pump clock source is selected as MIRC or Touch Key is scanning.
2. LXT (32768 Hz XTL) ON or OFF depends on SW setting in normal mode.
3. LIRC (38.4 kHz OSC) ON or OFF depends on S/W setting in normal mode.

4. If TIMER clock source is selected as LIRC/LXT and LIRC/LXT is on.
5. If WDT clock source is selected as LIRC and LIRC is on.
6. If RTC clock source is selected as LXT and LXT is on.
7. If UART clock source is selected as LXT and LXT is on.

## **Wake-up sources in Power-down mode:**

RTC, WDT, I<sup>2</sup>C, Timer, UART, USCI, BOD, GPIO, USB, and ACMP.

After chip enters power down, the following wake-up sources can wake chip up to normal mode. Table 6.2-5 lists the condition about how to enter Power-down mode again for each peripheral.

\*User needs to wait this condition before setting PDEN(CLK\_PWRCTL[7]) and execute WFI to enter Power-down mode.

Wake-Up Source	Wake-Up Condition	Power-Down Mode		System Can Enter Power-Down Mode Again Condition*
		PD FWKPD	DPD	
BOD	Brown-Out Detector Interrupt	Y	N	After software writes 1 to clear BODIF (SYS_BODCTL[4]).
LVR	LVR Reset	Y	N	After software writes 1 to clear LVRF (SYS_RSTSTS[3]).
		N	Y	After software writes 1 to CLRWK (CLK_PMUSTS[31]) to clear LVRWK (CLK_PMUSTS[12]) when DPD mode is entered.
INT	External Interrupt	Y	N	After software write 1 to clear the Px_INTSRC[n] bit.
GPIO	GPIO Interrupt	Y	N	After software write 1 to clear the Px_INTSRC[n] bit.
GPIO(PC.0) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK0(CLK_PMUSTS[0]) is cleared when DPD mode is entered.
GPIO(PB.0) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK1(CLK_PMUSTS[3]) is cleared when DPD mode is entered.
GPIO(PB.2) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK2(CLK_PMUSTS[4]) is cleared when DPD mode is entered.
GPIO(PB.12) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK3(CLK_PMUSTS[5]) is cleared when DPD mode is entered.
GPIO(PF.6) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK4(CLK_PMUSTS[6]) is cleared when DPD mode is entered.
TIMER	Timer Interrupt	Y	N	After software writes 1 to clear TWKF (TIMERx_INTSTS[1]) and TIF (TIMERx_INTSTS[0]).
Wakeup timer	Wakeup by wake-up timer time-out	N	Y	TMRWK (CLK_PMUSTS[1]) is cleared when SPD or DPD mode is entered.
WDT	WDT Interrupt	Y	N	After software writes 1 to clear WKF (WDT_CTL[5]) (Write Protect).
RTC	Alarm Interrupt	Y	N	After software writes 1 to clear ALMIF (RTC_INTSTS[0]).
	Time Tick Interrupt	Y	N	After software writes 1 to clear TICKIF (RTC_INTSTS[1]).
RTC	Wakeup by RTC alarm	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.
	Wakeup by RTC tick time	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.

	Wakeup by tamper event	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.
UART	nCTS wake-up	Y	N	After software writes 1 to clear CTSWK (UARTx_WKSTS[0]).
	Incoming Data wake-up	Y	N	After software writes 1 to clear DATWK (UARTx_WKSTS[1]).
	Received FIFO Threshold Wake-up	Y	N	After software writes 1 to clear RFRTWK (UARTx_WKSTS[2]).
	RS-485 AAD Mode Wake-up	Y	N	After software writes 1 to clear RS485WK (UARTx_WKSTS[3]).
	Received FIFO Threshold Time-out Wake-up	Y	N	After software writes 1 to clear TOUTWK (UARTx_WKSTS[4]).
USCI UART	CTS Toggle	Y	N	After software writes 1 to clear WK (UUART_WKSTS[0]).
	Data Toggle	Y	N	After software writes 1 to clear WK (UUART_WKSTS[0]).
USCI I <sup>2</sup> C	Data toggle	Y	N	After software writes 1 to clear WK (UI2C_WKSTS[0]).
	Address match	Y	N	After software writes 1 to clear WKAKDONE (UI2C_PROTSTS[16]), and then writes 1 to clear WK (UI2C_WKSTS[0]).
USCI SPI	SS Toggle	Y	N	After software writes 1 to clear WK (USPI_WKSTS[0]).
I <sup>2</sup> C	Address match wake-up	Y	N	After software writes 1 to clear WKAKDONE (I2C_WKSTS[1]). Then software writes 1 to clear WKIF (I2C_WKSTS[0]).
USBD	Remote Wake-up	Y	N	After software writes 1 to clear BUSIF (USBD_INTSTS[0]).
ACMP	Comparator Power-Down Wake-Up Interrupt	Y	N	After software writes 1 to clear WKIF0 (ACMP_STATUS[8]) and WKIF1 (ACMP_STATUS[9]).
TK	Touch Key detect be touched Interrupt	Y	N	After software writes 1 to clear TKIF <sub>x</sub> , x=0~16 (TK_STA[24:8]) TKIF_ALL (TK_STA[7]) and TKIF (TK_STA[6]) and SCIF (TK_STA[1]).

Table 6.2-6 Condition of Entering Power-down Mode Again

## 6.2.5 Chip Bus Matrix

The M251/M252/M254/M256/M258 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The M251/M252/M254/M256/M258 series only supports little-endian data format.

## 6.2.6 System Memory Map

The M251/M252/M254/M256/M258 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The M251/M252/M254/M256/M258 series only supports little-endian data format.

Address Space	Token	Controllers
Flash and SRAM Memory Space		
0x0000_0000 – 0x0003_FFFF	FLASH_BA	FLASH Memory Space (256 Kbytes)
0x2000_0000 – 0x2000_7FFF	SRAM0_BA	SRAM Memory Space (32 Kbytes)

0x6000_0000 – 0x6FFF_FFFF	EXTMEM_BA	External Memory Space (256 Mbytes)
Peripheral Controllers Space (0x4000_0000 – 0x400F_FFFF)		
0x4000_0000 – 0x4000_01FF	SYS_BA	System Control Registers
0x4000_0200 – 0x4000_02FF	CLK_BA	Clock Control Registers
0x4000_0300 – 0x4000_03FF	NMI_BA	NMI Control Registers
0x4000_4000 – 0x4000_4FFF	GPIO_BA	GPIO Control Registers
0x4000_8000 – 0x4000_8FFF	PDMA_BA	Peripheral DMA Control Registers
0x4000_C000 – 0x4000_CFFF	FMC_BA	Flash Memory Control Registers
0x4001_0000 – 0x4001_0FFF	EBI_BA	External Bus Interface Control Registers
0x4003_1000 – 0x4003_1FFF	CRC_BA	CRC Generator Registers
APB Controllers Space (0x4000_0000 ~ 0x400F_FFFF)		
0x4004_0000 – 0x4004_0FFF	WDT_BA	Watchdog Timer Control Registers
0x4004_1000 – 0x4004_1FFF	RTC_BA	Real Time Clock (RTC) Control Register
0x4004_3000 – 0x4004_3FFF	EADC_BA	Enhanced Analog-Digital-Converter (EADC) Control Registers
0x4004_5000 – 0x4004_5FFF	ACMP01_BA	Analog Comparator 0/ 1 Control Registers
0x4004_6000 – 0x4004_6FFF	OPA_BA	OP Amplifier Control Registers
0x4004_7000 – 0x4004_7FFF	DAC_BA	DAC Control Registers
0x4005_0000 – 0x4005_0FFF	TMR01_BA	Timer0/Timer1 Control Registers
0x4005_1000 – 0x4005_1FFF	TMR23_BA	Timer2/Timer3 Control Registers
0x4005_8000 – 0x4005_8FFF	PWM0_BA	PWM0 Control Registers
0x4005_9000 – 0x4005_9FFF	PWM1_BA	PWM1 Control Registers
0x4005_A000 – 0x4005_AFFF	BPWM0_BA	BPWM0 Control Registers
0x4005_B000 – 0x4005_BFFF	BPWM1_BA	BPWM1 Control Registers
0x4006_0000 – 0x4006_0FFF	QSPI0_BA	QSPI0 Control Registers
0x4006_1000 – 0x4006_1FFF	SPI0_BA	SPI0 Control Registers
0x4007_0000 – 0x4007_0FFF	UART0_BA	UART0 Control Registers
0x4007_1000 – 0x4007_1FFF	UART1_BA	UART1 Control Registers
0x4007_2000 – 0x4007_2FFF	UART2_BA	UART2 Control Registers
0x4008_0000 – 0x4008_0FFF	I2C0_BA	I2C0 Control Registers
0x4008_1000 – 0x4008_1FFF	I2C1_BA	I2C1 Control Registers
0x4009_0000 – 0x4009_0FFF	SC0_BA	Smartcard Host 0 Control Registers
0x400B_B000 – 0x400B_BFFF	SLCD_BA	SLCD Device Control Register
0x400C_0000 – 0x400C_0FFF	USBD_BA	USB Device Control Register
0x400C_2000 – 0x400C_2FFF	TK_BA	TK Control Register
0x400C_3000 – 0x400C_3FFF	PSIO_BA	PSIO Control Register

0x400D_0000 – 0x400D_0FFF	USCI0_BA	USCI0 Control Registers
0x400D_1000 – 0x400D_1FFF	USCI1_BA	USCI1 Control Registers
0x400D_2000 – 0x400D_2FFF	USCI2_BA	USCI2 Control Registers
System Controllers Space (0xE000_E000 ~ 0xE000_EFFF)		
0xE000_E010 – 0xE000_E0FF	SCS_BA	System Timer Control Registers
0xE000_E100 – 0xE000_ECFF	SCS_BA	External Interrupt Controller Control Registers
0xE000_ED00 – 0xE000_ED8F	SCS_BA	System Control Registers

Table 6.2-7 Address Space Assignments for On-Chip Controllers

6.2.7 SRAM Memory Organization

The M251/M252/M254/M256/M258 series supports embedded SRAM with up to 32 Kbytes size.

- Supports up to 32 Kbytes SRAM
- Supports byte /half word /word write
- Supports oversize response error

Table 6.2-9 shows the M251/M252/M254/M256/M258 series SRAM organization. The address between 0x2000\_8000 to 0x3FFF\_FFFF is illegal memory space and chip will enter hardfault if CPU accesses these illegal memory addresses.

Figure 6.2-8 SRAM Memory Organization

### 6.2.8 IRC Auto Trim

This chip supports auto-trim function: the HIRC trim (48 MHz RC oscillator) and MIRC trim (4.032 MHz RC oscillator), according to the accurate LXT (32.768 kHz crystal oscillator) or internal USB synchronous mode, automatically gets accurate output frequency, 0.25 % deviation within all temperature ranges.

For instance, the system needs an accurate 4.032 MHz clock. In such case, if neither uses PLL as the system clock source nor solders 32.768 kHz crystal in system, user has to set REFCKSEL (SYS\_MIRCTIMCTL[10] reference clock selection) to “1”, set FREQSEL (SYS\_MIRCTIMCTL[1:0] trim frequency selection) to “10”, and the auto-trim function will be enabled. Interrupt status bit FREQLOCK (SYS\_MIRCTIMSTS[0] MIRC frequency lock status) “1” indicates the MIRC output frequency is accurate within 0.25% deviation.

In HIRC case, the system needs an accurate 48 MHz clock. In such case, if neither uses PLL as the system clock source nor solders 32.768 kHz crystal in system, user has to set REFCKSEL (SYS\_HIRCTIMCTL[10] reference clock selection) to “1”, set FREQSEL (SYS\_HIRCTIMCTL[1:0] trim frequency selection) to “10”, and the auto-trim function will be enabled. Interrupt status bit FREQLOCK (SYS\_HIRCTIMSTS[0] HIRC frequency lock status) “1” indicates the HIRC output frequency is accurate within 0.25% deviation.

HIRC trim and MIRC trim can only work properly when the clock sources are stable. When the RC clock or the reference clock is not stable or the system goes into power down, HIRC trim and MIRC trim need to wait until the clock is stable or system wakes up, and then it can be enabled or will get a clock error flag.

### 6.2.9 UART0\_TXD/USC0\_DAT0 Modulation with PWM

This chip supports UART0\_TXD/USC0\_DAT0 to modulate with PWM channel. User can set MODPWMSEL(SYS\_MODCTL[7:4]) to select which PWM0 channel to modulate with UART0\_TXD/USC0\_DAT0 and set MODEN(SYS\_MODCTL[0]) to enable modulation function.

Figure 6.2-11 UART0\_TXD/USC0\_DAT0 Modulated with PWM Channel

## 6.2.10 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

## 6.2.11 Register Description

Part                      Device                      Identification                      Number                      Register  
(SYS\_PDID)

Register	Offset	R/W	Description	Reset Value
SYS_PDID	SYS_BA+0x00	R	Part Device Identification Number Register	0xFFFF_FFFF

[1] Every part number has a unique default reset value.

31	30	29	28	27	26	25	24
PDID							
23	22	21	20	19	18	17	16
PDID

PDID							
7	6	5	4	3	2	1	0
PDID							

Bits	Description
[31:0]	<b>PDID</b> <b>Part Device Identification Number (Read Only)</b> This register reflects device part number code. Software can read this register to identify which device is used.

System	Reset	Status	Register
<b>(SYS_RSTSTS)</b>			

This register provides specific information for software to identify this chip's reset source from last operation.

Register	Offset	R/W	Description	Reset Value
<b>SYS_RSTSTS</b>	SYS_BA+0x04	R/W	System Reset Status Register	0x0000_0043

31	30	29	28	27	26	25	24

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved						VBATLVRF	CPULKRF
7	6	5	4	3	2	1	0
CPURF	PMURF	SYSRF	BODRF	LVRF	WDTRF	PINRF	PORF

Bits	Description
[31:10]	<b>Reserved</b> Reserved.
[9]	<b>VBATLVRF</b> <b>V<sub>BAT</sub> LVR Reset Flag</b> The V <sub>BAT</sub> LVR reset flag is set by the "Reset Signal" from the V <sub>BAT</sub> Low Voltage Reset Controller to indicate the previous reset source. 0 = No reset from V <sub>BAT</sub> LVR. 1 = V <sub>BAT</sub> LVR controller had issued the reset signal to reset the system. <b>Note:</b> Write 1 to clear this bit to 0.
[8]	<b>CPULKRF</b> <b>CPU Lockup Reset Flag</b> 0 = No reset from CPU lockup happened. 1 = The Cortex®-M23lockup happened and chip is reset. <b>Note:</b> Write 1 to clear this bit to 0. <b>Note 2:</b> When CPU lockup happened under ICE is connected, This flag will set to 1 but chip will not reset.
[7]	<b>CPURF</b> <b>CPU Reset Flag</b> The CPU reset flag is set by hardware if software writes CPURST (SYS_IPRST0[1]) 1 to reset Cortex®-M23Core and Flash Memory Controller (FMC). 0 = No reset from CPU. 1 = The Cortex®-M23 Core and FMC are reset by software setting CPURST to 1. <b>Note:</b> Write 1 to clear this bit to 0.
[6]	<b>PMURF</b> <b>PMU Reset Flag,</b> The PMU reset flag is set by any reset signal when MCU is in power down state. 0 = No reset in power down state. 1 = Any reset signal happens in power down state. <b>Note:</b> Write 1 to clear this bit to 0.

Bits	Description	
[5]	<b>SYSRF</b>	<p><b>System Reset Flag</b></p> <p>The system reset flag is set by the "Reset Signal" from the Cortex®M23Core to indicate the previous reset source.</p> <p>0 = No reset from Cortex®-M23.</p> <p>1 = The Cortex®- M23 had issued the reset signal to reset the system by writing 1 to the bit SYSRESETREQ(AIRCR[2], Application Interrupt and Reset Control Register, address = 0xE000ED0C) in system control registers of Cortex®-M23core.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[4]	<b>BODRF</b>	<p><b>BOD Reset Flag</b></p> <p>The BOD reset flag is set by the "Reset Signal" from the Brown-Out Detector to indicate the previous reset source.</p> <p>0 = No reset from BOD.</p> <p>1 = The BOD had issued the reset signal to reset the system.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[3]	<b>LVRF</b>	<p><b>LVR Reset Flag</b></p> <p>The LVR reset flag is set by the "Reset Signal" from the Low Voltage Reset Controller to indicate the previous reset source.</p> <p>0 = No reset from LVR.</p> <p>1 = LVR controller had issued the reset signal to reset the system.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[2]	<b>WDTRF</b>	<p><b>WDT Reset Flag</b></p> <p>The WDT reset flag is set by the "Reset Signal" from the Watchdog Timer or Window Watchdog Timer to indicate the previous reset source.</p> <p>0 = No reset from watchdog timer or window watchdog timer.</p> <p>1 = The watchdog timer or window watchdog timer had issued the reset signal to reset the system.</p> <p><b>Note 1:</b> Write 1 to clear this bit to 0.</p> <p><b>Note 2:</b> Watchdog Timer register RSTF(WDT_CTL[2]) bit is set if the system has been reset by WDT time-out reset. Window Watchdog Timer register WWDRF(WWDT_STATUS[1]) bit is set if the system has been reset by WWDT time-out reset.</p>
[1]	<b>PINRF</b>	<p><b>NRESET Pin Reset Flag</b></p> <p>The nRESET pin reset flag is set by the "Reset Signal" from the nRESET Pin to indicate the previous reset source.</p> <p>0 = No reset from nRESET pin.</p> <p>1 = Pin nRESET had issued the reset signal to reset the system.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[0]	<b>PORF</b>	<p><b>POR Reset Flag</b></p> <p>The POR reset flag is set by the "Reset Signal" from the Power-on Reset (POR) Controller or bit CHIPRST (SYS_IPRST0[0]) to indicate the previous reset source.</p> <p>0 = No reset from POR or CHIPRST.</p> <p>1 = Power-on Reset (POR) or CHIPRST had issued the reset signal to reset the system.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>

Peripheral                      Reset                      Control                      Register                      0

CRCRST	Reserved			EBIRST	PDMARST	CPURST	CHIPRST

Bits	Description
[31:13]	<b>Reserved</b> Reserved.
[12]	<b>CRYPTRST</b> <b>CRYPTO Controller Reset (Write Protect)</b> Setting this bit to 1 will generate a reset signal to the CRYPTO controller. User needs to set this bit to 0 to release from the reset state. 0 = CRYPTO controller normal operation. 1 = CRYPTO controller reset. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[11:8]	<b>Reserved</b> Reserved.
[7]	<b>CRCRST</b> <b>CRC Calculation Controller Reset (Write Protect)</b> Setting this bit to 1 will generate a reset signal to the CRC calculation controller. User needs to set this bit to 0 to release from the reset state. 0 = CRC calculation controller normal operation. 1 = CRC calculation controller reset. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[6:4]	<b>Reserved</b> Reserved.
[3]	<b>EBIRST</b> <b>EBI Controller Reset (Write Protect)</b> Setting this bit to 1 will generate a reset signal to the EBI. User needs to set this bit to 0 to release from the reset state. 0 = EBI controller normal operation. 1 = EBI controller reset. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[2]	<b>PDMARST</b> <b>PDMA Controller Reset (Write Protect)</b> Setting this bit to 1 will generate a reset signal to the PDMA. User needs to set this bit to 0 to release from reset state. 0 = PDMA controller normal operation. 1 = PDMA controller reset.

		<b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[1]	<b>CPURST</b>	<p><b>Processor Core One-shot Reset (Write Protect)</b></p> <p>Setting this bit will only reset the processor core and Flash Memory Controller(FMC), and this bit will automatically return to 0 after the 2 clock cycles.</p> <p>0 = Processor core normal operation. 1 = Processor core one-shot reset.</p> <p><b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[0]	<b>CHIPRST</b>	<p><b>Chip One-shot Reset (Write Protect)</b></p> <p>Setting this bit will reset the whole chip, including Processor core and all peripherals, and this bit will automatically return to 0 after the 2 clock cycles.</p> <p>The CHIPRST is same as the POR reset, all the chip controllers is reset and the chip setting from Flash are also reload.</p> <p>For the difference between CHIPRST and SYSRESETREQ(AIRCR[2]), please refer to section 6.2.2</p> <p>0 = Chip normal operation. 1 = Chip one-shot reset.</p> <p><b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 2:</b> Reset by power on reset</p>

Peripheral	Reset	Control	Register	1
<b>(SYS_IPRST1)</b>				

Setting these bits 1 will generate asynchronous reset signals to the corresponding module controller. Users need to set these bits to 0 to release corresponding module controller from reset state.

LVREN	BODOUT	BODLPM	BODIF	BODRSTEN	Reserved		BODEN

Bits	Description
[31:19]	Reserved. Reserved.
[18:16]	<b>BODVL</b> <b>Brown-out Detector Threshold Voltage Selection (Write Protect)</b> The default value is set by Flash controller user configuration register CBOV (CONFIG0 [23:21]). 000 = Reserved. 001 = Brown-Out Detector threshold voltage is 1.8V. 010 = Brown-Out Detector threshold voltage is 2.0V. 011 = Brown-Out Detector threshold voltage is 2.4V. 100 = Brown-Out Detector threshold voltage is 2.7V. 101 = Brown-Out Detector threshold voltage is 3.0V. 110 = Brown-Out Detector threshold voltage is 3.7V. 111 = Brown-Out Detector threshold voltage is 4.4V. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note:</b> Reset by power on reset.
[15]	Reserved. Reserved.

Bits	Description	
[14:12]	LVRDGSEL	<p><b>LVR Output De-glitch Time Select (Write Protect)</b></p> <p>000 = Without de-glitch function.  001 = 4 MIRC clock (4 MHz), 1 us.  010 = 8 MIRC clock (4 MHz), 2 us.  011 = 16 MIRC clock (4 MHz), 4 us.  100 = 32 MIRC clock (4 MHz), 8 us.  101 = 64 MIRC clock (4 MHz), 16 us.  110 = 128 MIRC clock (4 MHz), 32 us.  111 = 256 MIRC clock (4 MHz), 64 us.</p> <p><b>Note:</b> These bits are write protected. Refer to the SYS_REGLCTL register.  <b>Note:</b> The MIRC enabled automatically when LVRDGSEL is not 000 and LVREN is 1.</p>
[11]	Reserved	Reserved.
[10:8]	BODDGSEL	<p><b>Brown-out Detector Output De-glitch Time Select (Write Protect)</b></p> <p>000 = BOD output is sampled by LIRC.  001 = 4 system clock (HCLK).  010 = 8 system clock (HCLK).  011 = 16 system clock (HCLK).  100 = 32 system clock (HCLK).  101 = 64 system clock (HCLK).  110 = 128 system clock (HCLK).  111 = 256 system clock (HCLK).</p> <p><b>Note:</b> These bits are write protected. Refer to the SYS_REGLCTL register.</p>
[7]	LVREN	<p><b>Low Voltage Reset Enable Bit (Write Protect)</b></p> <p>The LVR function resets the chip when the input power voltage is lower than LVR circuit setting. LVR function is enabled by default.</p> <p>0 = Low Voltage Reset function Disabled.  1 = Low Voltage Reset function Enabled.</p> <p><b>Note 1:</b> After enabling the bit, the LVR function will be active with 3ms delay for LVR output stable (default).  <b>Note 2:</b> For BOD low power mode to be active, this bit must be set to 1.  <b>Note 3:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[6]	BODOUT	<p><b>Brown-out Detector Output Status</b></p> <p>0 = Brown-out Detector output status is 0.  It means the detected voltage is higher than BODVL setting or BODEN is 0.  1 = Brown-out Detector output status is 1.  It means the detected voltage is lower than BODVL setting. If the BODEN is 0, BOD function disabled, this bit always responds 0000.</p>
[5]	BODLPM	<p><b>Brown-out Detector Low Power Mode (Write Protect)</b></p> <p>0 = BOD operate in normal mode (default).  1 = BOD Low Power mode Enabled.</p> <p><b>Note 1:</b> The BOD consumes about 100uA in normal mode, the low power mode can reduce the current to about 1/10 but slow the BOD response.  <b>Note 2:</b> For BOD low power mode to be active, LVREN must be set to 1  <b>Note 3:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>

Bits	Description	
[4]	<b>BODIF</b>	<p><b>Brown-out Detector Interrupt Flag</b></p> <p>0 = Brown-out Detector does not detect any voltage draft at <math>V_{DD}</math> down through or up through the voltage of BODVL setting.</p> <p>1 = When Brown-out Detector detects the <math>V_{DD}</math> is dropped down through the voltage of BODVL setting or the <math>V_{DD}</math> is raised up through the voltage of BODVL setting, this bit is set to 1 and the brown-out interrupt is requested if brown-out interrupt is enabled.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[3]	<b>BODRSTEN</b>	<p><b>Brown-out Reset Enable Bit (Write Protect)</b></p> <p>The default value is set by Flash controller user configuration register CBORST(CONFIG0[20]) bit.</p> <p>0 = Brown-out "INTERRUPT" function Enabled.</p> <p>1 = Brown-out "RESET" function Enabled.</p> <p><b>Note 1:</b> While the Brown-out Detector function is enabled (BODEN high) and BOD reset function is enabled (BODRSTEN high), BOD will assert a signal to reset chip when the detected voltage is lower than the threshold (BODOUT high).</p> <p>While the BOD function is enabled (BODEN high) and BOD interrupt function is enabled (BODRSTEN low), BOD will assert an interrupt if BODOUT is high. BOD interrupt will keep till to the BODEN set to 0. BOD interrupt can be blocked by disabling the NVIC BOD interrupt or disabling BOD function (set BODEN low).</p> <p><b>Note 2:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 3:</b> Reset by power on reset.</p>
[2:1]	<b>Reserved</b>	Reserved.
[0]	<b>BODEN</b>	<p><b>Brown-out Detector Enable Bit (Write Protect)</b></p> <p>The default value is set by Flash controller user configuration register CBODEN (CONFIG0 [19]).</p> <p>0 = Brown-out Detector function Disabled.</p> <p>1 = Brown-out Detector function Enabled.</p> <p><b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 2:</b> Reset by power on reset.</p>

**Register**                      **Lock**                      **Control**                      **Register**  
**(SYS\_REGLCTL)**

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power-on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data "59h", "16h" "88h" to the register SYS\_REGLCTL address at 0x4000\_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check the protection disable bit at address 0x4000\_0100 bit0, 1 is protection disable, and 0 is protection enable. Then user can update the target protected register value and then write any data to the address "0x4000\_0100" to enable register protection.

This register is written to disable/enable register protection and read for the REGLCTL status.

## 6.2.12 System Timer (SysTick)

The Cortex®-M23 includes an integrated system timer, SysTick, which provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real Time Operating System (RTOS) tick timer or as a simple counter.

When system timer is enabled, it will count down from the value in the SysTick Current Value Register (SYST\_VAL) to zero, and reload (wrap) to the value in the SysTick Reload Value Register (SYST\_LOAD) on the next clock cycle, and then decrement on subsequent clocks. When the counter transitions to zero, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

The SYST\_VAL value is UNKNOWN on reset. Software should write to the register to clear it to zero before enabling the feature. This ensures the timer will count from the SYST\_LOAD value rather than an arbitrary value when it is enabled.

If the SYST\_LOAD is zero, the timer will be maintained with a current value of zero after it is reloaded

with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the “Arm® Cortex®-M23 Technical Reference Manual” and “Arm® v8-M Architecture Reference Manual”.

### 6.2.12.1 System Timer Control Register Map

[23:0]	<b>CURRENT</b> <b>System Tick Current Value</b> Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

### 6.2.13 Nested Vectored Interrupt Controller (NVIC)

The NVIC and the processor core interface are closely coupled to enable low latency interrupt processing and efficient processing of late arriving interrupts. The NVIC maintains knowledge of the stacked, or nested, interrupts to enable tail-chaining of interrupts. You can only fully access the NVIC from privileged mode, but you can cause interrupts to enter a pending state in user mode if you enable the Configuration and Control Register. Any other user mode access causes a bus fault. You can access all NVIC registers using byte, halfword, and word accesses unless otherwise stated. NVIC registers are located within the SCS (System Control Space). All NVIC registers and system debug registers are little-endian regardless of the endianness state of the processor.

The NVIC supports:

- An implementation-defined number of interrupts, in the range 1-64 interrupts.
- A programmable priority level of 0-3 for each interrupt; a higher level corresponds to a lower priority, so level 0 is the highest interrupt priority.
- Level and pulse detection of interrupt signals.
- Dynamic reprioritization of interrupts.
- Grouping of priority values into group priority and subpriority fields.
- Interrupt tail-chaining.
- An external Non Maskable Interrupt (NMI)
- WIC with Ultra-low Power Sleep mode support

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling.

#### 6.2.13.1 Exception Model and System Interrupt Map

Table 6.2-8 lists the exception model supported by the M251/M252/M254/M256/M258 series. Software can set 4 levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as "0x00" and the lowest priority is denoted as "0xC0" (The 6-LSB always 0). The default priority of all the user-configurable interrupts is "0x00". Note that priority "0" is treated as the fourth priority on the system, after three system exceptions "Reset", "NMI" and "Hard Fault".

When any interrupts is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. On system reset, the vector table is fixed at address 0x00000000. Privileged software can write to the VTOR to relocate the vector table start address to a different memory location, in the range 0x00000080 to 0x3FFFFFF80.

The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with exception handler entry as illustrated in previous section.

Exception Type	Vector Number	Vector Address	Priority
Reset	1	0x00000004	-3
NMI	2	0x00000008	-2
Hard Fault	3	0x0000000C	-1
Reserved	4~ 10		Reserved
SVCall	11	0x0000002C	Configurable
Reserved	12~13		Reserved
PendSV	14	0x00000038	Configurable

SysTick	15	0x0000003C	Configurable
Interrupt (IRQ0 ~ IRQ63)	16 ~ 63	0x00000000 + (Vector Number)*4	Configurable

Table 6.2-8 Exception Model

Vector Number	Interrupt Number (Bit In Interrupt Registers)	Interrupt Name	Interrupt Description
0 ~ 15	-	-	System exceptions
16	0	BODOUT	Brown-Out low voltage detected interrupt
17	1	IRC_INT	IRC TRIM interrupt
18	2	PWRWU_INT	Clock controller interrupt for chip wake-up from power-down state
19	3	Reserved	Reserved
20	4	CLKFAIL	Clock fail detected interrupt
21	5	Reserved	Reserved
22	6	RTC_INT	Real time clock interrupt
23	7	TAMPER_INT	Backup register tamper interrupt
24	8	WDT_INT	Watchdog Timer interrupt
25	9	WWDT_INT	Window Watchdog Timer interrupt
26	10	EINT0	External interrupt from PA.6 or PB.5 pins
27	11	EINT1	External interrupt from PA.7, PB.4 or PD.15 pins
28	12	EINT2	External interrupt from PB.3 or PC.6 pin
29	13	EINT3	External interrupt from PB.2 or PC.7 pin
30	14	EINT4	External interrupt from PA.8, PB.6 or PF.15 pin
31	15	EINT5	External interrupt from PB.7 or PD.12 pin
32	16	GPA_INT	External interrupt from PA[15:0] pin
33	17	GPB_INT	External interrupt from PB[15:0] pin
34	18	GPC_INT	External interrupt from PC[15:0] pin
35	19	GPD_INT	External interrupt from PD[15:0] pin
36	20	GPE_INT	External interrupt from PE[15:0] pin
37	21	GPF_INT	External interrupt from PF[15:0] pin
38	22	QSPI0_INT	QSPI0 interrupt
39	23	SPI0_INT	SPI0 interrupt
40	24	BRAKE0_INT	PWM0 brake interrupt
41	25	PWM0_P0_INT	PWM0 pair 0 interrupt
42	26	PWM0_P1_INT	PWM0 pair 1 interrupt

43	27	PWM0_P2_INT	PWM0 pair 2 interrupt
44	28	BRAKE1_INT	PWM1 brake interrupt
45	29	PWM1_P0_INT	PWM1 pair 0 interrupt
46	30	PWM1_P1_INT	PWM1 pair 1 interrupt
47	31	PWM1_P2_INT	PWM1 pair 2 interrupt
48	32	TMR0_INT	Timer 0 interrupt
49	33	TMR1_INT	Timer 1 interrupt
50	34	TMR2_INT	Timer 2 interrupt
51	35	TMR3_INT	Timer 3 interrupt
52	36	UART0_INT	UART0 interrupt
53	37	UART1_INT	UART1 interrupt
54	38	I2C0_INT	I2C0 interrupt
55	39	I2C1_INT	I2C1 interrupt
56	40	PDMA_INT	PDMA interrupt
57	41	DAC_INT	DAC interrupt
58	42	EADC_INT	EADC interrupt source 0
59	43	EADC1_INT	EADC interrupt source 1
60	44	ACMP01_INT	ACMP0 and ACMP1 interrupt
61	45	BPWM0	BPWM0 interrupt
62	46	EADC2_INT	EADC interrupt source 2
63	47	EADC3_INT	EADC interrupt source 3
64	48	UART2_INT	UART2 interrupt
65	49	UART3_INT	UART3 interrupt
66	50	USCI0	USCI0 interrupt
67	51	SPI1_INT	SPI1 interrupt
68	52	USCI1	USCI1 interrupt
69	53	USBD_INT	USB device interrupt
70	54	BPWM1	BPWM1
71	55	PSIO_INT	PSIO interrupt
72	56	Reserved	Reserved
73	57	CRYPTO_INT	Crypto interrupt
74	58	SC0_INT	Smart card host 0 interrupt
75	59	Reserved	Reserved
76	60	USCI2	USCI2 interrupt
77	61	LCD_INT	LCD interrupt

78	62	OPA0	OPA0 interrupt
79	63	TK_INT	TK interrupt

Table 6.2-9 Interrupt Number Table

### 6.2.13.2 Operation Description

NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in the next section.

### 6.2.13.3 NVIC Control Registers

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>NVIC Base Address:</b> <b>NVIC_BA = 0xE000_E100</b>				
<b>NVIC_ISER0</b>	NVIC_BA+0x000	R/W	IRQ0 ~ IRQ31 Set-enable Control Register	0x0000_0000
<b>NVIC_ISER1</b>	NVIC_BA+0x004	R/W	IRQ32 ~ IRQ63 Set-enable Control Register	0x0000_0000
<b>NVIC_ICER0</b>	NVIC_BA+0x080	R/W	IRQ0 ~ IRQ31 Clear-enable Control Register	0x0000_0000
<b>NVIC_ICER1</b>	NVIC_BA+0x084	R/W	IRQ32 ~ IRQ63 Clear-enable Control Register	0x0000_0000
<b>NVIC_ISPR0</b>	NVIC_BA+0x100	R/W	IRQ0 ~ IRQ31 Set-pending Control Register	0x0000_0000
<b>NVIC_ISPR1</b>	NVIC_BA+0x104	R/W	IRQ32 ~ IRQ63 Set-pending Control Register	0x0000_0000
<b>NVIC_ICPR0</b>	NVIC_BA+0x180	R/W	IRQ0 ~ IRQ31 Clear-pending Control Register	0x0000_0000
<b>NVIC_ICPR1</b>	NVIC_BA+0x184	R/W	IRQ32 ~ IRQ63 Clear-pending Control Register	0x0000_0000
<b>NVIC_IABR0</b>	NVIC_BA+0x200	R/W	IRQ0 ~ IRQ31 Active Bit Register	0x0000_0000
<b>NVIC_IABR1</b>	NVIC_BA+0x204	R/W	IRQ32 ~ IRQ63 Active Bit Register	0x0000_0000
<b>NVIC_IPRn</b> <b>n=0,1..15</b>	0xE000E400 +0x4*n	R/W	IRQ0 ~ IRQ63 Priority Control Register	0x0000_0000

IRQ0 ~ IRQ31 Set-enable Control Register  
(NVIC\_ISER0)

## 6.2.14 System Control Register

The Cortex®-M23 status and operation mode control are managed by System Control Registers. Including CPUID, Cortex®-M23 interrupt priority and Cortex®-M23 power management can be controlled through these system control registers.

For more detailed information, please refer to the “Arm® Cortex®-M23 Technical Reference Manual” and “Arm® v6-M Architecture Reference Manual”.

[20:0]	Reserved

## 6.3 Clock Controller

### 6.3.1 Overview

The clock controller generates clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individually clock ON/OFF control, clock source selection and a clock divider. The chip will not enter Power-down mode until CPU sets the Power-down enable bit PDEN(CLK\_PWRCTL[7]) and Cortex®-M23 core executes the WFI instruction. After that, chip enters Power-down mode and wait for wake-up interrupt source triggered to leave Power-down mode. In Power-down mode, the clock controller turns off the 4~32 MHz external high speed crystal (HXT), 48 MHz internal high speed RC oscillator (HIRC) and 4 MHz internal median speed RC oscillator (MIRC) to reduce the overall system power consumption. Figure 6.3-1 shows the clock generator and the overview of the clock source control.

Table 6.3-1 Clock Controller Feature Comparison Table at Different chip

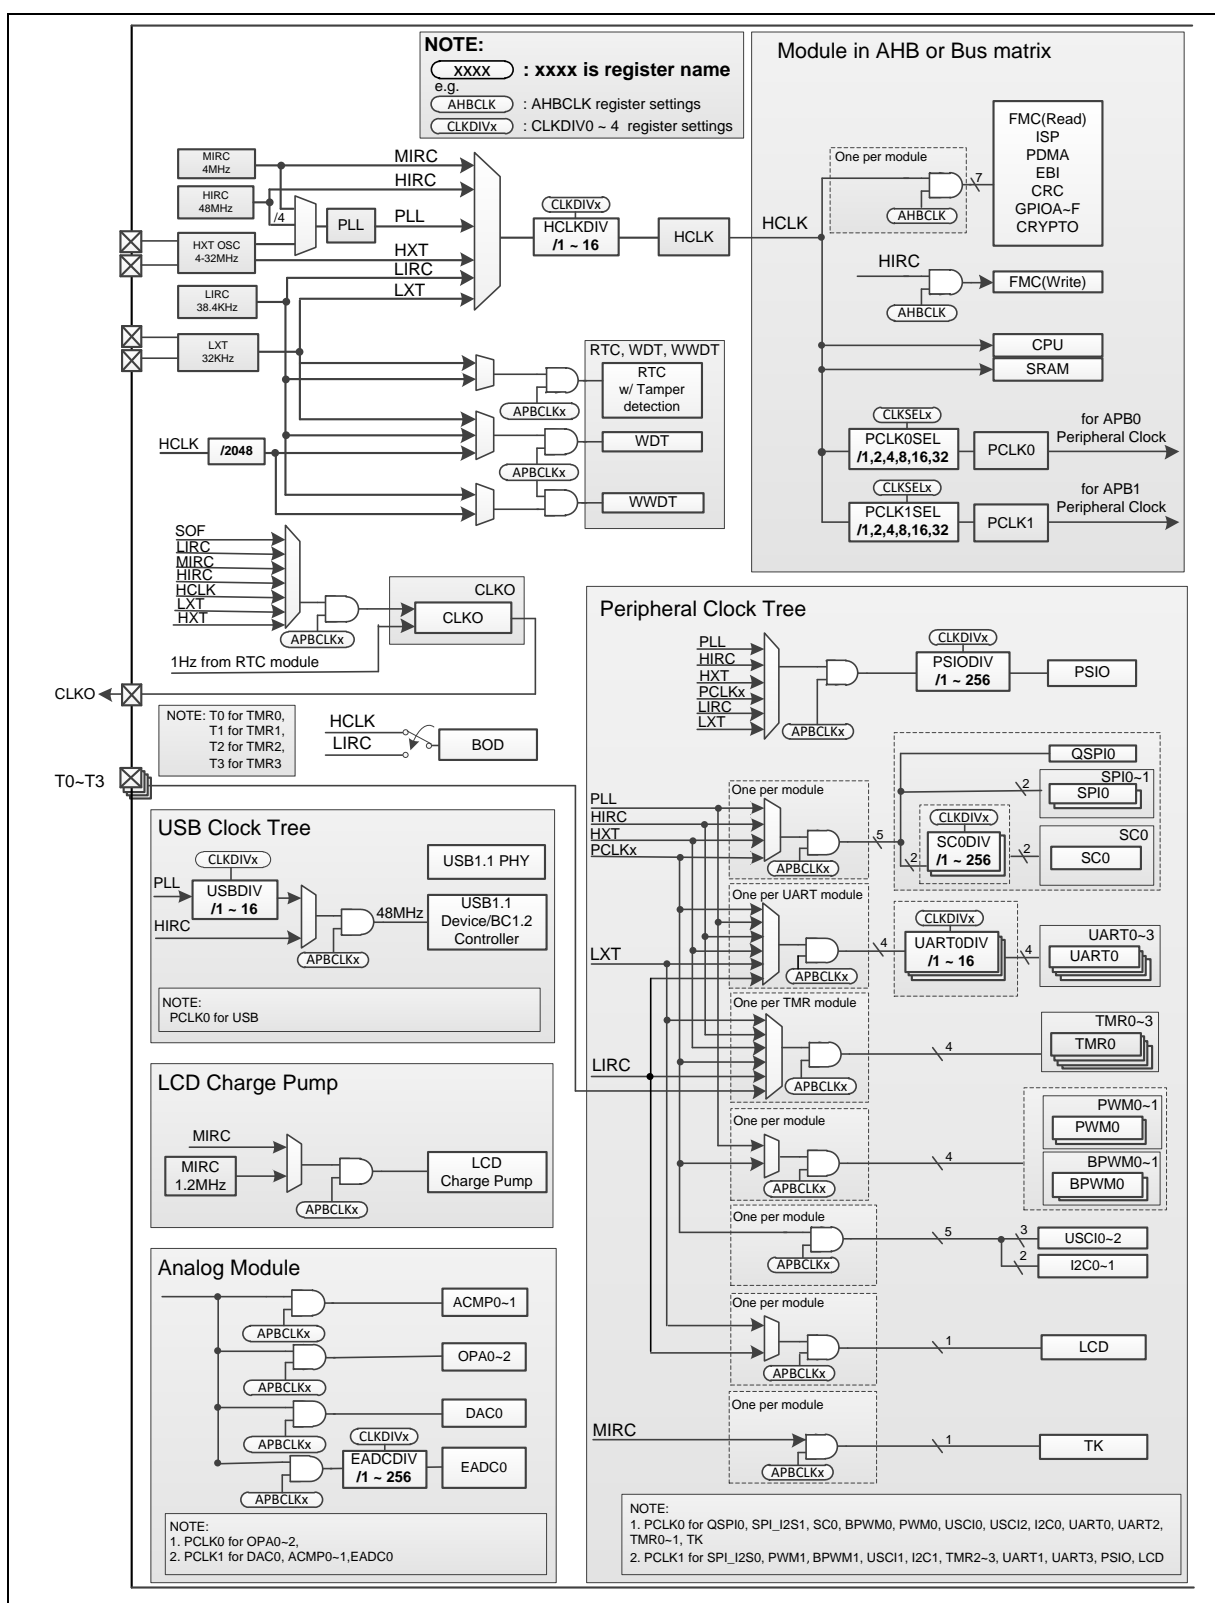

Figure 6.3-1 Clock Generator Global View Diagram

### 6.3.2 Clock Generator

The clock generator consists of 6 clock sources, which are listed below:

- 32.768 kHz external low speed crystal oscillator (LXT)
- 4~32 MHz external high speed crystal oscillator (HXT)
- Programmable PLL output clock frequency (PLLFOUT) - PLL source can be selected from external 4~32 MHz external high speed crystal (HXT), 48 MHz internal high speed oscillator (HIRC/4) or 4 MHz internal medium speed oscillator (MIRC)
- 48 MHz internal high speed RC oscillator (HIRC)
- 38.4 kHz internal low speed RC oscillator (LIRC)
- 4 MHz internal medium speed oscillator (MIRC)

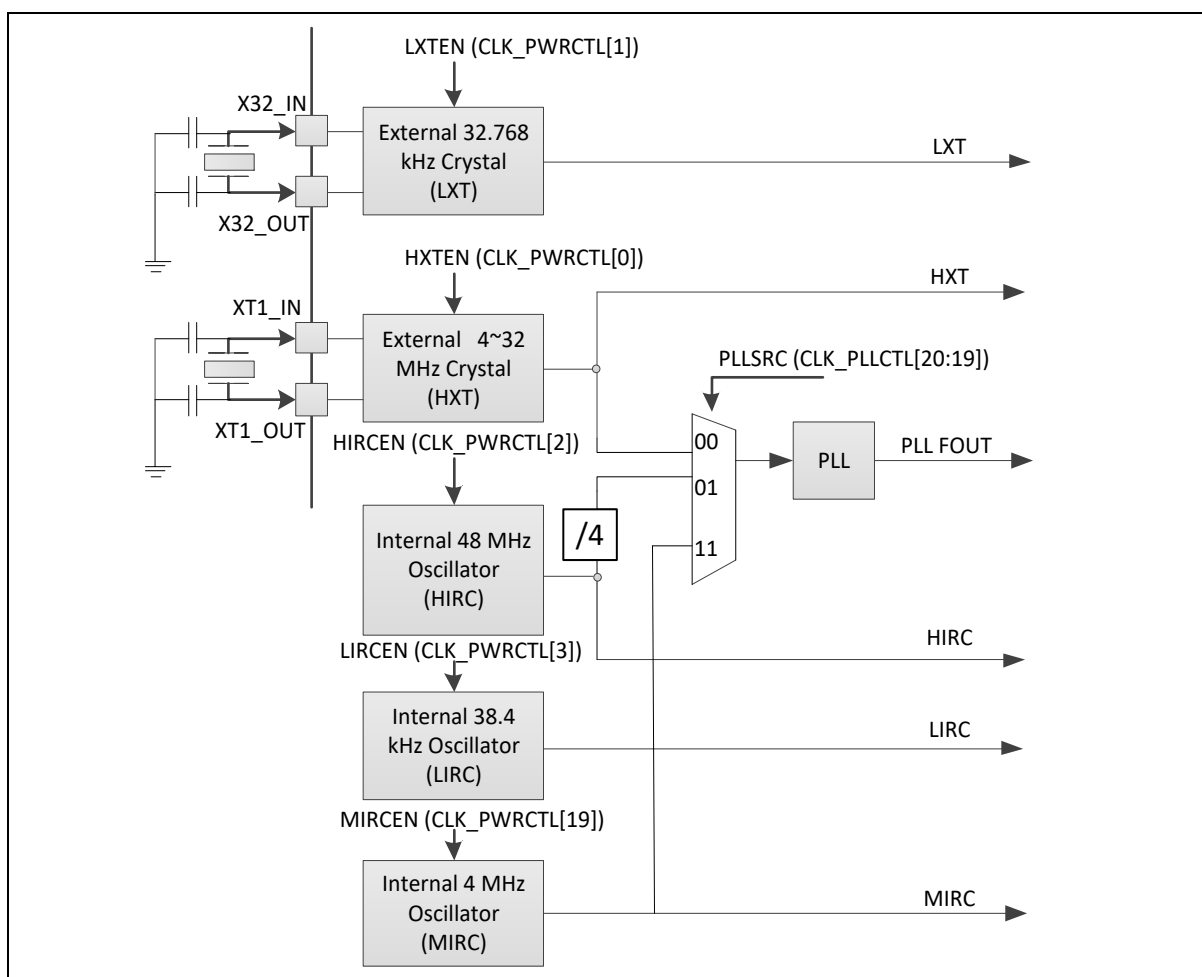

Figure 6.3-2 Clock Generator Block Diagram

### 6.3.3 System Clock and SysTick Clock

The system clock has 6 clock sources, which are generated from clock generator block. The clock source switch depends on the register HCLKSEL (CLK\_CLKSEL0[2:0]). The block diagram is shown in Figure 6.3-3

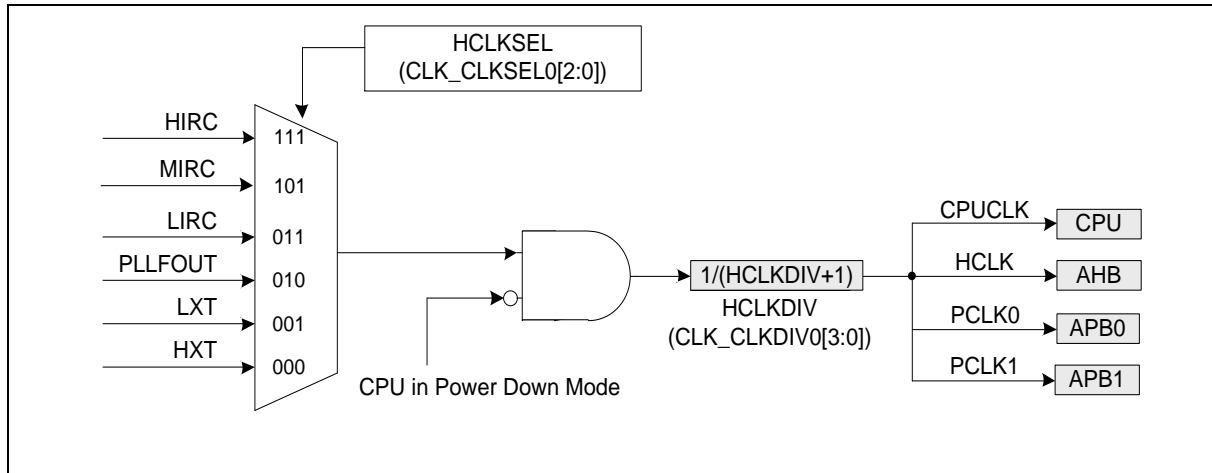

Figure 6.3-3 System Clock Block Diagram

There are two clock fail detectors to observe HXT and LXT clock source and they have individual enable and interrupt control. When HXT detector is enabled, the MIRC clock is enabled automatically. When LXT detector is enabled, the LIRC clock is enabled automatically.

When HXT clock detector is enabled, the system clock will auto switched to MIRC if HXT clock stops being detected in the following condition: system clock source comes from HXT or system clock source comes from PLL with HXT as the input of PLL. If HXT clock stop condition is detected, the HXTFIF (CLK\_CLKDSTS[0]) is set to 1 and chip will enter interrupt if HXTFIE (CLK\_CLKDCTL[5]) is set to 1. User can try to recover HXT by disable HXT and enable HXT again to check if the clock stable bit is set to 1 or not. If HXT clock stable bit is set to 1, it means HXT is recovered to oscillate after re-enable action and user can switch system clock to HXT again.

The HXT clock stop detect and system clock switch to MIRC procedure is shown in Figure 6.3-4.

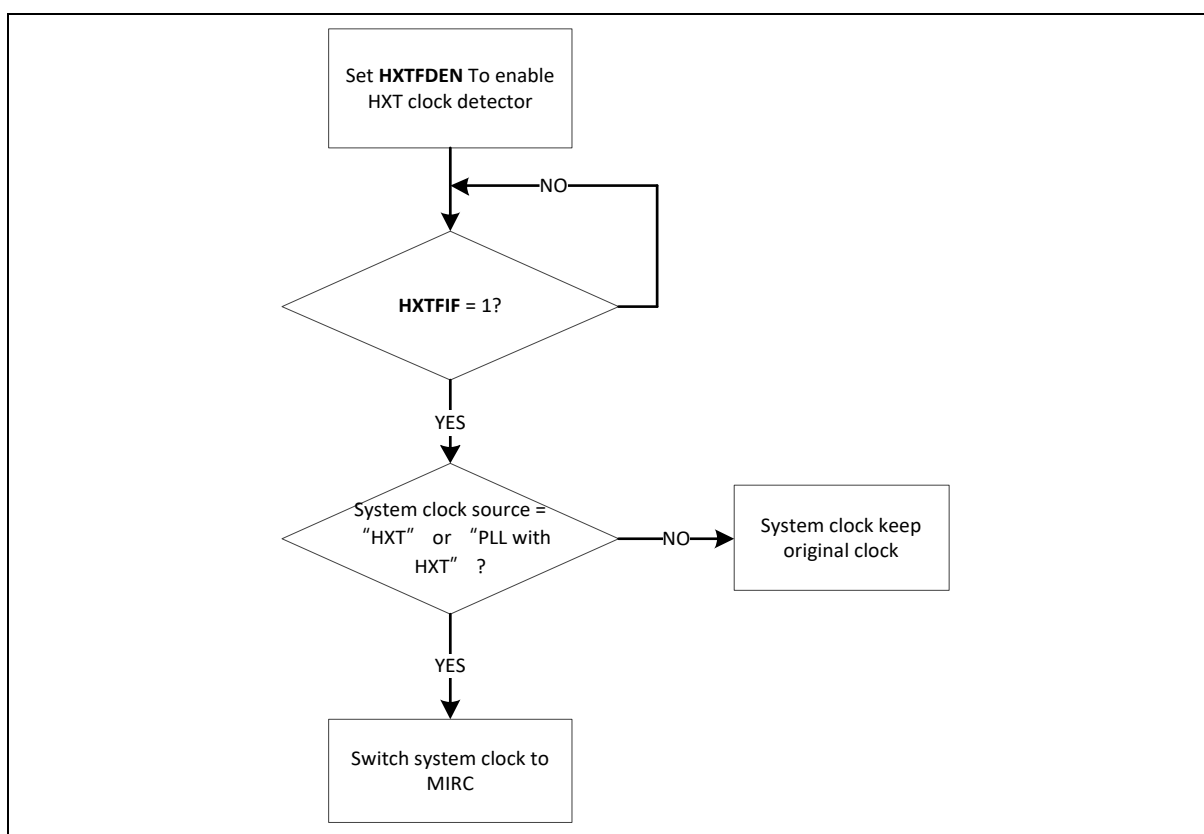

Figure 6.3-4 HXT Stop Protect Procedure

The clock source of SysTick in Cortex®-M23 core can use CPU clock or external clock (SYST\_CTRL[2]). If using external clock, the SysTick clock (STCLK) has 5 clock sources. The clock source switch depends on the setting of the register STCLKSEL (CLK\_CLKSEL0[5:3]). The block diagram is shown in Figure 6.3-5.

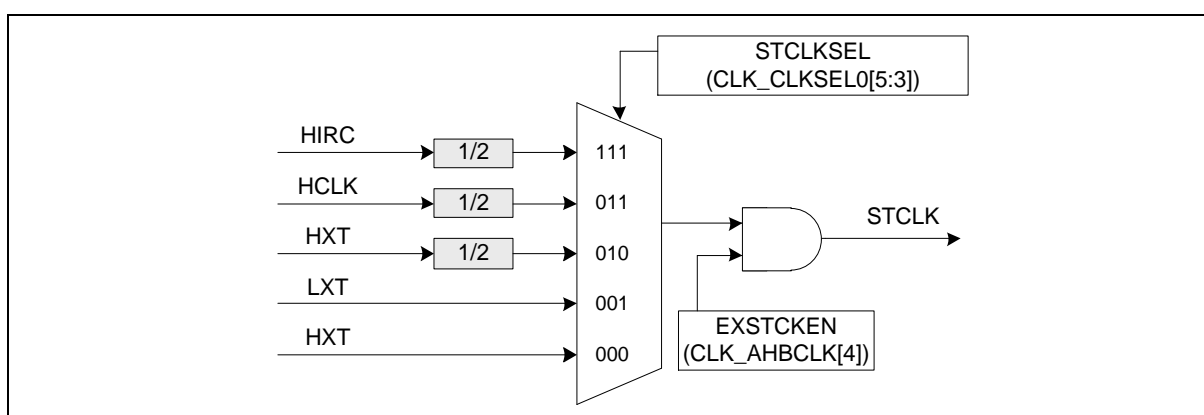

Figure 6.3-5 SysTick Clock Control Block Diagram

### 6.3.4 Peripherals Clock

The peripherals clock has different clock source switch setting, which depends on the different peripheral. Please refer to the CLK\_CLKSEL1 and CLK\_CLKSEL2 register description in Register Description section.

### 6.3.5 Power-down Mode Clock

When entering Power-down mode, system clocks, some clock sources and some peripheral clocks are disabled. Some clock sources and peripherals clock are still active in Power-down mode.

For these clocks, which still keep active, are listed below:

- Clock Generator
  - 38.4 kHz internal low speed RC oscillator (LIRC) clock
  - 32.768 kHz external low speed crystal oscillator (LXT) clock
  - 4 MHz internal medium speed oscillator (MIRC) clock if LCD and TK enabled.
- Peripherals clock, except for HCLK, PCLK0 and PCLK1 (when the modules adopt LXT or LIRC as clock source).

### 6.3.6 Clock Output

This device is equipped with a power-of-2 frequency divider which is composed by 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from  $F_{in}/2^1$  to  $F_{in}/2^{16}$  where  $F_{in}$  is input clock frequency to the clock divider.

The output formula is  $F_{out} = F_{in}/2^{(N+1)}$ , where  $F_{in}$  is the input clock frequency,  $F_{out}$  is the clock divider output frequency and N is the 4-bit value in FREQSEL (CLK\_CLKOCTL[3:0]).

When writing 1 to CLKOEEN (CLK\_CLKOCTL[4]), the chained counter starts to count. When writing 0 to CLKOEEN (CLK\_CLKOCTL[4]), the chained counter continuously runs till divided clock reaches low state and stays in low state.

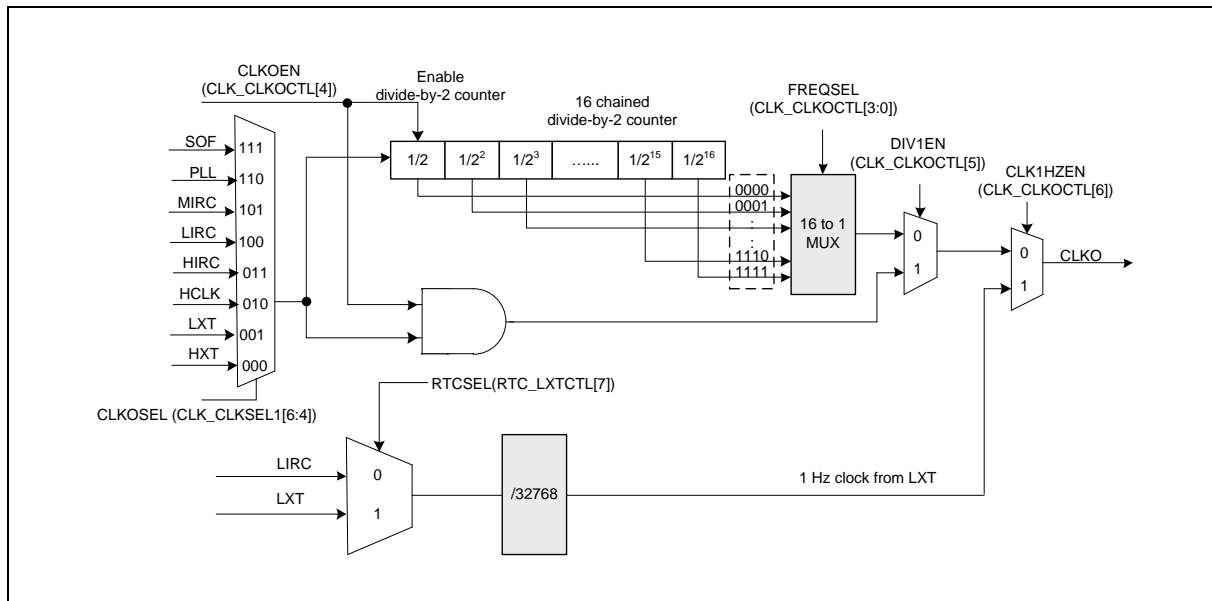

Figure 6.3-6 Clock Output Block Diagram

### 6.3.7 USB Clock Source

The clock source of USB 1.0 is generated from 48 MHz HIRC or programmable PLL output. The generated clocks are shown in Figure 6.3-7. USBPLLDIV is the clock divider output frequency, the output formula is (PLLFOUT frequency) / (USBDIV + 1).

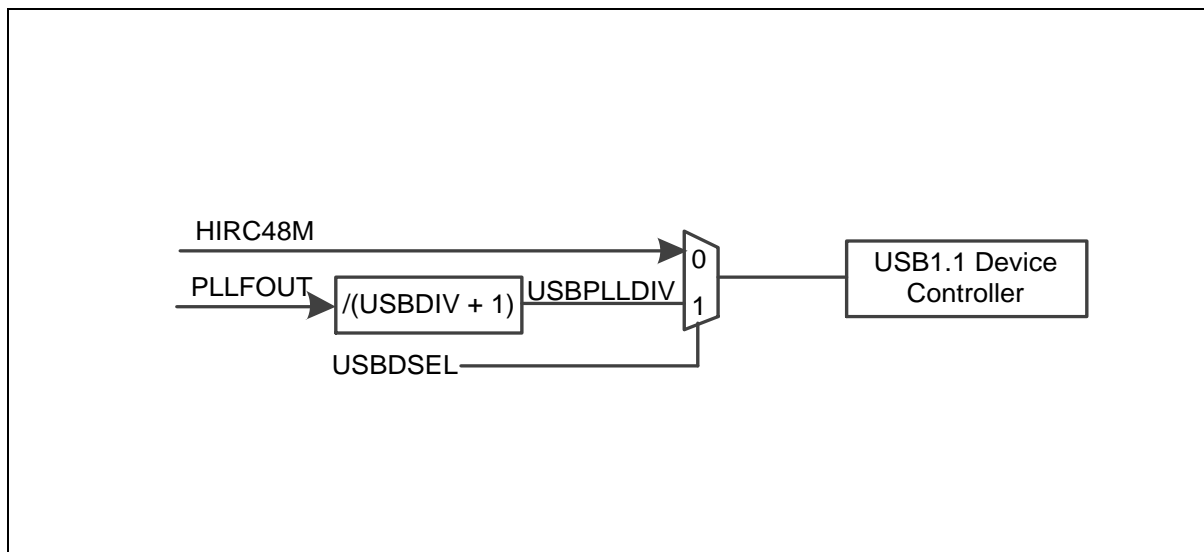

Figure 6.3-7 USB Clock Source

## 6.3.8 Register Map

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved	HXTGAIN			MIRCEN	Reserved		
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
PDEN	PDWKIF	PDWKIEN	PDWKDLY	LIRCEN	HIRCEN	LXTEN	HXTEN

Bits	Description
[31:23]	<b>Reserved</b> Reserved.
[22:20]	<b>HXTGAIN</b> <b>HXT Gain Control Bit (Write Protect)</b> This is a protected register. Please refer to open lock sequence to program it. Gain control is used to enlarge the gain of crystal to make sure crystal work normally. If gain control is enabled, crystal will consume more power than gain control off. 000= HXT frequency 1~4 MHz. 001= HXT frequency 4~8 MHz. 010= HXT frequency 8~12 MHz. 011= HXT frequency 12~ 16 MHz. 100= HXT frequency 16~24 MHz. 101= HXT frequency 24~32 Mhz. 110= HXT frequency 24~32 Mhz. 111= HXT frequency 24~32 Mhz. <b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note 2:</b> Reset by power on reset.
[19]	<b>MIRCEN</b> <b>MIRC Enable Bit (Write Protect)</b> 0 = 4 MHz internal high speed RC oscillator (MIRC) Disabled. 1 = 4 MHz internal high speed RC oscillator (MIRC) Enabled. <b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note 2:</b> This bit is forced on when CLKSEL0[2:0] = 101b.
[18:8]	<b>Reserved</b> Reserved.
[7]	<b>PDEN</b> <b>System Power-down Enable (Write Protect)</b> When this bit is set to 1, Power-down mode is enabled, chip enters Power-down mode immediately after the PDEN bit set. When chip wakes up from Power-down mode, this bit is auto cleared. Users need to set this bit again for next Power-down.

		<p>In Power-down mode, HXT, MIRC and HIRC will be disabled in this mode, but LXT and LIRC are not controlled by Power-down mode.</p> <p>In Power-down mode, the PLL, HCLK, PCLK0 and PCLK1 clocks are disabled, and ignored the clock source selection. The clocks of peripheral are not controlled by Power-down mode, if the peripheral clock source is from LXT or LIRC.</p> <p>0 = Chip operating normally or chip in idle mode because of WFI command. 1 = Chip enters Power-down mode instant or wait CPU sleep command WFI.</p> <p><b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[6]	PDWKIF	<p><b>Power-down Mode Wake-up Interrupt Status</b></p> <p>Set by "Power-down wake-up event" indicates that resume from Power-down mode"</p> <p>The flag is set if any wake-up source is occurred. Refer Power Modes and Wake-up Sources chapter.</p> <p><b>Note 1:</b> Write 1 to clear the bit to 0.</p> <p><b>Note 2:</b> This bit works only if PDWKIEN (CLK_PWRCTL[5]) is set to 1.</p>
[5]	PDWKIEN	<p><b>Power-down Mode Wake-up Interrupt Enable Bit (Write Protect)</b></p> <p>0 = Power-down mode wake-up interrupt Disabled. 1 = Power-down mode wake-up interrupt Enabled.</p> <p><b>Note 1:</b> The interrupt will occur when both PDWKIF and PDWKIEN are high.</p> <p><b>Note 2:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[4]	PDWKDLY	<p><b>Enable the Wake-up Delay Counter (Write Protect)</b></p> <p>When the chip wakes up from Power-down mode, the clock control will delay certain clock cycles to wait system clock stable.</p> <p>The delayed clock cycle is 4096 clock cycles when chip works at 4~32 MHz external high speed crystal oscillator (HXT),</p> <p>The delayed clock cycle is 512 clock cycles when chip works at 48 MHz internal high speed RC oscillator (HIRC)</p> <p>The delayed clock cycle is 64 clock cycles when chip works at 4 MHz internal median speed RC oscillator (MIRC)</p> <p>0 = Clock cycles delay Disabled. 1 = Clock cycles delay Enabled.</p> <p><b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[3]	LIRCEN	<p><b>LIRC Enable Bit (Write Protect)</b></p> <p>0 = 38.4 kHz internal low speed RC oscillator (LIRC) Disabled. 1 = 38.4 kHz internal low speed RC oscillator (LIRC) Enabled.</p> <p><b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 2:</b> LIRC will also be forced on in the following conditions: 1. Power down and ~(CONFIG0[3] &amp; CONFIG0[4] &amp; ~CONFIG0[31] &amp; CONFIG0[30]); 2. Not power down and ~(CONFIG0[3] &amp; CONFIG0[4] &amp; CONFIG0[31]).</p>
[2]	HIRCEN	<p><b>HIRC Enable Bit (Write Protect)</b></p> <p>0 = 48 MHz internal high speed RC oscillator (HIRC) Disabled. 1 = 48 MHz internal high speed RC oscillator (HIRC) Enabled.</p> <p><b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[1]	LXTEN	<p><b>LXT Enable Bit (Write Protect)</b></p> <p>0 = 32.768 kHz external low speed crystal (LXT) Disabled. 1 = 32.768 kHz external low speed crystal (LXT) Enabled.</p> <p><b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 2:</b> Reset by RTC power on reset.</p>
[0]	HXTEN	<p><b>HXT Enable Bit (Write Protect)</b></p> <p>0 = 4~32 MHz external high speed crystal (HXT) Disabled.</p>

		<p>1 = 4~32 MHz external high speed crystal (HXT) Enabled.</p> <p><b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p><b>Note 2:</b> Reset by power on reset.</p>

## PLL Control Register

### (CLK\_PLLCTL)

The PLL reference clock input is from the 4~32 MHz external high speed crystal oscillator (HXT) clock input or from the 12 MHz internal high speed RC oscillator (HIRC). This register is used to control the PLL output frequency and PLL operation mode.

Programming these bits needs to write “59h”, “16h”, “88h” to address 0x4000\_0100 to disable register protection. Refer to the register SYS\_REGLCTL at address SYS\_BA+0x100.

CLK\_PLLCTL only can be modified while PD(CLK\_PLLCTL[16]) is set.

Register	Offset	R/W	Description	Reset Value
CLK_PLLCTL	CLK_BA+0x40	R/W	PLL Control Register	0x0005_4618

31	30	29	28	27	26	25	24

Bits	Description
[31:25]	<b>Reserved</b> Reserved.
[24]	<b>PLLCLFEN</b> 1: PLL Clock Filter On 0 : OFF
[23]	<b>STBSEL</b> <b>PLL Stable Counter Selection (Write Protect)</b> 0 = PLL stable time is 1200 PLL source clock (suitable for source clock is equal to or less than 12 MHz). 1 = PLL stable time is 3200 PLL source clock (suitable for source clock is larger than 12 MHz). <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[22:21]	<b>Reserved</b> Reserved.
[20:19]	<b>PLLSRC</b> <b>PLL Source Clock Selection (Write Protect)</b> 00 = PLL source clock from 4~32 MHz external high-speed crystal oscillator (HXT). 01 = PLL source clock from 12 MHz internal high-speed oscillator (HIRC/4). 10 = PLL source clock from 4~32 MHz external high-speed crystal oscillator (HXT). 11 = PLL source clock from 4 MHz internal high-speed oscillator (MIRC). <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note:</b> MIRC and HIRC have to be both on when source switch between them
[18]	<b>OE</b> <b>PLL FOUT Enable Pin Control (Write Protect)</b> 0 = PLL FOUT Enabled. 1 = PLL FOUT is fixed low. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.

[17]	BP	<b>PLL Bypass Control (Write Protect)</b> 0 = PLL is in normal mode (default). 1 = PLL clock output is same as PLL input clock FIN. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[16]	PD	<b>Power-down Mode (Write Protect)</b> If set the PDEN bit to 1 in CLK_PWRCTL register, the PLL will enter Power-down mode, too. 0 = PLL is in normal mode. 1 = PLL is in Power-down mode (default). <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[15:14]	OUTDIV	<b>PLL Output Divider Control (Write Protect)</b> Refer to the formulas below the table. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[13]	Reserved	Reserved.
[12:9]	INDIV	<b>PLL Input Divider Control (Write Protect)</b> Refer to the formulas below the table. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[8:6]	Reserved	Reserved.
[5:0]	FBDIV	<b>PLL Feedback Divider Control (Write Protect)</b> Refer to the formulas below the table. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.

By default, when FIN is 12Mhz, PLL output is 48Mhz, Output Clock Frequency formula:

$$F_{OUT} = F_{IN} \times \frac{NF}{NR} \times \frac{1}{NO}$$

$F_{REF} = F_{IN} / NR$ , where  $F_{REF}$  is the comparison frequency for the PFD (phase frequency detector).

$$F_{VCO} = F_{OUT} * NO$$

For proper operation in normal mode, the following constraints must be satisfied:

$$4 \text{ MHz} \leq F_{REF} \leq 8 \text{ MHz}$$

$$64 \text{ MHz} \leq F_{VCO} \leq 100 \text{ MHz}$$

$$16 \text{ MHz} \leq F_{OUT} \leq 100 \text{ MHz}$$

Symbol	Description
$F_{OUT}$	Output Clock Frequency
$F_{IN}$	Input (Reference) Clock Frequency
NR	Input Divider (INDIV), when INDIV = 0, NR = 16
NF	Feedback Divider (FBDIV), when FBDIV = 0, NF = 64
NO	OUTDIV = "00" : NO = 1 OUTDIV = "01" : NO = 2 OUTDIV = "10" : NO = 4 OUTDIV = "11" : NO = 4

Table 6.3-2 The symbol definition of PLL Output Frequency formula

Clock (CLK STATUS)	Status	Monitor	Register
-----------------------	--------	---------	----------

The bits in this register are used to monitor if the chip clock source is stable or not, and whether the clock switch is failed.

## 6.4 Flash Memory Controller (FMC)

### 6.4.1 Overview

The FMC is equipped with 32/64/128/256 Kbytes on-chip embedded Flash for application. A User Configuration block is provided for system initiation. A 4 Kbytes loader ROM (LDROM) is used for In-System-Programming (ISP) function. XOM (Execution Only Memory) setting block is used to conceal user program in XOM region. A 512/1024/2048 bytes cache with zero wait cycle is used to improve Flash access performance. This chip also supports In-Application-Programming (IAP) function. User switches the code executing without chip reset after the embedded Flash is updated.

### 6.4.2 Features

- Supports 32/64/128/256 Kbytes application ROM (APROM)
- Supports 4 Kbytes loader ROM (LDROM)
- Supports 1 XOM (Execution Only Memory) region to conceal user program in APROM
- Supports 12 bytes User Configuration block to control system initiation.
- Supports 512 bytes page erase for all embedded Flash
- Supports 32-bit and multi-word Flash programming function
- Supports CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports embedded SRAM remap to system vector memory
- Supports In-System-Programming (ISP) / In-Application-Programming (IAP) to update embedded Flash memory
- Supports cache memory to improve Flash access performance and reduce power consumption

### 6.4.3 Block Diagram

The Flash memory controller (FMC) consists of AHB slave interface, cache memory controller, Flash control registers, Flash initialization controller, Flash operation control and embedded Flash memory. The block diagram of Flash memory controller is shown in Figure 6.4-1.

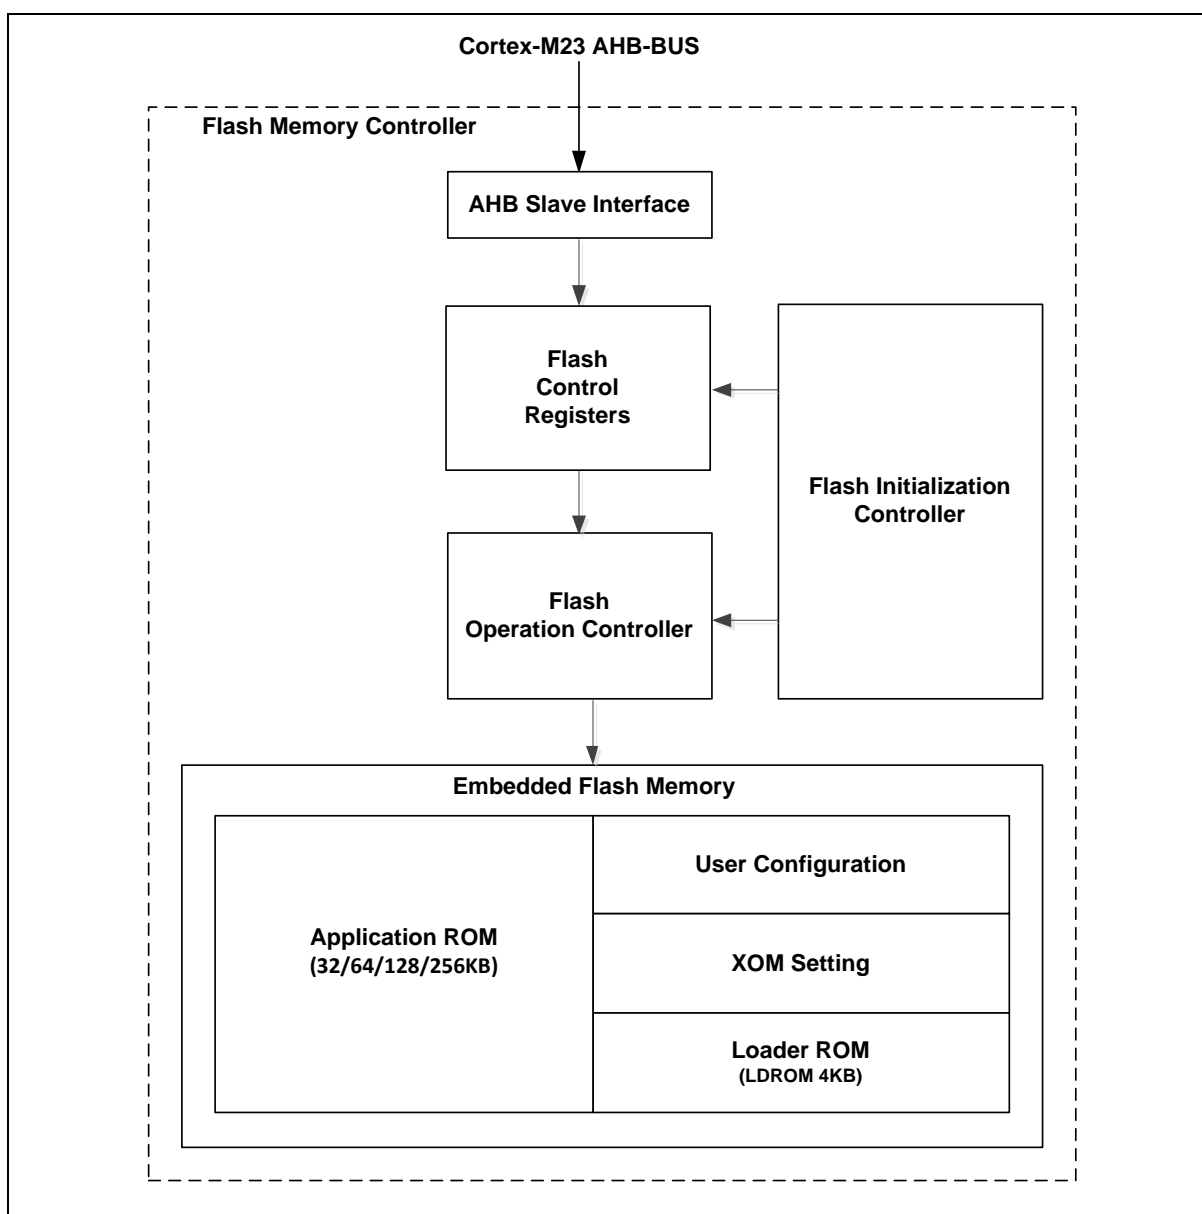

Figure 6.4-1 Flash Memory Controller Block Diagram

### **AHB Slave Interface**

There is one AHB slave interface in Flash memory controller, the bus is from Cortex®-M23 AHB-Lite Bus for the instruction and data fetch and Flash control registers access including ISP registers.

### **Cache Memory Controller**

A 512/1024/2048 bytes cache with zero wait cycle is implemented between Cortex®-M23 CPU and embedded Flash memory. This cache memory controller improves the Flash access performance and reduces power consumption of the embedded Flash memory.

### **Flash Control Registers**

All of ISP control and status registers are in the Flash control registers. The detailed registers description is in the Register Description section.

#### **Flash Initialization Controller**

When chip is powered on or active from reset, the Flash initialization controller will start to access Flash automatically and check the Flash stability, and also reload User Configuration content to the Flash control registers for system initiation.

#### **Flash Operation Controller**

The Flash operations, such as Flash erase, Flash program, and Flash read operation, have specific control timing for embedded Flash memory. The Flash operation controller generates those control timing by requested from the cache memory controller, the Flash control registers and the Flash initialization controller.

#### **Embedded Flash Memory**

The embedded Flash memory is the main memory for user application code and parameters. It consists of the user configuration block, 4 Kbytes LDROM, 512 bytes XOM setting page and 32/64/128/256 Kbytes APROM. The page erase Flash size is 512 bytes, and the minimum program bit size is 32 bits.

### **6.4.4 Functional Description**

FMC functions include the memory organization, boot selection, IAP, ISP, the embedded Flash programming, and checksum calculation. The Flash memory map and system memory map are also introduced in the memory organization.

#### **6.4.4.1 Memory Organization**

The FMC memory consists of the embedded Flash memory which is programmable, and includes APROM, LDROM, XOM setting pages and the User Configuration block. The address map includes Flash memory map and four system address maps: LDROM with IAP, LDROM without IAP, APROM with IAP and APROM without IAP functions.

#### **6.4.4.2 LDROM and APROM**

LDROM is designed for a loader to implement In-System-Programming (ISP) function by user. LDROM is a 4 Kbytes embedded Flash memory, the Flash address range is from 0x0010\_0000 to 0x0010\_0FFF. APROM is main memory for user applications. APROM size is 32/64/128/256 Kbytes. The page size of all of the embedded Flash memory is 512 bytes.

#### **6.4.4.3 User Configuration Block**

User Configuration block is internal programmable configuration area for boot options, such as Flash security lock, boot select and brown-out voltage level. It works like a fuse for power on setting. It is loaded from Flash memory to its corresponding control registers during chip power on. User can set these bits according to different application requests. User Configuration block can be updated by ISP function and located at 0x0030\_0000 with three 32 bits words (CONFIG0, CONFIG1 and CONFIG2). Any change on User Configuration block will take effect after system reboot.

#### 6.4.4.4 Execution Only Memory (XOM)

The execution only memory (XOM) is used to store instructions for security application which are not allowed for data access via AHB-Bus. There is only one XOM region in APROM (XOM0). To define a new XOM region, user must complete XOM settings in XOM setting page (0x20\_0000 ~ 0x20\_000B) via In-System-Programming (ISP) function. XOMR0BASE is used to define XOM region start address and XOMR0SIZE is used to define total page size of XOM region. Both XOMR0BASE and XOMR0SIZE must be page alignment. XOMR0CTRL is used to define the XOM region attribute, which can be defined as active, inactive or debug mode. After setting and restarting Flash initialization by any reset except CPU reset and MCU reset, user can check XOM status from FMC\_XOMSTS and check each XOM range (i.e. base and size) from FMC\_XOMR0STS. User needs to do chip reset after setting or erasing XOM.

When using XOM setting page and XOM regions, users must pay attention to the following limitations:

- XOM region cannot be programmed after finishing its XOM setting
- XOM setting cannot be changed during runtime
- Only use Flash 32-bit program command to program XOM setting page
- Clear XOM setting and XOM region by mass erase command or XOM page erase function (a special erase command for XOM)
- User must restart Flash initialization to activate any new XOM setting
- ICE cannot step in XOM region except debug mode, otherwise ICE will disconnect

Once the XOM region is active, user can only adopt mass erase command or XOM page erase function to clear XOM region and its corresponding XOM setting. To execute XOM page erase function, user must perform FLASH Page Erase (0x22) by writing the base address of the target XOM region in FMC\_ISPADDR and the constant value 0x0055aa03 in FMC\_ISPDAT. User should not set XOM at region where chip can boot from.

User needs to check the lock value is effective to change 0x5A(0101_1010). <b>Note 2:</b> The active state has come into effect after power-on or reset cycle.

#### 6.4.4.5 Flash Memory Map

The Flash memory map is different from system memory map. The system memory map is used by CPU fetch code or data from FMC memory. The Flash memory map is used for ISP function to read, program or erase FMC memory. The Flash memory map is as Figure 6.4-2.

#### 6.4.4.6 System Memory Map with IAP Mode

The address from 0x0000\_0000 to 0x0000\_01FF is called vector.map space. The vector map consists of vector table for stack and exceptions. By remapping the vector table in APROM or LDROM to the vector map space, it is possible to reboot to different applications.

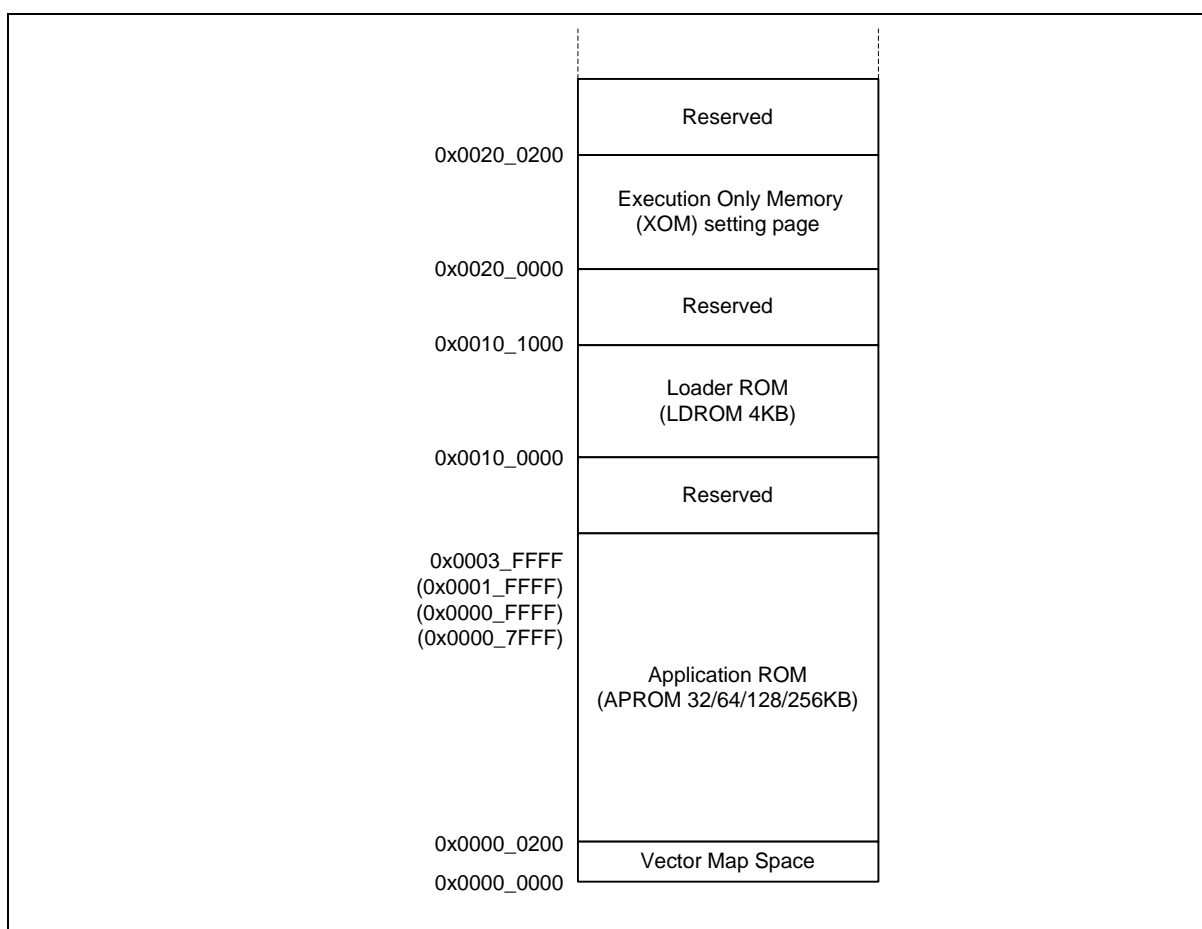

Figure 6.4-3 System Memory Map with IAP Mode

There are two kinds of system memory map with IAP mode when chip booting: (1) LDROM with IAP, (2) APROM with IAP.

In APROM with IAP mode, the vector map of APROM (0x0000\_0000~0x0000\_01FF) is mapped to the vector map space. Therefore, when CPU reset or System Reset Request reset, the stack pointer and reset handler in APROM vector table are used to reboot the system. This is so called boot from APROM.

In LDROM with IAP mode, the vector table of LDROM(0x0010\_0000~0x0010\_01FF) is mapped to the vector map space. Therefore, when CPU reset or System Reset Request reset, the stack pointer and reset handler in LDROM vector table are used to reboot the system. This is so called boot from LDROM.

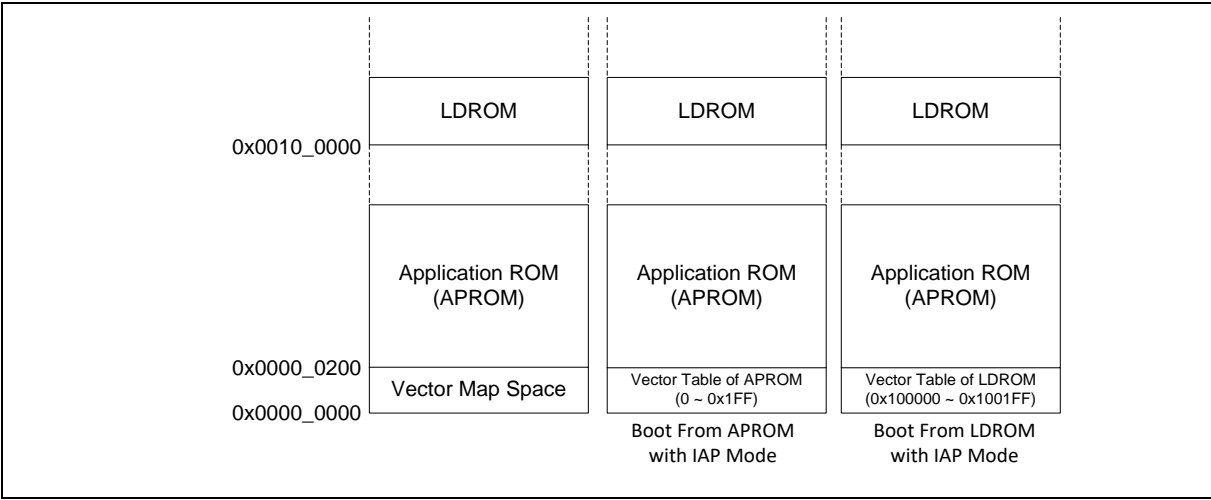

Figure 6.4-4 APROM/LDROM Boot with IAP Mode

The vector map space not only can map from vector table of APROM or LDROM. User can also map any 512 bytes alignment space of APROM, LDROM or SRAM to vector map space. To set vector map space mapping, user should write the target remap address to FMC\_ISPADDR register and then trigger ISP procedure with the "Vector Page Remap" command (0x2E). The final system memory vector mapping address is shown on VECMAP (FMC\_ISPSTS[29:9]). Please note that the vector mapping function is only valid in IAP mode.

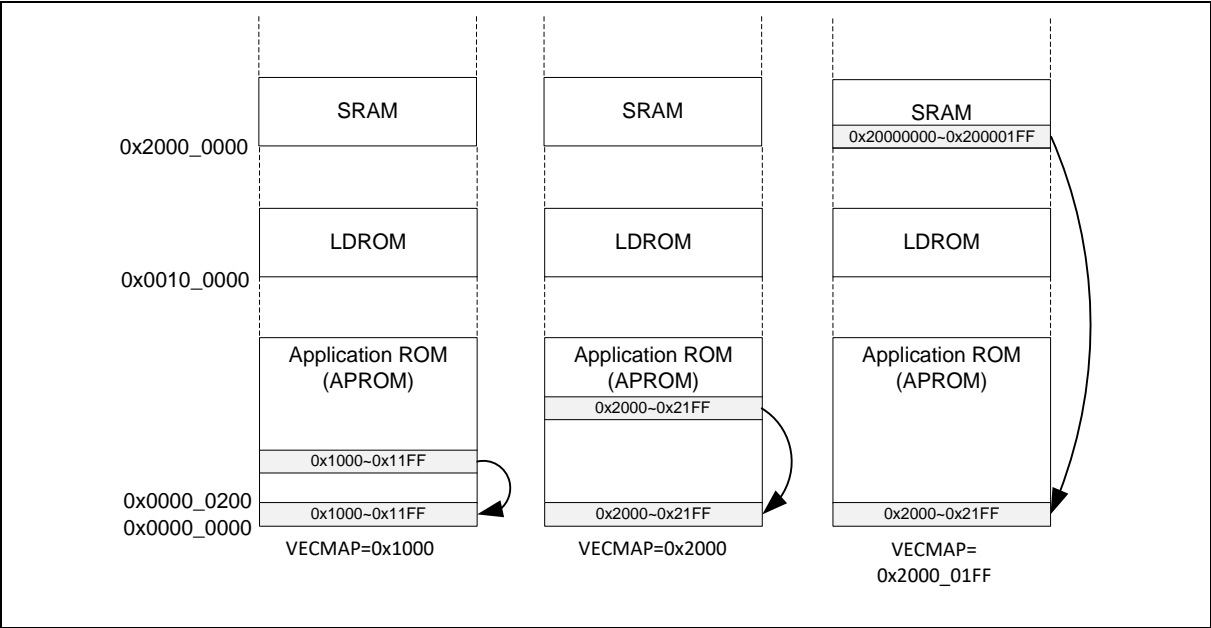

Figure 6.4-5 VECMAP Setting Example in IAP Mode

#### 6.4.4.7 System Memory Map without IAP Mode

In system memory map without IAP mode, the system memory vector mapping is not supported. There are two kinds of system memory map without IAP mode when chip booting: (1)LDROM without IAP, (2) APROM without IAP.

In LDROM without IAP mode, LDROM base is mapped to 0x0000\_0000. CPU cannot read or execute code from APROM. In other words, APROM is absent in the system memory map of LDROM without

IAP.

In APROM without IAP mode, APROM base is mapped to 0x0000\_0000. CPU cannot read or execute code from LDROM. In this mode, LDROM is absent for current system memory map.

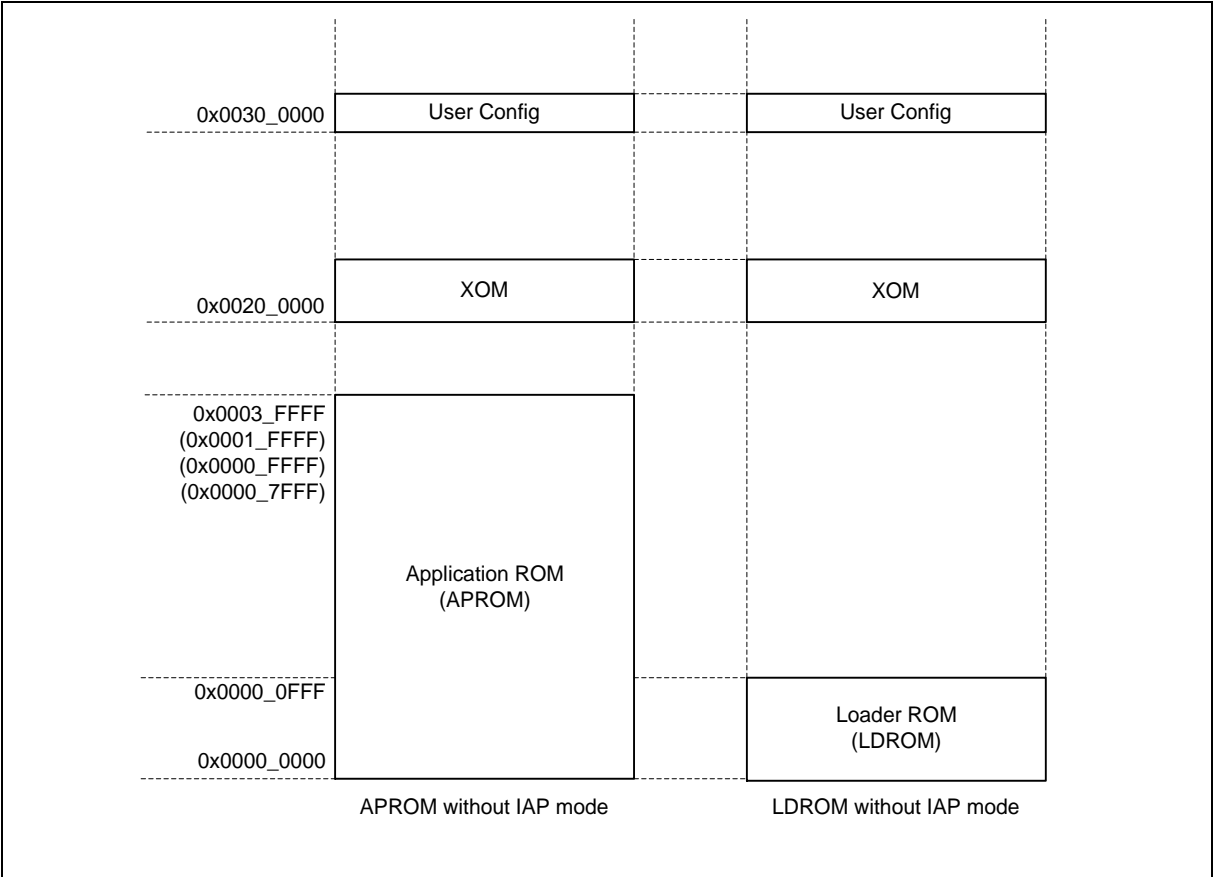

Figure 6.4-6 System Memory Map without IAP Mode

6.4.4.8 Boot Selection

This chip provides four booting sources for user to select, including LDROM with IAP, LDROM without IAP, APROM with IAP and APROM without IAP. The booting source and system memory map are setting by CBS (CONFIG0[7:6]). The vector mapping function is only supported in IAP mode, i.e. APROM with IAP and LDROM with IAP.

CBS[1:0]	Boot Selection/System Memory Map	Vector Mapping Supporting
00	LDROM with IAP	Yes
01	LDROM without IAP	No
10	APROM with IAP	Yes
11	APROM without IAP	No

Table 6.4-1 Boot Source Selection Table

6.4.4.9 In-Application-Programming (IAP)

In-Application-Programming (IAP) mode is used for user to switch the code executing between APROM, LDROM. User can enable the IAP mode by booting chip and setting the chip boot selection bits in CBS (CONFIG0[7:6]) as 2b'10 or 2'b00.

When chip boots with IAP function is enabled, any executable code (align to 512 bytes) is allowed to map to the system memory vector. User can change the remap address to FMC\_ISPADDR and then trigger ISP procedure with the "Vector Page Remap" command (0x2E).

#### 6.4.4.10 In-System-Programming (ISP)

The In-System-Programming (ISP) function allows the embedded Flash memory to be reprogrammed under software control. ISP is performed without addition devices and just utilize on-chip connectivity interface, such as UART, USB, I<sup>2</sup>C and SPI. Table 6.4-2 lists all supported ISP commands, including command code, address and data limitations.

ISP provides the following functions for embedded Flash memory.

- Supports Flash page erase function
- Supports Flash data program function
- Supports Flash data read function
- Supports company ID read function
- Supports device ID read function
- Supports unique ID read function
- Supports memory CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports system memory vector remap function

#### ISP Commands

ISP Command	FMC_ISPCMD	FMC_ISPADDR	FMC_ISPDAT FMC_MPDAT0~ FMC_MPDAT3
Flash Page Erase	0x22	Valid address of Flash memory. It must be page alignment.	N/A or 0x0055AA03 if page erase XOM.
Flash 32-bit Program	0x21	Valid address of Flash memory. It must be word alignment.	FMC_ISPDAT :Programming Data FMC_MPDAT0~FMC_MPDAT3 : N/A

Vector Remap	0x2E	Valid address in APROM, LDROM or SRAM with 512-byte alignment	N/A

Table 6.4-2 ISP Command List

### ISP Procedure

The FMC controller provides embedded Flash memory read, erase and program operation. Several control bits of FMC control register are write-protected, thus it is necessary to unlock before setting.

After unlocking the protected register bits, user needs to set the FMC\_ISPCTL control register to decide to update LDROM, APROM or user configuration block, and then set ISPEN (FMC\_ISPCTL[0]) to enable ISP function.

Once the FMC\_ISPCTL register is set properly, user can set FMC\_ISPCMD (refer to Table 6.4-2 ISP command list) for specify operation. Set FMC\_ISPADDR for target Flash memory based on Flash memory organization. FMC\_ISPDAT can be used to set the data to program or used to return the read data according to FMC\_ISPCMD. For Checksum calculation and All-One Verification commands, FMC\_ISPDAT is used to define the size for calculation or verification.

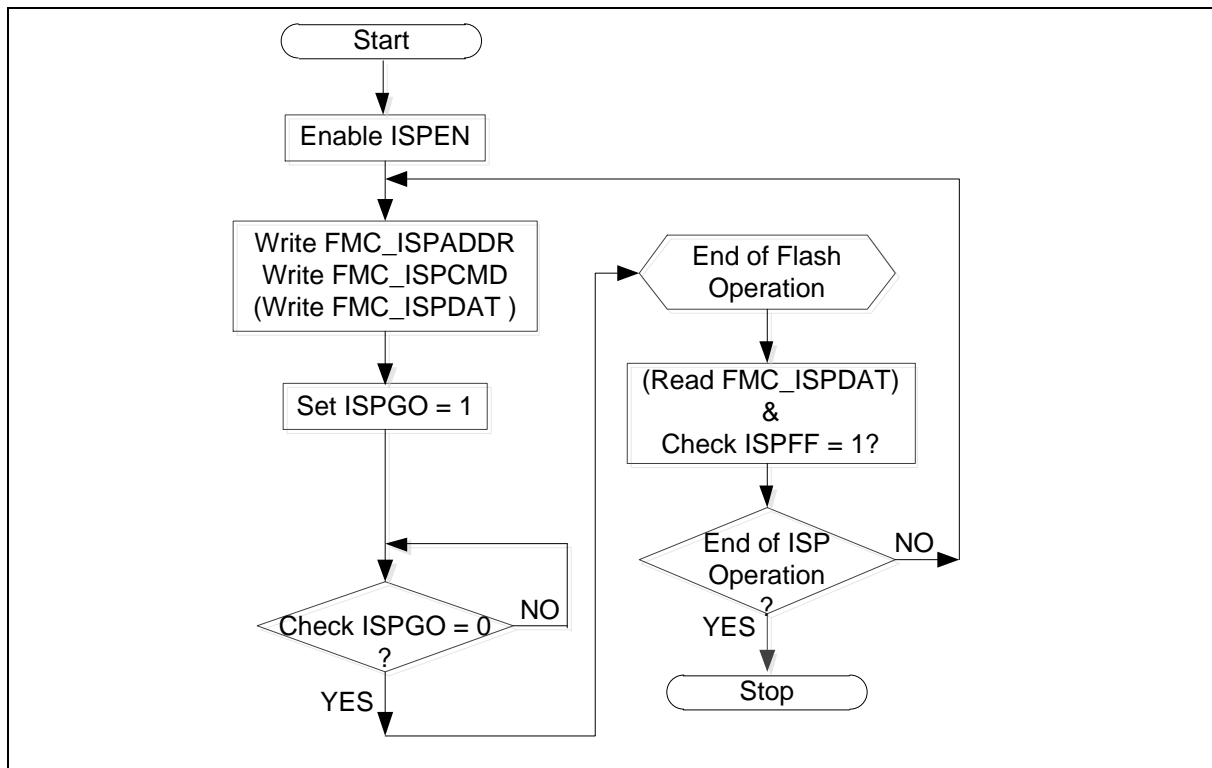

Figure 6.4-7 ISP Procedure Example

Finally, set the ISPGO (FMC\_ISPTRG[0]) register to perform the relative ISP function. When ISP function is active, the ISPBUSY(FMC\_ISPSTS[0]) and MPBUSY(FMC\_MPSTS[0]) are set to 1. The ISPGO(FMC\_ISPTRG[0]), ISPBUSY(FMC\_ISPSTS[0]) and MPBUSY(FMC\_MPSTS[0]) are self-cleared when ISP function has been done.

Several error conditions will be checked after ISP is completed. If an error condition occurs, ISP operation is not started and the ISP fail flag will be set instead. ISPFF(FMC\_ISPSTS[6]) flag can only be cleared by software. The next ISP procedure can be started even ISPFF(FMC\_ISPSTS[6]) bit is kept as 1. Therefore, it is recommended to check the ISPFF(FMC\_ISPSTS[6]) bit and clear it after each ISP operation if it is set to 1.

While FMC is processing ISP command, CPU will be halt to wait ISP done if CPU tries to access Flash memory. For example, if any interrupt request occurs, CPU will not service it till ISP operation is finished. User could move their code and exception handlers to SRAM to avoid this situation. The peripheral still keeps working as usual when ISP processing.

When ISP operation is finished, the ISPGO bit will be cleared by hardware automatically. User can check whether ISP operation is finished or not by the ISPGO(FMC\_ISPTRG[0]) bit.

#### 6.4.4.11 VECMAP for Interrupt and Memory Programming

##### **Accelerate Interrupt by VECMAP**

In IAP mode, VECMAP function can be used to map 512 bytes SRAM to vector map space. It means it is possible to store all exception vectors to SRAM. Then, if any exceptions assert, CPU can read exception handler from SRAM with zero wait state to speed up exception latency.

Because the vector map space is fixed to be 512 bytes, user must copy all 512 bytes to SRAM before remapping SRAM to vector map space. Otherwise, CPU may get wrong data from vector map space after remapping. Figure 6.4-8 shows an example for accelerating interrupt by VECMAP.

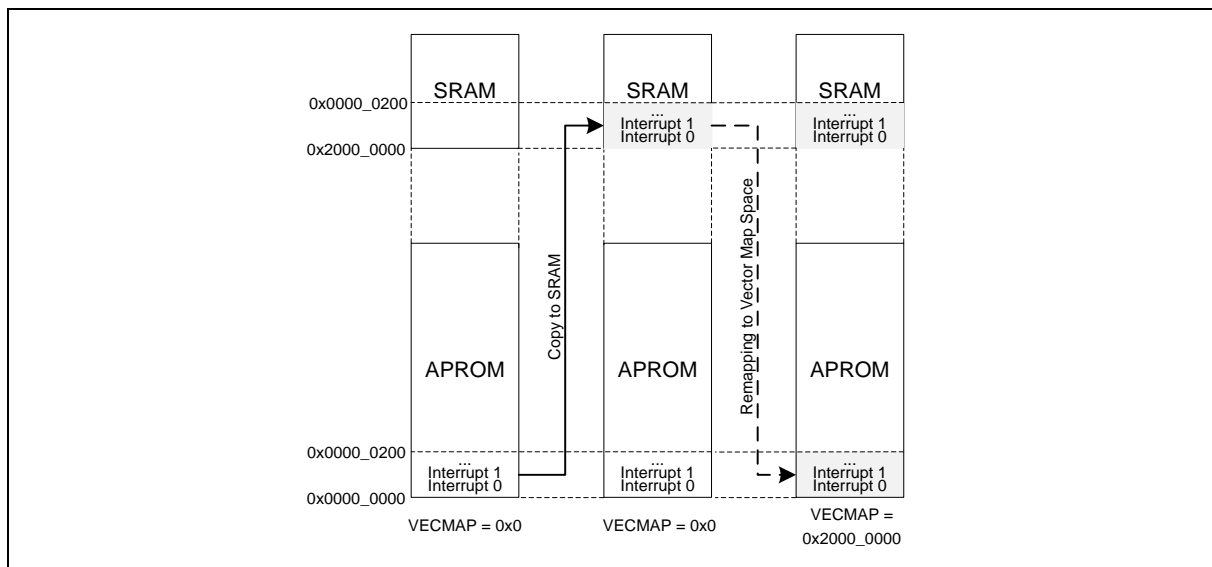

Figure 6.4-8 Example for Accelerating Interrupt by VECMAP

##### **Avoid CPU Halt When Flash Programming**

When Flash memory controller is busy, any CPU access to Flash memory will cause CPU halt for waiting Flash controller ready. If Flash controller is busy in page erasing, it may cause CPU halt for a long time to erase pages. To avoid this situation, user needs to avoid CPU access Flash memory when page

erasing. The easiest way is to execute code in SRAM and use VECMAP to map all exceptions to SRAM. By executing code in SRAM, CPU will not access Flash to get instructions. By mapping all exceptions to SRAM, all interrupts will not need to get exception handler from Flash memory.

#### 6.4.4.12 Embedded Flash Memory Programming

This chip provides 32-bit and multi-word Flash memory programming function to speed up Flash updated procedure. Table 6.4-3 lists required FMC control registers in each embedded Flash programming function.

Register	Description	32-Bit Programming	Multi-Word Programming
FMC_ISPCTL	ISP Control Register	√	√
FMC_ISPADDR	ISP Address Register	√	√
FMC_ISPDAT	ISP Data Register	√	N/A
FMC_ISPCMD	ISP CMD Register	0x21	0x27
FMC_ISPTRG	ISP Trigger Register	√	√
FMC_ISPSTS	ISP Status Register	√	N/A
FMC_MPDAT0	ISP Data0 Register	N/A	√
FMC_MPDAT1	ISP Data1 Register	N/A	√
FMC_MPDAT2	ISP Data2 Register	N/A	√
FMC_MPDAT3	ISP Data3 Register	N/A	√
FMC_MPSTS	ISP Multi-Program status	N/A	√
FMC_MPADDR	ISP Multi-Program Address	N/A	√

Table 6.4-3 FMC Control Registers for Flash Programming

FMC\_ISPDAT is used for 32-bit programming data register. Figure 6.4-9 shows ISP 32-bit programming procedure.

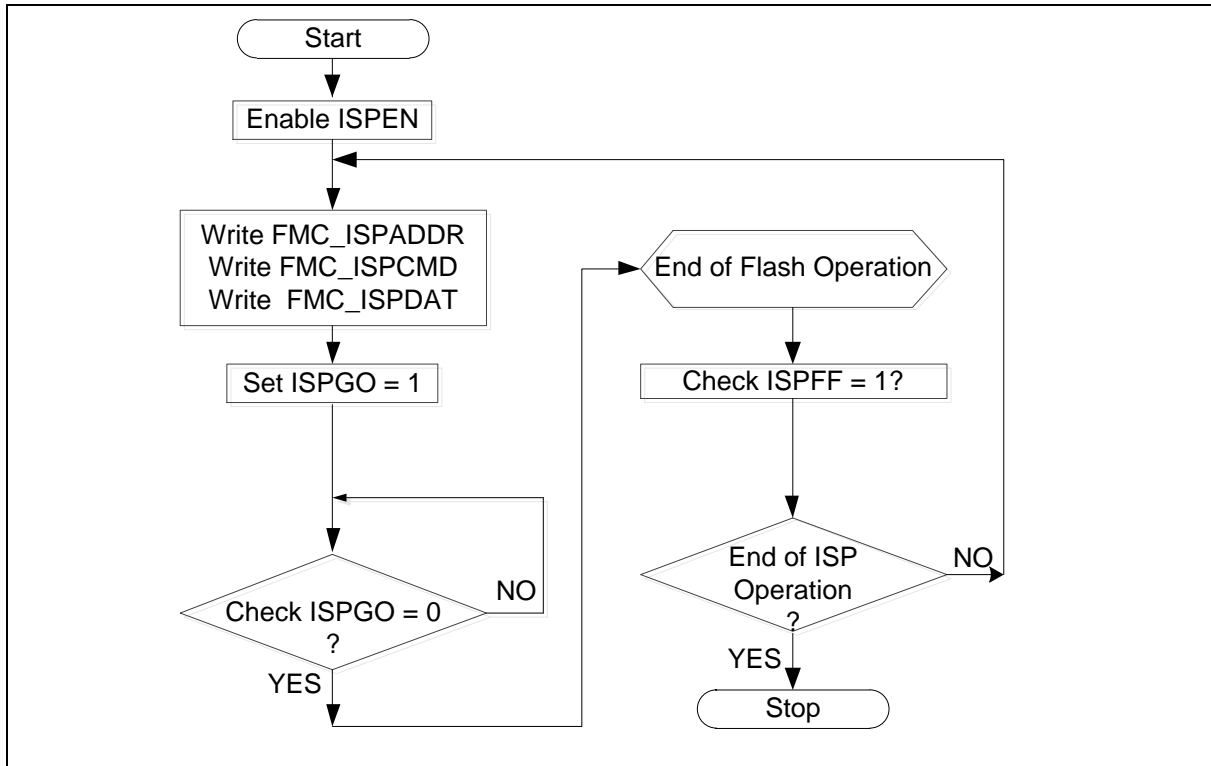

Figure 6.4-9 ISP 32-bit Programming Procedure

### **Multi-word Programming**

This chip supports multi-word programming function to speed up Flash updated procedure. The maximum programming length is up to 128 bytes, and the minimum programming length is 4 bytes (1 words). The multi-word programming is the fastest programming function if the programming words more than 4 bytes.

In multi-word programming operation, Cortex®-M23 CPU has to monitor the empty status of the programming buffer. CPU has to prepare the next data for programming continuity. The multi-program firmware should not be located in APROM or LDROM, because CPU instruction fetch cannot be hold during ISP processing. The firmware has to be located in embedded SRAM of chip to avoid CPU hold. The multi-word programming code also needs to make sure all exceptions will not access Flash memory when ISP processing. Please note that, when doing multi-word programming, HCLK must select clock source from HIRC and frequency is not lower than 4 MHz.

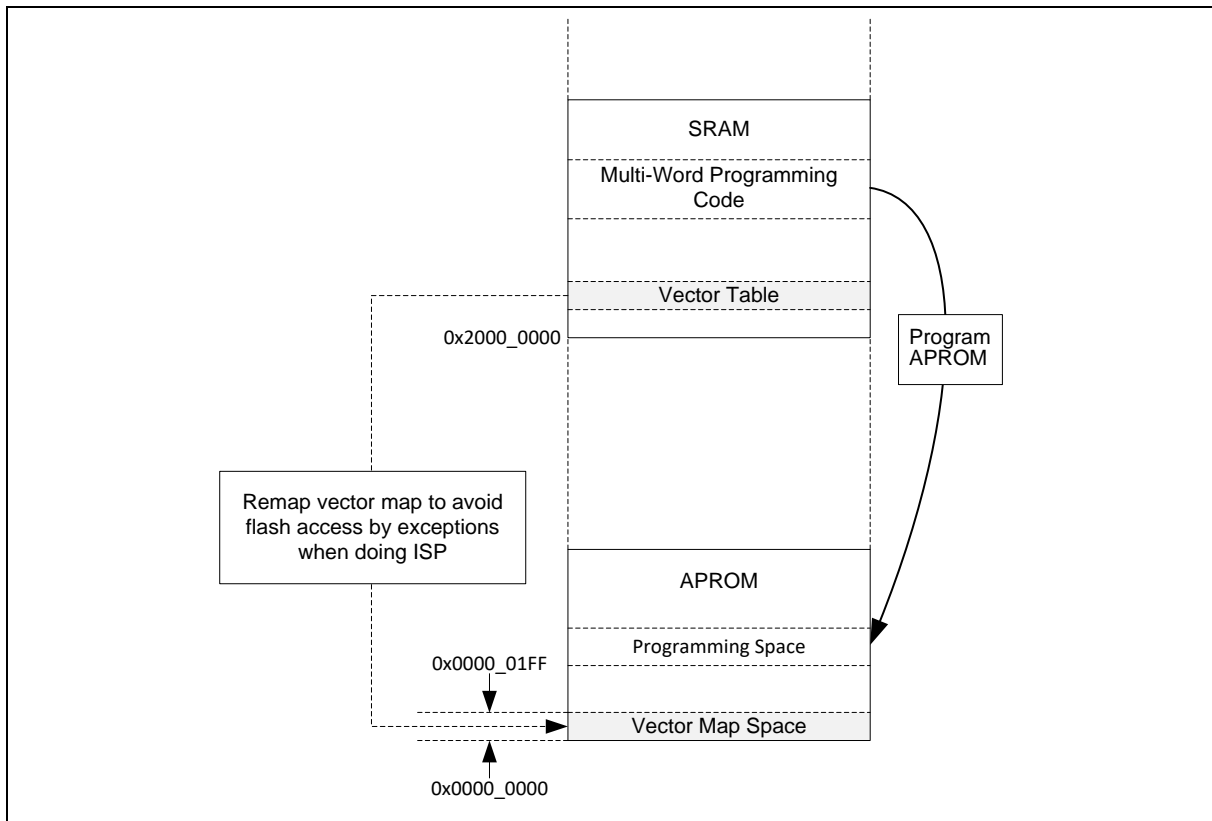

Figure 6.4-10 Firmware in SRAM for Multi-word Programming

The multi-word programming flow is shown in Figure 6.4-11. The starting ISP address (FMC\_ISPADDR) has to be 4-byte align. FMC\_MPDATA0 is the data word of the offset 0x0, FMC\_MPDATA1 is the second word (offset 0x4), FMC\_MPDATA2 is the third word (offset 0x8), and FMC\_MPDATA3 is forth word (offset 0xC). If the starting ISP address FMC\_ISPADDR [3] is 0, the 1<sup>st</sup> data word should put on FMC\_MPDATA0, and 2<sup>nd</sup> word is FMC\_MPDATA1, 3<sup>rd</sup> word is FMC\_MPDATA2, and 4<sup>th</sup> word is FMC\_MPDATA3. If the starting ISP address FMC\_ISPADDR [3] is 1, the 1<sup>st</sup> data word should put on FMC\_MPDATA2, and 2<sup>nd</sup> word is FMC\_MPDATA3, 3<sup>rd</sup> word is FMC\_MPDATA0, and 4<sup>th</sup> word is FMC\_MPDATA1. The maximum programming size is 128 bytes. While FMC controller performs multi-word programming operation, CPU needs to monitor the buffer status D3~D0(FMC\_MPSTS[7:4]) and MPBUSY (FMC\_MPSTS[0]) to wait any one buffer empty, and then CPU needs to update the next programming data ( FMC\_MPDATA0, FMC\_MPDATA1, FMC\_MPDATA2 and FMC\_MPDATA3) before D3~D0 all equal to 0. Otherwise, FMC controller will exit multi-word programming operation (MPBUSY (FMC\_MPSTS[0]) = 0). If CPU cannot update the data in time (MPBUSY (FMC\_MPSTS[0]) = 0), CPU needs restart a new multi-word programming procedure to continue, FMC\_MPADDR provides the last program address information. At the end of operation, CPU has to check ISPFF (FMC\_MPSTS[2]) to confirm the multi-word operation is successfully completed.

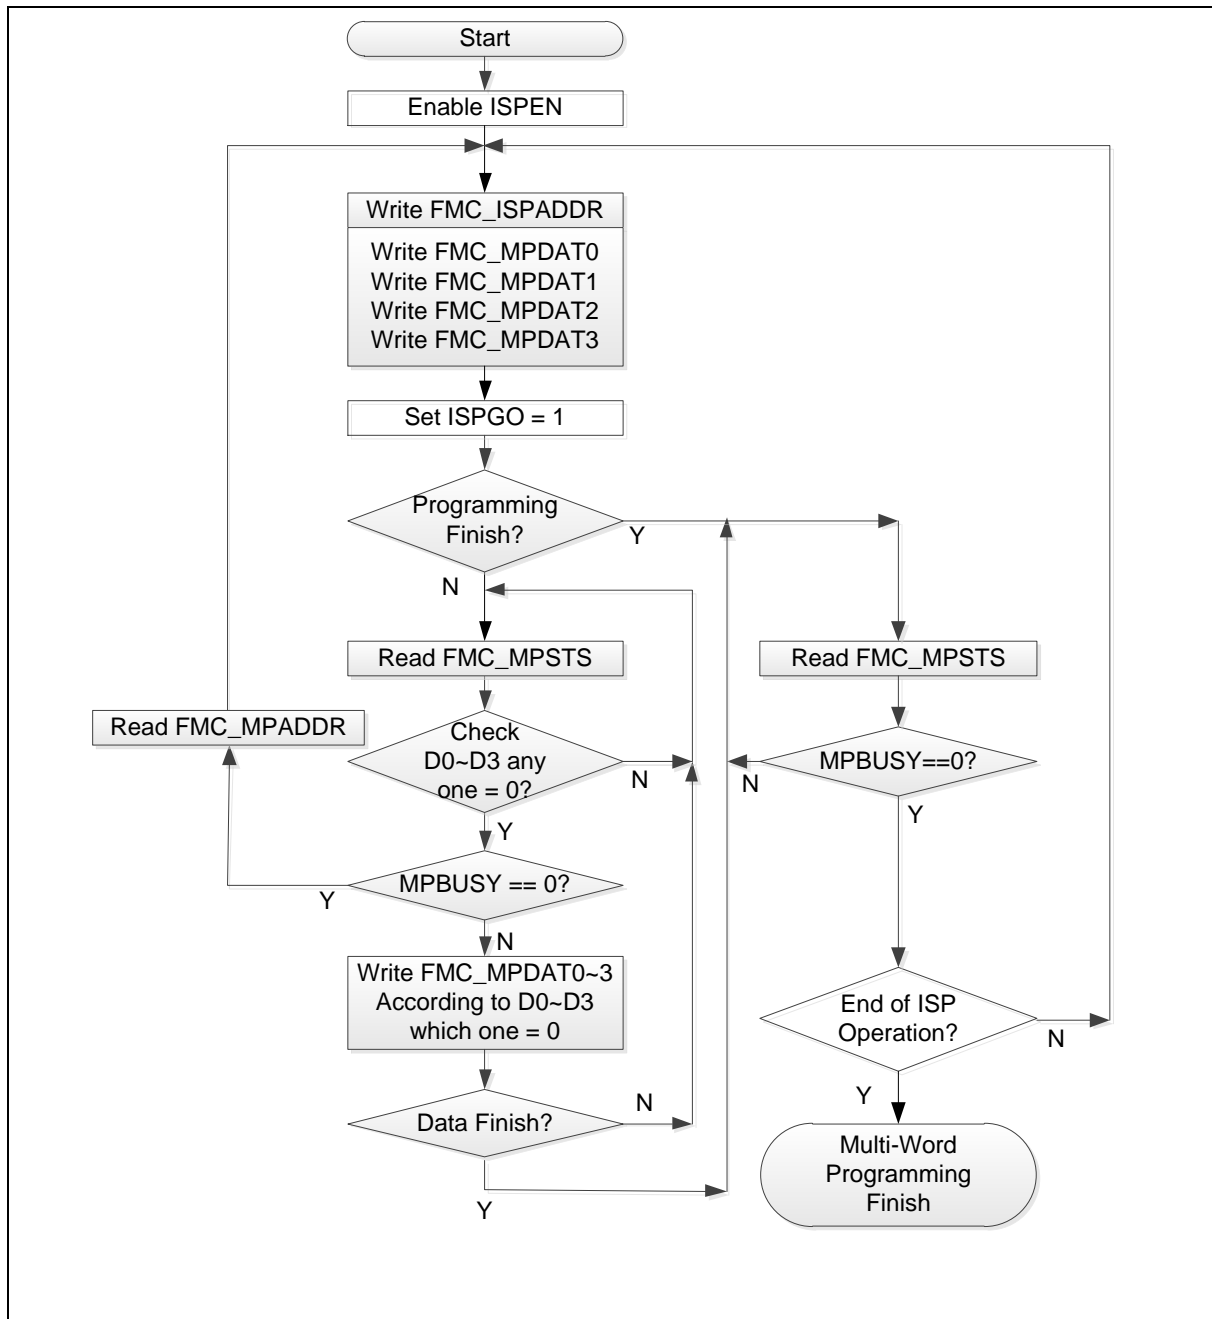

Figure 6.4-11 Multi-word Programming Flow

#### 6.4.4.13 Fast Flash Programming Verification

In traditional Flash programming operation, the controller receives the programming trigger event then control the timing to perform the programming embedded Flash memory as show in Figure 6.4-12.

This chip supports the fast Flash programming verification function, which provides hardware verification for Flash programming to save time of the CPU read back and comparison. When data is programmed to the embedded Flash memory, the controller asserts the Flash read operation to read data out, and performs data comparison with data in. Finally, the comparison result is saved in PGFF (FMC\_ISPSTS[5]). The PGFF is set to 1 if output data is not the same as the input programming data. The flag is kept until clear by software or a new erase operation. The fast Flash programming verification flow is shown in Figure 6.4-12.

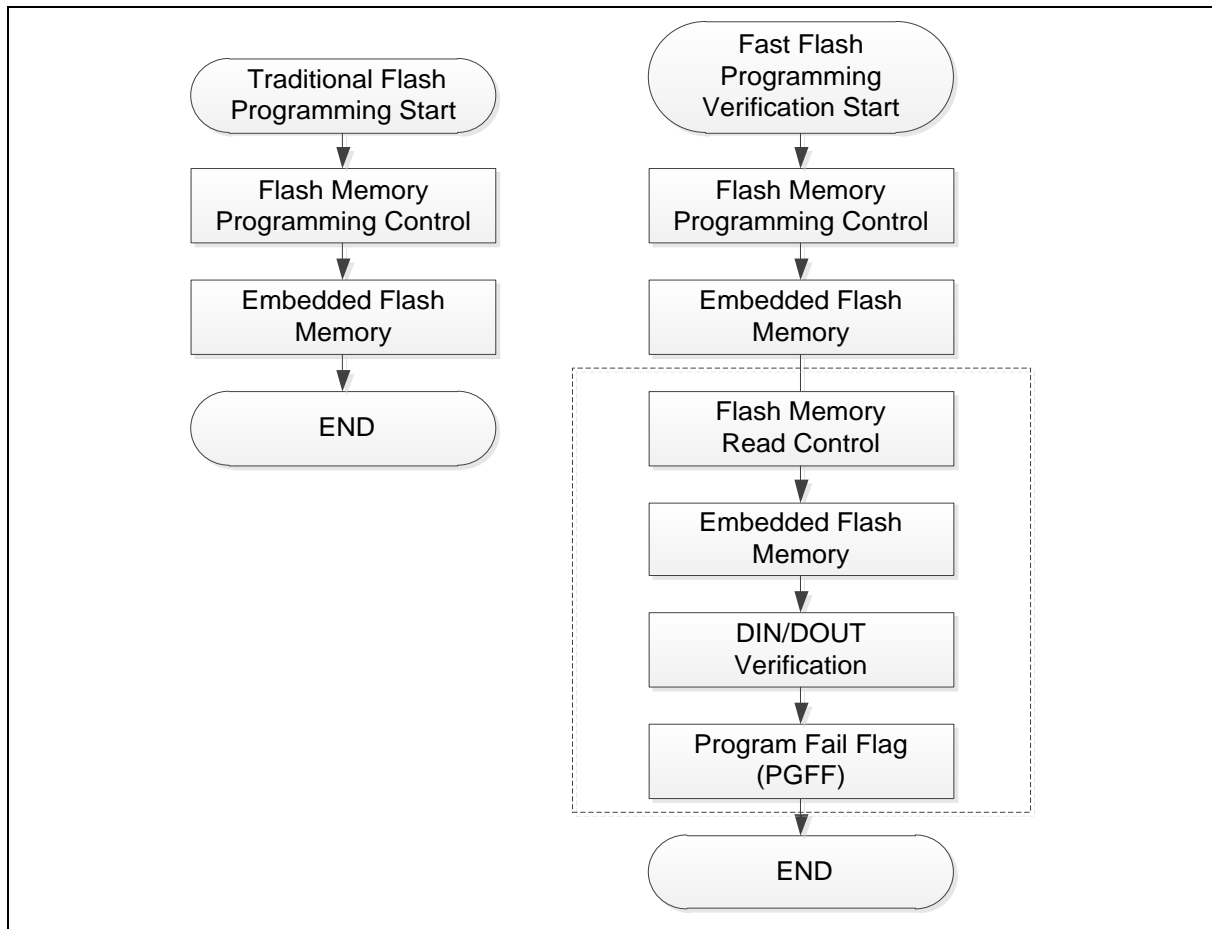

Figure 6.4-12 Fast Flash Programming Verification Flow

In traditional Flash updated operation, the Flash memory has to perform three steps to complete the Flash memory updated procedure, (1) Flash ERASE (2) Flash PROGRAM (3) Flash READ back all of data to check the correction. In this chip, it only reads FMC\_ISPSTS to check PGFF flag in Step (3) without reading data back to confirm.

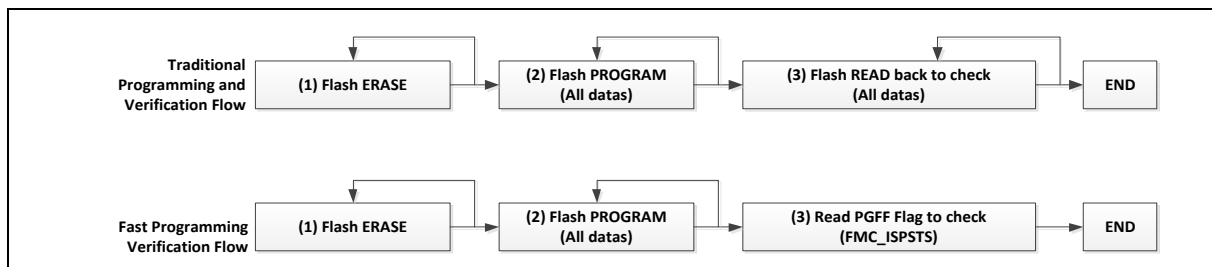

Figure 6.4-13 Verification Flow

The fast Flash programming verification function is released for 32-bit programming, but multi-word programming operation is not suitable due to the embedded Flash HV (High Voltage) of continuous programming.

#### 6.4.4.14 CRC32 Checksum Calculation

This chip supports the CRC32 checksum calculation, and helps user quickly check the memory content includes APROM and LDROM. The CRC32 polynomial is

$$\text{CRC-32} : X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$

With seed = 0xFFFF\_FFFF

The CRC32 checksum calculation flow is shown in Figure 6.4-14.

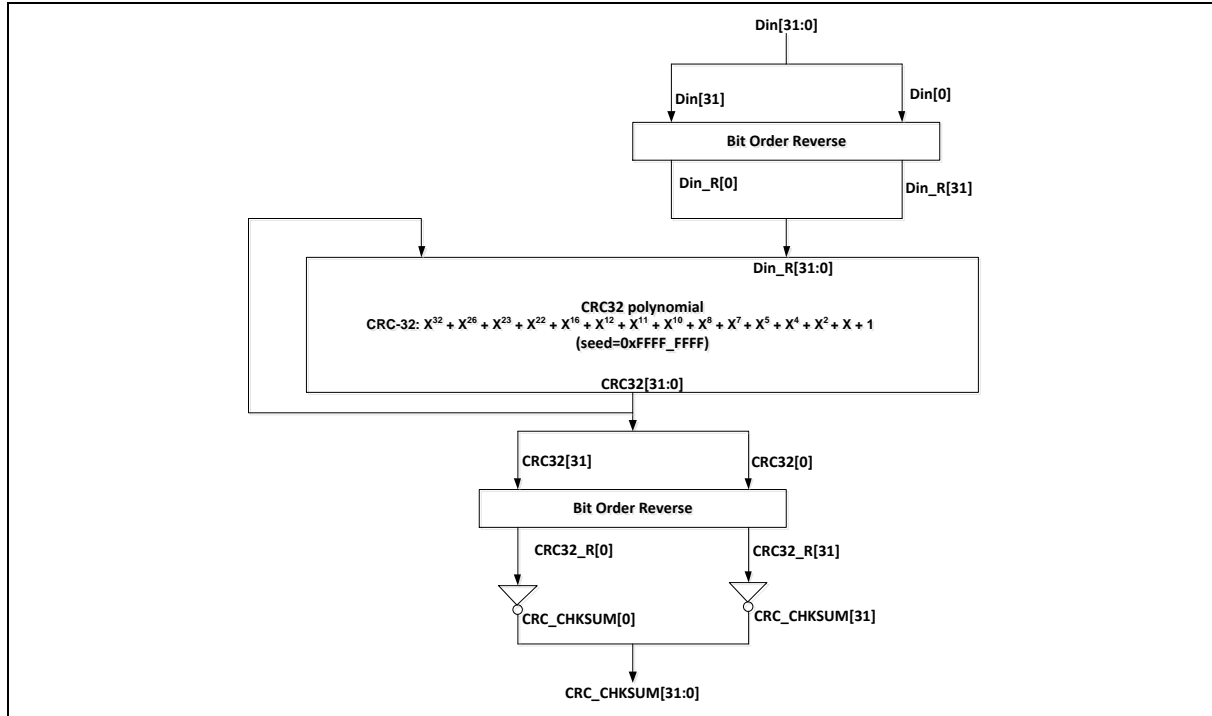

Figure 6.4-14 Flash CRC32 Checksum Calculation

Three steps complete this CRC32 checksum calculation.

1. Perform ISP “Run Memory CRC32 Checksum” operation
2. Perform ISP “Read Memory CRC32 Checksum” operation
3. Read FMC\_ISPDAT to get checksum.

In Step 1, user has to set the memory starting address (FMC\_ISPADDR) and size (FMC\_ISPDAT) to calculate. Both address and size have to be 4 Kbytes alignment, the size should be  $\geq 4$  Kbytes and the starting address includes APROM and LDROM.

In Step 2, the FMC\_ISPADDR should be kept as the same as Step 1.

In Step 3, the checksum is read from FMC\_ISPDAT. If the checksum is 0x0000\_0000, there is one of two conditions: (1) Checksum calculation is in-progress, and (2) Address and size is over device limitation.

When Flash is locked, user can still calculate the CRC of the data in Flash. It is useful for checking data corrupt or data retention issue under Flash security lock mode or XOM active mode

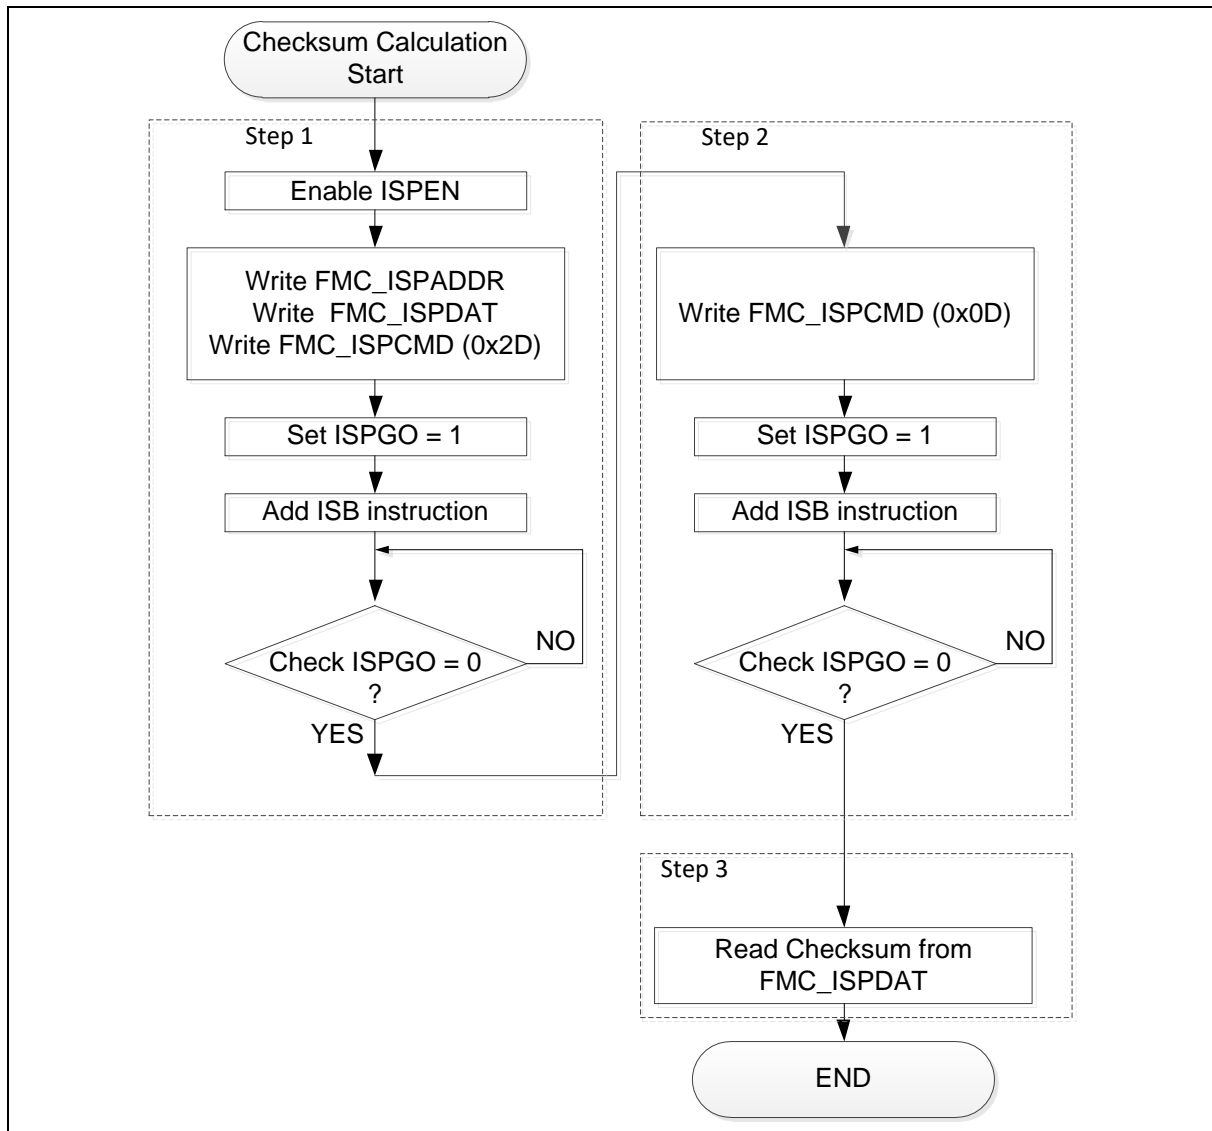

Figure 6.4-15 CRC-32 Checksum Calculation Flow

#### 6.4.4.15 Flash All One Verification

This chip supports the Flash all one verification function to help user quickly check a memory block content blanking for APROM and LDROM after Flash erase operation.

Two steps complete this Flash all one verification.

Two-step flow:

1. Perform ISP "Run Flash All One Verification" operation
2. Read ALLONE(FMC\_ISPSTA[7])bit to get the verification result
  - ALLONE: 1, all of Flash bits are 1 in verification block memory.
  - ALLONE: 0, Flash bits are not all 1 in verification block memory.

In Step 1, user has to set the memory starting address (FMC\_ISPADDR) and size (FMC\_ISPDAT) to

verify. Both address and size have to be 512 bytes alignment, the size should be  $\geq 512$  bytes and the starting address includes APROM and LDROM.

In Step 2, the FMC\_ISPADDR should be kept as the same as Step 1.

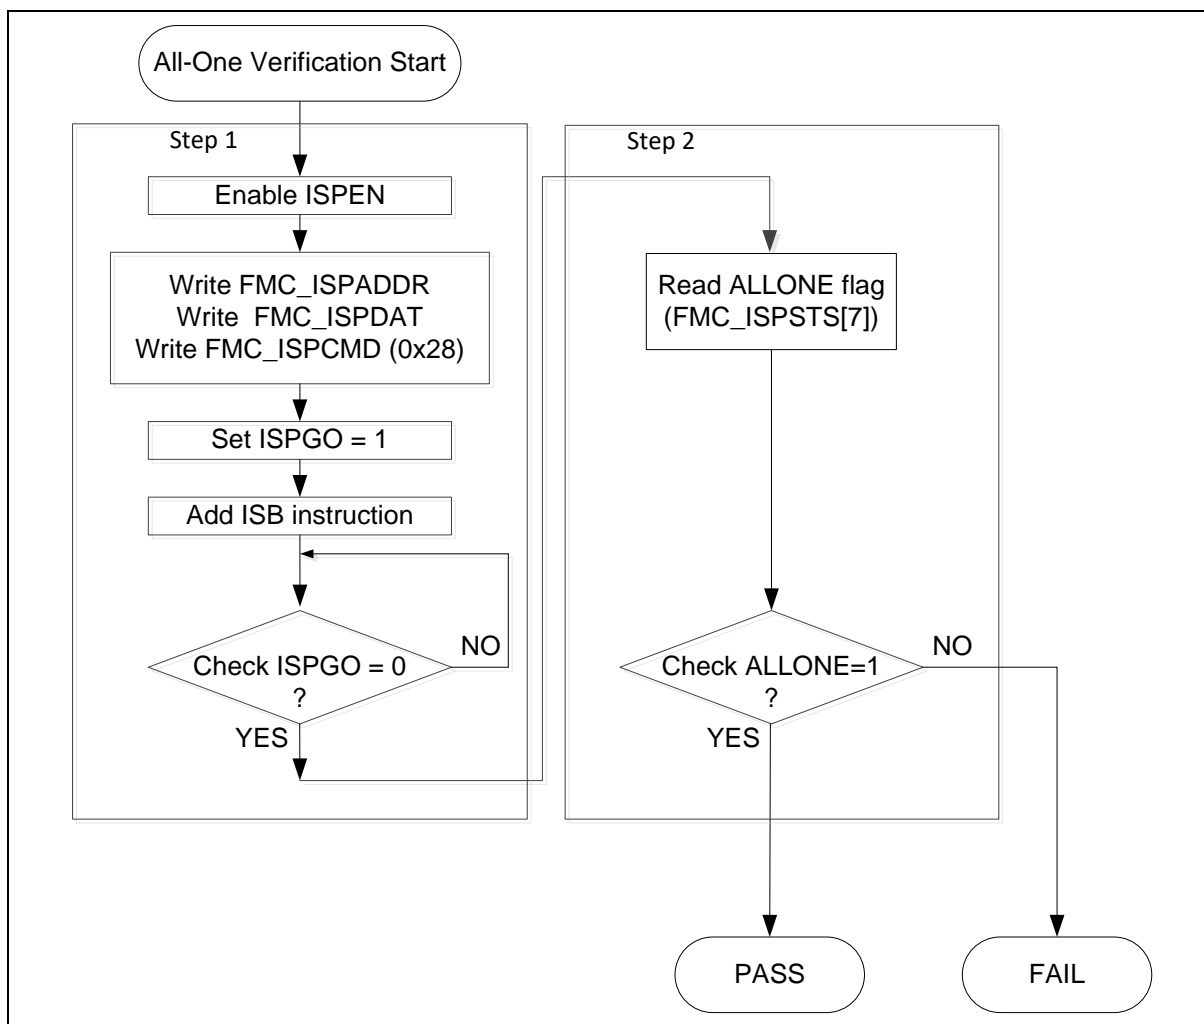

Figure 6.4-16 All-One Verification Flow

## 6.5 General Purpose I/O (GPIO)

### 6.5.1 Overview

This chip has up to 86 General Purpose I/O pins to be shared with other function pins depending on the chip configuration. These 86 pins are arranged in 6 ports named as PA, PB, PC, PD, PE, and PF. PA, PB and PE has 16 pins on port. PC has 14 pins on port, PD has 15 pins on port. PF has 9 pins on port. Each of the 86 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as Input, Push-pull output, Open-drain output or Quasi-bidirectional mode. After the chip is reset, the I/O mode of all pins are depending on CIOINI (CONFIG0[10]). Each I/O pin has a very weakly individual pull-up/pull-down resistor which is about 50 k $\Omega$ . Please refer to the M251/M252/M254/M256/M258 Datasheet for detailed pin operation voltage information about  $V_{DD}$ ,  $V_{DDIO}$  and  $V_{BAT}$  electrical characteristics.

### 6.5.2 Features

- Four I/O modes:
  - Quasi-bidirectional mode
  - Push-Pull Output mode
  - Open-Drain Output mode
  - Input only with high impedance mode
- TTL/Schmitt trigger input selectable
- I/O pin can be configured as interrupt source with edge/level setting
- Supports High Slew Rate I/O mode
- Configurable default I/O mode of all pins after reset by CIOINI (CONFIG0[10]) setting
  - CIOINI = 0, all GPIO pins in Quasi-bidirectional mode after chip reset
  - CIOINI = 1, all GPIO pins in input mode after chip reset
- Supports independent pull-up and pull-down control
- Enabling the pin interrupt function will also enable the wake-up function
- Improves access efficiency by using single cycle I/O bus

### 6.5.3 Block Diagram

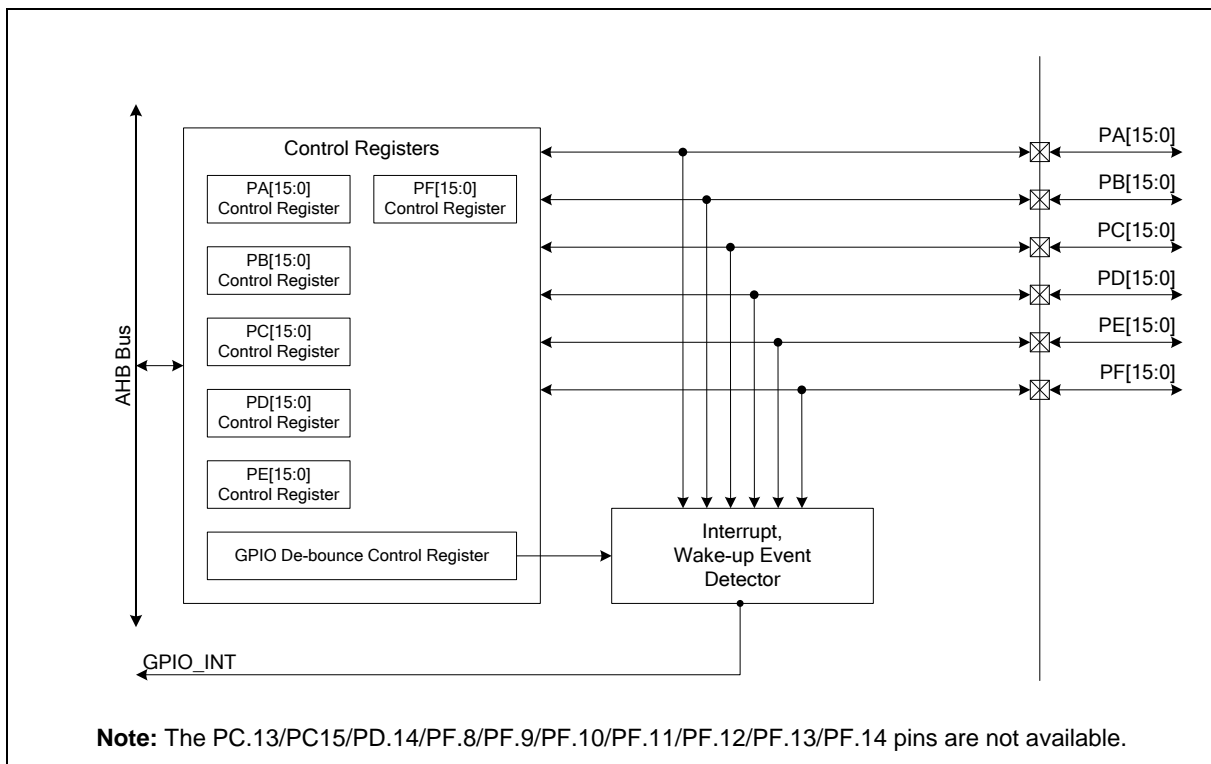

Figure 6.5-1 GPIO Controller Block Diagram

#### 6.5.4 Basic Configuration

- Reset configuration
  - Reset GPIO in GPIORST (SYS\_IPRST1[1])

#### 6.5.5 Functional Description

##### 6.5.5.1 Input Mode

Set  $MODE_n$  ( $Px\_MODE[2n+1:2n]$ ) to 00 as the  $Px.n$  pin is in Input mode and the I/O pin is in tri-state (high impedance) without output drive capability. The  $PIN$  ( $Px\_PIN[n]$ ) value reflects the status of the corresponding port pins.

Each I/O pin includes an internal resistor. Set ( $Px\_PUSEL[2n+1:2n]$ ) to 01 to enable internal pull-up resistor and ( $Px\_PUSEL[2n+1:2n]$ ) to 10 to enable internal pull-down resistor. Setting both pull-up/down is not available.

Figure 6.5-2 Input Mode

##### 6.5.5.2 Push-pull Output Mode

Figure 6.5-3 shows the diagram of Push-pull Output Mode. Set  $MODE_n$  ( $Px\_MODE[2n+1:2n]$ ) to 01 as  $Px.n$  pin is in Push-pull Output mode and the I/O pin supports digital output function with source/sink current capability. The bit value in the corresponding DOUT ( $Px\_DOUT[n]$ ) is driven on the pin.

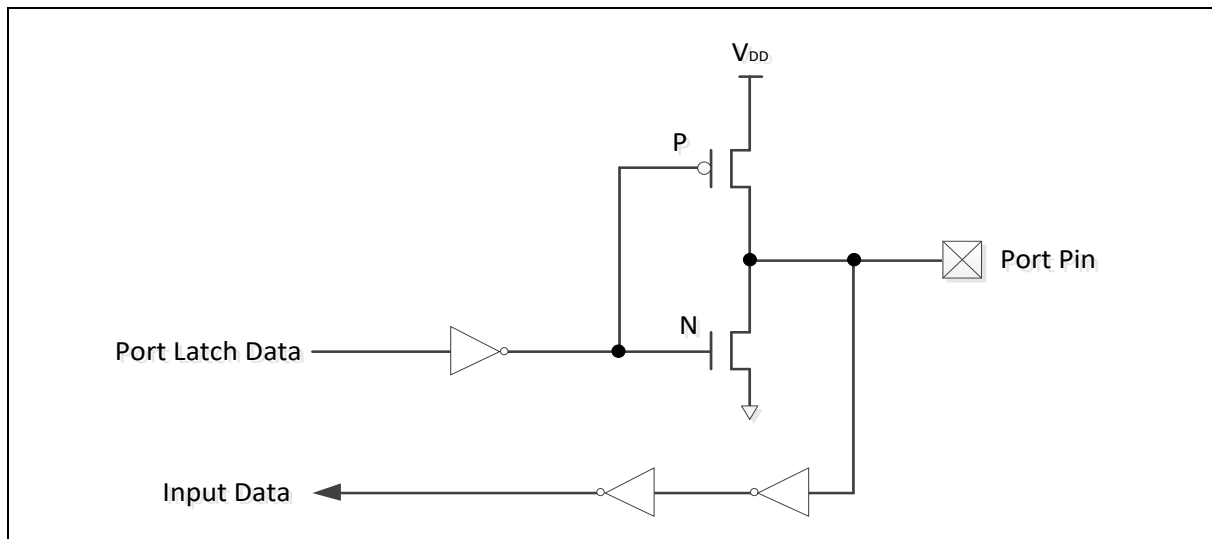

Figure 6.5-3 Push-Pull Output

#### 6.5.5.3 Open-drain Mode

Figure 6.5-4 shows the diagram of Open-drain Mode. Set  $MODE_n$  ( $Px\_MODE[2n+1:2n]$ ) to 10 the  $Px.n$  pin is in Open-drain mode and the digital output function of I/O pin supports only sink current capability, an external pull-up register is needed for driving high state. If the bit value in the corresponding DOUT ( $Px\_DOUT[n]$ ) bit is 0, the pin drives a low output on the pin. If the bit value in the corresponding DOUT ( $Px\_DOUT[n]$ ) bit is 1, the pin output drives high that is controlled by external pull high resistor.

Each I/O pin includes an internal resistor. Set ( $Px\_PUSEL[2n+1:2n]$ ) to 01 to enable internal pull-up resistor. Only pull-up is available in Open-drain mode.

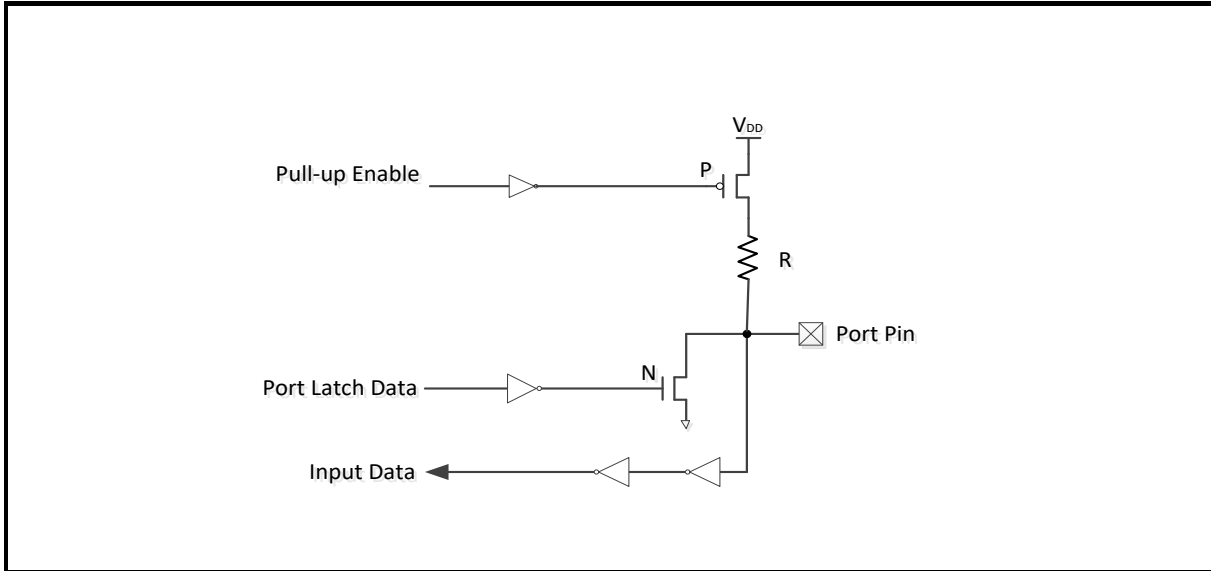

Figure 6.5-4 Open-Drain Output

#### 6.5.5.4 Quasi-bidirectional Mode

Figure 6.5-5 shows the diagram of Quasi-bidirectional Mode. Set  $MODE_n$  ( $Px\_MODE[2n+1:2n]$ ) to 11 as the  $Px.n$  pin is in Quasi-bidirectional mode and the I/O pin supports digital output and input function at the same time but the source current is only up to hundreds  $\mu A$ . Before the digital input function is performed the corresponding DOUT ( $Px\_DOUT[n]$ ) bit must be set to 1. The quasi-bidirectional output is common on the 80C51 and most of its derivatives. If the bit value in the corresponding DOUT ( $Px\_DOUT[n]$ ) bit is 0, the pin drives a low output on the pin. If the bit value in the corresponding DOUT ( $Px\_DOUT[n]$ ) bit is 1, the pin will check the pin value. If pin value is high, no action takes. If pin state is low, the pin will drive strong high with 2 clock cycles on the pin and then disable the strong output drive. Meanwhile, the pin status is controlled by internal pull-up resistor. Note that the source current capability in quasi-bidirectional mode, please refer to the M251/M252/M254/M256/M258 Datasheet for detailed information.

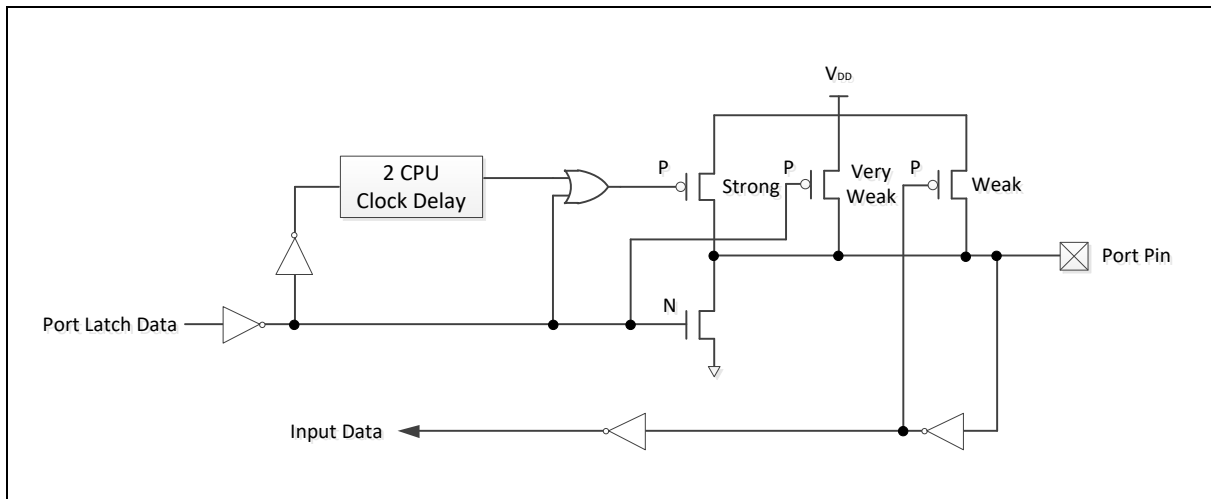

Figure 6.5-5 Quasi-Bidirectional I/O Mode

#### 6.5.5.5 GPIO Interrupt and Wake-up Function

Each GPIO pin can be set as chip interrupt source by setting correlative RHIE (Px\_INTEN[n+16])/FLIE (Px\_INTEN[n]) bit and TYPE (Px\_INTTYPE[n]). There are five types of interrupt conditions that can be selected: low level trigger, high level trigger, falling edge trigger, rising edge trigger and both rising and falling edge trigger. The GPIO can also be the chip wake-up source when chip enters Idle/Power-down mode. Level trigger source needs to keep its state until entering interrupt handler. The setting of wake-up trigger condition is the same as GPIO interrupt trigger.

#### 6.5.5.6 GPIO De-bounce Function

GPIO de-bounce function can be used to sample interrupt input for each GPIO pin and prevent unexpected interrupt happened which caused by noise. GPIO de-bounce function only support edge detection trigger type. For edge trigger condition, there are three types of interrupt conditions that can be selected for de-bounce function: falling edge trigger, rising edge trigger and both rising and falling edge trigger. If user wants to use de-bounce function, de-bounce enable control register Px\_DBEN must be set for corresponding GPIO pin. The de-bounce clock source can be HCLK or LIRC (38.4 kHz) by setting DBCLKSRC (Px\_DBCTL[4]) register. And DBCLKSEL (Px\_DBCTL[3:0]) register can control sampling cycle period.

Figure 6.5-5 shows GPIO rising edge trigger interrupt. The interval of time between the two valid sample signal is determined by DBCLKSRC (Px\_DBCTL[4]) and DBCLKSEL (Px\_DBCTL[3:0]). Each valid data from GPIO pin need to be sample twice. For rising edge setting, if pin status is low before setting DBEN (Px\_DBEN), interrupt will happen when generating a pin high valid data. But, if pin status is high before setting DBEN (Px\_DBEN), interrupt will happen when generating a pin low valid data first, and then generating a pin high valid data. For falling edge trigger, Figure 6.5-6 shows the situation is opposite to rising edge trigger.

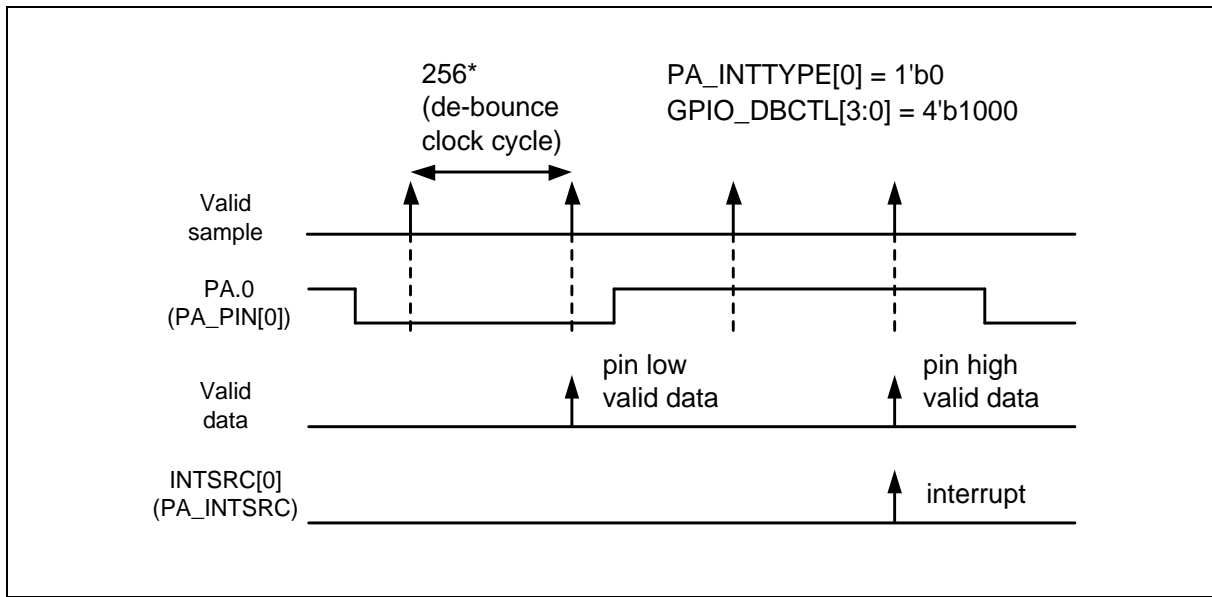

Figure 6.5-6 GPIO Rising Edge Trigger Interrupt

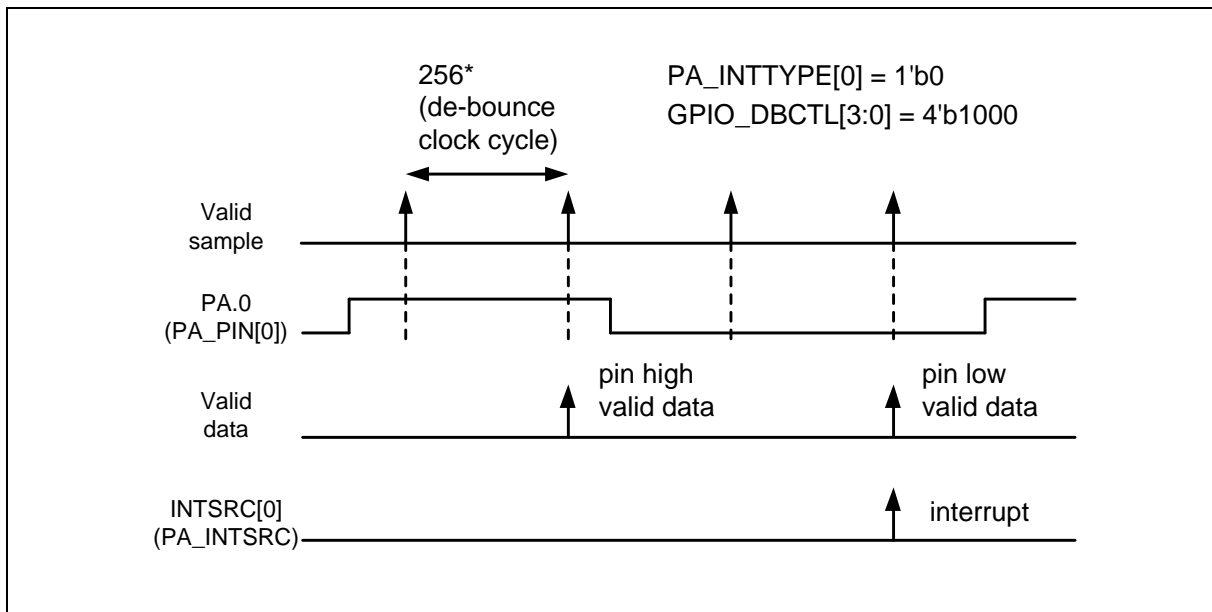

Figure 6.5-7 GPIO Falling Edge Trigger Interrupt

#### 6.5.5.7 GPIO Digital Input Path Disable Control

User can disable GPIO digital input path by setting DINOFF (Px\_DINOFF[n+16]). When GPIO digital input path is disabled, the digital input pin value PIN (Px\_PIN[n]) is tied to low. By the way, the GPIO digital input path is force disabled by hardware and DINOFF control is useless when I/O function is configured as ADC/ACMP/ext. XTL/LCD/DAC or analog function pin.

## 6.5.6 Register Map

DATMSK							

Bits	Description
[31:8]	<b>Reserved</b> Reserved.
[n] n=0,1..15	<b>Port A-F Pin[n] Data Output Write Mask</b> These bits are used to protect the corresponding DOUT (Px_DOUT[n]) bit. When the DATMSK (Px_DATMSK[n]) bit is set to 1, the corresponding DOUT (Px_DOUT[n]) bit is protected. If the write signal is masked, writing data to the protect bit is ineffective. 0 = Corresponding DOUT (Px_DOUT[n]) bit can be updated. 1 = Corresponding DOUT (Px_DOUT[n]) bit protected. <b>Note 1:</b> This function only protects the corresponding DOUT (Px_DOUT[n]) bit, and will not protect the corresponding PDIO (Pxn_PDIO[0]) bit. <b>Note 2:</b> The PC.13/PC.15/PD.14/PF.8~14 pins are ineffective.

DBEN							

Bits	Description
[31:16]	<b>Reserved</b> Reserved.
[n] n=0,1..15	<b>Port A-F Pin[n] Input Signal De-bounce Enable Bit</b> The DBEN[n] bit is used to enable the de-bounce function for each corresponding bit. If the input signal pulse width cannot be sampled by continuous two de-bounce sample cycle, the input signal transition is seen as the signal bounce and will not trigger the interrupt. The de-bounce clock source is controlled by DBCLKSRC (GPIO_DBCTL [4]), one de-bounce sample cycle period is controlled by DBCLKSEL (GPIO_DBCTL [3:0]). 0 = Px.n de-bounce function Disabled. 1 = Px.n de-bounce function Enabled. The de-bounce function is valid only for edge triggered interrupt. If the interrupt mode is level triggered, the de-bounce enable bit is ineffective. <b>Note:</b> The PC.13/PC.15/PD.14/PF.8~14 pins are ineffective.

Port A-F Interrupt Type Control  
(Px\_INTTYPE)

Register	Offset	R/W	Description	Reset Value

## 6.6 PDMA Controller (PDMA)

### 6.6.1 Overview

The peripheral direct memory access (PDMA) controller is used to provide high-speed data transfer. The PDMA controller can transfer data from one address to another without CPU intervention. This has the benefit of reducing the workload of CPU and keeps CPU resources free for other applications. The PDMA controller has a total of 8 channels and each channel can perform transfer between memory and peripherals or between memory and memory.

### 6.6.2 Features

- Supports up to 8 independently configurable channels
- Supports selectable 2 level of priority (fixed priority or round-robin priority)
- Supports transfer data width of 8, 16, and 32 bits
- Supports source and destination address increment size can be byte, half-word, word or no increment
- Request source can be from software, PSIO, SPI/I<sup>2</sup>S, UART, USCI, EADC, DAC, PWM capture event and TIMER
- Supports Scatter-gather mode to perform sophisticated transfer through the use of the descriptor link list table
- Supports single and burst transfer type
- Supports time-out function on channel 0 and channel 1
- Supports stride function from channel 0 to channel 5

### 6.6.4 Basic Configuration

- Clock Source Configuration
  - Enable PDMA controller clock in PDMACKEN(CLK\_AHBCLK [1]).
- Reset Configuration
  - Reset PDMA controller in PDMARST (SYS\_IPRST0[2]).

### 6.6.5 Functional Description

The PDMA controller transfers data from one address to another without CPU intervention. The PDMA controller supports 8 independent channels and serves only one channel at one time, as the result, PDMA controller supports two level channel priorities: fixed and round-robin priority, PDMA controller serves channel in order from highest to lowest priority channel. The PDMA controller supports two operation modes: Basic mode and Scatter-gather mode. Basic mode is used to perform one descriptor table transfer. Scatter-gather mode has more entries for each PDMA channel, and thus the PDMA controller supports sophisticated transfer through the entries. The descriptor table entry data structure contains many transfer information including the transfer source address, transfer destination address, transfer count, burst size, transfer type and operation mode. Figure 6.6-2 shows the diagram of descriptor table (DSCT) data structure.

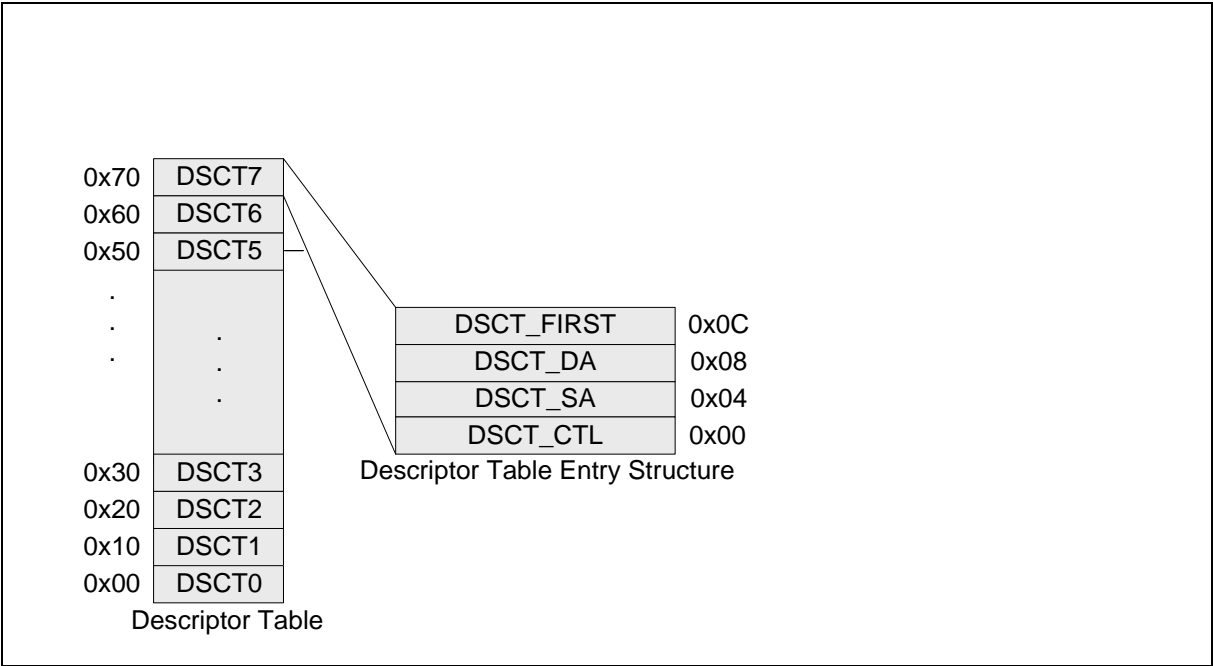

Figure 6.6-2 Descriptor Table Entry Structure

The PDMA controller also supports single and burst transfer type and the request source can be from software or peripheral request, transfer between memory to memory using software request. A single transfer means that software or peripheral is ready to transfer one data (every data needs one request), and the burst transfer means that software or peripherals will transfer multiple data (multiple data only need one request).

6.6.5.1 Channel Priority

The PDMA controller supports two level channel priorities including fixed and round-robin priority. The fixed priority channel has higher priority than round-robin priority channel. If multiple channels are set as fixed or round-robin priority, the higher channel will have higher priority. The priority order is listed in Table 6.6-2.

PDMA_PRISET	Channel Number	Priority Setting	Arbitration Priority In Descending Order
1	7	Channel7, Fixed Priority	Highest
1	6	Channel6, Fixed Priority	---
---	---	---	---
1	0	Channel0, Fixed Priority	---
0	7	Channel7, Round-Robin Priority	---
0	6	Channel6, Round-Robin Priority	---
---	---	---	---
0	0	Channel0, Round-Robin Priority	Lowest

Table 6.6-2 Channel Priority Table

6.6.5.2 PDMA Operation Mode

The PDMA controller supports two operation modes including Basic mode and Scatter-gather mode.

### Basic Mode

Basic mode is used to perform one descriptor table transfer mode. This mode can be used to transfer data between memory and memory, peripherals and memory or peripherals and peripherals, but if user want to transfer data between peripherals and peripherals, one thing must be sured is that the request from peripherals knows that the data is ready for transfer or not. PDMA controller operation mode can be set from OPMODE (PDMA\_DSCTn\_CTL[1:0], n denotes PDMA channel), the default setting is in idle state (OPMODE (PDMA\_DSCTn\_CTL[1:0]) = 0x0) and recommend user configure the descriptor table in idle state. If operation mode is not in idle state, user re-configure channel setting may make some operation error.

User must fill the transfer count TXCNT (PDMA\_DSCTn\_CTL[31:16]) register and select transfer width TXWIDTH (PDMA\_DSCTn\_CTL[13:12]), destination address increment size DAINC (PDMA\_DSCTn\_CTL[11:10]), source address increment size SAINC (PDMA\_DSCTn\_CTL[9:8]), burst size BURSIZE (PDMA\_DSCTn\_CTL[6:4]) and transfer type TXTYPE (PDMA\_DSCTn\_CTL[2]), then the PDMA controller will perform transfer operation in transfer state after receiving request signal. Finishing this task will generate an interrupt to CPU if corresponding PDMA interrupt bit INTENn (PDMA\_INTEN[7:0]) is enabled and the operation mode will be updated to idle state as shown in Figure 6.6-3. If software configures the operation mode to idle state, the PDMA controller will not perform any transfer and then clear this operation request. Finishing this task will also generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled.

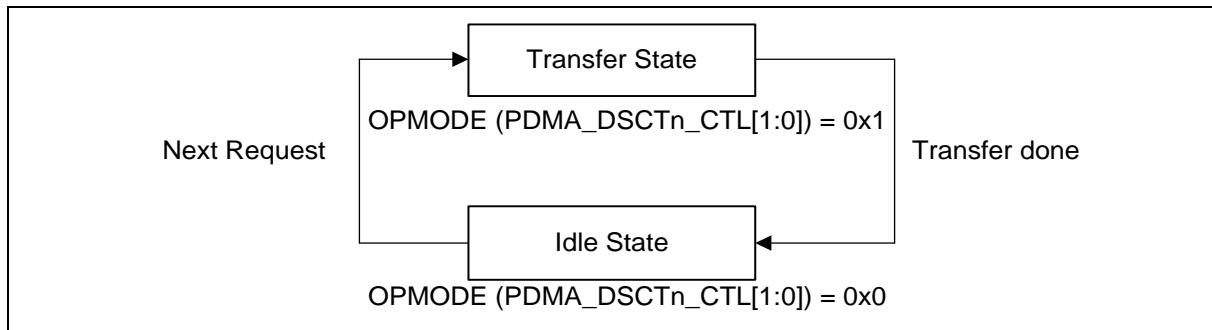

Figure 6.6-3 Basic Mode Finite State Machine

### Scatter-gather Mode

Scatter-gather mode is a complex mode and can perform sophisticated transfer through the use of the description link list table as shown in Figure 6.6-4. Through operation mode user can perform peripheral wrapper-around, and multiple PDMA task can be used for data transfer between varied locations in system memory instead of a set of contiguous locations. Scatter-gather mode only needs a request to finish all table entries task till the last task with OPMODE (PDMA\_DSCTn\_CTL[1:0]) is idle state without ack. It also means Scatter-gather mode can only be used to transfer data between memory to memory without handshaking.

In Scatter-gather mode, the table is just used for jumping to the next table entry. The first task will not perform any operation transfer. Finishing each task will generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled and TBINTDIS (PDMA\_DSCTn\_CTL[7]) bit is "0" (when finishing task and TBINTDIS bit is "0", corresponding TDIFn (PDMA\_TDSTS[7:0]) flag will be asserted and if this bit is "1" TDIFn will not be active).

If channel 7 has been triggered, and the operation mode is in Scatter-gather mode (OPMODE (PDMA\_DSCTn\_CTL[1:0]) = 0x2), the hardware will load the real PDMA information task from the address generated by adding PDMA\_DSCTn\_NEXT (link address) and PDMA\_SCATBA (base address) registers. For example, base address is 0x2000\_0000 (only MSB 16 bits valid in PDMA\_SCATBA), the current link address is 0x0000\_0100 (only LSB 16-bits without last two bits [1:0] valid in PDMA\_DSCTn\_NEXT), and then the next DSCT entry start address is 0x2000\_0100.

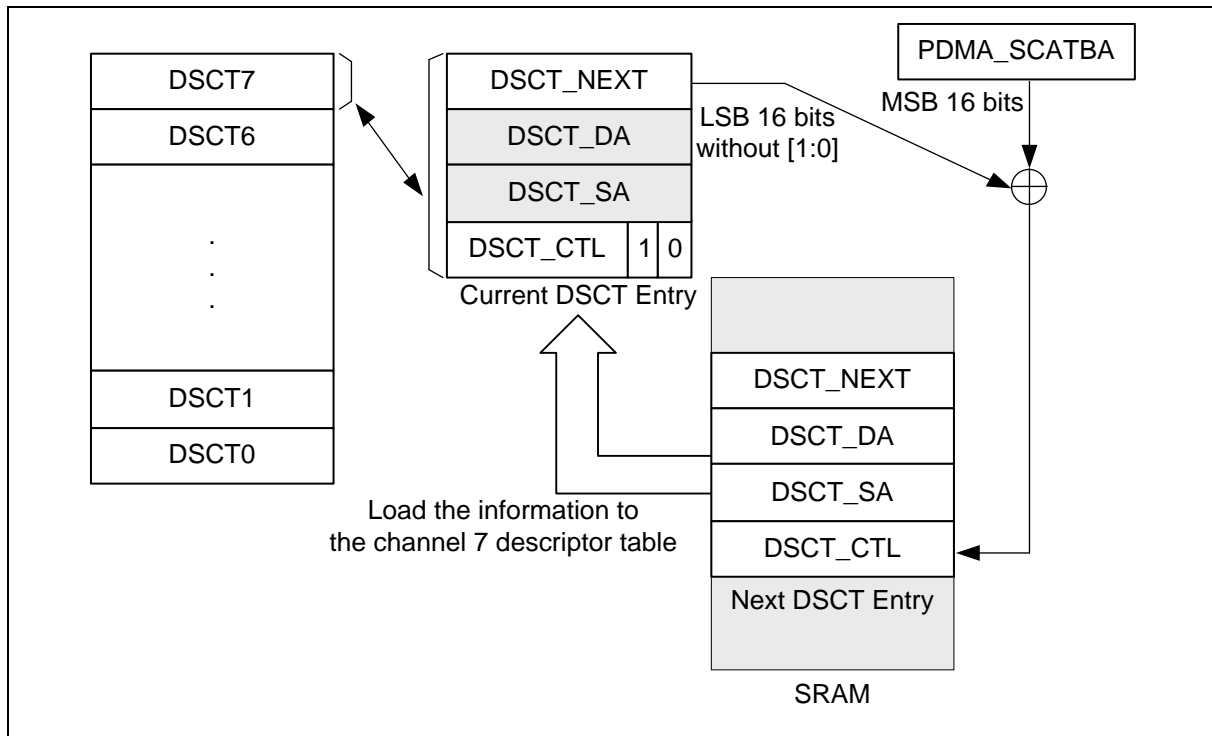

Figure 6.6-4 Descriptor Table Link List Structure

The above link list table operation is DSCT state in Scatter-gather Mode as shown in Figure 6.6-5. When loading the information is finished, it will go to transfer state and start transfer by this information automatically. However, if the next PDMA information is also set to Scatter-gather mode, the hardware will catch the next PDMA information block when the current task is finished. The Scatter-gather mode switches to basic mode when doing the next task. Then, the basic mode switches to Idle state when the last task is finished.

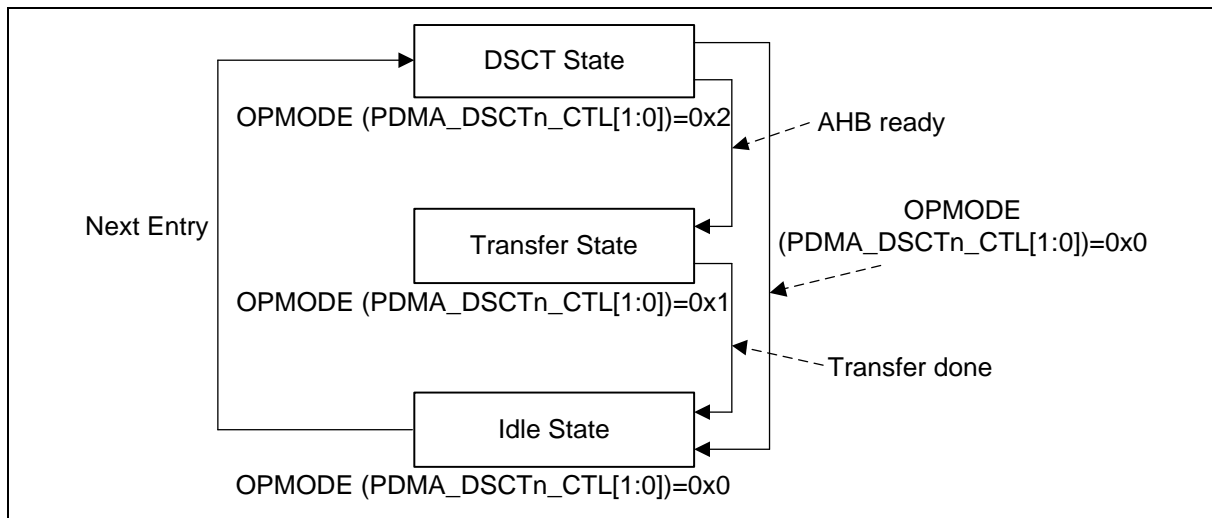

Figure 6.6-5 Scatter-gather Mode Finite State Machine

### 6.6.5.3 Transfer Type

The PDMA controller supports two transfer types: single transfer type and burst transfer type, configure by setting TXTYPE (PDMA\_DSCTn\_CTL[2]).

When the PDMA controller is operated in single transfer type, each transfer data needs one request signal for one transfer, after transferred data, TXCNT (PDMA\_DSCTn\_CTL[31:16]) will decrease 1. Transfer will be finished after the TXCNT (PDMA\_DSCTn\_CTL[31:16]) decreases to 0. In this mode, the BURSIZE (PDMA\_DSCTn\_CTL[6:4]) is not useful to control the transfer size. The BURSIZE (PDMA\_DSCTn\_CTL[6:4]) will be fixed as one.

For the burst transfer type, the PDMA controller transfers TXCNT (PDMA\_DSCTn\_CTL[31:16]) of data and need only one request signal. After transferred BURSIZE (PDMA\_DSCTn\_CTL[6:4]) of data, TXCNT (PDMA\_DSCTn\_CTL[31:16]) will decrease BURSIZE number. Transfer will be done after the transfer count TXCNT (PDMA\_DSCTn\_CTL[31:16]) decreases to 0. Note that burst transfer type can only be used for PDMA controller to do burst transfer between memory and memory. User must use single request type for memory-to-peripheral and peripheral-to-memory transfers.

Figure 6.6-6 shows an example about single and burst transfer type in basic mode. In this example, channel 1 uses single transfer type and TXCNT (PDMA\_DSCTn\_CTL[31:16]) = 127. Channel 0 uses burst transfer type, BURSIZE (PDMA\_DSCTn\_CTL[6:4]) = 128 and TXCNT (PDMA\_DSCTn\_CTL[31:16]) = 255. The operation sequence is described below:

1. Channel 0 and channel 1 get the trigger signal at the same time.
2. Channel 1 has higher priority than channel 0 by default; the PDMA controller will load the channel 1 descriptor table first and executing. But channel 1 is single transfer type, and thus the PDMA controller will only transfer one transfer data.
3. Then, the PDMA controller turns to the channel 0 and loads channel 0's descriptor table. The channel 0 is burst transfer type and the burst size selected to 128. Therefore, the PDMA controller will transfer 128 transfer data.
4. When channel 0 transfers 128 data, channel 1 gets another request signal, then after channel 0 finishes 128 transfer data, the PDMA controller will turn to channel 1 and transfer next one data.
5. After channel 1 transfers data, the PDMA controller switches to low priority channel 0 to continuous next 128 data transfer. If no channel 1 request receives, PDMA will start next channel 0, 128 data transfer.
6. The PDMA controller will complete transfer when channel 0 finishes data transfer 256 times, and channel 1 finishes transferring 128 times.

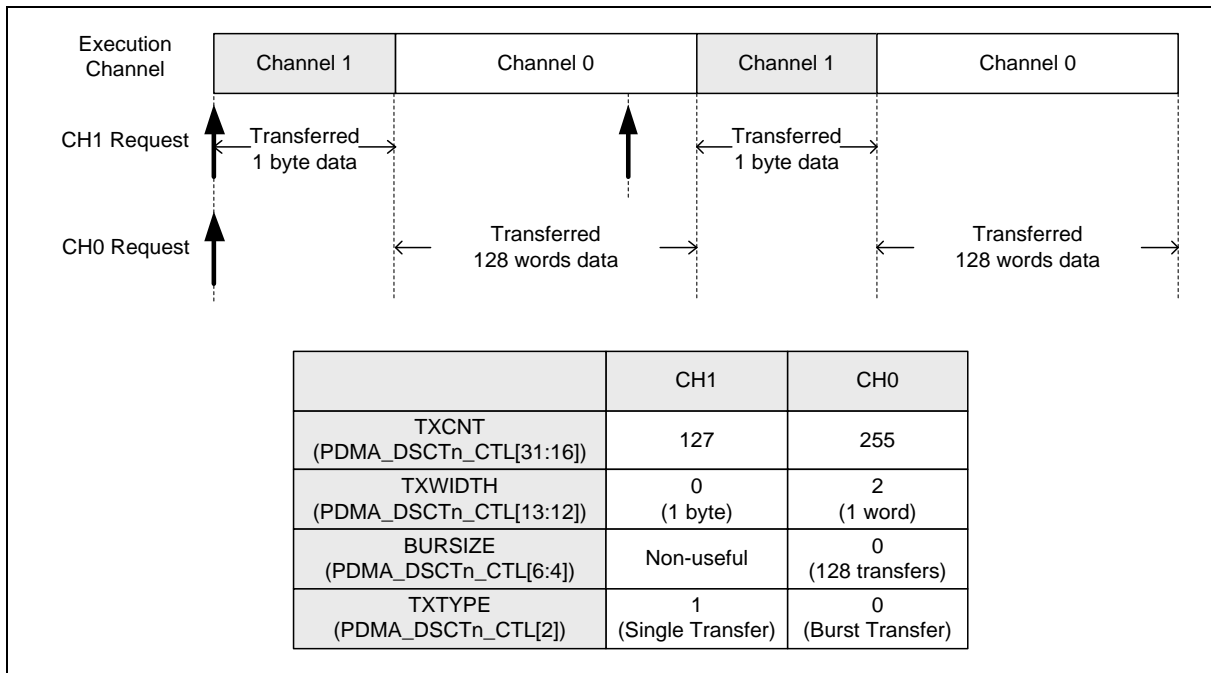

Figure 6.6-6 Example of Single Transfer Type and Burst Transfer Type in Basic Mode

#### 6.6.5.4 Channel Time-out

Only PDMA channel 0 and channel 1 support time-out function. When the transfer channel is enabled and selected to the peripheral, corresponding channel time-out TOUTENn (PDMA\_TOUTEN [n], n=0,1) is enabled, then channel's corresponding time-out counter will start count up from 0 while the channel has received trigger signal from the peripheral.

The time-out counter is based on output of HCLK prescaler, which is set by corresponding channel's TOUTPSCn (PDMA\_TOUTPSC [2+4n:4n], n=0,1). If time-out counter counts up from 0 to corresponding channel's TOCn (PDMA\_TOC0\_1 [16(n+1)-1:16n], n=0,1), the PDMA controller will generate interrupt signal when corresponding TOUTIENn (PDMA\_TOUTIEN [n], n=0,1) is enabled. When time-out occurred, corresponding channel's REQTOFn (PDMA\_INTSTS [n+8], n=0,1) will be set to indicate channel time-out is happened.

Time-out counter will restart from 0 while counter count to TOCn (PDMA\_TOC0\_1 [16(n+1)-1:16n], n=0,1), received trigger signal, time-out function is disabled or chip enters Power-down mode. The time-out counter will keep counting until time-out function is disabled.

Figure 6.6-7 shows an example about time-out counter operation. The operation sequence is described below:

1. The channel 0 time-out counter is not counting when time-out function is enabled by setting TOUTEN0(PDMA\_TOUTEN[0]) bit to 1.
2. Time-out counter starts counting from 0 to the value of TOC0(PDMA\_TOC0\_1[15:0]) bits when receiving the first peripheral request.
3. Time-out counter is reset to 0 by received second peripheral request.
4. Channel 0 request time-out flag(REQTOF0(PDMA\_INTSTS[8])) is set to high when time-out counter counts to 5. The counter will keep counting.
5. Time-out counter is reset to 0 when time-out function is disabled.

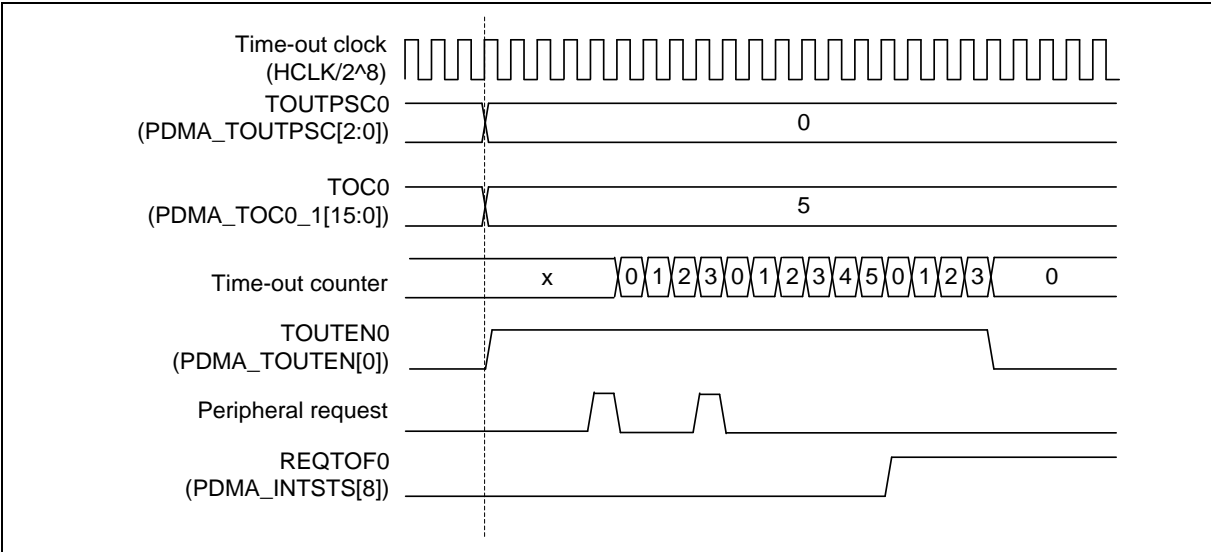

Figure 6.6-7 Example of PDMA Channel 0 Time-out Counter Operation

6.6.5.5 Stride Function

The PDMA supports channel 0 to channel 5 six channels with stride function. The stride function can transfer data from one address to another address and support block transfer with stride. When operating with stride function, the transfer address can be fixed or incremented successively.

Set STRIDEEN (PDMA\_DSCTn\_CTL[15]) to enable the stride function, and then write a valid source address to the PDMA\_DSCTn\_SA register and a source address offset count to SASOL (PDMA\_ASOCRn[15:0]) register, a destination address to the PDMA\_DSCTn\_DA register and a destination address offset count to DASOL (PDMA\_ASOCRn[31:16]), and a transfer count to the TXCNT (PDMA\_DSCTn\_CTL) register and a stride transfer count to STC (PDMA\_STCn[15:0]). Next, trigger the SWREQn (PDMA\_SWREQ[5:0]). The PDMA will start and then stop the transfer after TXCNT (PDMA\_DSCTn\_CTL) counts down to 0. Figure 6.6-8 shows the block transfer relationship between source memory and destination memory. The stride function also supports peripheral to memory or memory to peripheral transfer.

Figure 6.6-8 Stride Function Block Transfer

TBINTDIS	BURSIZE			Reserved	TXTYPE	OPMODE	

Bits	Description	
[31:16]	TXCNT	<b>Transfer Count</b> The TXCNT represents the required number of PDMA transfer, the real transfer count is (TXCNT + 1); The maximum transfer count is 65536, every transfer may be byte, half-word or word that is dependent on TXWIDTH field. <b>Note:</b> When PDMA finishes each transfer data, this field will be decreased immediately.
[15]	STRIDEEN	<b>Stride Mode Enable Bit</b> 0 = Stride transfer mode Disabled. 1 = Stride transfer mode Enabled.
[14]	Reserved	Reserved.
[13:12]	TXWIDTH	<b>Transfer Width Selection</b> This field is used for transfer width. 00 = One byte (8 bit) is transferred for every operation. 01 = One half-word (16 bit) is transferred for every operation. 10 = One word (32-bit) is transferred for every operation. 11 = Reserved. <b>Note:</b> The PDMA transfer source address (PDMA_DSCT_SA) and PDMA transfer destination address (PDMA_DSCT_DA) should be alignment under the TXWIDTH selection
[11:10]	DAINC	<b>Destination Address Increment</b> This field is used to set the destination address increment size. 11 = No increment (fixed address). Others = Increment and size is depended on TXWIDTH selection. <b>Note:</b> The fixed address function does not support in memory to memory transfer type.
[9:8]	SAINC	<b>Source Address Increment</b> This field is used to set the source address increment size.

Bits	Description	
		<p>11 = No increment (fixed address).  Others = Increment and size is depended on TXWIDTH selection.  <b>Note:</b> The fixed address function do not support in memory to memory transfer type.</p>
[7]	<b>TBINTDIS</b>	<p><b>Table Interrupt Disable Bit</b>  This field can be used to decide whether to enable table interrupt or not. If the TBINTDIS bit is enabled it will not generates TDIFn(PDMA_TDSTS[7:0]) when PDMA controller finishes transfer task.  0 = Table interrupt Enabled.  1 = Table interrupt Disabled.  <b>Note:</b> This function only for Scatter-gather mode.</p>
[6:4]	<b>BURSIZE</b>	<p><b>Burst Size</b>  This field is used for peripheral to determine the burst size or used for determine the re-arbitration size.  000 = 128 Transfers.  001 = 64 Transfers.  010 = 32 Transfers.  011 = 16 Transfers.  100 = 8 Transfers.  101 = 4 Transfers.  110 = 2 Transfers.  111 = 1 Transfers.  <b>Note:</b> This field is only useful in burst transfer type.</p>
[3]	<b>Reserved</b>	Reserved.
[2]	<b>TXTYPE</b>	<p><b>Transfer Type</b>  0 = Burst transfer type.  1 = Single transfer type.</p>
[1:0]	<b>OPMODE</b>	<p><b>PDMA Operation Mode Selection</b>  00 = Idle state: Channel is stopped or this table is complete, when PDMA finishes channel table task, OPMODE will be cleared to idle state automatically.  01 = Basic mode: The descriptor table only has one task. When this task is finished, the PDMA_INTSTS[1] will be asserted.  10 = Scatter-gather mode: When operating in this mode, user must give the next descriptor table address in PDMA_DSCT_NEXT register; the PDMA controller will ignore this task, then load the next task to execute.  11 = Reserved.  <b>Note:</b> Before filling new transfer task in the Descriptor Table, user must check the PDMA_INTSTS[1] to make sure the current task is complete.</p>

## 6.7 Timer Controller (TMR)

### 6.7.1 Overview

The timer controller includes four 32-bit timers, Timer0 ~ Timer3, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, delay timing, clock generation, and event counting by external input pins, and interval measurement by external capture pins.

The timer controller also provides four PWM generators. Each PWM generator supports one PWM output and two selectable PWM output channels (TMx or TMx\_EXT). The output state of PWM output pin can be control by polarity control, output enable control and output channel select.

### 6.7.2 Features

#### 6.7.2.1 Timer Function Features

- Four sets of 32-bit timers, each timer having one 24-bit up counter and one 8-bit prescale counter
- Independent clock source for each timer
- Provides one-shot, periodic, toggle-output and continuous counting operation modes
- 24-bit up counter value is readable through CNT (TIMERx\_CNT[23:0])
- Supports event counting function
- 24-bit capture value is readable through CAPDAT (TIMERx\_CAP[23:0])
- Supports external capture pin (TMx\_EXT) event for interval measurement
- Supports external capture pin (TMx\_EXT) event to reset 24-bit up counter
- Supports internal clock (HIRC, LIRC, MIRC) and external clock (HXT, LXT) for capture event
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated
- Supports Timer0 ~ Timer3 time-out interrupt signal or capture interrupt signal to trigger BPWM, PWM, EADC, DAC and PDMA function
- Supports internal capture triggered while internal ACMP output signal transition
- Supports Inter-Timer trigger mode
- Supports event counting source from internal USB SOF signal
- Supports Timer0~3 time-out interrupts signal (TIF) to trigger Touch-Key scan.

#### 6.7.2.2 PWM Function Features

- Supports PWM generator with two selectable output channels
- Supports 16-bit PWM counter
  - Up count operation type
  - One-shot or auto-reload counter operation mode
- Supports 8-bit prescale from 1 to 256
- Supports 16-bit compare register and period register and double buffer for period register and compare register
- Supports tri-state enable and polarity control for each PWM selectable output channels
- Supports interrupt on the following events:

- PWM period point, up-count compared point events
- Supports wake-up when interrupt occurs when clock source is LXT or LIRC
- PWM can generate output in Power-down mode
- Supports trigger EADC, PDMA, and DAC on the following events:
  - PWM period point and up-count compared point events

### 6.7.3 Block Diagram

The timer controller block diagram and clock control are shown as follows.

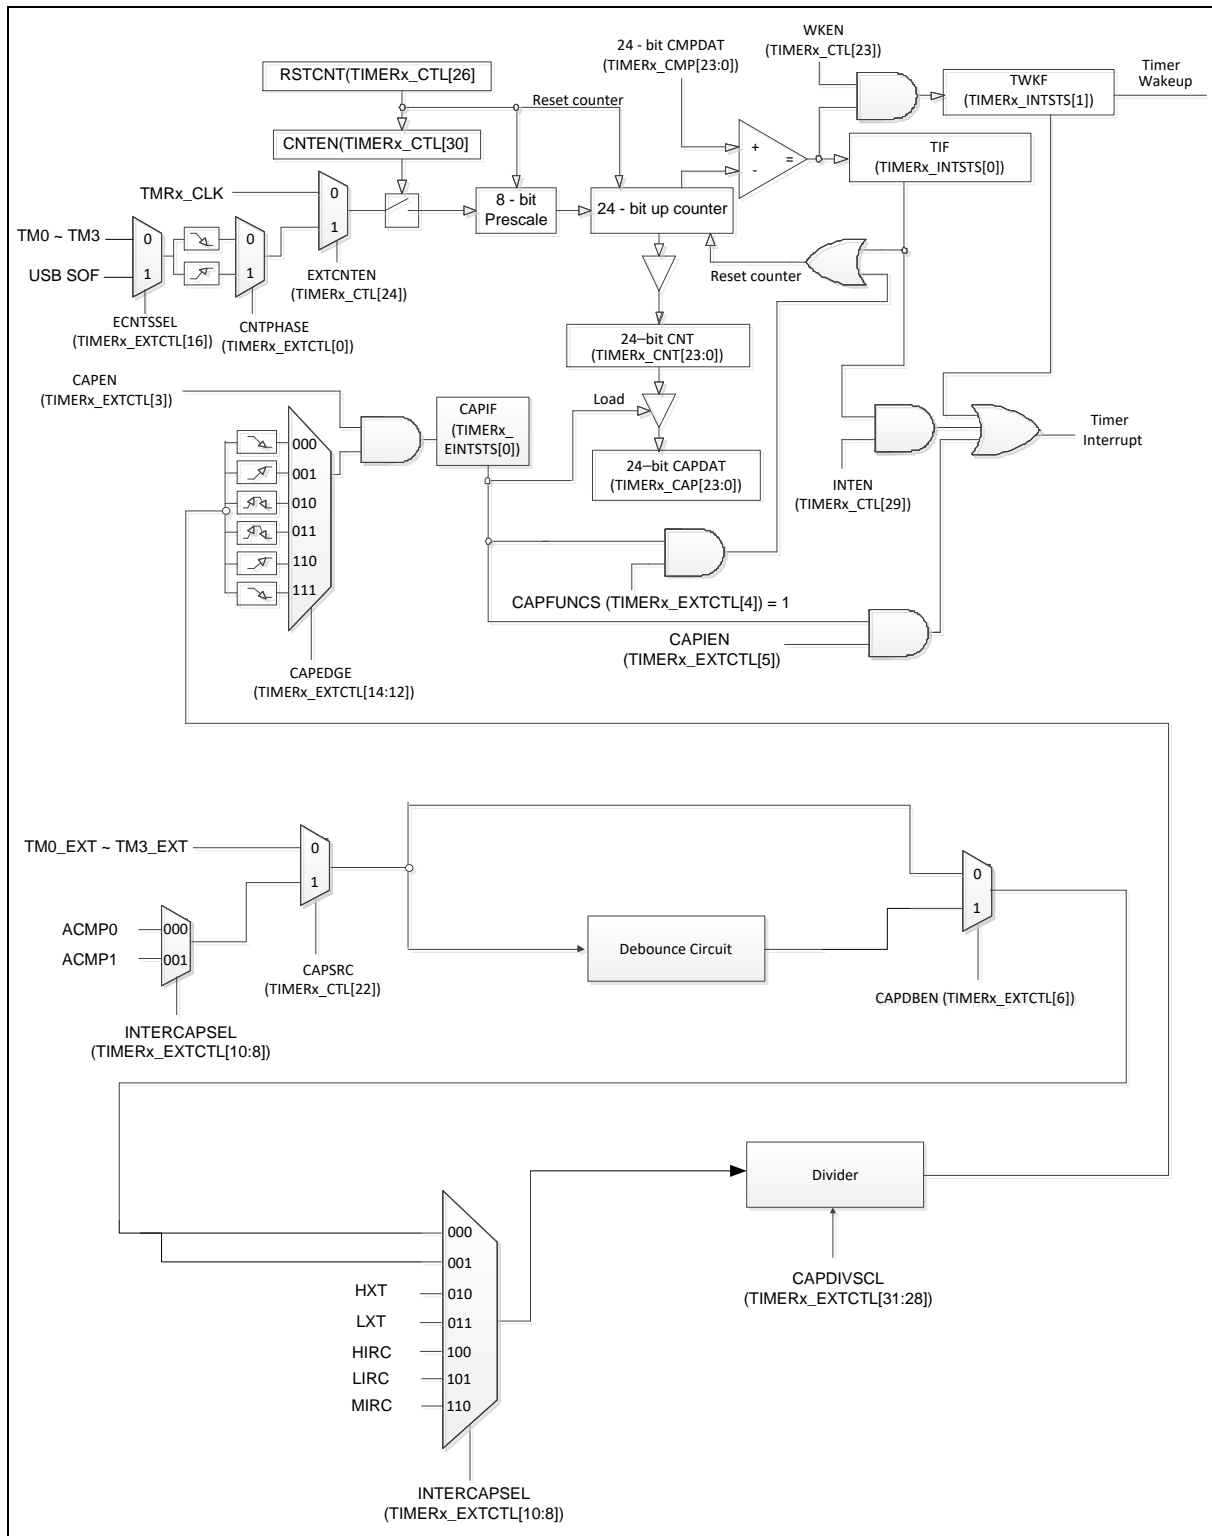

Figure 6.7-1 Timer Controller Block Diagram

Set FUNSEL (TIMERx\_CTL[15]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK\_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK\_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK\_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK\_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK\_CLKSEL1[22:20]) for Timer3 as Figure 6.7-2.

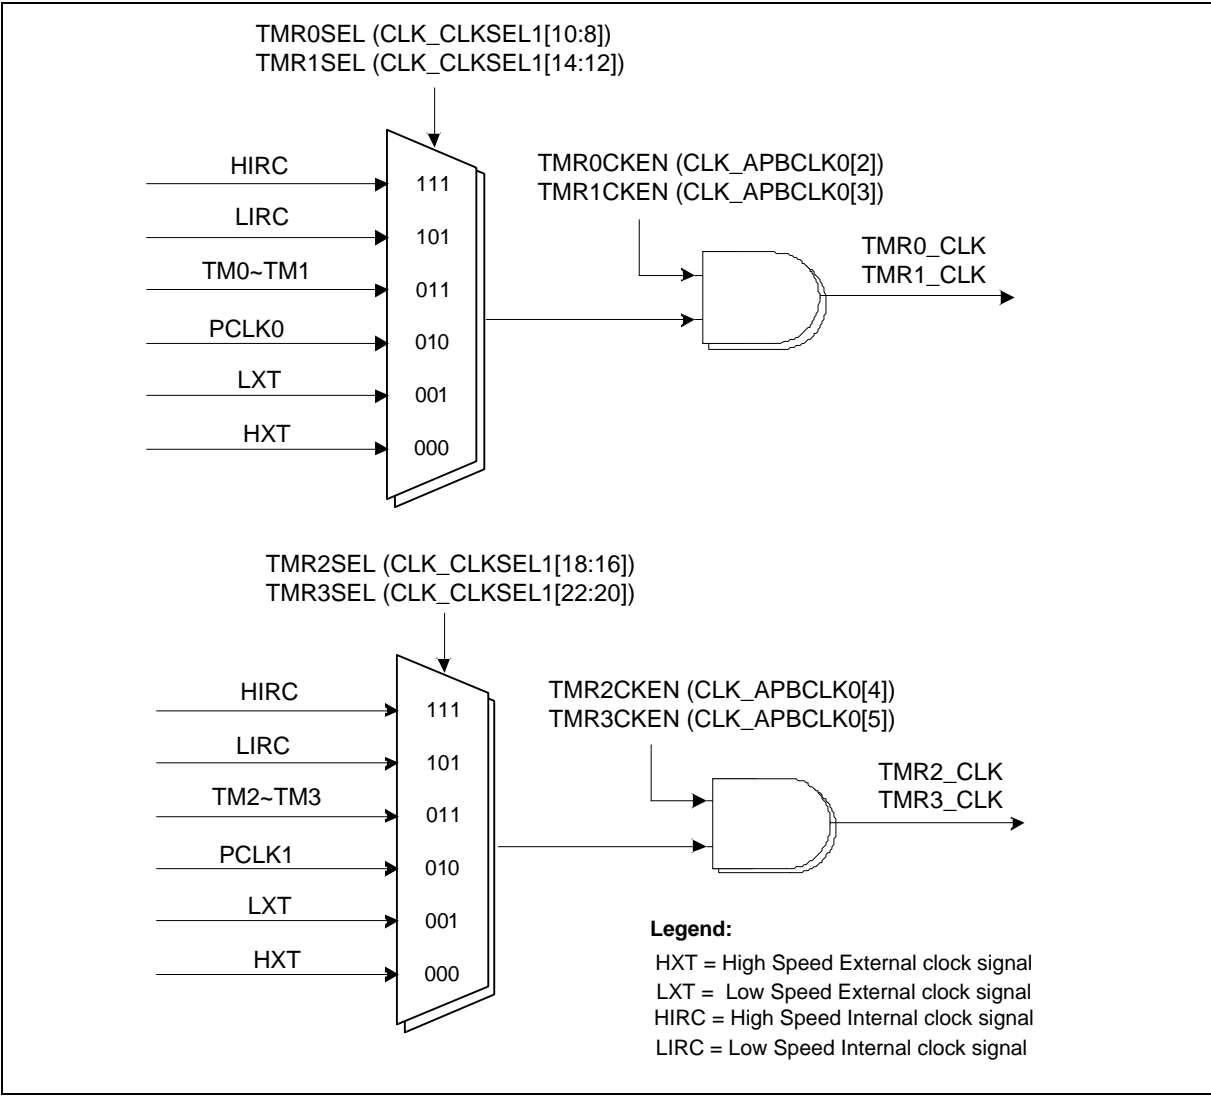

Figure 6.7-2 Clock Source of Timer Controller

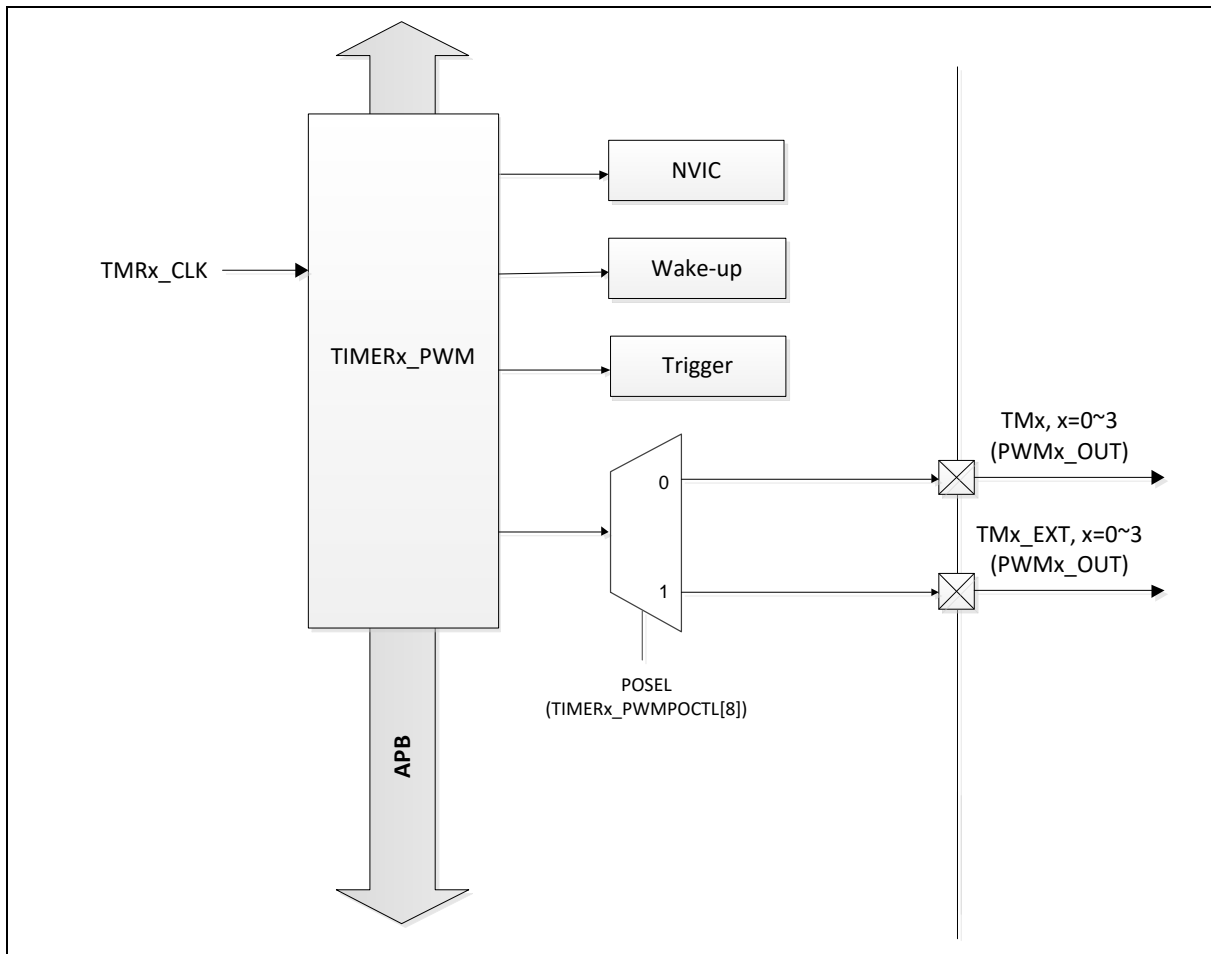

Figure 6.7-3 PWM Generator Overview Block Diagram

Set FUNSEL (TIMERx\_CTL[15]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK\_APBCLK0[5:2]). PWM system clock and counter clock source are from TMRx\_CLK.

Figure 6.7-4 illustrates the PWM architecture that supports one PWM output and two selectable TMx or TMx\_EXT output channels in each PWM generator.

When PERIOD (TIMERx\_PWMPERIOD[15:0]) is equal to CMP (TIMERx\_PWMCMPDAT[15:0]), relative events will be generated. These events are passed to corresponding generators to generate PWM pulse (Pulse Generator), interrupt signal (Interrupt Generator), wake-up (Wake-up Generator) and trigger signal (Trigger Generator) for EADC, PDMA and DAC to start conversion. Output Control block is used to decide PWM pulse output.

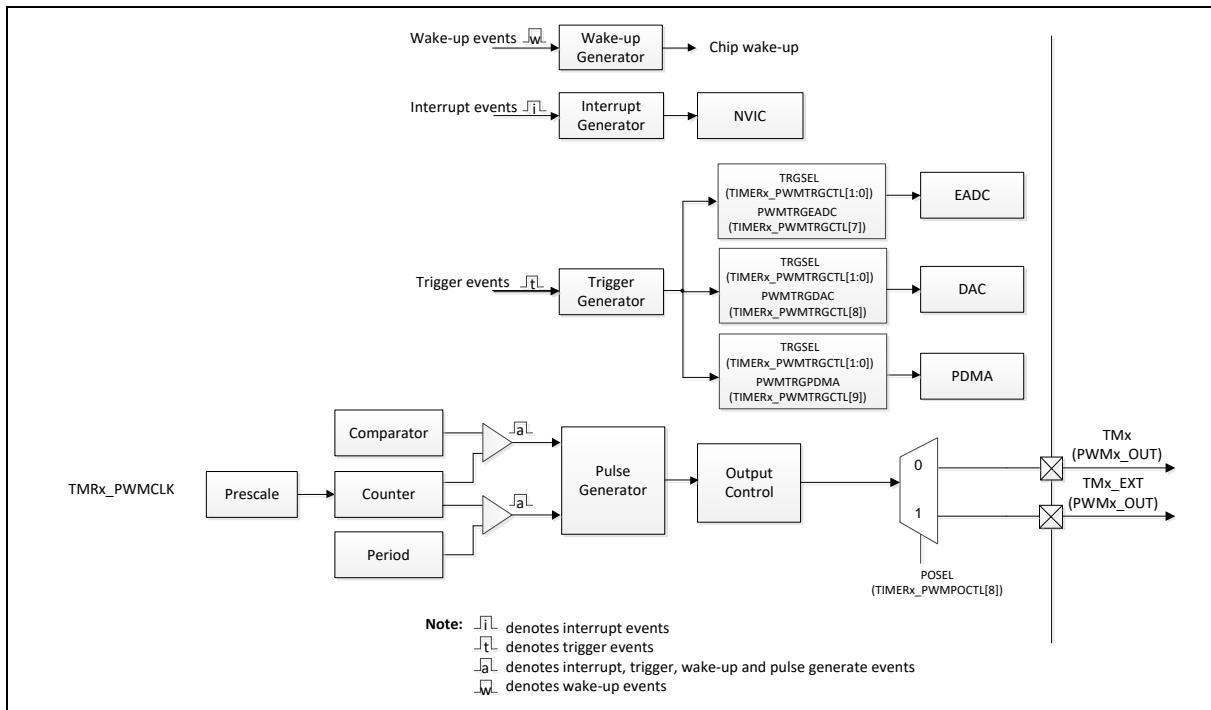

Figure 6.7-4 PWM Architecture Diagram

#### 6.7.4 Basic Configuration

Set FUNSEL (TIMERx\_CTL[15]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK\_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK\_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK\_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK\_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK\_CLKSEL1[22:20]) for Timer3.

Set FUNSEL (TIMERx\_CTL[15]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK\_APBCLK0[5:2]). PWM system clock and counter clock source are from TMRx\_CLK.

##### 6.7.4.1 TIMER01 Basic Configurations

- Clock Source Configuration
  - Enable TIMER0 peripheral clock in TMR0CKEN (CLK\_APBCLK0[2]).
  - Enable TIMER1 peripheral clock in TMR1CKEN (CLK\_APBCLK0[3]).
- Reset Configuration
  - Reset TIMER0 controller in TMR0RST (SYS\_IPRST1[2]).
  - Reset TIMER1 controller in TMR1RST (SYS\_IPRST1[3]).

##### 6.7.4.2 TIMER23 Basic Configurations

- Clock Source Configuration
  - Enable TIMER2 peripheral clock in TMR2CKEN (CLK\_APBCLK0[4]).
  - Enable TIMER3 peripheral clock in TMR3CKEN (CLK\_APBCLK0[5]).
- Reset Configuration
  - Reset TIMER2 controller in TMR2RST (SYS\_IPRST1[4]).
  - Reset TIMER3 controller in TMR3RST (SYS\_IPRST1[5]).

## 6.7.5 Timer Functional Description

### 6.7.5.1 Timer Interrupt Flag

The timer controller supports the following interrupt flags; one is TIF (TIMERx\_INTSTS[0]) and its set while timer counter value CNT (TIMERx\_CNT[23:0]) matches the timer compared value CMPDAT (TIMERx\_CMP[23:0]), and CAPIF (TIMERx\_EINTSTS[0]) is set means when the transition on the TMx\_EXT pin ,ACMP, internal clock (HIRC, LIRC, MIRC) or external clock (HXT, LXT) associated CAPEDGE (TIMERx\_EXTCTL[14:12]) setting. The TWKF (TIMERx\_INTSTS[1]) bit indicates the interrupt wake-up flag status of timer. User can set CAPSRC (TIMERx\_CTL[22]) and INTERCAPSEL (TIMERx\_EXTCTL[10:8]) to select capture source. Set WKEN (TIMERx\_CTL[23]) to 1 can use wake-up function.

### 6.7.5.2 Timer Counting Mode

The timer controller provides four timer counting modes: one-shot, periodic, toggle-output and continuous counting operation modes:

#### **One-shot Mode**

If the timer controller is configured at one-shot mode (TIMERx\_CTL[28:27] is 00) and CNTEN (TIMERx\_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx\_CNT[23:0]) value reaches CMPDAT (TIMERx\_CMP[23:0]) value, the TIF (TIMERx\_INTSTS[0]) will be set to 1, CNT value and CNTEN bit is cleared automatically by timer controller then timer counting operation stops. In the meantime, if the INTEN (TIMERx\_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also.

User can monitor the RSTACT (TIMERx\_CNT[31]) to ensure counter reset operation active and disable ICE debug mode acknowledgement effects TIMER counting by setting ICEDEBUG (TIMERx\_CTL[31]) to 1.

#### **Periodic Mode**

If the timer controller is configured at periodic mode (TIMERx\_CTL[28:27] is 01) and CNTEN (TIMERx\_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx\_CNT[23:0]) value reaches CMPDAT (TIMERx\_CMP[23:0]) value, the TIF (TIMERx\_INTSTS[0]) will be set to 1, CNT value will be cleared automatically by timer controller and timer counter operates counting again. In the meantime, if the INTEN (TIMERx\_CTL[29]) bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. In this mode, the timer controller operates counting and compares with CMPDAT value periodically until the CNTEN bit is cleared by user.

User can set PERIOSEL (TIMERx\_CTL[20]) to select Timer behavior.

#### **Toggle-Output Mode**

If the timer controller is configured at toggle-output mode (TIMERx\_CTL[28:27] is 10) and CNTEN (TIMERx\_CTL[30]) is set, the timer counter starts up counting. The counting operation of toggle-output mode is almost the same as periodic mode, except toggle-output mode has associated TM0 ~ TM3 or TM0\_EXT ~ TM3\_EXT pin to output signal while specify TIF (TIMERx\_INTSTS[0]) is set. User can set TGLPINSEL (TIMERx\_CTL[21]) to choose TMx or TMx\_EXT as toggle-output pin. Thus, the toggle-output signal on TM0 ~ TM3 pin is high and changing back and forth with 50% duty cycle.

#### **Continuous Counting Mode**

If the timer controller is configured at continuous counting mode (TIMERx\_CTL[28:27] is 11) and CNTEN (TIMERx\_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx\_CNT[23:0]) value reaches CMPDAT (TIMERx\_CMP[23:0]) value, the TIF (TIMERx\_INTSTS[0]) will be set to 1 and CNT value keeps up counting. In the meantime, if the INTEN (TIMERx\_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. User can change different CMPDAT value immediately without disabling timer counting and restarting timer counting in this mode.

For example, CMPDAT value is set as 80, first. The TIF will set to 1 when CNT value is equal to 80, timer counter is kept counting and CNT value will not goes back to 0, it continues to count 81, 82, 83, ... to  $(2^{24} - 1)$ , 0, 1, 2, 3, ... to  $(2^{24} - 1)$  again and again. Next, if user programs CMPDAT value as 200 and clears TIF, the TIF will set to 1 again when CNT value reaches to 200. At last, user programs CMPDAT as 500 and clears TIF, the TIF will set to 1 again when CNT value reaches to 500.

In this mode, the timer counting is continuous. So this operation mode is called as continuous counting mode.

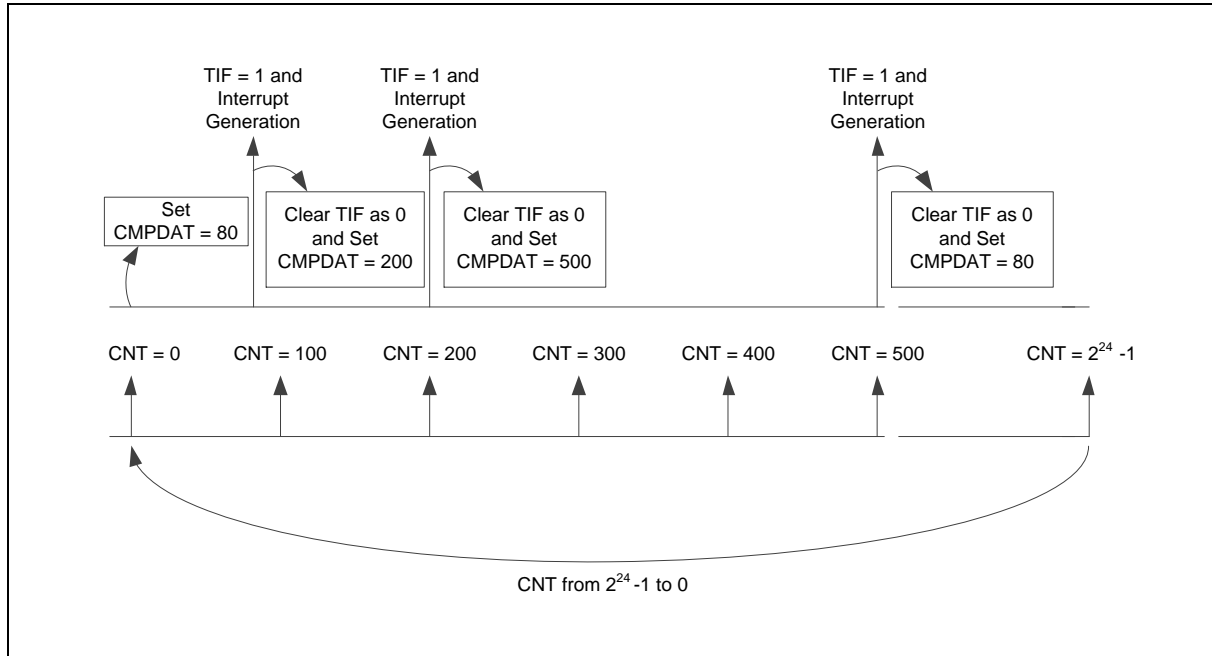

Figure 6.7-5 Continuous Counting Mode

#### 6.7.5.3 Event Counting Mode

The timer controller also provides an application which can count the input event from TMx (x= 0~3) pin and the number of event will reflect to CNT (TIMERx\_CNT[23:0]) value. It is also called as event counting function. In this function, EXTCNTEN (TIMERx\_CTL[24]) should be set and the timer peripheral clock source should be set as PCLK.

If ECNTSSEL (TIMERx\_EXTCTL[16]) is 0, the event counter source is from external TMx pin. User can enable or disable TMx pin de-bounce circuit by setting CNTDBEN (TIMERx\_EXTCTL[7]). The input event frequency should be less than 1/3 PCLK if TMx pin de-bounce disabled or less than 1/8 PCLK if TMx pin de-bounce enabled to assure the returned CNT value is correct, and user can also select edge detection phase of TMx pin by setting CNTPHASE (TIMERx\_EXTCTL[0]) bit.

In event counting mode, the timer counting operation mode can be selected as one-shot, periodic and continuous counting mode to counts the counter value CNT (TIMERx\_CNT[23:0]) for TMx. .

If ECNTSSEL (TIMERx\_EXTCTL[16]) is 1, the event counter source will generate by USB device detect the start-of-frame (SOF) packet. Please refer USB device specifications.

#### 6.7.5.4 Capture Mode

The event capture function is used to load CNT (TIMERx\_CNT[23:0]) value to CAPDAT (TIMERx\_CAP[23:0]) value while edge transition detected on TMx\_EXT (x= 0~3) pin, ACMP, internal clock and external clock. In this mode, CAPFUNCS (TIMERx\_EXTCTL[4]) should be as 0 to trigger event capture function and the timer peripheral clock source should be set as PCLK.

If CAPSRC (TIMERx\_CTL[22]) is 0, the capture event is triggered by TMx\_EXT pin transition. User can enable or disable TMx\_EXT pin de-bounce circuit by setting CAPDBEN (TIMERx\_EXTCTL[6]). The transition frequency of TMx\_EXT pin should be less than 1/3 PCLK if TMx\_EXT pin de-bounce disabled or less than 1/8 PCLK if TMx\_EXT pin de-bounce enabled to assure the capture function can be work normally, and user can also select edge transition detection of TMx\_EXT pin by setting CAPEDGE (TIMERx\_EXTCTL[14:12]).

In event capture mode, user does not consider what timer counting operation mode is selected, the capture event occurred only if edge transition on TMx\_EXT pin is detected.

User can enable CAPIEN (TIMERx\_EXTCTL[5]) to use capture interrupt function. When the TMx\_EXT edge transition meets setting, CAPIF is high.

User must consider the Timer will keep register TIMERx\_CAP unchanged and drop the new capture value, if the CPU does not clear the CAPIF status.

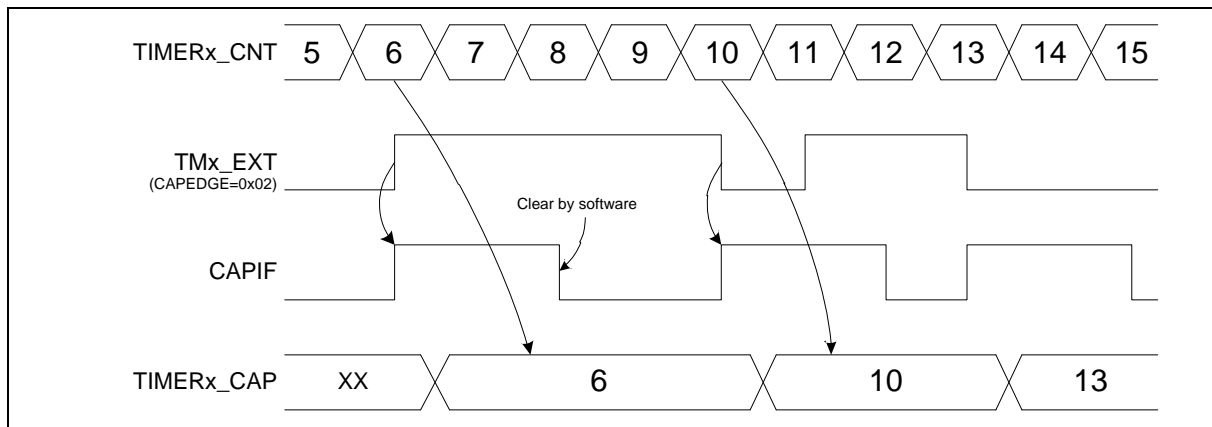

Figure 6.7-6 External Capture Mode

If CAPSRC (TIMERx\_CTL[22]) is 1, set INTERCAPSEL (TIMERx\_EXTCTL[10:8]) to choose different capture source. The capture event can be triggered by internal output signal transition on ACMP0 if INTERCAPSEL (TIMERx\_EXTCTL[10:8]) is 000, or ACMP1 if INTERCAPSEL is 001 ; Other capture sources are HXT, LXT, MIRC, LIRC, HIRC if INTERCAPSEL is 010, 011, 110, 101, 100 respectively. User can switch capture source only when original source and target source is all off. For example, if user wants to switch LXT or LIRC, both of capture source should be set off first.

The capture source can be divided by capture divider. User can set CAPDIVSCL (TIMERx\_EXTCTL[31:28]) to select different divider number. Be aware that timer clock frequency must be four times than capture source at least.

#### 6.7.5.5 Reset Counter Mode

The timer controller also provides reset counter function to reset CNT (TIMERx\_CNT[23:0]) value while capture event is generated. In this mode, CAPFUNCS (TIMERx\_EXTCTL[4]) should be 1. User must set CAPSRC and INTERCAPSEL to select TMx\_EXT transition, internal ACMPx output signal and internal clock or external clock to trigger reset counter value.

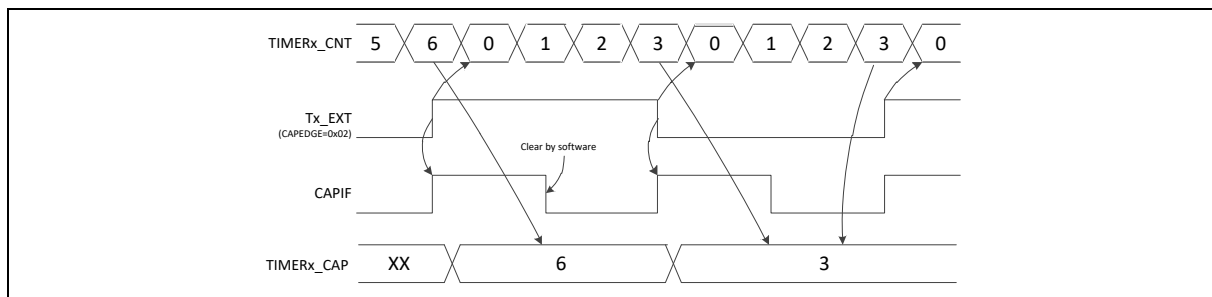

Figure 6.7-7 Reset Counter Mode

#### 6.7.5.6 Timer Trigger Function

The timer controller provides timer time-out interrupt or capture interrupt to trigger PWM, BPWM, EADC, DAC and PDMA. If TRGSSEL (TIMERx\_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger PWM, BPWM, EADC, DAC and PDMA. If TRGSSEL (TIMERx\_TRGCTL[0]) is 1, capture interrupt signal is used to trigger PWM, BPWM, EADC, DAC and PDMA.

When the TRGPWM (TIMERx\_TRGCTL[1]) is set, if the timer interrupt signal is generated, the timer controller will generate a trigger pulse as PWM/BPWM external clock source.

When the TRGEADC (TIMERx\_TRGCTL[2]) is set, if the timer interrupt signal is generated, the timer controller will trigger EADC to start converter.

When the TRGDAC (TIMERx\_TRGCTL[3]) is set, if the timer interrupt signal is generated, the timer controller will trigger DAC to start converter.

When the TRGPDMA (TIMERx\_TRGCTL[4]) is set, if the timer interrupt signal is generated, the timer controller will trigger PDMA.

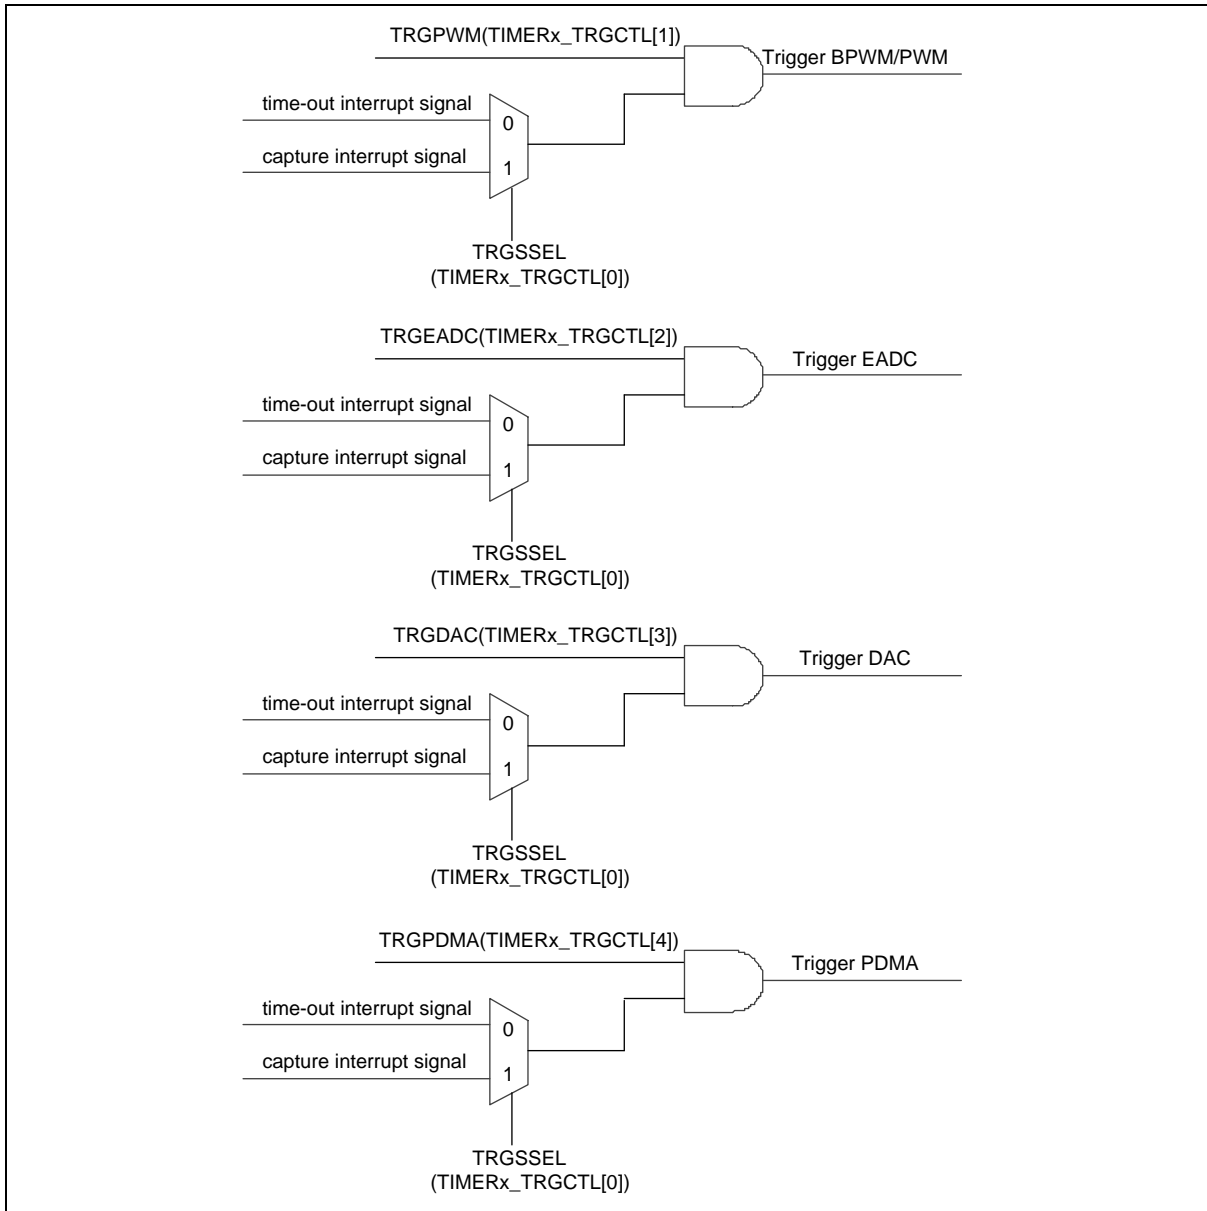

Figure 6.7-8 Internal Timer Trigger

When both the TRGPDMA (TIMERx\_TRGCTL[4]) and TRGSSEL (TIMERx\_TRGCTL[0]) are 1, TIMERx\_CAP will change when encountering timer capture edge no matter whether CPU clear CAPIF status or not. In Trigger EADC DAC or PWM function, user must consider that the Timer will keep register TIMERx\_CAP unchanged if the CPU does not clear the CAPIF status.

Figure 6.7-9 Capture interrupt trigger PDMA

#### 6.7.5.7 Inter-Timer Trigger Capture Mode

In this mode, the Timer0/2 will be forced in event counting mode, counting with external event, and will generate an internal signal (INTR\_TMR\_TRG) to trigger Timer1/3 start or stop counting. Also, the Timer1/3 will be forced in capture mode and start/stop trigger-counting by Timer0/2 counter status.

Setting Timer0 Inter-timer Trigger Capture enabled, trigger-counting capture function is forced on Timer1. Setting Timer2 Inter-Timer Trigger Capture enabled, trigger-counting capture function is forced on Timer3.

##### Start Trigger

While INTRGEN (TIMERx\_CTL[19]) in Timer0/2 is set, the Timer0/2 will make a rising-edge transition of INTR\_TMR\_TRG while Timer0/2 24-bit counter value (CNT) is counting from 0x0 to 0x1 and Timer1/3 counter will start counting immediately and automatically.

##### Stop Trigger

When Timer0/2 CNT reaches the Timer0/2 CMPDAT (TIMERx\_CMP[23:0]) value, the Timer0/2 will make a falling-edge transition of INTR\_TMR\_TRG. Then Timer0/2 counter mode function will be disabled and INTRGEN (TIMERx\_CTL[19]) will be cleared by hardware then Timer1/3 will stop counting also. At the same time, the Timer1/3 CNT value will be saved into Timer1/3 CAPDAT (TIMERx\_CAP[23:0]).

User can use inter-timer trigger mode to measure the period of external event (TMx) more precisely. Figure 6.7-10 shows the sample flow of Inter-Timer Trigger Capture Mode for Timer0 as event counting mode and Timer1 as trigger-counting capture mode.

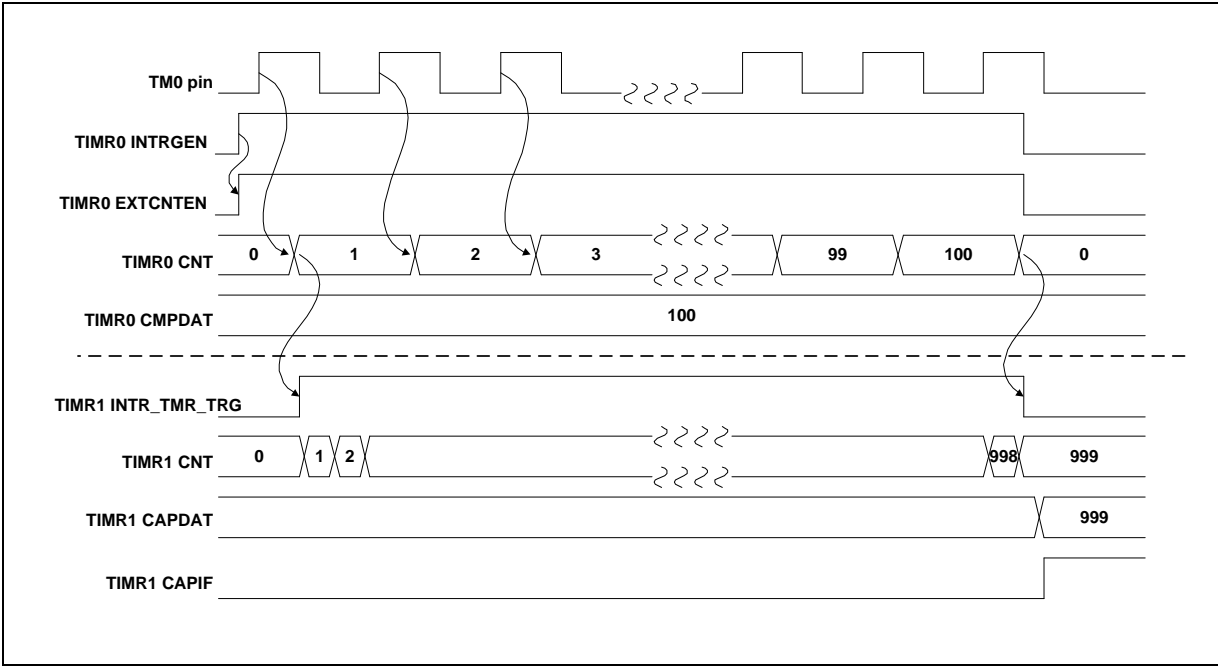

Figure 6.7-10 Inter-Timer Trigger Capture Timing

User must clear Timer1/3 CAPIF if user wants to use second inter-timer trigger function again.

### 6.7.6 PWM Functional Description

#### 6.7.6.1 PWM Block Diagram

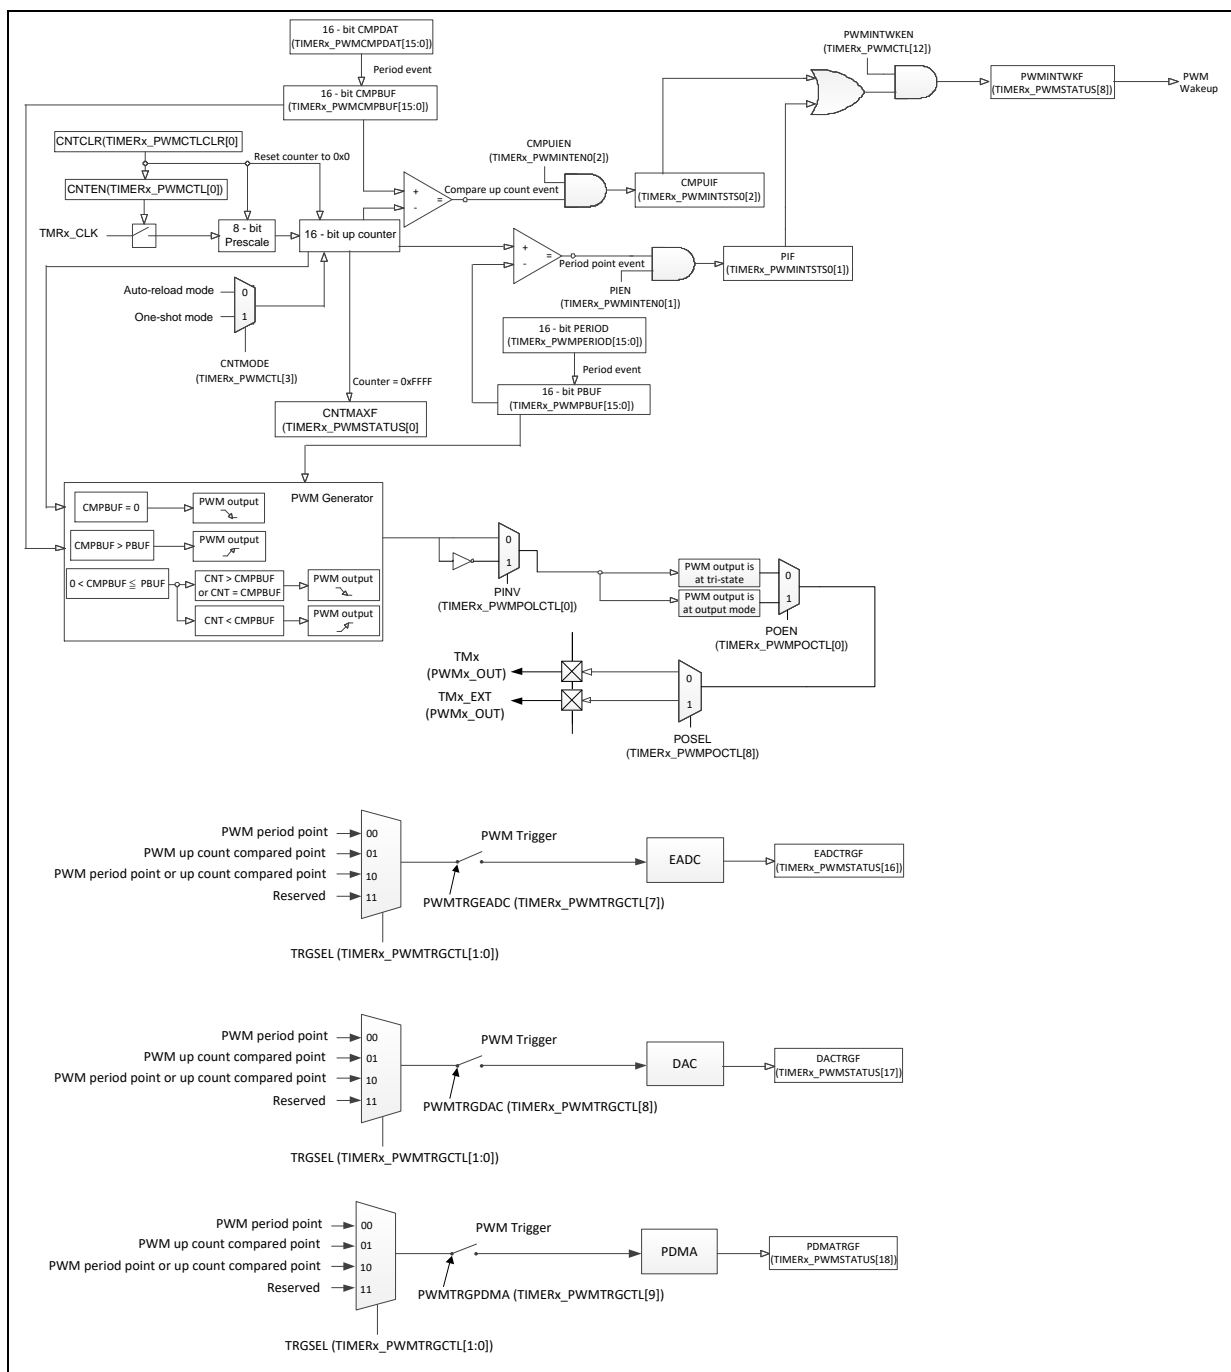

Figure 6.7-11 Timer PWM Block Diagram

#### 6.7.6.2 PWM Prescale

The PWM prescale is used to divide clock source, and the clock of PWM counter is divided by (CLKPSC + 1). The prescale is set by CLKPSC (TIMERx\_PWMCLKPSC[7:0]). Figure 6.7-12 shows an example of PWM prescale waveform in up count type.

Figure 6.7-12 PWM Prescale Waveform in Up Count Type

#### 6.7.6.3 PWM Counter

The PWM supports up count type

It starts up-counting from 0 to PERIOD (TIMERx\_PWMPERIOD[15:0]). The current counter value can be read from the CNT (TIMERx\_PWMCNT[15:0]). PWM generates a period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.7-13 shows an example of PWM up count type, where PWM period time is  $(\text{PERIOD}+1) * (\text{CLKPSC}+1) * \text{TMRx\_PWMCLK}$ .

Figure 6.7-13 PWM Up Count Type

#### 6.7.6.4 PWM Counter Operation mode

The PWM counter supports two operation modes: one-shot mode and auto-reload mode. PWM counter will operate in one-shot mode if CNTMODE (TIMERx\_PWMCTL[3]) bit is set to 1, and operate in auto-reload mode if CNTMODE bit is set to 0.

In both modes, CMP (TIMERx\_PWMCMPDAT[15:0]) and PERIOD (TIMERx\_PWMPERIOD[15:0]) should be written first and then set CNTEN (TIMERx\_PWMCTL[0]) bit to 1 to start counter running.

In one-shot mode, PWM counter value will reload to 0 after one PWM period is completed. User can write CMP to continuous one-shot operation to generate next one-shot pulse once no matter current one-shot counter is running or completed.

For example, user writes 0x10 to CMP, writes 0x3F to PERIOD and set CMPUIEN (TIMERx\_PWMINTEN0[2]) and PIEN (TIMERx\_PWMINTEN0[1]) to 1. When counter (CNT) counts to 0x10, CMPUIF (TIMERx\_PWMINTSTS0[2]) is set to 1. Counter keeps counting until 0x3F, PIF (TIMERx\_PWMINTSTS0[1]) is set to 1 then counter reload to 0, and counter stops counting.

Another example is user writes 0x10 to CMP, writes 0x3F to PERIOD and set CMPUIEN and PIEN to 1. If user writes 0x25 to CMP when counter counting, this value will load to CMPBUF (TIMERx\_PWMCMPBUF[15:0]) when counter counts to 0x3F and PIF is set to 1, then counter counts

from 0. If user clears CMPUIF and PIF before counter counts to 0x25, CMPUIF and PIF will be set to 1 when counter counts to 0x25 and 0x3F, respectively.

In auto-reload mode, PWM counter is continuous running with current active PERIOD and CMP. If user sets PERIOD to zero in auto-reload mode, PWM counter value will reload to 0 after one PWM period is completed.

For example, user writes 0x10 to CMP, writes 0x3F to PERIOD. CMPUIEN and PIEN are set to 1. When counter counts to 0x10, CMPUIF is set to 1. Counter keeps counting until 0x3F, PIF is set to 1, and counter will restart counting from 0. If user clear CMPUIF and PIF before counter counts to 0x10 (2<sup>nd</sup> counts), CMPUIF will equal to 1 and PIF will equal to 1 when counter counts to 0x10 and 0x3F, respectively.

When user writes 0 to PERIOD and this value will be loaded to PBUF (TIMERx\_PWMPBUF[15:0]). This action will make counter be set to 0 and stops counting until user rewrites another value (except 0) to PERIOD and this value loads to PBUF, counter counts from 0.

The one-shot and auto-reload mode comparison is shown as Table 6.7-4.

Counter Mode Functions	One-Shot	Auto-Reload
CNTMODE (TIMERx_PWMCTL[3])	1	0
CNT = PERIOD (PERIOD is not 0)	Stops counting	Keeps counting from 0 to PERIOD (Periodic)
PERIOD = 0 and loads to PBUF, then write another value (Except 0) to PERIOD	CNT stops counting even though user writes new PERIOD	CNT = 0 (reset value), CNT stops counting until PERIOD and PBUF is not equal to 0

Table 6.7-4 One-shot and Auto-reload Functions

**Note:** PERIOD (TIMERx\_PWMPERIOD[15:0]) and CMP (TIMERx\_PWMCMPDAT[15:0]) will be loaded to PBUF (TIMERx\_PWMPBUF[15:0]) and CMPBUF (TIMERx\_PWMCMPBUF[15:0]), respectively when one PWM period completes. The first CMP and PERIOD will be loaded to CMPBUF and PBUF, respectively, after CNTEN (TIMERx\_PWMCTL[0]) is 1.

#### 6.7.6.5 PWM Comparator

The CMP (TIMERx\_PWMCMPDAT[15:0]) is comparator register of PWM. The CMP value is continuously compared to the corresponding counter value. When the counter is equal to CMP, PWM generates a compared point event. This event will generate PWM output pulse, interrupt signal wake-up or trigger EADC, PDMA, DAC to start conversion.

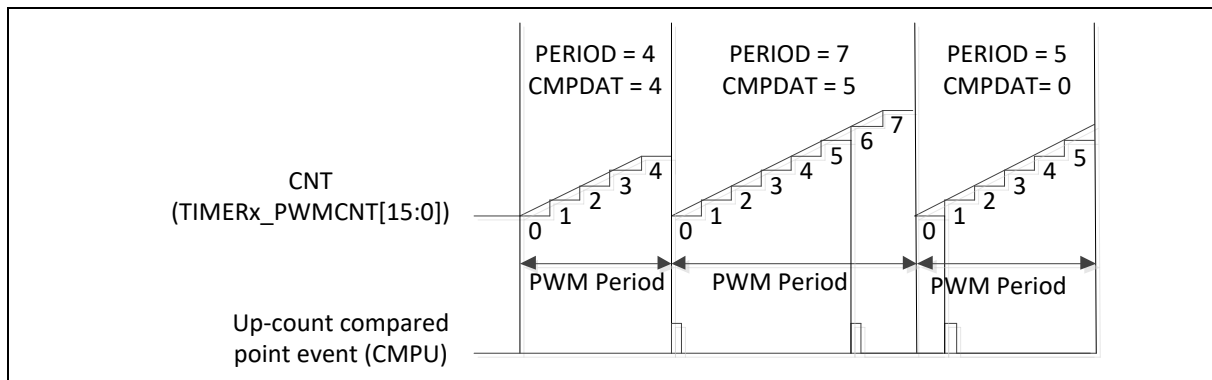

Figure 6.7-14 PWM Comparator Events in Up Count Type

#### 6.7.6.6 Period Loading Mode

The PWM provides PBUF (TIMERx\_PWMPBUF[15:0]) is the active PERIOD buffer register and CMPBUF (TIMERx\_PWMCMPBUF[15:0]) is the active CMP buffer register. In period loading mode, both PERIOD (TIMERx\_PWMPERIOD[15:0]) and CMP (TIMERx\_PWMCMPDAT[15:0]) will load to their active PBUF and CMPBU register while each PWM period is completed. Figure 6.7-15 shows period loading timing of up count type, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by user and so on, CMP also follows this rule. The following steps are the sequence of Figure 6.7-15.

1. User writes CMP DATA1 to CMP at point 1.
2. Period loading CMP DATA1 to CMPBUF at the end of PWM period at point 2.
3. User writes PERIOD DATA1 to PERIOD at point 3.
4. Period loading PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. User writes PERIOD DATA2 to PERIOD at point 5.
6. Period loading PERIOD DATA2 to PBUF at the end of PWM period at point 6.

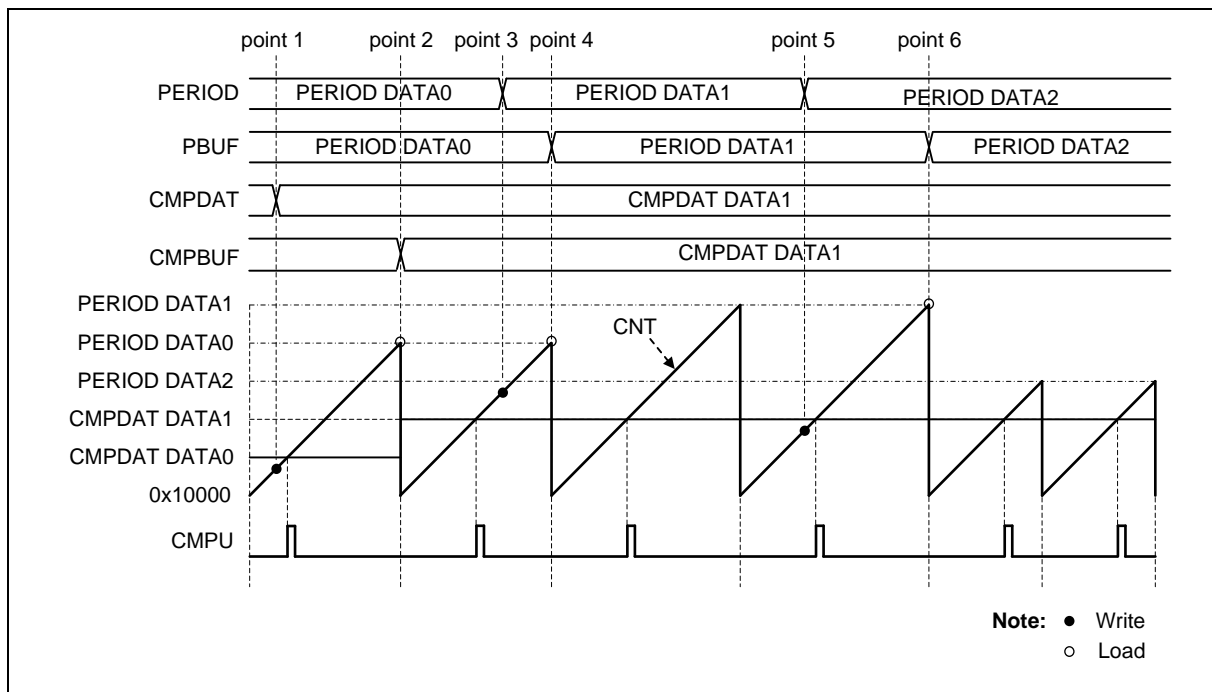

Figure 6.7-15 Period Loading Mode with Up Count Type

#### 6.7.6.7 PWM Pulse Generator

PWM pulse generator uses counter and comparator events to generate PWM output pulse. The events are zero point in up count type and counter equal to comparator point in up count type.

The event point can generate PWM output waveform in up count type as shown in Figure 6.7-16.

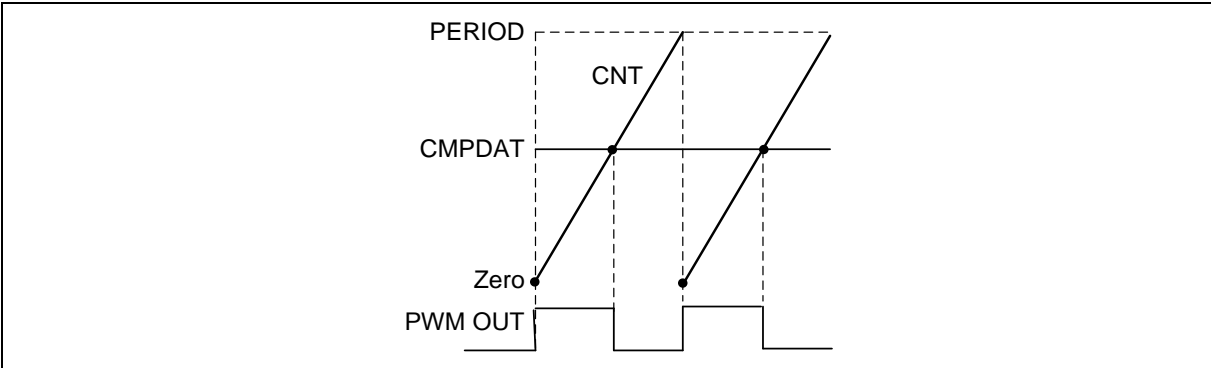

Figure 6.7-16 PWM Pulse Generation in Up Count Type

The PWM output pulse is associated with CMPBUF (TIMERx\_PWMCMPBUF[15:0]) and PBUF (TIMERx\_PWMPBUF[15:0]). The rules are listed as below.

- 1. If CMPBUF is zero, PWM output is 100% low.
- 2. If CMPBUF > PBUF, PWM output is 100% high.
- 3. If  $0 < \text{CMPBUF} \leq \text{PBUF}$ , PWM output high/low duty is according to counter value (TIMERx\_PWMCNT[15:0]).
  - 1) If PWM counter is higher than CMPBUF or equal to CMPBUF, PWM output is low.
  - 2) If PWM counter is lower than CMPBUF, PWM output is high.

The PWM output level table is shown as Table 6.7-5.

Conditions	CMPBUF = 0	CMPBUF > PBUF	0 < CMPBUF ≤ PBUF	
			CNT ≥ CMPBUF	CNT < CMPBUF
PWM Output	Low	High	Low	High

Table 6.7-5 PWM Output Level

Figure 6.7-17 is an example about PWM duty cycle from 0% to 100% in up count type where PERIOD is 4 with different CMP value.

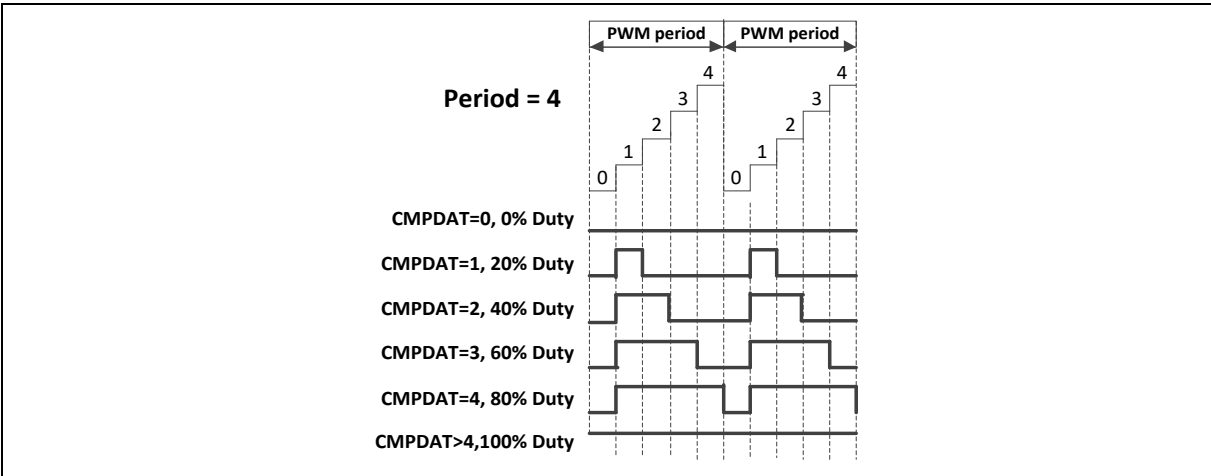

Figure 6.7-17 PWM 0% to 100% Duty Cycle in Up Count Type

#### 6.7.6.8 PWM Output Control

After PWM pulse generator, there are three steps to control output waveform. User can set POEN (TIMERx\_PWMPOCTL[0]) 1 to enable PWMx\_OUT output waveform and set POSEL (TIMERx\_PWMPOCTL[8]) to select TMx or TMx\_EXT as PWM output channel.

There are polarity control, output enable control and output channel select to control output waveform as shown in Figure 6.7-18.

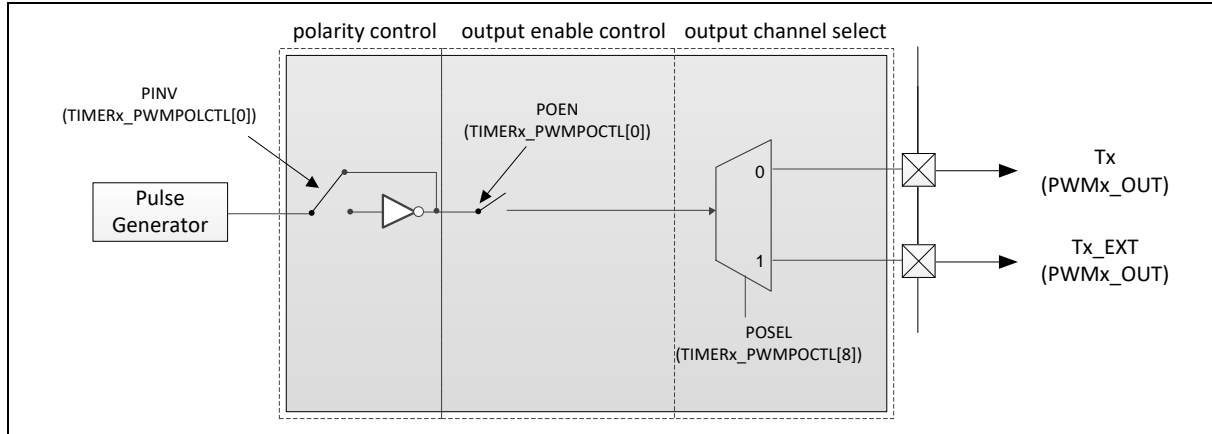

Figure 6.7-18 PWM Output PWMx\_OUT Control

#### 6.7.6.9 Polarity Control

Each PWMx\_OUT (TMx or TMx\_EXT) has an independent polarity control to configure the polarity of the active state of PWM output. User can control polarity state on PINV (TIMERx\_PWMPOCTL[0]). Figure shows the PWMx\_OUT with polarity control.

When PWM output is selected as TMx pin, PINV is 0, TMx\_EXT pin is kept as 0. Similarly, TMx\_EXT pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx\_EXT pin, PINV is 0, TMx pin is kept as 0. Similarly, TMx pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx pin, PINV is 0, but POEN (TIMERx\_PWMPOCTL[0]) is set as 0, TMx pin is kept as 0. Similarly, TMx pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx\_EXT pin, PINV is 0, but POEN is set as 0, TMx\_EXT pin is kept as 0. Similarly, TMx\_EXT pin is kept as 1 when PINV is 1.

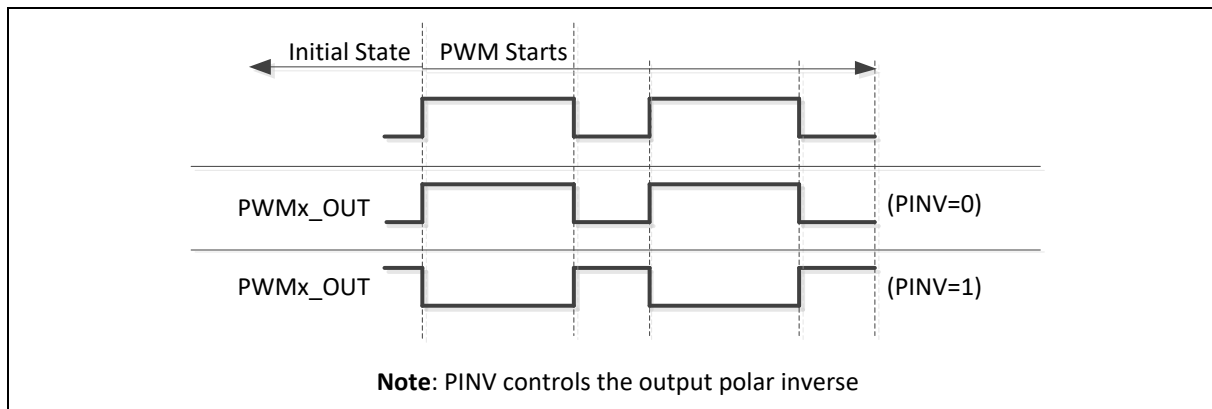

Figure 6.7-19 PWMx\_OUT Polarity Control

6.7.6.10 PWM Interrupt Generator

There are independent interrupts for each PWM as shown in Figure 6.7-20.

The PWM interrupt (PWMx\_INT) comes from PWM complementary pair events. The counter can generate the period point interrupt flag PIF (TIMERx\_PWMINTSTS0[1]). When counter equals to the comparator value stored in CMP (TIMERx\_PWMCMPDAT[15:0]) at up-count direction, the comparator up interrupt flag CMPUIF (TIMERx\_PWMINTSTS0[2]) is set. If the corresponding interrupt enable bits are set, the interrupt trigger events will also generates interrupt signals.

Figure 6.7-20 PWM Interrupt Architecture Diagram

6.7.6.11 PWM Wake-up Generator

User can set PWMINTWKEN (TIMERx\_PWMCTL[12]) high to wake up when PWM interrupt occurs. Before enter power-down mode, user must select LXT or LIRC as PWM clock source.

When PWM wake-up occurs, PWMINTWKF (TIMERx\_PWMSTATUS[8]) is set to 1. User can write 1 to this bit to clear this flag.

Figure 6.7-21 PWM Wake-up Architecture Diagram

6.7.6.12 PWM Trigger EADC, PDMA, DAC Generator

PWM counter event can be one of the EADC, PDMA, DAC conversion trigger source. User sets TRGSEL (TIMERx\_PWMTRGCTL[1:0]) to select which PWM counter event can trigger conversion.

When the PWMTRGEADC (TIMERx\_PWMTRGCTL[7]) is set to 1, the PWM can trigger EADC. When the PWMTRGDAC (TIMERx\_PWMTRGCTL[8]) is set to 1, the PWM can trigger DAC. When the PWMTRGPDMA (TIMERx\_PWMTRGCTL[9]) is set to 1, the PWM can trigger PDMA.

There are three PWM counter events can be selected as the trigger source to start conversion as shown in Figure 6.7-22.

The PWM interrupt, wake-up and trigger comparison table is shown as Table 6.7-6.

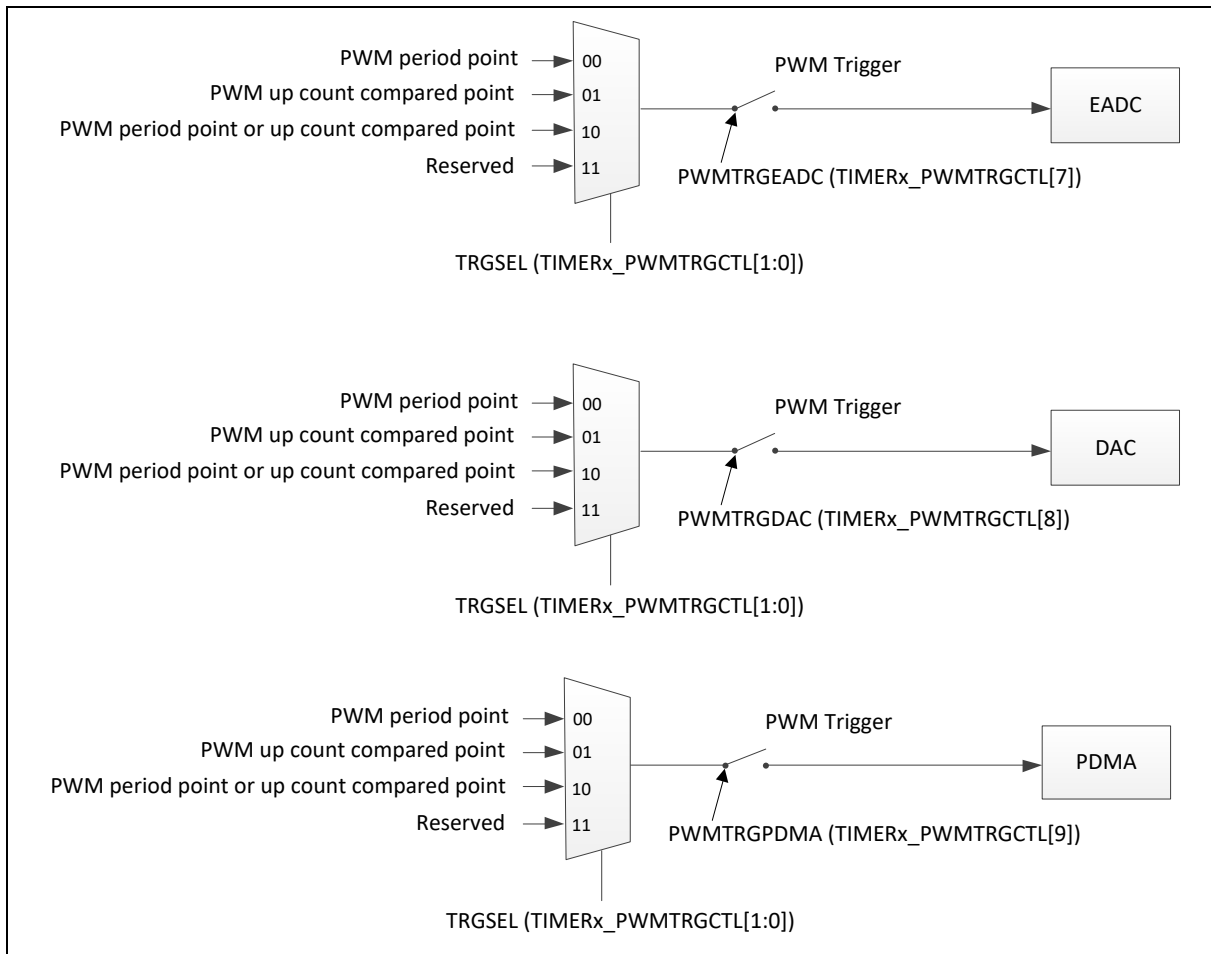

Figure 6.7-22 PWM Trigger Block Diagram

Functions Events		Interrupt	Wake-Up PWMINTWKEN (TIMERx_PWMCTL[12])		Trigger
			= 0	= 1	
CNT = CMP	CMPUIEN = 1	Yes	No	Yes	EADC, DAC, PDMA (Note1)
	CMPUIEN = 0	No	No	No	No
CNT = PERIOD	PIEN = 1	Yes	No	Yes	EADC, DAC, PDMA (Note1)
	PIEN = 0	No	No	No	No

Table 6.7-6 PWM Interrupt, Wake-up and Trigger Events Comparison

**Note:** Set TRGSEL (TIMERx\_PWMTRGCTL[1:0]) to select trigger event and set PWMTRGEADC (TIMERx\_PWMTRGCTL[7]), PWMTRGPWM (TIMERx\_PWMTRGCTL[8]), PWMTRGPDMA (TIMERx\_PWMTRGCTL[9]) to select which device will be triggered.

## 6.7.6.13 Mode Transition

If user needs to change timer mode to PWM mode or PWM mode to timer mode, user must do reset before change mode or check the previous mode is end.

### **The Timer mode to PWM mode transition steps are shown below.**

1. Set Timer CNTEN (TIMERx\_CTL[30]) as 0
2. Polling ACTSTS (TIMERx\_CTL[25]). If ACTSTS is 0, user can set FUNCSEL (TIMERx\_CTL[15]) as 1 to enable PWM mode.
3. PWM function settings.

### **The PWM mode to Timer mode transition steps are shown below.**

1. Set PWM CNTEN (TIMERx\_PWMCTL[0]) as 0.
2. Set FUNCSEL as 0 to disable PWM mode.
3. Polling FUNCSEL. If FUNCSEL is 0, user can set Timer settings.

## 6.7.7 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>TIMER Base Address:</b> <b>TMR01_BA = 0x4005_0000</b> <b>TMR23_BA = 0x4005_1000</b>

Bits	Description
[31]	<p><b>ICE Debug Mode Acknowledge Disable Bit (Write Protect)</b></p> <p>0 = ICE debug mode acknowledgement effects TIMER counting.            TIMER counter will be held while CPU is held by ICE.            1 = ICE debug mode acknowledgement Disabled.            TIMER counter will keep going no matter CPU is held by ICE or not.  <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[30]	<p><b>Timer Counting Enable Bit</b></p> <p>0 = Stops/Suspends counting.            1 = Starts counting.</p> <p><b>Note 1:</b> In stop status, and then set CNTEN to 1 will enable the 24-bit up counter to keep counting from the last stop counting value.</p> <p><b>Note 2:</b> This bit is auto-cleared by hardware in one-shot mode (TIMER_CTL[28:27] = 00) when the timer time-out interrupt flag TIF (TIMERx_INTSTS[0]) is generated.</p> <p><b>Note 3:</b> Set enable/disable this bit needs 2 * TMR_CLK period to become active, user can read ACTSTS (TIMERx_CTL[25]) to check enable/disable command is completed or not.</p>
[29]	<p><b>Timer Interrupt Enable Bit</b></p> <p>0 = Timer time-out interrupt Disabled.            1 = Timer time-out interrupt Enabled.</p> <p><b>Note:</b> If this bit is enabled, when the timer time-out interrupt flag TIF is set to 1, the timer interrupt signal is generated and inform to CPU.</p>

[28:27]	<b>OPMODE</b>	<b>Timer Counting Mode Select</b> 00 = The timer controller is operated in One-shot mode. 01 = The timer controller is operated in Periodic mode. 10 = The timer controller is operated in Toggle-output mode. 11 = The timer controller is operated in Continuous Counting mode.
[26]	<b>Reserved</b>	Reserved.
[25]	<b>ACTSTS</b>	<b>Timer Active Status Bit (Read Only)</b> This bit indicates the 24-bit up counter status. 0 = 24-bit up counter is not active. 1 = 24-bit up counter is active. <b>Note:</b> This bit may active when CNT 0 transition to CNT 1.
[24]	<b>EXTCNTEN</b>	<b>Event Counter Mode Enable Bit</b> This bit is for external counting pin function enabled. 0 = Event counter mode Disabled. 1 = Event counter mode Enabled. <b>Note:</b> When timer is used as an event counter, this bit should be set to 1 and select PCLK as timer clock source.
[23]	<b>WKEN</b>	<b>Wake-up Function Enable Bit</b> If this bit is set to 1, while timer interrupt flag TIF (TIMERx_INTSTS[0]) is 1 and INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal will generate a wake-up trigger event to CPU. 0 = Wake-up function Disabled if timer interrupt signal generated. 1 = Wake-up function Enabled if timer interrupt signal generated.
[22]	<b>CAPSRC</b>	<b>Capture Pin Source Selection</b> 0 = Capture Function source is from TMx_EXT (x= 0~3) pin. 1 = Capture Function source is from internal ACMP output signal, internal clock (MIRC, LIRC, HIRC), or external clock (HXT, LXT). <b>Note:</b> When CAPSRC = 1, User can set INTERCAPSEL (TIMERx_EXTCTL[10:8]) to decide which internal ACMP output signal or which clock is as timer capture source.
[21]	<b>TGLPINSEL</b>	<b>Toggle-output Pin Select</b> 0 = Toggle mode output to TMx (Timer Event Counter Pin). 1 = Toggle mode output to TMx_EXT (Timer External Capture Pin).
[20]	<b>PERIOSEL</b>	<b>Periodic Mode Behavior Selection Enable Bit</b> 0 = The behavior selection in periodic mode is Disabled. When user updates CMPDAT while timer is running in periodic mode, CNT will be reset to default value. 1 = The behavior selection in periodic mode is Enabled. When user updates CMPDAT while timer is running in periodic mode, the limitations as bellows list, If updated CMPDAT value > CNT, CMPDAT will be updated and CNT keep running continually. If updated CMPDAT value = CNT, timer time-out interrupt will be asserted immediately. If updated CMPDAT value < CNT, CNT will be reset to default value.
[19]	<b>INTRGEN</b>	<b>Inter-timer Trigger Mode Enable Bit</b> Setting this bit will enable the inter-timer trigger capture function. The Timer0/2 will be in event counter mode and counting with external clock source or event. Also, Timer1/3 will be in trigger-counting mode of capture function. 0 = Inter-Timer Trigger Capture mode Disabled. 1 = Inter-Timer Trigger Capture mode Enabled. <b>Note:</b> For Timer1/3, this bit is ineffective and the read back value is always 0.

[18:16]	<b>Reserved</b>	Reserved.
[15]	<b>FUNCSEL</b>	<b>Function Selection</b> 0 = Timer controller is used as timer function. 1 = Timer controller is used as PWM function. <b>Note:</b> When timer is used as PWM, the clock source of time controller will be forced to PCLKx automatically.
[14:8]	<b>Reserved</b>	Reserved.
[7:0]	<b>PSC</b>	<b>Prescale Counter</b> Timer input clock or event source is divided by (PSC+1) before it is fed to the timer up counter. If this field is 0 (PSC = 0), then there is no scaling. <b>Note:</b> Update prescale counter value will reset internal 8-bit prescale counter and 24-bit up counter value.

## Timer (TIMERx\_CMP) Comparator Register

Register	Offset	R/W	Description	Reset Value
TIMER0_CMP	TMR01_BA+0x04	R/W	Timer0 Comparator Register	0x0000_0000

CNT							

Bits	Description
[31]	<b>RSTACT</b> <b>Timer Data Register Reset Active (Read Only)</b> This bit indicates if the counter reset operation active. When user writes this CNT register, timer starts to reset its internal 24-bit timer up-counter to 0 and reload 8-bit pre-scale counter. At the same time, timer set this flag to 1 to indicate the counter reset operation is in progress. Once the counter reset operation done, timer clear this bit to 0 automatically. 0 = Reset operation is done. 1 = Reset operation triggered by writing TIMERx_CNT is in progress.
[30:24]	<b>Reserved</b> Reserved.
[23:0]	<b>CNT</b> <b>Timer Data Register</b> Read operation. Read this register to get CNT value. For example: If EXTCNTEN (TIMERx_CTL[24]) is 0, user can read CNT value for getting current 24-bit counter value. If EXTCNTEN (TIMERx_CTL[24]) is 1, user can read CNT value for getting current 24-bit event input counter value. Write operation. Writing any value to this register will reset current CNT value to 0 and reload internal 8-bit prescale counter.

## 6.8 Watchdog Timer (WDT)

### 6.8.1 Overview

The Watchdog Timer (WDT) is used to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, this Watchdog Timer supports the function to wake up system from Idle/Power-down mode.

### 6.8.2 Features

- 20-bit free running up counter for WDT time-out interval
- Selectable time-out interval ( $2^4 \sim 2^{20}$ ) and the time-out interval is 417us ~ 27.3 s if WDT\_CLK = 38.4 kHz (LIRC).
- System kept in reset state for a period of  $(1 / \text{WDT\_CLK}) * 63$
- Supports selectable WDT reset delay period, including 1026, 130, 18 or 3 WDT\_CLK reset delay period
- Supports to force WDT enabled after chip powered on or reset by setting CWDTEN[2:0] in Config0 register
- Supports WDT time-out wake-up function only if WDT clock source is selected as 38.4 kHz LIRC or LXT.

### 6.8.3 Block Diagram

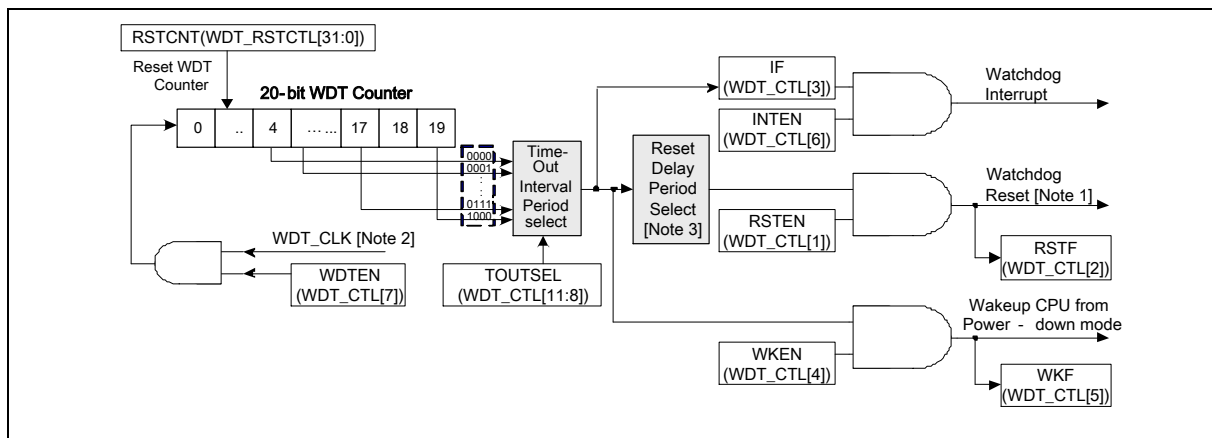

Figure 6.8-1 Watchdog Timer Block Diagram

**Note1:** WDT resets CPU and lasts 63 WDT\_CLK.

**Note2:** The WDT reset delay period can be selected as 3/18/130/1026 WDT\_CLK.

**Note3:** Chip can be woken up by WDT time-out interrupt signal generated only if WDT clock source is selected to LIRC or LXT.

**Note4:** After system is woken up from Power-down mode, the WDT counter will be reset automatically by all wake up events.

### 6.8.4 Basic Configuration

- Clock Source Configuration
  - Select the source of WDT peripheral clock on WDTSEL (CLK\_CLKSEL1[1:0])
  - Enable WDT peripheral clock in WDTCKEN (CLK\_APBCLK0[0]).

- Force enable WDT controller after chip powered on or reset in CWDTEN[2:0] (CWDTEN[2] is Config0[31], CWDTEN[1:0] is Config0[4:3])
- WDT clock source can be changed only if CWDTEN[2:0] is 111

The WDT clock control is shown in Figure 6.8-2.

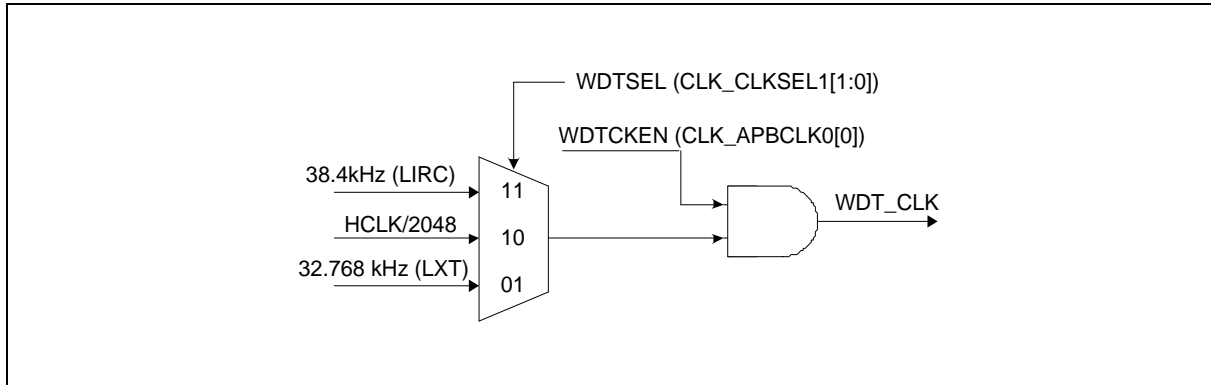

Figure 6.8-2 Watchdog Timer Clock Control

### 6.8.5 Functional Description

The WDT includes an 20-bit free running up counter with programmable time-out intervals. Table 6.8-1 shows the WDT time-out interval period selection and Figure 6.8-3 shows the WDT time-out interval and reset period timing.

#### 6.8.5.1 WDT Time-out Interrupt

Setting WDTEEN (WDT\_CTL [7]) to 1 will enable the WDT function and the WDT counter to start counting up. The SYNC (WDT\_CTL[30]) can be indicated whether enable/disable WDTEEN function is completed or not. There are eight time-out interval period can be selected by setting TOUTSEL (WDT\_CTL[10:8]). When the WDT up counter reaches the TOUTSEL (WDT\_CTL[11:8]) settings, WDT time-out interrupt will occur then WDT time-out interrupt flag IF (WDT\_CTL[3]) will be set to 1 immediately. If INTEN (WDT\_CTL[6]) is enabled, WDT time-out interrupt will inform CPU.

#### 6.8.5.2 WDT Reset Delay Period and Reset System

There is a specified  $T_{RSTD}$  reset delay period follows the IF (WDT\_CTL[3]) is setting to 1. User should set WDT\_RSTCNT to reset the 20-bit WDT up counter value to avoid generate WDT time-out reset signal before the  $T_{RSTD}$  reset delay period expires. Moreover, user should set RSTDSEL (WDT\_ALTCTL [1:0]) to select reset delay period to clear WDT counter. If the WDT up counter value has not been cleared after the specific  $T_{RSTD}$  delay period expires, the WDT control will set RSTF (WDT\_CTL[2]) to 1 if RSTEN (WDT\_CTL[1]) bit is enabled, then chip enters to reset state immediately.  $T_{RST}$  reset period will keep last 63 WDT clocks then chip restart executing program from reset vector (0x0000\_0000). The RSTF (WDT\_CTL[2]) will keep 1 after WDT time-out resets the chip, user can check RSTF (WDT\_CTL[2]) by software to recognize the system has been reset by WDT time-out reset or not.

TOUTSEL	Time-Out Interval Period $T_{TIS}$	Reset Delay Period $T_{RSTD}$
0000	$2^4 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0001	$2^6 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0010	$2^8 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0011	$2^{10} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0100	$2^{12} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0101	$2^{14} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0110	$2^{16} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0111	$2^{18} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
1000	$2^{20} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$

Table 6.8-1 Watchdog Timer Time-out Interval Period Selection

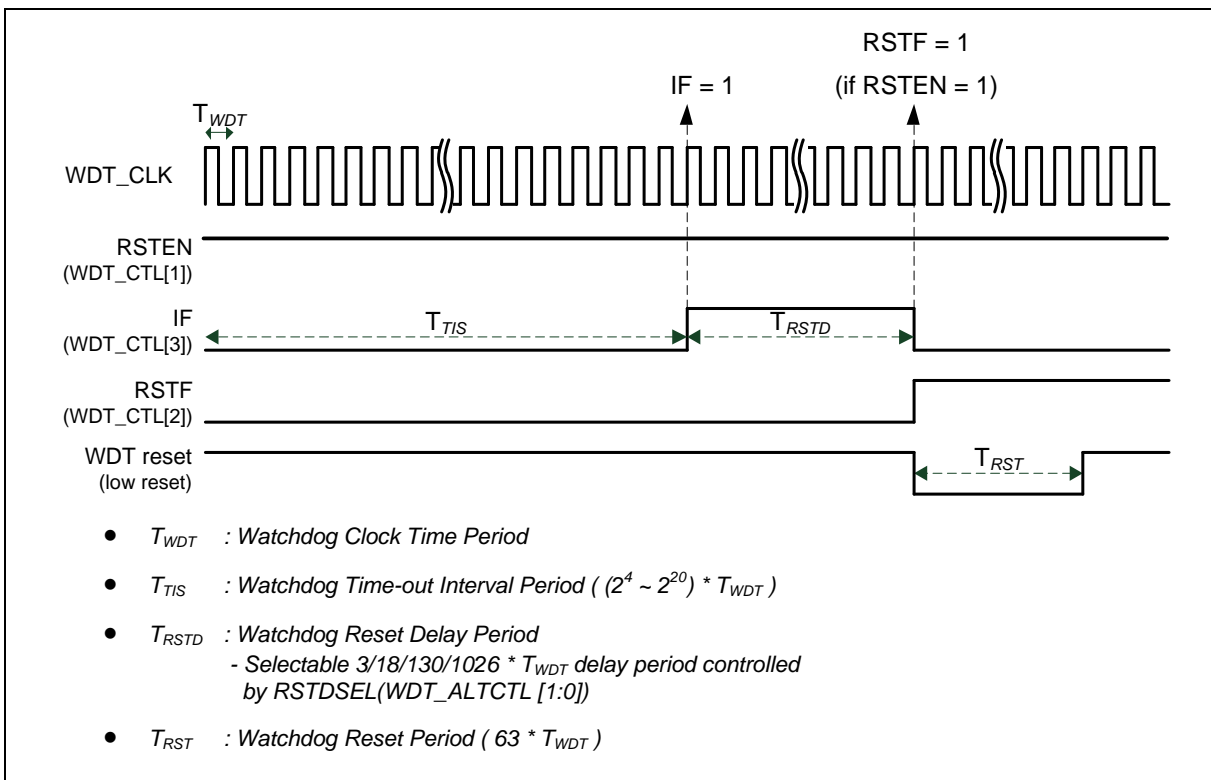

Figure 6.8-3 Watchdog Timer Time-out Interval and Reset Period Timing

#### 6.8.5.3 WDT Wake-up

If WDT clock source is selected to LIRC or LXT, system can be woken up from Power-down mode while WDT time-out interrupt signal is generated and WKEN (WDT\_CTL[4]) enabled. Note that user should set LXTEN (CLK\_PWRCTL [1]) or LIRCEN (CLK\_PWRCTL [3]) to select clock source before system enters Power-down mode because the system peripheral clock are disabled when system is in Power-down mode. In the meanwhile, the WKF (WDT\_CTL[5]) will be set to 1 automatically, and user can check WKF (WDT\_CTL[5]) status by software to recognize the system has been woken up by WDT time-out interrupt or not.

After system is woken up from Power-down mode, the WDT counter will be reset automatically by all wake up events.

#### 6.8.5.4 WDT ICE Debug

When ICE is connected to MCU, WDT counter is counting or not by ICEDEBUG (WDT\_CTL[31]). The default value of ICEDEBUG is 0, WDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WDT counter will keep counting no matter CPU is held by ICE or not.

### 6.8.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Bits	Description
[31]	<b>ICE Debug Mode Acknowledge Disable Bit (Write Protect)</b> 0 = ICE debug mode acknowledgement affects WDT counting. WDT up counter will be held while CPU is held by ICE. 1 = ICE debug mode acknowledgement Disabled. WDT up counter will keep going no matter CPU is held by ICE or not. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[30]	<b>WDT Enable Control SYNC Flag Indicator (Read Only)</b> If user executes enable/disable WDTEN (WDT_CTL[7]), this flag can be indicated enable/disable WDTEN function is completed or not. 0 = Set WDTEN bit is completed. 1 = Set WDTEN bit is synchronizing and not become active yet. <b>Note:</b> Performing enable or disable WDTEN bit needs 2 * WDT_CLK period to become active.
[29:12]	Reserved.
[11:8]	<b>WDT Time-out Interval Selection (Write Protect)</b> These four bits select the time-out interval period for the WDT. 0000 = $2^4 * \text{WDT\_CLK}$ . 0001 = $2^6 * \text{WDT\_CLK}$ . 0010 = $2^8 * \text{WDT\_CLK}$ . 0011 = $2^{10} * \text{WDT\_CLK}$ . 0100 = $2^{12} * \text{WDT\_CLK}$ . 0101 = $2^{14} * \text{WDT\_CLK}$ . 0110 = $2^{16} * \text{WDT\_CLK}$ . 0111 = $2^{18} * \text{WDT\_CLK}$ . 1000 = $2^{20} * \text{WDT\_CLK}$ . <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.

[7]	WDTEN	<b>WDT Enable Bit (Write Protect)</b> 0 = WDT Disabled (This action will reset the internal up counter value). 1 = WDT Enabled. <b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note 2:</b> If CWDTEN[2:0] (combined by Config0[31] and Config0[4:3]) bits is not configured to 111, this bit is forced as 1 and user cannot change this bit to 0.
[6]	INTEN	<b>WDT Time-out Interrupt Enable Bit (Write Protect)</b> If this bit is enabled, the WDT time-out interrupt signal is generated and inform to CPU. 0 = WDT time-out interrupt Disabled. 1 = WDT time-out interrupt Enabled. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[5]	WKF	<b>WDT Time-out Wake-up Flag (Write Protect)</b> This bit indicates the interrupt wake-up flag status of WDT 0 = WDT does not cause chip wake-up. 1 = Chip wake-up from Idle or Power-down mode if WDT time-out interrupt signal generated. <b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note 2:</b> This bit is cleared by writing 1 to it.
[4]	WKEN	<b>WDT Time-out Wake-up Function Control (Write Protect)</b> If this bit is set to 1, while WDT time-out interrupt flag IF (WDT_CTL[3]) is generated to 1 and interrupt enable bit INTEN (WDT_CTL[6]) is enabled, the WDT time-out interrupt signal will generate a wake-up trigger event to chip. 0 = Wake-up trigger event Disabled if WDT time-out interrupt signal generated. 1 = Wake-up trigger event Enabled if WDT time-out interrupt signal generated. <b>Note 1:</b> This bit is write protected. Refer to the SYS_REGLCTL register. <b>Note 2:</b> Chip can be woken up by WDT time-out interrupt signal generated only if WDT clock source is selected to 38.4 kHz internal low speed RC oscillator (LIRC) or LXT.
[3]	IF	<b>WDT Time-out Interrupt Flag</b> This bit will set to 1 while WDT up counter value reaches the selected WDT time-out interval 0 = WDT time-out interrupt did not occur. 1 = WDT time-out interrupt occurred. <b>Note:</b> This bit is cleared by writing 1 to it.
[2]	RSTF	<b>WDT Time-out Reset Flag</b> This bit indicates the system has been reset by WDT time-out reset or not. 0 = WDT time-out reset did not occur. 1 = WDT time-out reset occurred. <b>Note:</b> This bit is cleared by writing 1 to it.
[1]	RSTEN	<b>WDT Time-out Reset Enable Bit (Write Protect)</b> Setting this bit will enable the WDT time-out reset function if the WDT up counter value has not been cleared after the specific WDT reset delay period expires. 0 = WDT time-out reset function Disabled. 1 = WDT time-out reset function Enabled. <b>Note:</b> This bit is write protected. Refer to the SYS_REGLCTL register.
[0]	Reserved	Reserved.

## 6.9 Window Watchdog Timer (WWDT)

### 6.9.1 Overview

The Window Watchdog Timer (WWDT) is used to perform a system reset within a specified window period to prevent software running to uncontrollable status by any unpredictable condition.

### 6.9.2 Features

- 6-bit down counter value (CNTDAT, WWDT\_CNT[5:0]) and 6-bit compare value (CMPDAT, WWDT\_CTL[21:16]) to make the WWDT time-out window period flexible
- Supports 4-bit value (PSCSEL, WWDT\_CTL[11:8]) to programmable maximum 11-bit prescale counter period of WWDT counter
- WWDT counter suspends in Idle/Power-down mode

### 6.9.3 Block Diagram

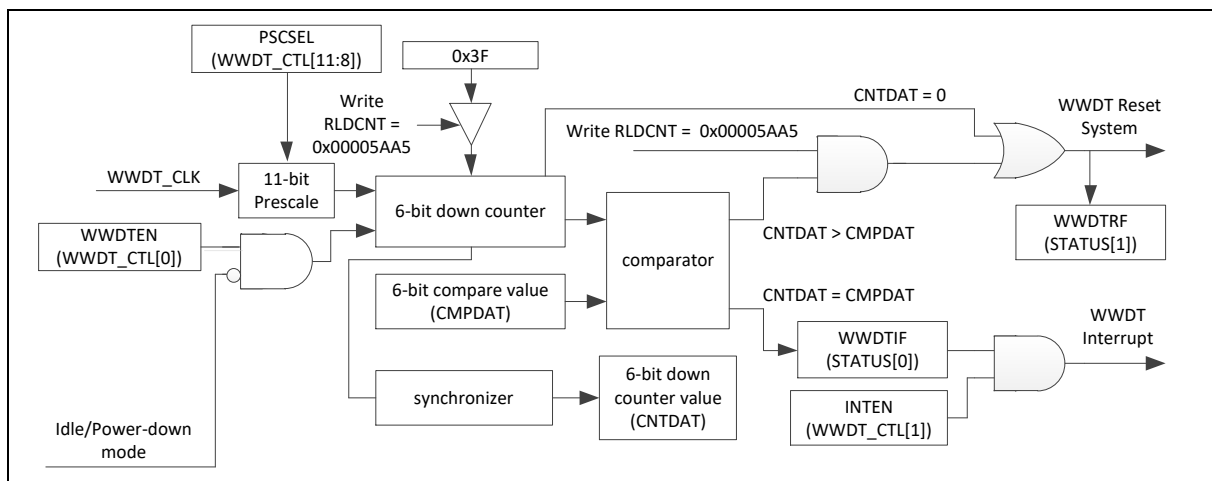

Figure 6.9-1 WWDT Block Diagram

### 6.9.4 Basic Configuration

- Clock Source Configuration
  - Select the source of WWDT peripheral clock on WWDTSSEL (CLK\_CLKSEL1[31:30])
  - Enable WWDT peripheral clock in WDTCKEN (CLK\_APBCLK0[0]).

The WWDT clock control is shown in Figure 6.9-2.

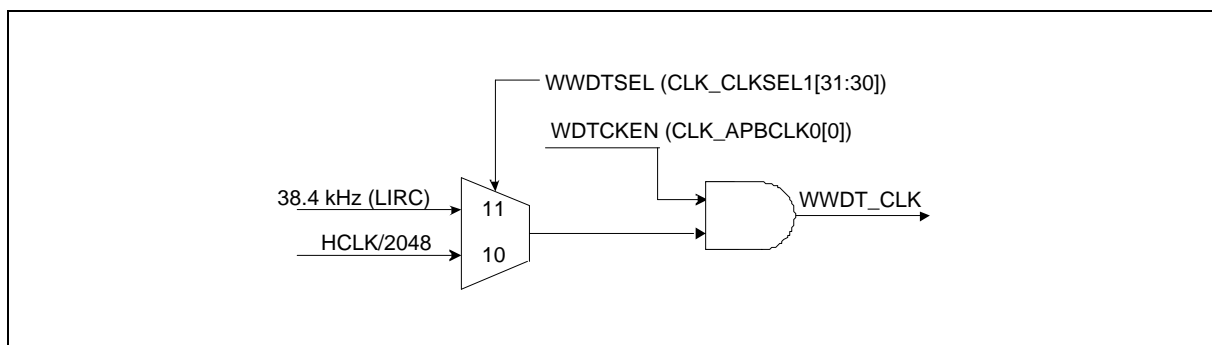

Figure 6.9-2 WWDT Clock Control

### 6.9.5 Functional Description

The WWDT includes a 6-bit down counter with programmable prescale value to define different WWDT time-out intervals. The clock source of 6-bit WWDT is based on system clock divide 2048 (HCLK/2048) or 38.4 kHz internal low speed RC oscillator (LIRC) with a programmable 11-bit prescale counter value which controlled by PSCSEL (WWDT\_CTL[11:8]). Also, the correlate of PSCSEL (WWDT\_CTL[11:8]) and prescale value are listed in Table 6.9-1.

PSCSEL	Prescaler Value	Max. Time-Out Period	Max. Time-Out Interval (WWDT_CLK=38.4 kHz)
0000	1	$1 * 64 * T_{WWDT}$	1.667 ms
0001	2	$2 * 64 * T_{WWDT}$	3.333 ms
0010	4	$4 * 64 * T_{WWDT}$	6.667 ms
0011	8	$8 * 64 * T_{WWDT}$	13.333 ms
0100	16	$16 * 64 * T_{WWDT}$	26.667 ms
0101	32	$32 * 64 * T_{WWDT}$	53.333 ms
0110	64	$64 * 64 * T_{WWDT}$	106.667 ms
0111	128	$128 * 64 * T_{WWDT}$	213.333 ms
1000	192	$192 * 64 * T_{WWDT}$	320 ms
1001	256	$256 * 64 * T_{WWDT}$	426.667 ms
1010	384	$384 * 64 * T_{WWDT}$	640 ms
1011	512	$512 * 64 * T_{WWDT}$	853.333 ms
1100	768	$768 * 64 * T_{WWDT}$	1.28 s
1101	1024	$1024 * 64 * T_{WWDT}$	1.701 s
1110	1536	$1536 * 64 * T_{WWDT}$	2.56 s
1111	2048	$2048 * 64 * T_{WWDT}$	3.413 s

Table 6.9-1 WWDT Prescaler Value Selection

#### 6.9.5.1 WWDT Counting

When the WWDTEN (WWDT\_CTL[0]) is set, WWDT down counter will start counting from 0x3F to 0. To prevent program runs to disable WWDT counter counting unexpected, the WWDT\_CTL register can only be written once after chip is powered on or reset. User cannot disable WWDT counter counting (WWDTEN), change counter prescale period (PSCSEL) or change window compare value (CMPDAT) while WWDTEN (WWDT\_CTL[0]) has been enabled by user unless chip is reset.

To avoid the system is reset while CPU clock is disabled, the WWDT counter will stop counting when CPU enters Idle/Power-down mode. After CPU enters normal mode, the WWDT counter will start down counting.

#### 6.9.5.2 WWDT Compare Match Interrupt

During down counting by the WWDT counter, the WWDTIF (WWDT\_STATUS[0]) is set to 1 while the WWDT counter value (CNTDAT) is equal to window compare value (CMPDAT) and WWDTIF can be cleared by user; if INTEN (WWDT\_CTL[1]) is also set to 1 by user, the WWDT compare match interrupt signal is generated also while WWDTIF is set to 1 by hardware.

#### 6.9.5.3 WWDT Reset System

Figure 6.9-3 shows three cases of WWDT reset and reload behavior.

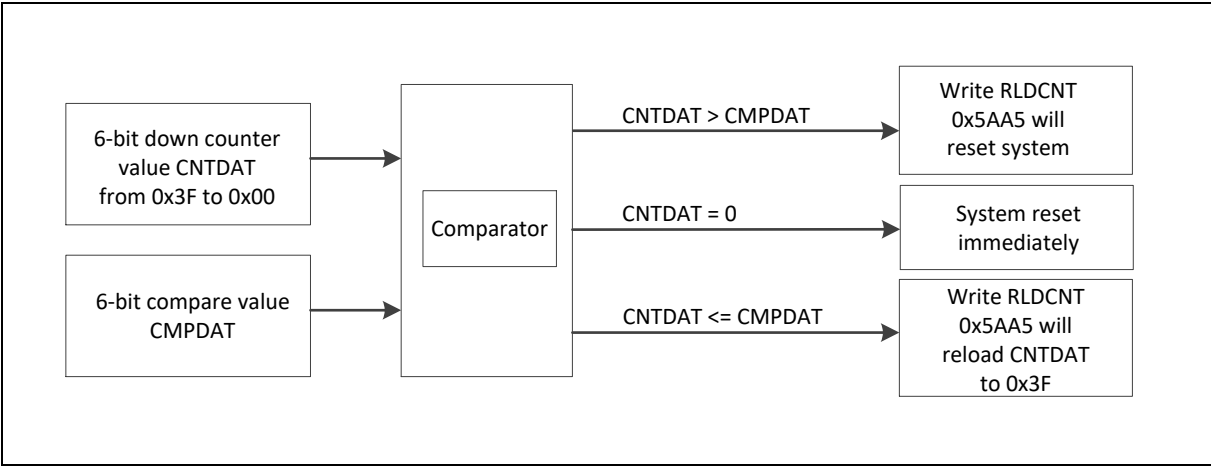

Figure 6.9-3 WWDT Reset and Reload Behavior

If the current CNTDAT (WWDT\_CNT[5:0]) is greater than CMPDAT (WWDT\_CTL[21:16]) and user writes 0x00005AA5 to the WWDT\_RLDCNT register, the WWDT reset system signal will be generated immediately to cause chip reset also. The waveform of WWDT reload counter when CNTDAT > CMPDAT is shown in Figure 6.9-4.

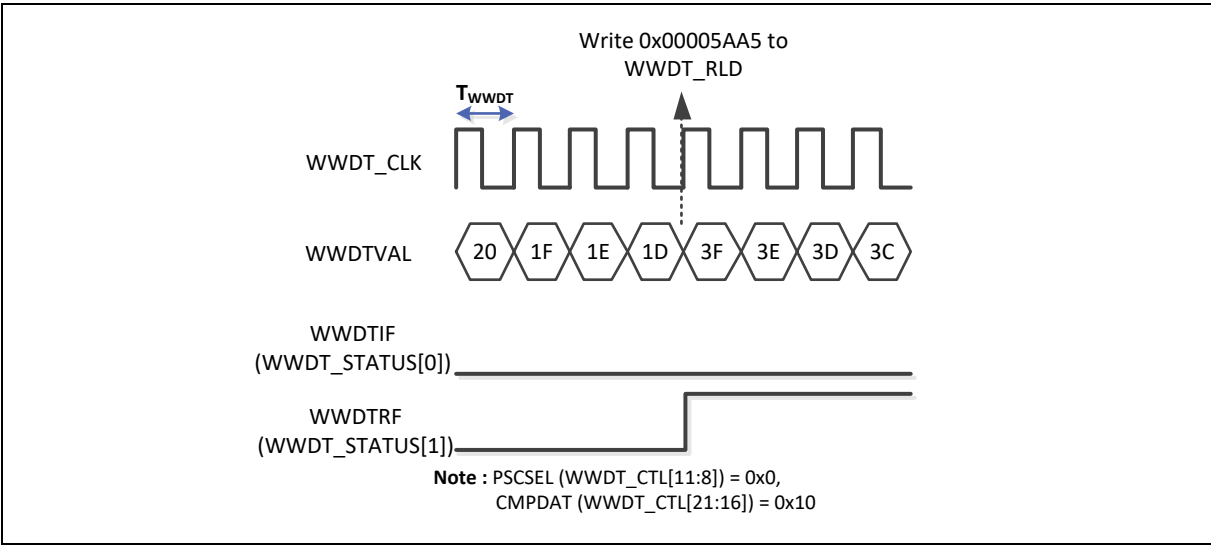

Figure 6.9-4 WWDT Reload Counter When CNTDAT > CMPDAT

When WWDTIF (WWDT\_STATUS[0]) is generated, user must reload WWDT counter value to 0x3F by writing 0x00005AA5 to WWDT\_RLDCNT register, and also to prevent WWDT counter value reached to 0 and generate WWDT reset system signal to inform system reset. Figure 6.9-5 shows the waveform of WWDT reload counter when CNTDAT < CMPDAT and Figure 6.9-6 shows WWDT generates reset system signal (WWDTTRF) if user doesn't write 0x00005AA5 to WWDT\_RLD before WWDT counter value reaches 0.

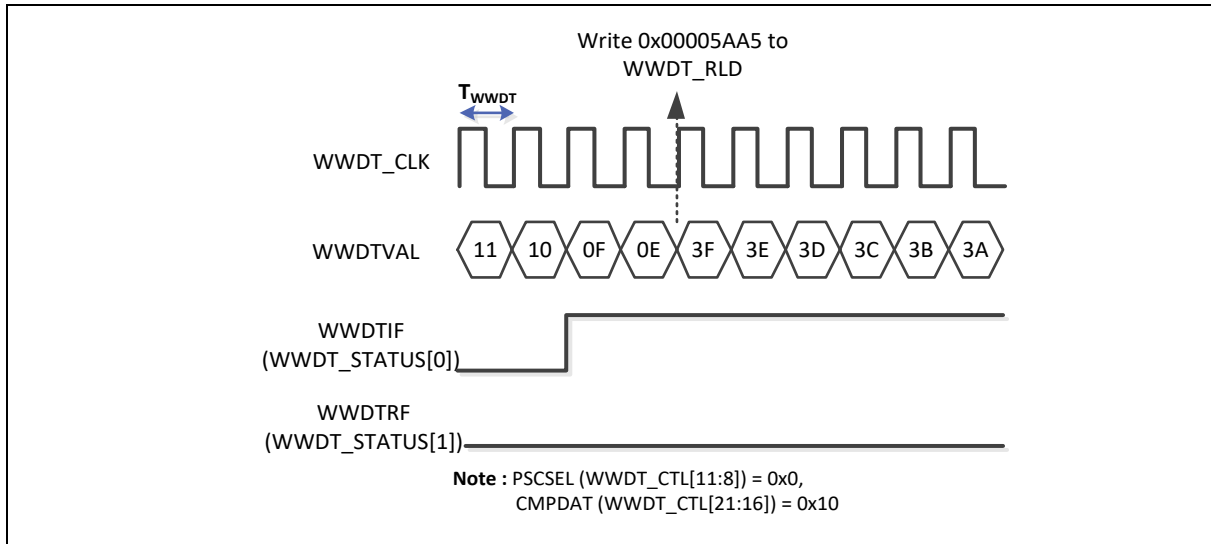

Figure 6.9-5 WWDT Reload Counter When WWDT\_CNT < WINCMP

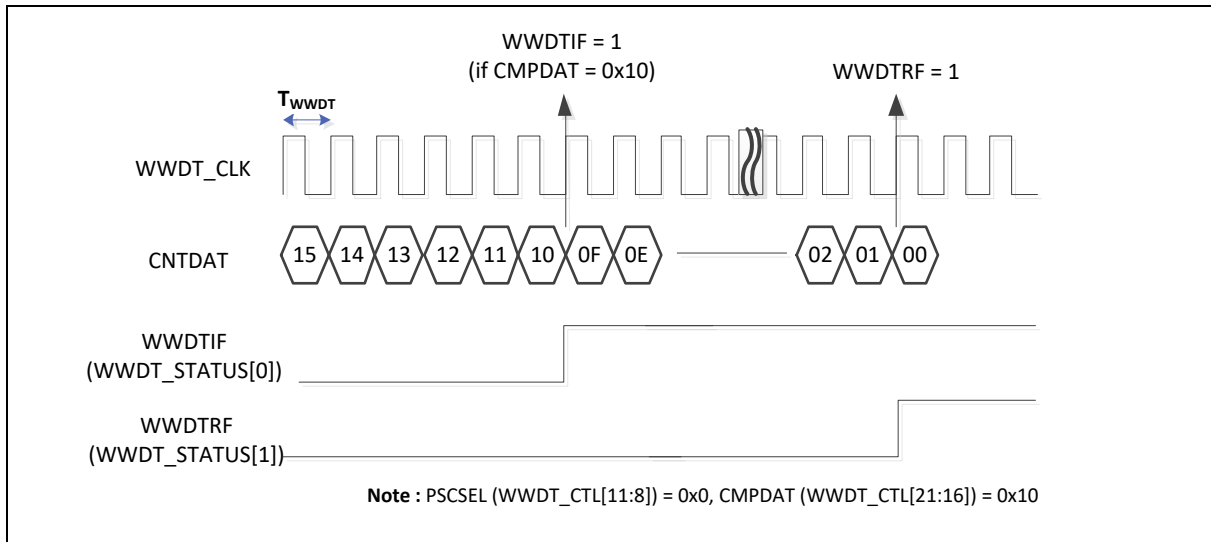

Figure 6.9-6 WWDT Interrupt and Reset Signals

#### 6.9.5.4 WWDT Window Setting Limitation

When user writes 0x0005AA5 to WWDT\_RLDCNT register to reload WWDT counter value to 0x3F, it needs 3 WWDT clocks to sync the reload command to actually perform reload action. Note that if user sets PSCSEL (WWDT\_CTL[11:8]) to 0000, the counter prescale value should be as 1, and the CMPDAT (WWDT\_CTL[21:16]) must be greater than 2. Otherwise, writing WWDT\_RLDCNT register to reload WWDT counter value to 0x3F is unavailable, WWDTIF (WWDT\_STATUS[0]) is generated, and WWDT reset system event always happened. The WWDT CMPDAT setting limitation is shown in Table 6.9-2.

If user sets CMPDATA as 0x3F and 0x0, the interrupt doesn't occur. The reset occurs when WWDT counts to 0x0, so the interrupt doesn't occur when CMPDATA is 0x0.

PSCSEL	Prescale Value	Valid CMPDAT Value
0000	1	0x3 ~ 0x3E
0001	2	0x2 ~ 0x3E

Others	Others	0x1 ~ 0x3E
--------	--------	------------

Table 6.9-2 CMPDAT Setting Limitation

6.9.5.5 WWDT ICE Debug

When ICE is connected to MCU, the WWDT counter is counting or not by ICEDEBUG (WWDT\_CTL[31]). The default value of ICEDEBUG is 0. The WWDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WWDT counter will keep counting no matter CPU is held by ICE or not.

## 6.9.6 Register Map

## 6.10 Real Time Clock (RTC)

### 6.10.1 Overview

The Real Time Clock (RTC) controller provides the real time and calendar message. The RTC offers programmable time tick and alarm match interrupts. The data format of time and calendar messages are expressed in BCD format. A digital frequency compensation feature is available to compensate external crystal oscillator frequency accuracy.

### 6.10.2 Features

- Supports external power pin  $V_{BAT}$ .
- Supports real time counter in RTC\_TIME (hour, minute, second) and calendar counter in RTC\_CAL (year, month, day) for RTC time and calendar check.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) settings in RTC\_TALM and RTC\_CALM.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) mask enable in RTC\_TAMSK and RTC\_CAMSK.
- Selectable 12-hour or 24-hour time scale in RTC\_CLKFMT register.
- Supports Leap Year indication in RTC\_LEAPYEAR register.
- Supports Day of the Week counter in RTC\_WEEKDAY register.
- Frequency of RTC clock source compensate by RTC\_FREQADJ register.
- All time and calendar message expressed in BCD format.
- Supports periodic RTC Time Tick interrupt with 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second.
- Supports RTC Time Tick and Alarm Match interrupt.
- Supports 1 Hz clock output.
- Supports chip wake-up from Idle or Power-down mode while a RTC interrupt signal is generated.
- Supports Daylight Saving Time software control in RTC\_DSTCTL.
- Supports one tamper pin.
- Supports 20 bytes spare registers and tamper-pin detection to clear the content of these spare registers.

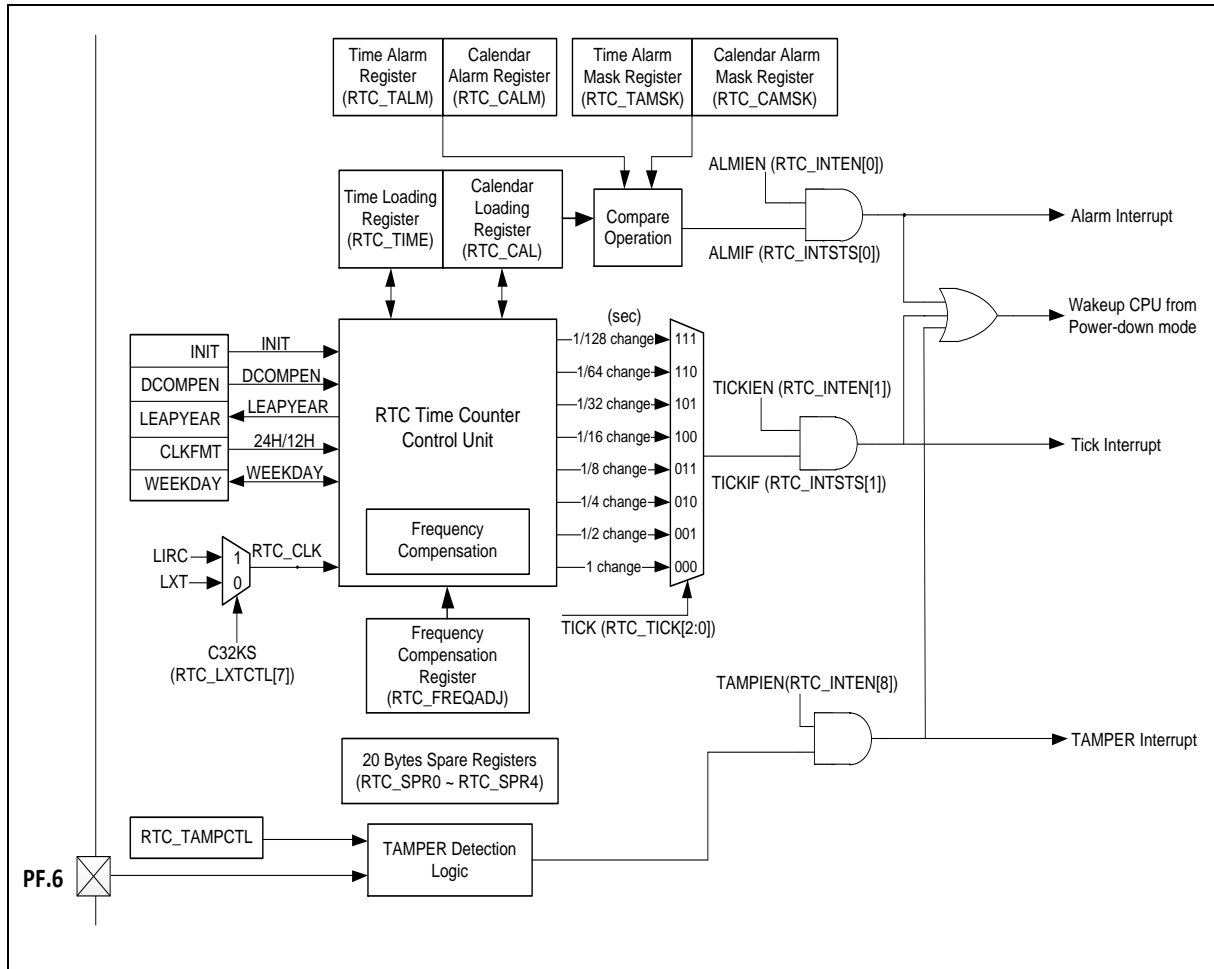

Figure 6.10-1 RTC Block Diagram

### 6.10.4 Basic Configuration

- Clock Source Configuration
  - The RTC controller clock source is enabled by RTCKEN (APBCLK0[1]) and RTC Time Counter source is selected by RTC\_LXTCTL[7] LXT or LIRC.

### 6.10.5 Functional Description

#### 6.10.5.1 RTC Initiation

When a RTC block is powered on, RTC is at reset state. User has to write a number 0xa5eb1357 to RTC initial register INIT(RTC\_INIT[31:0]) to make RTC leaving reset state. Once the INIT register is written as 0xa5eb1357, the RTC will be in normal active state permanently. User can read INIT[0](RTC\_INIT[0]) to check the RTC is at normal active state or reset state.

The RTC control registers access attributes are shown in Table 6.10-2.

Register	INIR = 0

Table 6.10-2 RTC Read/Write Enable

### 6.10.5.2 Frequency Compensation

Frequency compensation circuit supports dynamic compensation to adjust compensation value without reset the compensation circuit. The enable bit for dynamic compensation is DCOMPEN(RTC\_CLKFMT[16]).

If dynamic compensation is enabled, the minimal interval to continuous writing RTC\_FREQADJ is 0.24 seconds, and FCRBUSY(RTC\_FREQADJ[31]) flag is used to indicate that new register write operation is prohibited. The compensate value will be loaded into compensation circuit after 0.24~1.16 seconds when written to RTC\_FREQADJ.

The RTC\_FREQADJ register allows user to make digital compensation to a clock input. Please follow the example and formula below to write the actual frequency of 32 kHz crystal to RTC\_FREQADJ register. Following are the compensation examples for higher or lower than 32768 Hz.

#### Example 1:

Frequency counter measurement: 32773.65 Hz

Integer Part: 32773 => RTC\_FREQADJ[12:8] = 0x15, Refer the INTEGER(RTC\_FREQADJ[13:8]) to get detailed setting value.

Fraction Part: 0.65 X 64 = 41.6(0x2A) => RTC\_FREQADJ[5:0]=0x2A

#### Example 2:

Frequency counter measurement: 32763.25 Hz

Integer part: 32763=> RTC\_FREQADJ[12:8] = 0x0B, Refer to the INTEGER(RTC\_FREQADJ[13:8]) to get detailed setting value.

Fraction part: 0.25 X 64 = 16(0x10) => RTC\_FREQADJ[5:0] = 0x10

**Note:** The value of RTC\_FREQADJ register will be the default value (0x0000\_1000) while the compensation is not executed. User can utilize a frequency counter to measure RTC clock source via clock output function in manufacturing. In the meanwhile, user can use clock output function to check the result of RTC frequency compensation.

### 6.10.5.3 Time and Calendar Counter

RTC\_TIME and RTC\_CAL are used to load the real time and calendar. RTC\_TALM and RTC\_CALM are used for alarm time and calendar setup.

### 6.10.5.4 12/24 hour Time Scale Selection

The 12/24 hour time scale selection depends on 24HEN (RTC\_CLKFMT[0]). When RTC runs as 12-hour time scale mode, RTC\_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication; if RTC\_TIME[21] is 1, it indicates PM time message and RTC\_TIME[21] is 0, it indicates AM time message.) Table 6.10-3 shows RTC\_TIME mapping table of 12/24 hour time scale selection.

<b>Note: The Hour Value Is Written Into RTC_TIME[21:16]; Messages Are Expressed In BCD Format.</b>			
24-Hour Time Scale (24HEN = 1)		12-Hour Time Scale (PM Time + 0x20) (24HEN = 0) (PM Time + 0x20)	
0x00 (AM12)	0x12 (PM12)	0x12 (AM12)	0x32 (PM12)
0x01 (AM01)	0x13 (PM01)	0x01 (AM01)	0x21 (PM01)
0x02 (AM02)	0x14 (PM02)	0x02 (AM02)	0x22 (PM02)
0x03 (AM03)	0x15 (PM03)	0x03 (AM03)	0x23 (PM03)
0x04 (AM04)	0x16 (PM04)	0x04 (AM04)	0x24 (PM04)
0x05 (AM05)	0x17 (PM05)	0x05 (AM05)	0x25 (PM05)
0x06 (AM06)	0x18 (PM06)	0x06 (AM06)	0x26 (PM06)
0x07 (AM07)	0x19 (PM07)	0x07 (AM07)	0x27 (PM07)
0x08 (AM08)	0x20 (PM08)	0x08 (AM08)	0x28 (PM08)
0x09 (AM09)	0x21 (PM09)	0x09 (AM09)	0x29 (PM09)
0x10 (AM10)	0x22 (PM10)	0x10 (AM10)	0x30 (PM10)
0x11 (AM11)	0x23 (PM11)	0x11 (AM11)	0x31 (PM11)

Table 6.10-3 12/24 Hour Time Scale Selection

### 6.10.5.5 Day of the Week Counter

The RTC controller provides day of week in WEEKDAY bits (RTC\_WEEKDAY[2:0]). The value is defined from 0 to 6 to represent Sunday to Saturday respectively.

### 6.10.5.6 Periodic Time Tick Interrupt

The periodic time tick interrupt has 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second that are selected by TICK bits (RTC\_TICK[2:0]). When Periodic Time Tick interrupt is enabled

by setting TICKIEN (RTC\_INTEN[1]) to 1, the Periodic Time Tick interrupt is requested periodically in the period selected by RTC\_TICK[2:0] settings.

#### 6.10.5.7 Alarm Interrupt

When the real time and calendar message in RTC\_TIME and RTC\_CAL registers are equal to alarm time and calendar values in RTC\_TALM and RTC\_CALM registers, the RTC alarm interrupt flag ALMIF (RTC\_INTSTS[0]) is set to 1 and the RTC alarm interrupt signal assert if the alarm interrupt enable ALMIEN (RTC\_INTEN[0]) is enabled.

The RTC controller provides time alarm mask register (RTC\_TAMSK register) and Calendar Alarm Mask Register (RTC\_CAMSK register) to mask the specified digit and generate periodic interrupt without changing the alarm match condition in RTC\_TALM and RTC\_CALM registers in each alarm interrupt service routine.

#### 6.10.5.8 Daylight Saving Time

The RTC controller also provides RTC\_DSTCTL register to store the control settings of daylight saving time application. User can read DSBK(RTC\_DSTCTL[2]) value to check whether the current RTC date/time counter runs in daylight saving time mode or normal mode.

#### 6.10.5.9 1 Hz Clock Output

The RTC controller provides 1Hz clock output to CLKO function pin. User can set CLK1HZEN (CLK\_CLKOCTL[6]) to 1 and enable RTC, and 1Hz clock will output to CLKO function pin.

#### 6.10.5.10 Application Note

1. All data in RTC\_TALM, RTC\_CALM, RTC\_TIME and RTC\_CAL registers are all expressed in BCD format.
2. User has to make sure that the loaded values are reasonable. For example, Load RTC\_CAL as 201a (year), 13 (month), 00 (day), or RTC\_CAL does not match with RTC\_WEEKDAY, etc.
3. In RTC\_CAL and RTC\_CALM, only 2 BCD digits are used to express "year". The 2 BCD digits of xy means 20xy, rather than 19xy or 21xy.
4. Example of 12-Hour Time Setting  
If current RTC time is PM12:59:30 in 12-Hour Time Scale mode, the RTC\_TIME setting as:  
 HOUR:  
 RTC\_TIME[21:16]: 0x32 (0x12+0x20) combined by TENHR (RTC\_TIME[21:20]) is 0x3, HR (RTC\_TIME[19:16]) is 0x2.  
 MIN:  
 RTC\_TIME[14:8]: 0x59 combined by TENMIN (RTC\_TIME[14:12]) is 0x5, MIN (RTC\_TIME[11:8]) is 0x9.  
 SEC:  
 RTC\_TIME[6:0]: 0x30 combined by TENSEC (RTC\_TIME[6:4]) is 0x3, SEC (RTC\_TIME[3:0]) is 0x0.
5. Table 6.10-4 shows registers value after both core power and battery power are first powered on.

Register	Reset State
RTC_INIT	0
RTC_CAL	15/8/8 (year/month/day)
RTC_TIME	00:00:00 (hour : minute : second)
RTC_CALM	00/00/00 (year/month/day)

RTC_TALM	00:00:00 (hour : minute : second)
RTC_CLKFMT	1 (24-hour mode)
RTC_WEEKDAY	6 (Saturday)
RTC_INTEN	0
RTC_INTSTS	0
RTC_LEAPYEAR	0
RTC_TICK	0
RTC_DSTCTL	0

Table 6.10-4 Registers Value after Powered On

#### 6.10.5.11 Spare Registers and Tamper Detector

The RTC module is equipped with 20 bytes spare registers to store user's important information. These spare registers are located in RTC domain, user needs to enable SPRRWEN (RTC\_SPRCTL[2]) before writing one of 20 spare registers (RTC\_SPR0 ~ RTC\_SPR4) and the spare registers will be cleared automatically after the TAPMER occur.

When the transition condition defined in RTC\_TAMPCTL is detected on the tamper pin which is defined in the GPF[6], tamper detected interrupt flag TAMP0IF (RTC\_INTSTS[8]) will be generated. Meanwhile, the 20 bytes spare registers (RTC\_SPR0 ~ RTC\_SPR4) content will be cleared automatically by hardware to prevent the security data be disclosure and current RTC time and calendar will be loaded to RTC\_TAMPTIME and RTC\_TAMPCAL registers, these values can only be cleared automatically or update again when the TAMP0IF is cleared to 0. If TAMP0IF is set to 1, the interrupt is generated to NVIC if the tamper detect interrupt is active.

The RTC supports one tamper pin. The TAMP0LV (RTC\_TAMPCTL[9]) depends on level attribute of TAMPER0 pin for tamper detection.

#### **Static Tamper Programming Sequence Example**

1. Clean the TAMP0IF (RTC\_INTSTS[8]).
2. Set TAMP0LV (RTC\_TAMPCTL[9]) and TAMP0DBEN (RTC\_TAMPCTL[10]).
3. Enable TAMP0EN (RTC\_TAMPCTL[8]).

#### 6.10.5.12 Backup Domain GPIO Function

There are 3 I/O pins, PF.6, PF.5 and PF.4, can be backup in the V<sub>BAT</sub> domain. When PF.6 is not used as tamper pin, it can be used as GPIO pin function. PF.4/X32O and PF.5/X32I pins are not used as low speed 32 kHz oscillator function, but they can be used as GPIO pin function. The IOCTLSEL (RTC\_LXTCTL[8]) is used to select the PF.4/X32O, PF.5/X32I and PF.6/TAMPER0 pins are controlled by RTC or GPIO module. Figure 6.10-2 shows backup I/O control diagram.

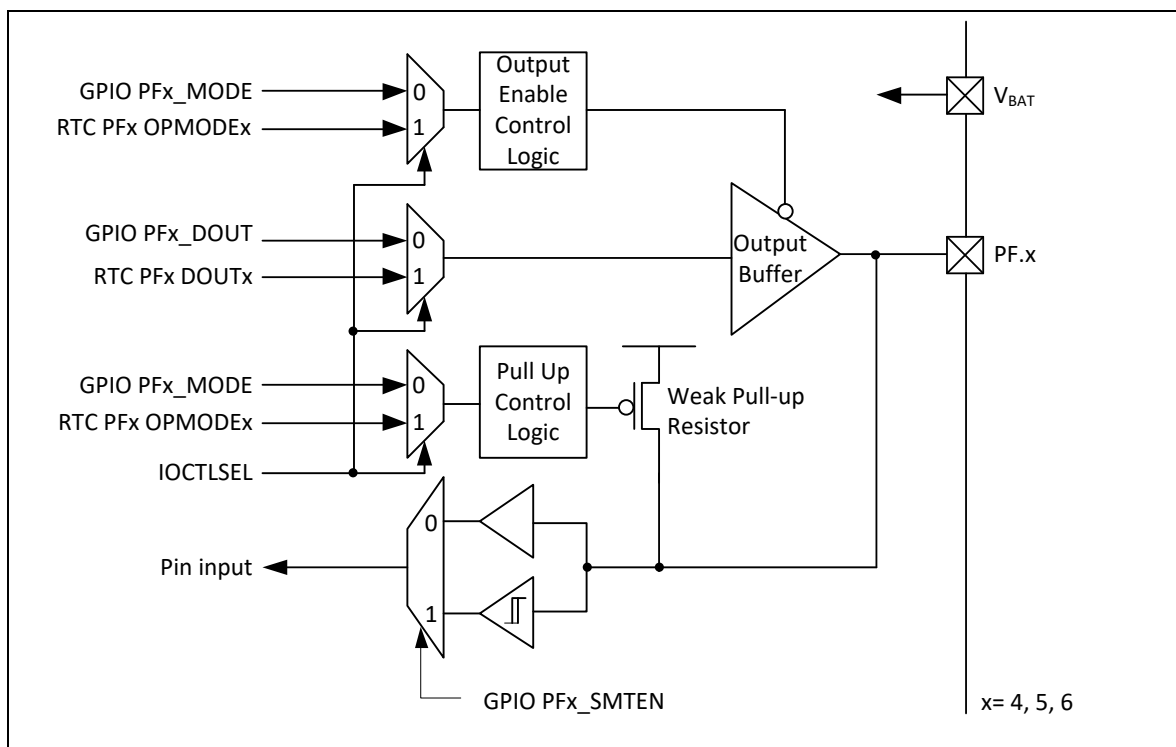

Figure 6.10-2 Backup I/O Control Diagram

## 6.10.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
RTC Base Address: RTC_BA = 0x4004_1000				
RTC_INIT	RTC_BA+0x00	R/W	RTC Initiation Register	0x0000_0000
RTC_FREQADJ	RTC_BA+0x08	R/W	RTC Frequency Compensation Register	0x0000_1000
RTC_TIME	RTC_BA+0x0C	R/W	RTC Time Loading Register	0x0000_0000
RTC_CAL	RTC_BA+0x10	R/W	RTC Calendar Loading Register	0x0015_0808
RTC_CLKFMT	RTC_BA+0x14	R/W	RTC Time Scale Selection Register	0x0000_0001
RTC_WEEKDAY	RTC_BA+0x18	R/W	RTC Day of the Week Register	0x0000_0006
RTC_TALM	RTC_BA+0x1C	R/W	RTC Time Alarm Register	0x0000_0000
RTC_CALM	RTC_BA+0x20	R/W	RTC Calendar Alarm Register	0x0000_0000

RTC_LXTCTL	RTC_BA+0x100	R/W	RTC 32.768 kHz Oscillator Control Register	0x780F_000E
RTC_GPIOCTL0	RTC_BA+0x104	R/W	RTC GPIO Control 0 Register	0x0000_0000
RTC_DSTCTL	RTC_BA+0x110	R/W	RTC Daylight Saving Time Control Register	0x0000_0000
RTC_TAMPCTL	RTC_BA+0x120	R/W	RTC Tamper Pin Control Register	0x0000_0000
RTC_TAMPTIME	RTC_BA+0x130	R	RTC Tamper Time Register	0x0000_0000
RTC_TAMPCAL	RTC_BA+0x134	R	RTC Tamper Calendar Register	0x0000_0000

### 6.10.7 Register Description

**RTC** **Initiation** **Register**  
**(RTC\_INIT)**

Register	Offset	R/W	Description	Reset Value
RTC_INIT	RTC_BA+0x00	R/W	RTC Initiation Register	0x0000_0000

31	30	29	28	27	26	25	24
INIT							
23	22	21	20	19	18	17	16
INIT							
15	14	13	12	11	10	9	8
INIT							
7	6	5	4	3	2	1	0
INIT							ACTIVE

Bits	Description
[31:1]	<b>RTC Initiation (Write Only)</b> When RTC block is powered on, RTC is at reset state. User has to write a number (0x a5eb1357) to INIT to make RTC leave reset state. Once the INIT is written as 0xa5eb1357, the RTC will be in un-reset state permanently. The INIT is a write-only field and read value will be always 0.
[0]	<b>RTC Active Status (Read Only)</b> 0 = RTC is at reset state. 1 = RTC is at normal active state.

## RTC Frequency Compensation Register

Register	Offset	R/W	Description	Reset Value
RTC_FREQADJ	RTC_BA+0x08	R/W	RTC Frequency Compensation Register	0x0000_1000

31	30	29	28	27	26	25	24
FCRBUSY	Reserved						
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved			INTEGER				
7	6	5	4	3	2	1	0
Reserved		FRACTION					

Bits	Description
[31]	<b>FCRBUSY</b> <b>Frequency Compensation Register Write Operation Busy (Read Only)</b> 0 = The new register write operation is acceptable. 1 = The last write operation is in progress and new register write operation prohibited. <b>Note:</b> This bit is only used when DCOMPEN(RTC_CLKFMT[16]) is enabled.
[30:13]	Reserved.
[12:8]	<b>INTEGER</b> <b>Integer Part</b> 00000 = Integer part of detected value is 32752. 00001 = Integer part of detected value is 32753. 00010 = Integer part of detected value is 32754. 00011 = Integer part of detected value is 32755. 00100 = Integer part of detected value is 32756. 00101 = Integer part of detected value is 32757. 00110 = Integer part of detected value is 32758. 00111 = Integer part of detected value is 32759. 01000 = Integer part of detected value is 32760. 01001 = Integer part of detected value is 32761. 01010 = Integer part of detected value is 32762. 01011 = Integer part of detected value is 32763. 01100 = Integer part of detected value is 32764. 01101 = Integer part of detected value is 32765. 01110 = Integer part of detected value is 32766. 01111 = Integer part of detected value is 32767. 10000 = Integer part of detected value is 32768. 10001 = Integer part of detected value is 32769. 10010 = Integer part of detected value is 32770. 10011 = Integer part of detected value is 32771.

		10100 = Integer part of detected value is 32772. 10101 = Integer part of detected value is 32773. 10110 = Integer part of detected value is 32774. 10111 = Integer part of detected value is 32775. 11000 = Integer part of detected value is 32776. 11001 = Integer part of detected value is 32777. 11010 = Integer part of detected value is 32778. 11011 = Integer part of detected value is 32779. 11100 = Integer part of detected value is 32780. 11101 = Integer part of detected value is 32781. 11110 = Integer part of detected value is 32782. 11111 = Integer part of detected value is 32783.
[7:6]	<b>Reserved</b>	Reserved.
[5:0]	<b>FRACTION</b>	<b>Fraction Part</b> Formula: FRACTION = (fraction part of detected value) x 64. <b>Note:</b> Digit in FCR must be expressed as hexadecimal number.

**Note:** If dynamic compensation is not enabled, i.e. DCOMPEN(RTC\_CLKFMT[16]) = 0, FREQADJ's counter will be reset for start to compensate when writing RTC\_FREQADJ. Imply RTC Time will be restarted.

31	30	29	28	27	26	25	24
Reserved

## 6.11 Basic PWM Generator and Capture Timer (BPWM)

### 6.11.1 Overview

The chip provides up to two BPWM generators — BPWM0 and BPWM1 as shown in Figure 6.11-1. Each BPWM supports 6 channels of BPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit BPWM counter with 16-bit comparator. The BPWM counter supports up, down and up-down counter types, all 6 channels share one counter. BPWM uses the comparator compared with counter to generate events. These events are used to generate BPWM pulse, interrupt and trigger signal for EADC to start conversion. For BPWM output control unit, it supports polarity output, independent pin mask and tri-state output enable.

The BPWM generator also supports input capture function to latch BPWM counter value to corresponding register when input channel has a rising transition, falling transition or both transition is happened.

### 6.11.2 Features

#### 6.11.2.1 BPWM Function Features

- Supports maximum clock frequency up to maximum PLL frequency.
- Supports up to two BPWM modules; each module provides 6 output channels
- Supports independent mode for BPWM output/Capture input channel
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution BPWM counter; each module provides 1 BPWM counter
  - Up, down and up/down counter operation type
- Supports mask function and tri-state enable for each BPWM pin
- Supports interrupt in the following events:
  - BPWM counter matches 0, period value or compared value
- Supports trigger EADC in the following events:
  - BPWM counter matches 0, period value or compared value

#### 6.11.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution
- Supports rising or falling capture condition
- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option

### 6.11.3 Block Diagram

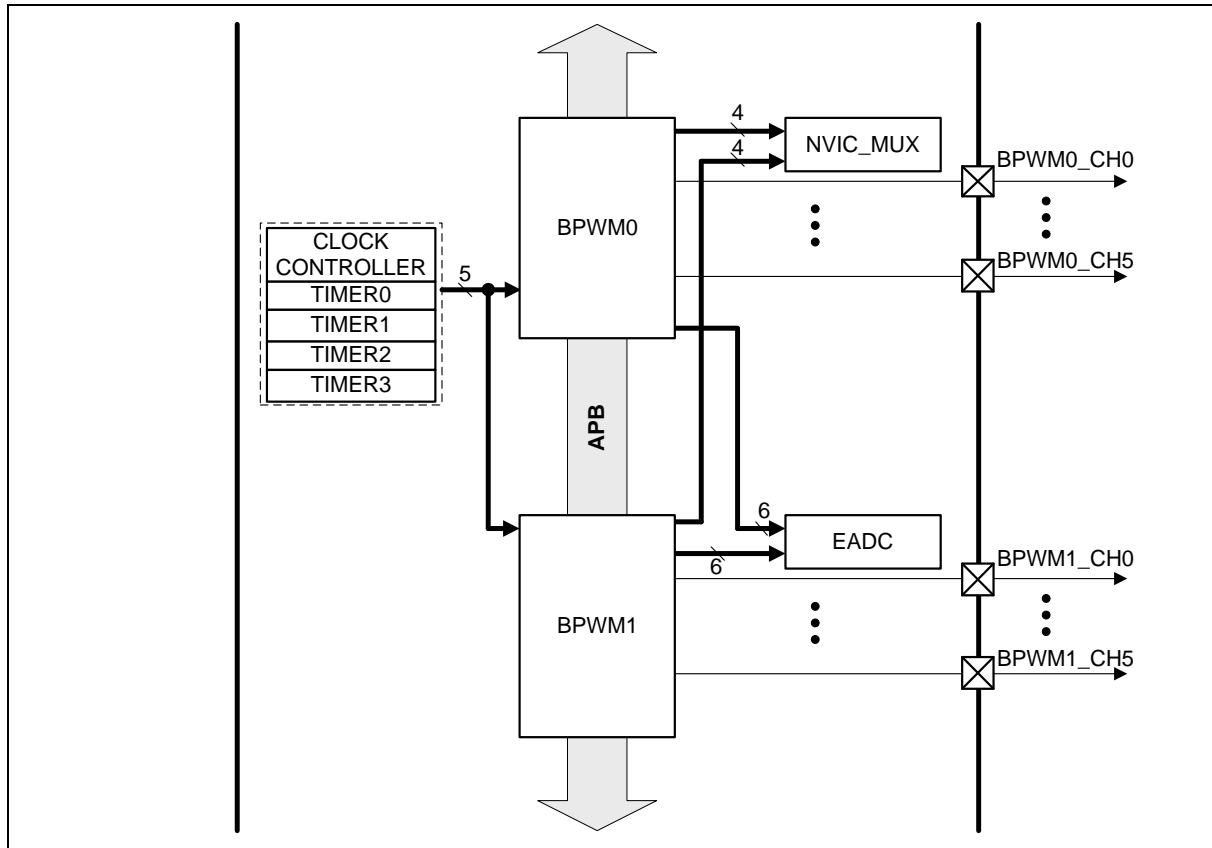

Figure 6.11-1 BPWM Generator Overview Block Diagram

Each BPWM generator has only one clock source inputs and can be selected from BPWM Clock or four TIMER trigger BPWM outputs as shown in Figure 6.11-2 by ECLKSRC0 (BPWM\_CLKSRC[2:0]) for BPWM\_CLK0. In general case, BPWM0 Clock must be selected from PCLK0 by setting BPWM0SEL (CLK\_CLKSEL2[8]) to 1 and BPWM1 Clock from PCLK1 by setting BPWM1SEL (CLK\_CLKSEL2[9]) to 1.

When operating in maximum PLL clock frequency as shown in Figure 6.11-3, and Table 6.11-1. BPWM0 and BPWM1 Clock must be selected to PLL clock by setting BPWM0SEL (CLK\_CLKSEL2[8]) and BPWM1SEL (CLK\_CLKSEL2[9]) to 0.

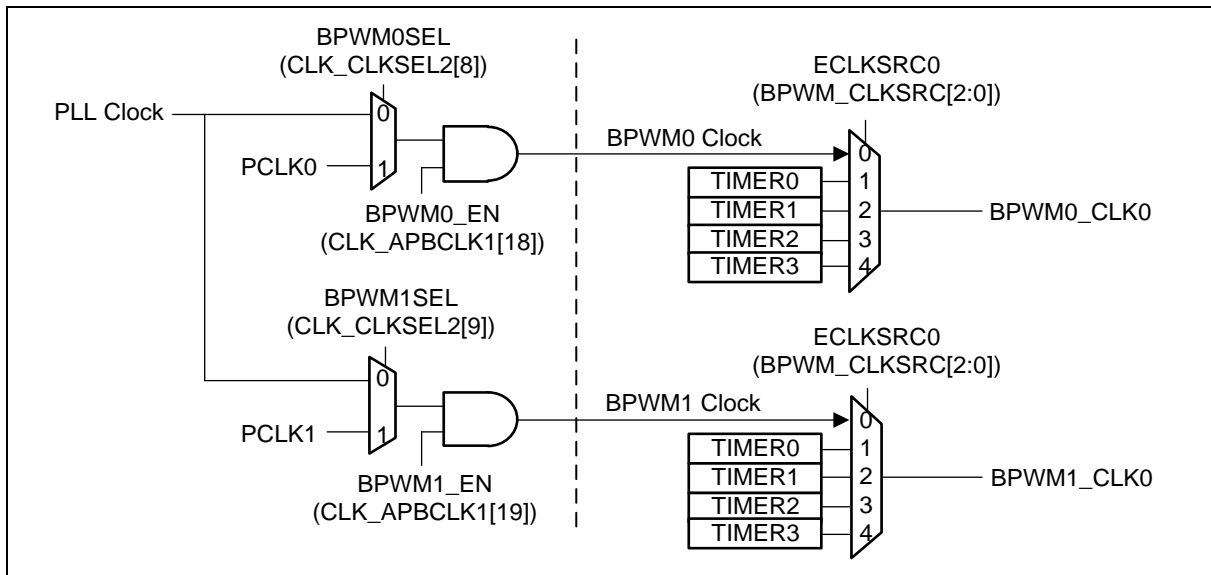

Figure 6.11-2 BPWM Clock Source Control

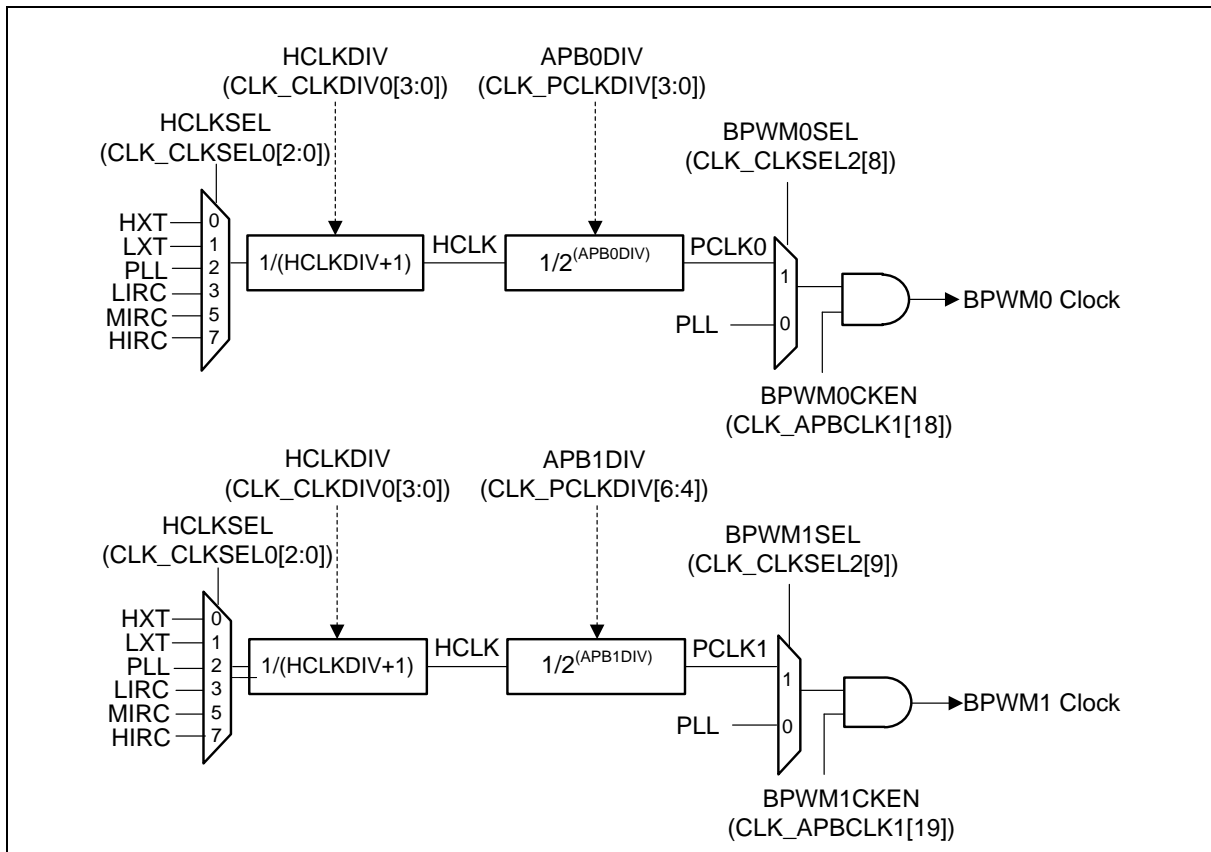

Figure 6.11-3 BPWM Clock Source Control

Table 6.11-1 BPWM Clock Source Control Registers Setting Table

Figure 6.11-4 illustrates the architecture of BPWM Independent mode. All six channels share the same counter. When the counter counts to 0, PERIOD (BPWM\_PERIOD[15:0]), or or equal to the comparator, events will be generated. These events are passed to the corresponding generators to generate BPWM pulse, interrupt signal and trigger signal for EADC to start conversion. Output control is used to change the BPWM pulse output state.

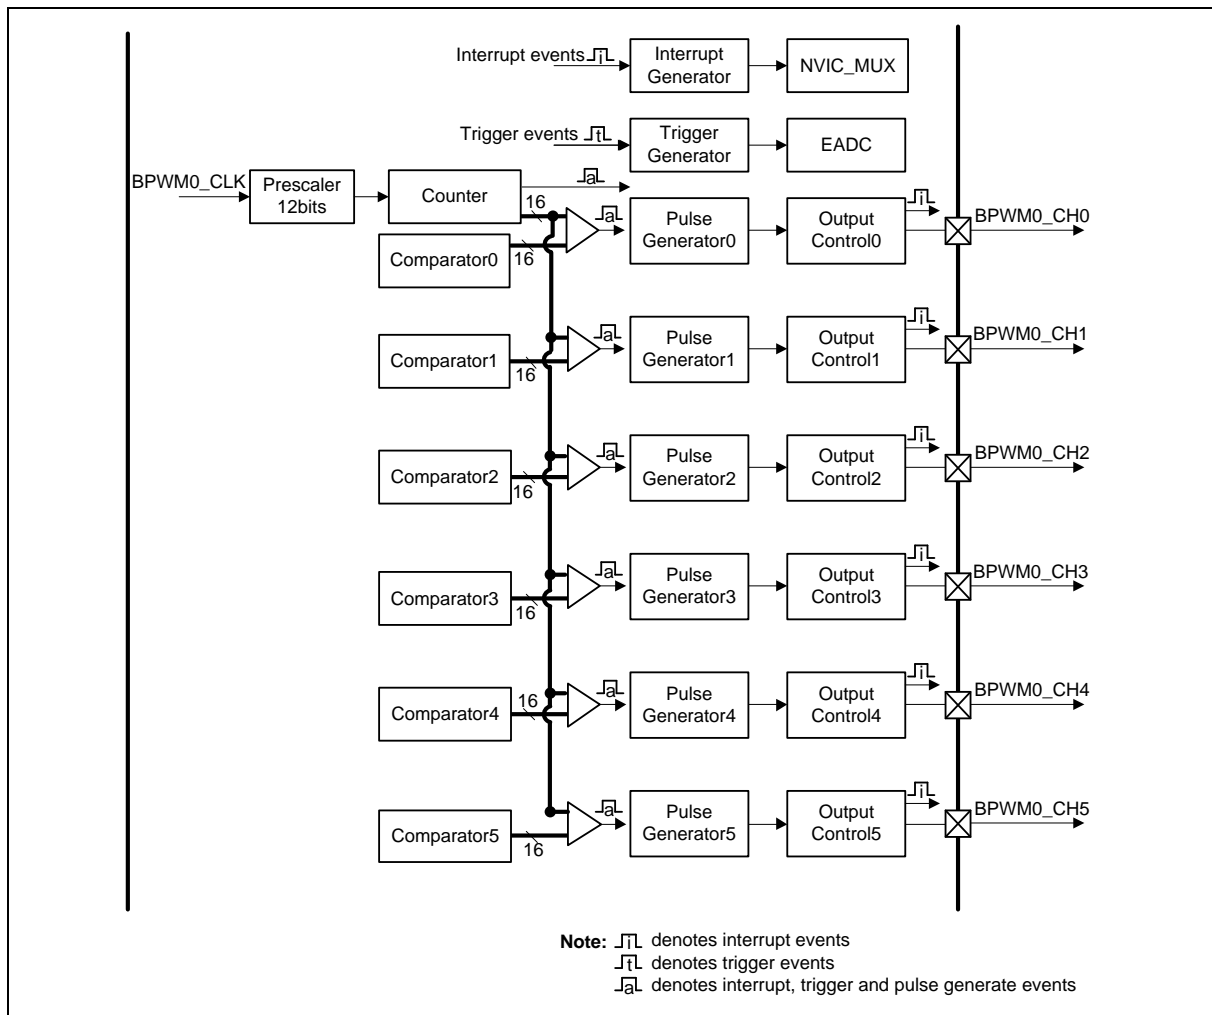

Figure 6.11-4 BPWM Independent Mode Architecture Diagram

## 6.11.4 Basic Configuration

### 6.11.4.1 BPWM0 Basic Configuration

- Clock Source Configuration

- Select the source of BPWM0 peripheral clock on BPWM0SEL (CLK\_CLKSEL2[8]).
- Enable BPWM0 peripheral clock in BPWM0CKEN (CLK\_APBCLK1[18]).
- Reset Configuration
  - Reset BPWM0 controller in BPWM0RST (SYS\_IPRST2[18]).
- BPWM1 Basic Configuration
- Clock Source Configuration
  - Select the source of BPWM1 peripheral clock on BPWM1SEL (CLK\_CLKSEL2[9]).
  - Enable BPWM1 peripheral clock in BPWM1CKEN (CLK\_APBCLK1[19]).
- Reset Configuration
  - Reset BPWM1 controller in BPWM1RST (SYS\_IPRST2[19]).

6.11.5 Functional Description

6.11.5.1 BPWM Prescaler

The BPWM prescaler is used to divide clock source, prescaler counting CLKPSC +1 times, and the BPWM counter only counts once. The prescale is set by CLKPSC (BPWM\_CLKPSC[11:0]). Figure 6.11-5 shows an example of BPWM channel 0 CLKPSC waveform. The prescale counter will reload CLKPSC at the beginning of the next prescale counter down-count.

Figure 6.11-5 BPWM\_CH0 CLKPSC Waveform

6.11.5.2 BPWM Counter

BPWM has one counter, and supports 3 counter types operation: Up Counter, Down Counter and Up-Down Counter types.

For BPWM channel0, CNT(BPWM\_CNT[15:0]) can clear to 0x00 by CNTCLR0 (BPWM\_CNTCLR[0]) when the prescale counter counts down to 0, and CNTCLR0(BPWM\_CNTCLR[0]) will be set as 0 by hardware automatically.

Figure 6.11-6 BPWM Counter Clear Waveform

#### 6.11.5.3 Up Counter Type

In the up counter operation, the 16 bits BPWM counter is an up counter and starts up-counting from 0 to PERIOD (BPWM\_PERIOD) to finish a BPWM period. The current counter value can be found by reading the CNT (BPWM\_CNT[15:0]). BPWM generates zero point event when the counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in up counter type, the BPWM period time = (PERIOD+1) \* (CLKPSC+1) \* BPWMx\_CLK clock time, is shown in Figure 6.11-7.

Figure 6.11-7 BPWM Up Counter Type

#### 6.11.5.4 Down Counter Type

In the down counter operation, the 16 bits BPWM counter is a down counter and starts down-counting from PERIOD to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when the counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in down counter type, the BPWM period time = (PERIOD+1) \* (CLKPSC+1) \* BPWMx\_CLK clock time, is shown in Figure 6.11-8.

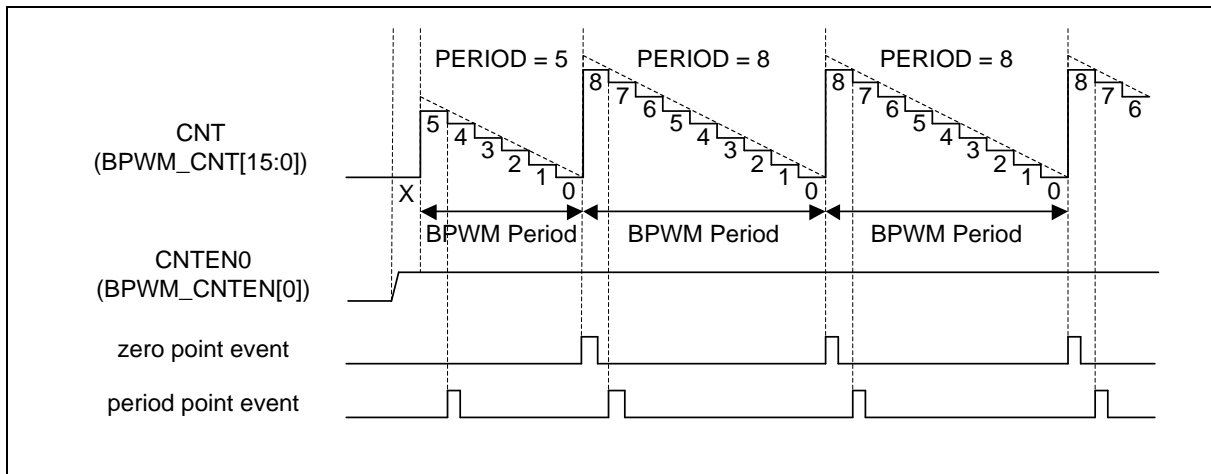

Figure 6.11-8 BPWM Down Counter Type

#### 6.11.5.5 Up-Down Counter Type

In the up-down counter operation, the 16 bits BPWM counter is an up-down counter and starts counting-up from 0 to PERIOD and then starts counting down to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when counter counts to 0 and generates center point event when counting to PERIOD. An example of the period time in up-down counter type, the BPWM period time =  $(2 \times \text{PERIOD}) \times (\text{CLKPSC} + 1) \times \text{BPWMx\_CLK}$  clock time, is shown in Figure 6.11-9. The DIRF (BPWM\_CNT[16]) is a counter direction indicator flag, where high is up counting, and low is down counting.

Figure 6.11-9 BPWM Up-Down Counter Type

#### 6.11.5.6 BPWM Comparator

The CMPDAT (BPWM\_CMPDATn[15:0]) is a basic comparator register of BPWM channel n; each channel only has one CMPDAT. The CMPDAT's value is continuously compared to the counter value. When the counter is equal to the compared register, BPWM generates an event and uses the event to generate BPWM pulse, interrupt or use to trigger EADC. In up-down counter type, two events will be

generated in a BPWM period as shown in Figure 6.11-10.

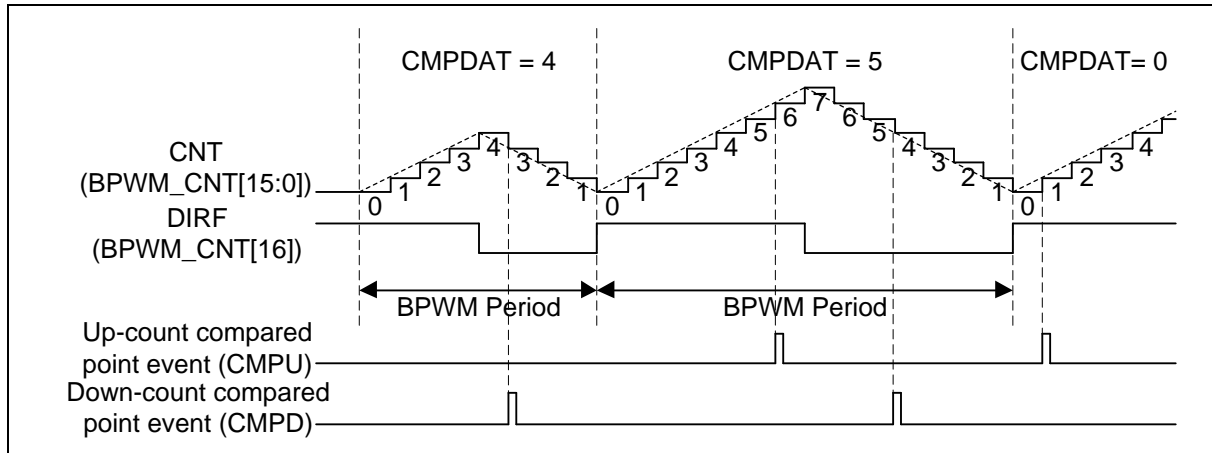

Figure 6.11-10 BPWM CMPDAT Events in Up-Down Counter Type

#### 6.11.5.7 Period Loading Mode

Period Loading mode is the default loading mode. It has lowest priority in loading modes. PERIOD and CMPDAT will both load to their buffer while a period is completed. For example, after BPWM counter up counts from 0 to PERIOD in up-counter operation or down counts from PERIOD to 0 in the down-counter operation or up counts from 0 to PERIOD and then down counts to 0 in up-down counter operation.

Figure 6.11-11 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on, CMPDAT also follows this rule. The following describes steps sequence of Figure 6.11-11. User can know the PERIOD and CMPDAT update condition, by watching BPWM period and CMPU event.

1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of PWM period at point 2.
3. Software writes PERIOD DATA1 to PERIOD at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes PERIOD DATA2 to PERIOD at point 5.
6. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 6.

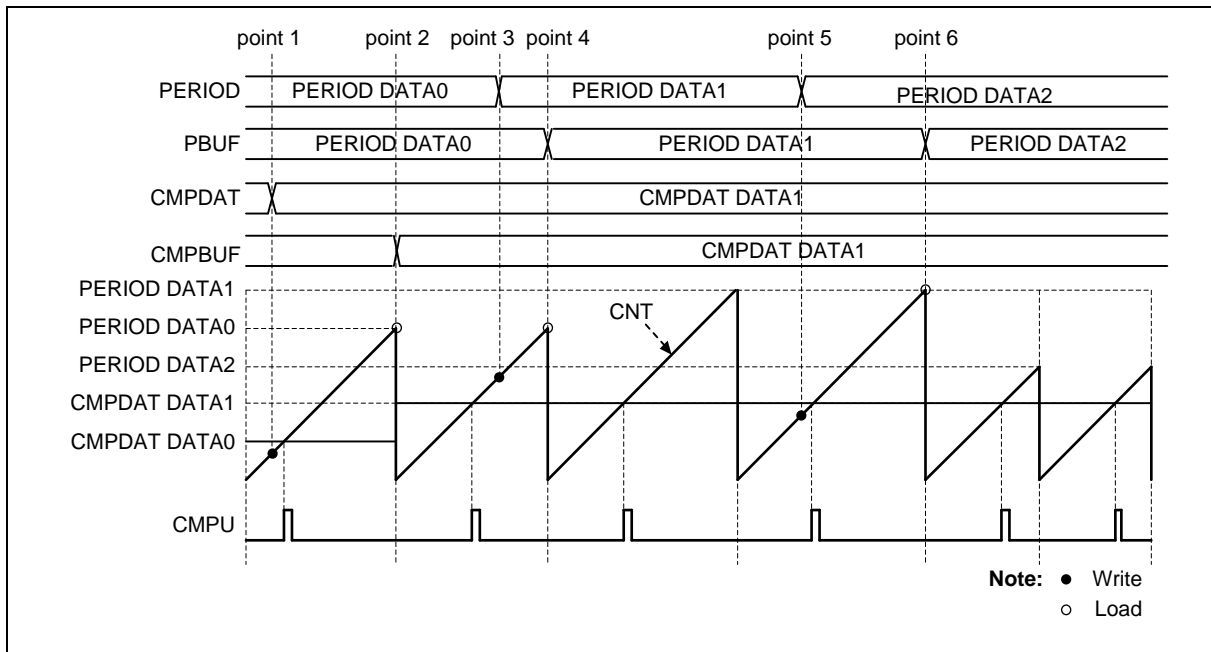

Figure 6.11-11 Period Loading Mode with Up-Counter Type

#### 6.11.5.8 Immediately Loading Mode

If the IMMLDENn (BPWM\_CTL0[21:16]) bit which corresponds to BPWM channel n is set to 1, software will load a value to buffer from PERIOD and CMPDAT immediately while software updates PERIOD or CMPDAT. If the update PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAX0 (BPWM\_STATUS[0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDENn has been set, other loading mode for channel n will become invalid. Figure 6.11-12 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loads CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than the current counter value at point 2; counter will continue counting until it is equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

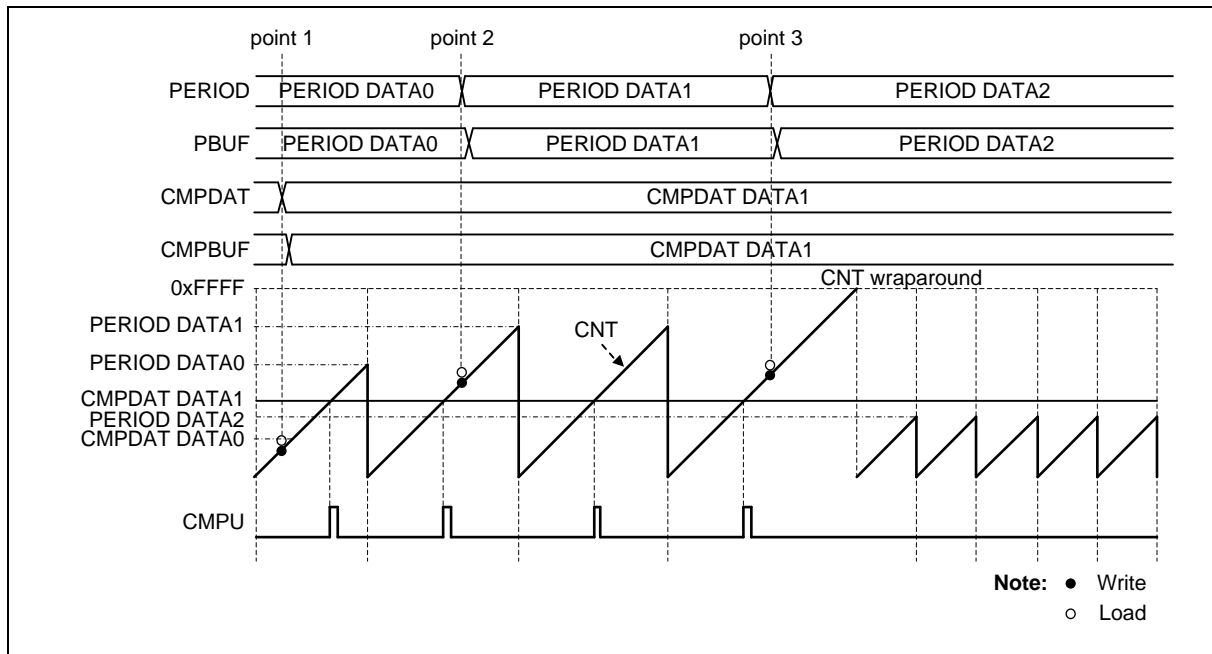

Figure 6.11-12 Immediately Loading Mode with Up-Counter Type

#### 6.11.5.9 Center Loading Mode

If the CTRLDN (BPWM\_CTL0[5:0]) bit which corresponds to BPWM channel n is set to 1 and in up-down counter type, CMPDAT will load to CMPBUFn in center of a period, that is, counter counts to PERIOD. PERIOD loading timing is the same as period loading mode. Figure 6.11-13 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of PWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of PWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 8.

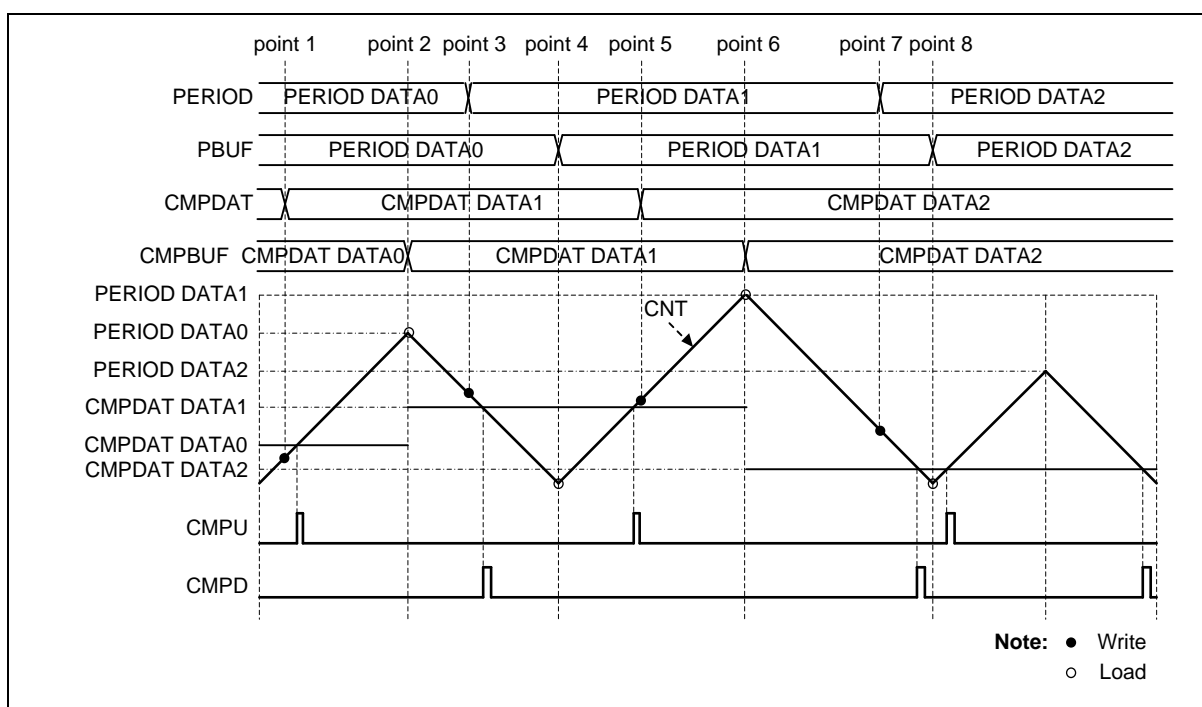

Figure 6.11-13 Center Loading Mode with Up-Down-Counter Type

#### 6.11.5.10 BPWM Pulse Generator

The BPWM pulse generator uses counter and comparator events to generate BPWM pulse. The events are: zero point, period point in up counter type and down counter type, center point in up-down counter type and counter equal to comparator point in three types. As to up-down counter type, there are two counter equal comparator points, one at up count another at down count.

Each event point can decide BPWM waveform to do nothing (X), set Low (L), set High (H) or toggle (T) by setting BPWM\_WGCTL0 and BPWM\_WGCTL1 registers. Using these points can easily generate asymmetric BPWM pulse or variant waveform as shown in Figure 6.11-14. In the figure, there is a comparator  $n$  to generate BPWM pulse, where  $n$  denotes channel number 0 to 5. CMPU denotes CNT is equal to CMPDAT when counting up, and CMPD denotes CNT is equal to CMPDAT when counting down.

Figure 6.11-14 BPWM Pulse Generation (Left: Asymmetric Pulse, Right: Variety Pulse)

The generation events may be sometimes set to the same value, as the reason, events priority between different counter types are list below, up counter type (Table 6.11-2) down counter type (Table 6.11-3) and up-down counter type (Table 6.11-4). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.11-15.

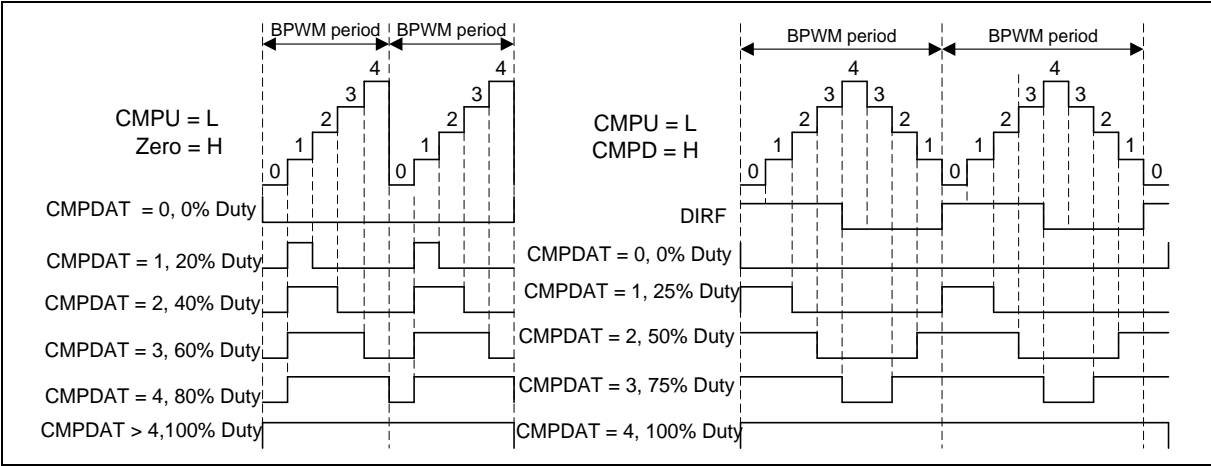

Figure 6.11-15 BPWM 0% to 100% Pulse Generation (Left: Up Counter Type, Right: Up-down Counter Type)

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)
2	Compare up event(CNT = CMPUn)
3 (Lowest)	Zero event (CNT = 0)

Table 6.11-2 BPWM Pulse Generation Event Priority for Up-Counter

Priority	Down Event
1 (Highest)	Zero event (CNT = 0)

2	Compare down event (CNT = CMPDn)
3 (Lowest)	Period event (CNT = PERIOD)

Table 6.11-3 BPWM Pulse Generation Event Priority for Down-Counter

Priority	Up Event	Down Event
1 (Highest)	Compare up event (CNT = CMPUn)	Compare down event (CNT = CMPDn)
2 (Lowest)	Zero event (CNT = 0)	Period (center) event (CNT = PERIOD)

Table 6.11-4 BPWM Pulse Generation Event Priority for Up-Down-Counter

#### 6.11.5.11 Synchronous function

To start BPWM and PWM counters in the same time, user has to set the BPWM Synchronous Start Control Register (BPWM\_SSCTL[0]) to enable the channel counters which are planned to start counting together, and select the SSR(CBPWM\_SSCTL[9:8]) to choose the Synchronous Start source, followed by setting the BPWM Synchronous Start Trigger Register CNTSEN (BPWM\_SSTRG[0]).

#### 6.11.5.12 BPWM Output Control

After BPWM pulse generation, there are three steps to control the output of BPWM channels. There are Mask, Pin Polarity and Output Enable three steps as shown in Figure 6.11-16.

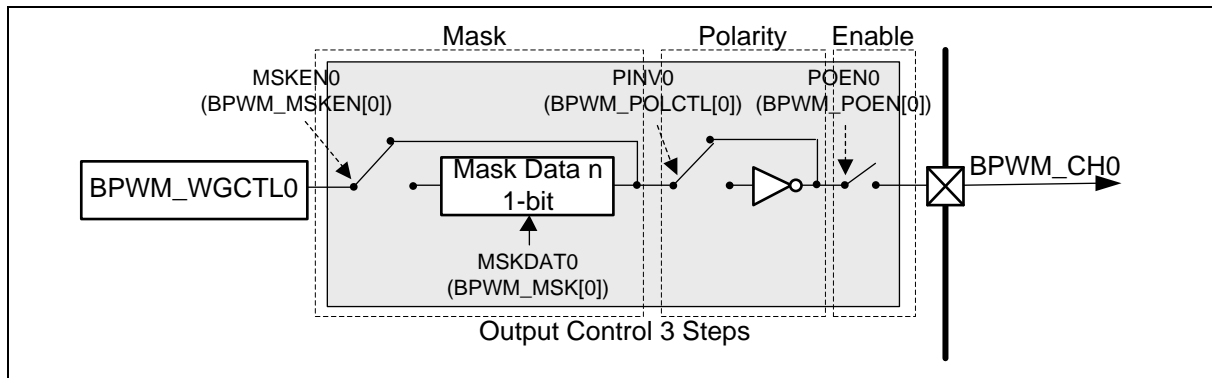

Figure 6.11-16 BPWM\_CH0 Output Control 3 Steps

#### 6.11.5.13 BPWM Mask Output Function

Each of the BPWM output channels can be manually overridden by using the appropriate bits in the BPWM Mask Enable Control Register (BPWM\_MSKEN) and BPWM Masked Data Register (BPWM\_MSK) to drive the BPWM channel outputs to specified logic states independent of the duty cycle comparison units. The BPWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The BPWM\_MSKEN register contains six bits, MSKENn(BPWM\_MSKEN[5:0]) determine which BPWM channel output will be overridden, MSKENn(BPWM\_MSKEN[5:0]) bits are active-high. The BPWM\_MSK register contains six bits, MSKDATn(BPWM\_MSK[5:0]), which determine the state of the BPWM channel output when the channel is masked via the MSKDAT bits. Figure 6.11-17 shows an example of how BPWM mask control can be used for the override feature.

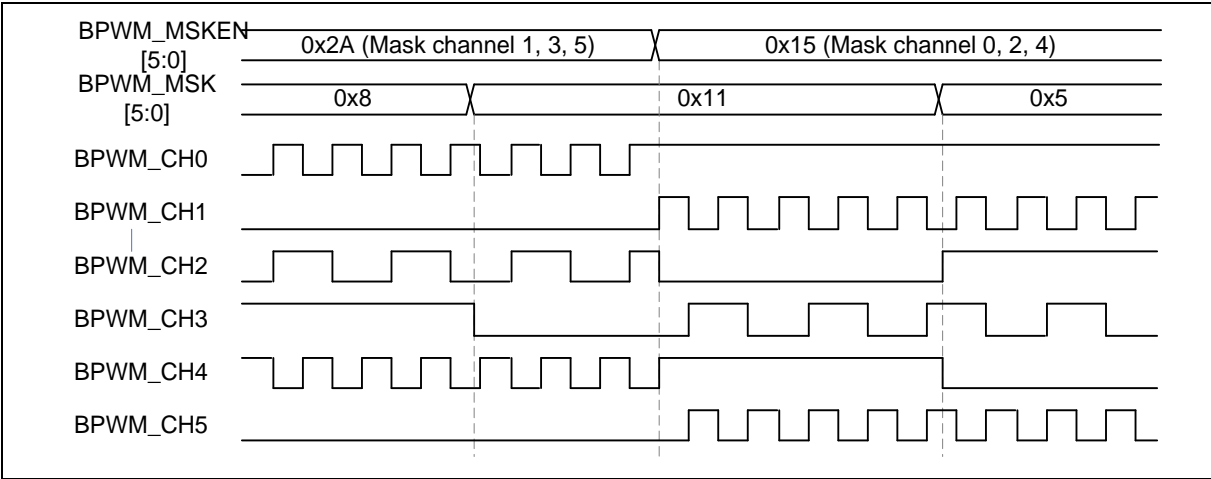

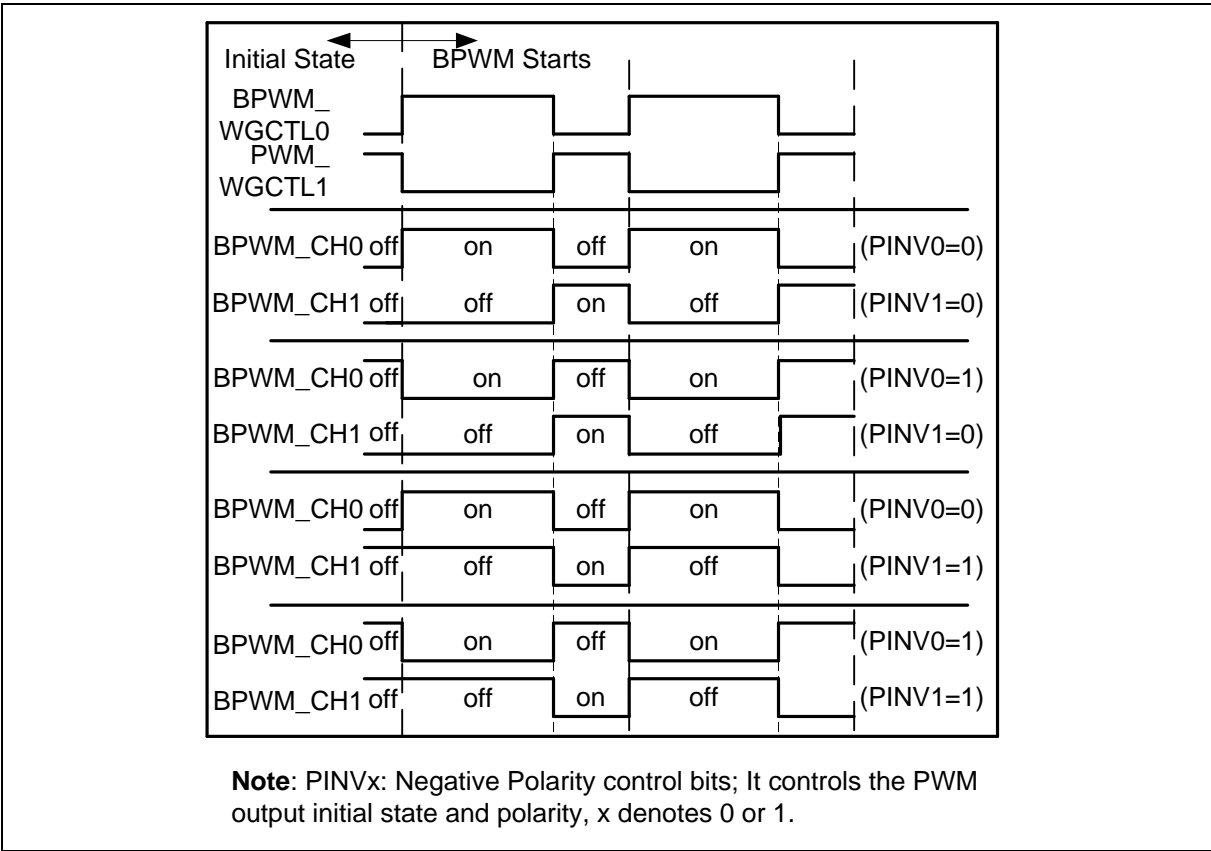

Figure 6.11-17 Mask Control Waveform Illustration

6.11.5.14 Polarity Control

Each BPWM port from BPWM\_CH0 to BPWM\_CH5 has an independent polarity control module to configure the polarity of the active state of BPWM output. By default, the BPWM output is active high. This implies the BPWM OFF state is low and ON state is high. This definition is variable through setting BPWM Negative Polarity Control Register (BPWM\_POLCTL), for each individual BPWM channel. Figure 6.11-18 shows the initial state before BPWM starts with different polarity settings.

**Note:** PINVx: Negative Polarity control bits; It controls the PWM output initial state and polarity, x denotes 0 or 1.

Figure 6.11-18 Initial State and Polarity Control

#### 6.11.5.15 BPWM Interrupt Generator

There are two independent interrupts for each BPWM as shown in Figure 6.11-19.

BPWM interrupt (BPWM\_INT) comes from BPWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIF0 (BPWM\_INTSTS[0]) and the Period point Interrupt Flag PIF0 (BPWM\_INTSTS[8]). When BPWM channel n's counter equals to the comparator value stored in BPWM\_CMPDATn, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (BPWM\_INTSTS[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (BPWM\_INTSTS[29:24]) is set. If the correspond interrupt enable bits are set, the trigger events will generates interrupt signals.

Another interrupt is the capture interrupt (CAP\_INT). It shares the BPWM\_INT vector in NVIC, CAP\_INT can be generated when the CAPRIFn (BPWM\_CAPIF[5:0]) is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (BPWM\_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CAPFIFn (BPWM\_CAPIF[13:8]) can be triggered when the Capture Falling Interrupt Enable bit CAPFIENn (BPWM\_CAPIEN[13:8]) is set to 1.

Figure 6.11-19 demonstrates the architecture of the BPWM interrupts.

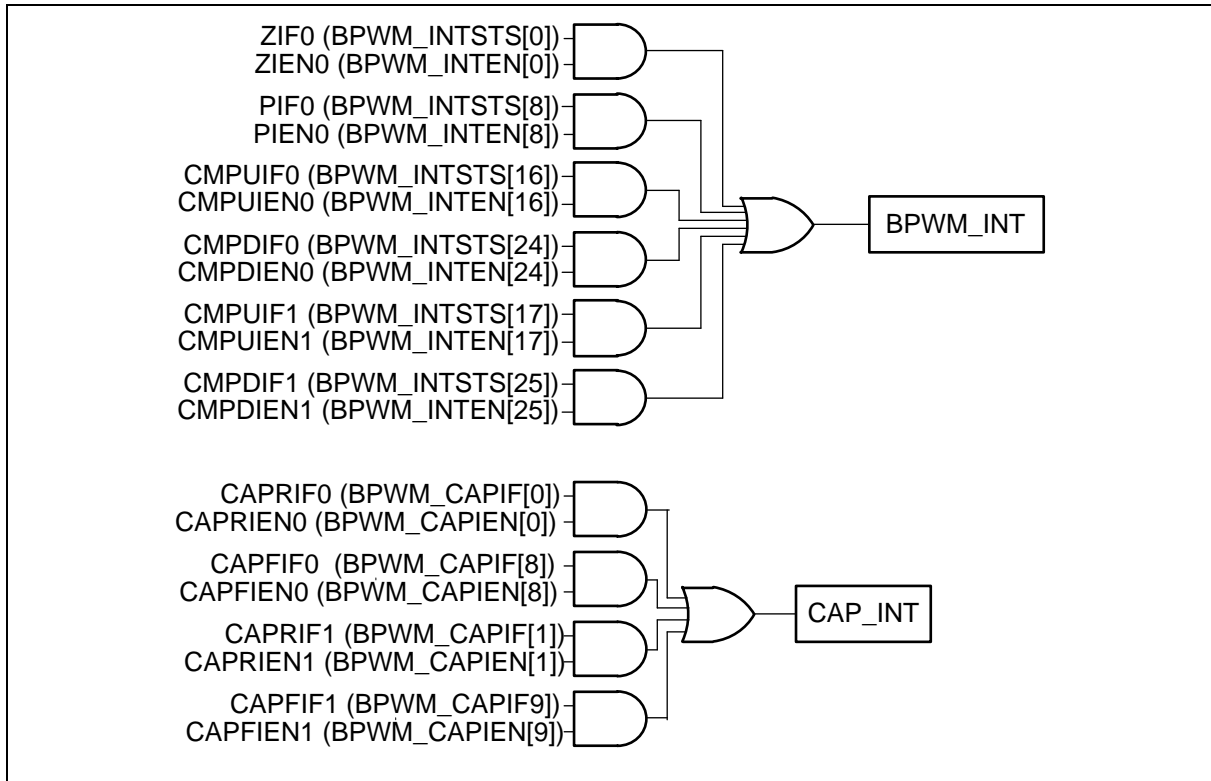

Figure 6.11-19 BPWM\_CH0 and BPWM\_CH1 Pair Interrupt Architecture Diagram

#### 6.11.5.16 BPWM Trigger EADC Generator

BPWM can be one of the EADC conversion trigger source. Each BPWM pair channels share the same trigger source. Setting TRGSELn is to select the trigger sources, where TRGSELn is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in BPWM\_EADCTS0[3:0], BPWM\_EADCTS0[11:8], BPWM\_EADCTS0[19:16], BPWM\_EADCTS0[27:24], BPWM\_EADCTS1[3:0] and BPWM\_EADTS1[11:8], respectively. Setting TRGENn is to enable the trigger output to EADC, where TRGENn is TRGEN0, TRGEN1, ..., TRGEN5, which are located in BPWM\_EADCTS0[7], BPWM\_EADCTS0[15], BPWM\_EADCTS0[23], BPWM\_EADCTS0[31], BPWM\_EADCTS1[7] and BPWM\_EADCTS1[15], respectively. The number n (n = 0,1, ...,5) denotes BPWM channel number.

There are 7 BPWM events can be selected as the trigger source for one pair of channels. Figure 6.11-20 is an example of BPWM\_CH0 and BPWM\_CH1. BPWM can trigger EADC to start conversion in different timings by setting PERIOD and CMPDAT. Figure 6.11-22 is the trigger EADC timing waveform in the up-down counter type.

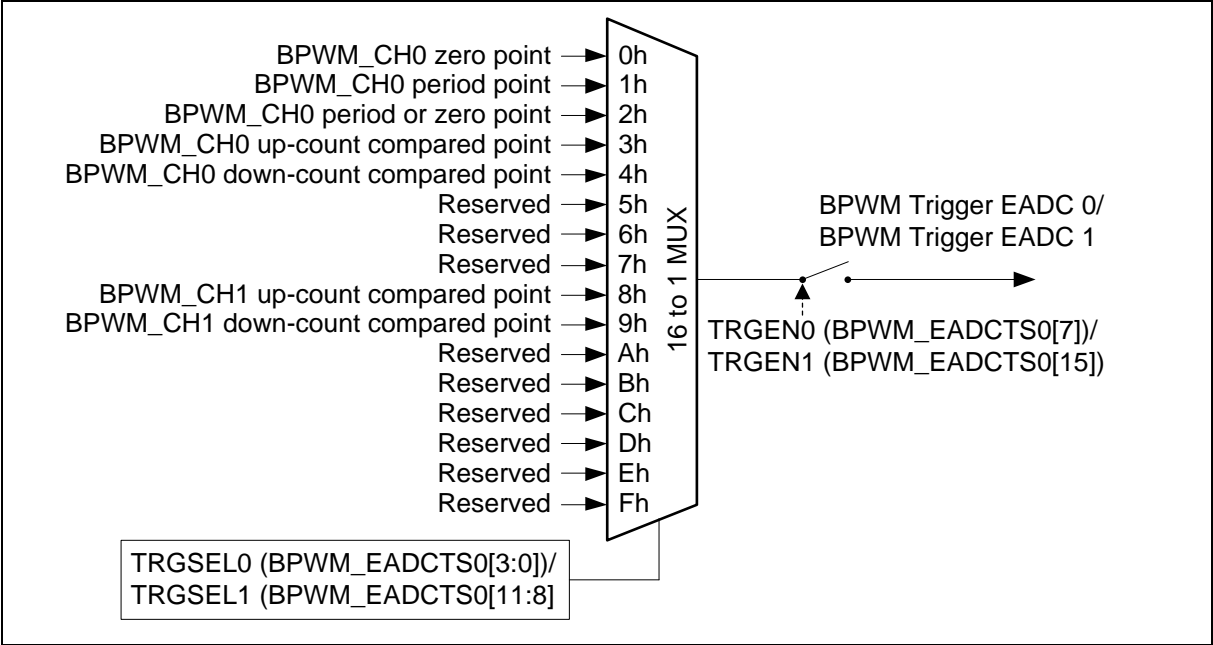

Figure 6.11-20 BPWM\_CH0 and BPWM\_CH1 Pair Trigger EADC Source Block Diagram

Figure 6.11-21 BPWM CH0~ CH5 Trigger EADC Block Diagram

Figure 6.11-22 BPWM Trigger EADC in Up-Down Counter Type Timing Waveform

#### 6.11.5.17 Capture Operation

The channels of the capture input and the BPWM output share the same pin and counter. The counter can operate in up or down counter type. The capture function will always latch the BPWM counter to the register RCAPDATn (BPWM\_RCAPDATn[15:0]) or the register FCAPDATn (BPWM\_FCAPDATn[15:0]) if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP\_INT (using BPWM\_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (BPWM\_CAPIEN[5:0]) is for the rising edge and the CAPFIENn (BPWM\_CAPIEN[13:8]) is for the falling edge. When rising or falling latch occurs, the corresponding BPWM counter may be reloaded with the value BPWM\_PERIOD, depending on the setting of RCRLDENn or FCRLDENn (where RCRLDENn and FCRLDENn are located at BPWM\_CAPCTL[21:16] and BPWM\_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (BPWM\_CAPINEN[5:0]) for the corresponding capture channel n. Figure 6.11-23 is the capture block diagram of channel 0.

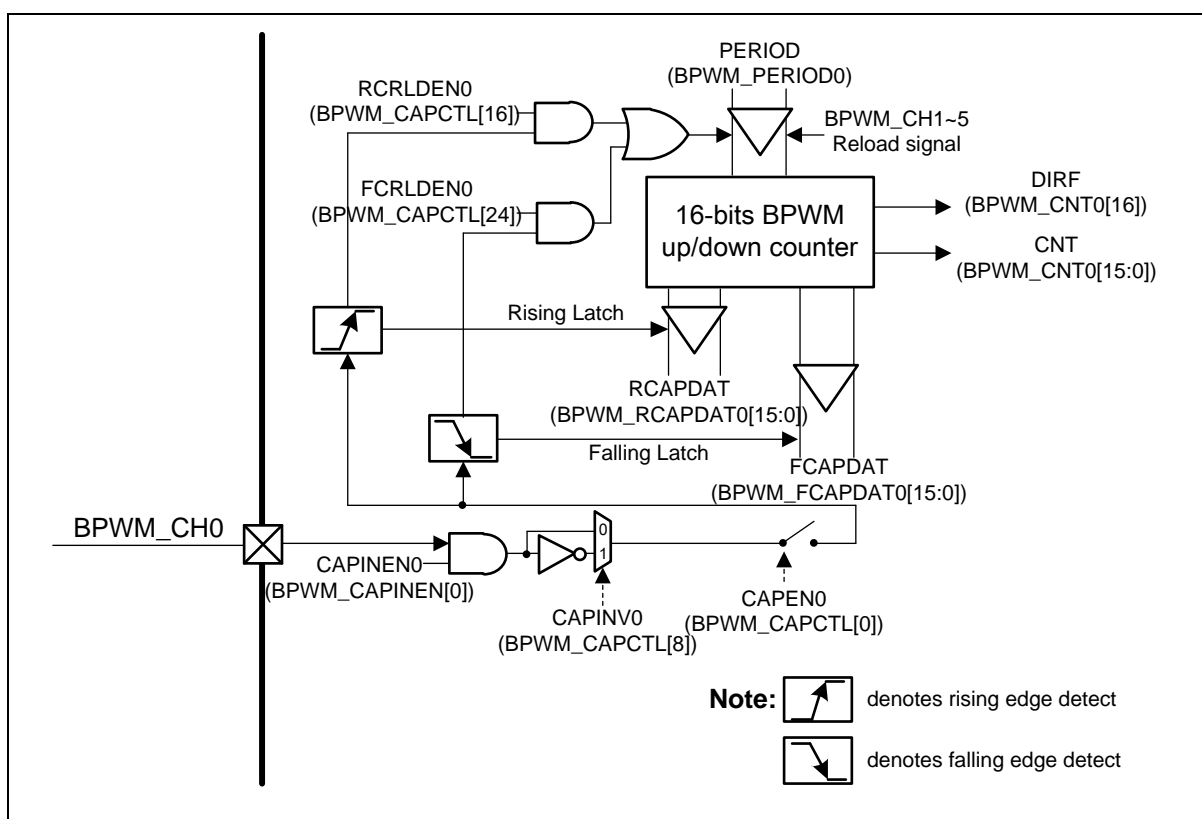

Figure 6.11-23 BPWM CH0 Capture Block Diagram

Figure 6.11-24 illustrates the capture function timing. In this case, the capture counter is set as BPWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches counter value to the BPWM\_FCAPDATn. When detecting the rising edge, it latches the counter value to the BPWM\_RCAPDATn. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD. It is important that the counter is shared by all channels, so the counter reloads time also controlled by all channels' reload signals.

Figure 6.11-24 also illustrates the timing example for the interrupt and interrupt flag generation. When the rising edge at channel n is detected, the corresponding bit CAPRIFn (BPWM\_CAPIF[5:0]) is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding bit CAPFIEn (BPWM\_CAPIF[13:8]) set by hardware. CAPRIFn (BPWM\_CAPIF[5:0]) and CAPFIEn (BPWM\_CAPIF[13:8]) can be cleared by software by writing '1'. If the CAPRIFn (BPWM\_CAPIF[5:0]) is set and the CAPRIENn is enabled, the capture function generates an interrupt. If the CAPFIEn (BPWM\_CAPIF[13:8]) is set and the CAPFIENn is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CAPRIFn(BPWM\_CAPIF[5:0]) is already set, the Over run status CRIFOVn (BPWM\_CAPSTS[5:0]) will be set to 1 by hardware to indicate the CAPRIFn (BPWM\_CAPIF[5:0]) overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the interrupt flag CAPFIF n (BPWM\_CAPIF[13:8]) and the Over run status CFIFOVn (BPWM\_CAPSTS[13:8]).

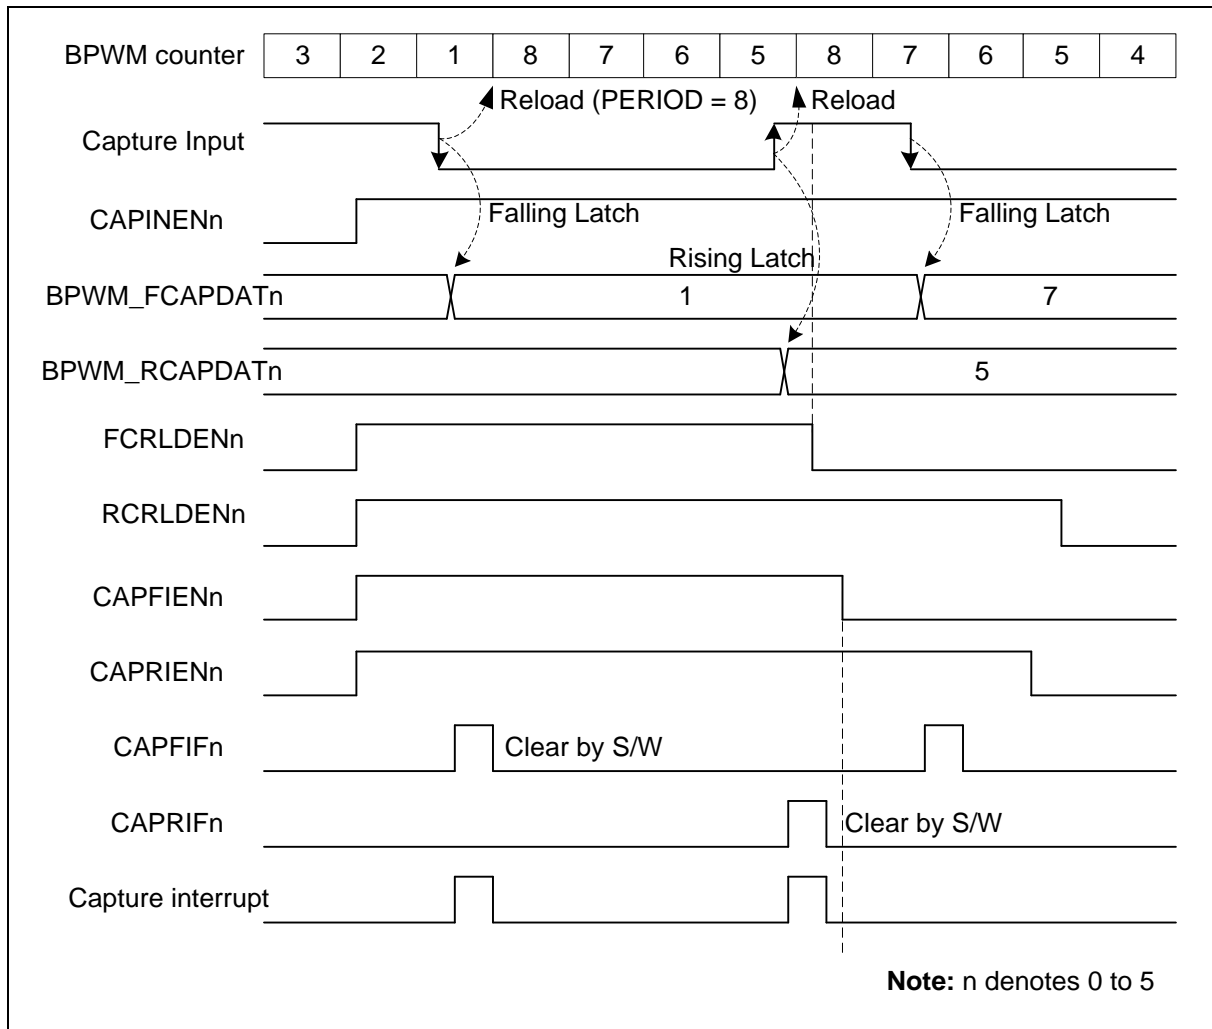

Figure 6.11-24 Capture Operation Waveform

The capture pulse width meeting the following conditions can be calculated according to the formula.

1. The capture positive or negative pulse width is shorter than a counter period.
2. The counter operates in down counter type.
3. The counter can be reloaded by both falling and rising capture events through setting FCRLDENn and RCRLDENn bits of PWM\_CAPCTL register to 1.

For the negative pulse case, the channel low pulse width is calculated as  $(BPWM\_PERIOD + 1 - BPWM\_RCAPDATn)$  BPWM counter time, where one BPWM counter time is  $(CLKPSC+1) * BPWMx\_CLK$  clock time. In the case shown in Figure 6.11-24, low pulse width is  $8+1-5 = 4$  BPWM counter time.

For the positive pulse case, the channel high pulse width is calculated as  $(BPWM\_PERIOD + 1 - BPWM\_FCAPDATn)$  BPWM counter time, where one BPWM counter time is  $(CLKPSC+1) * BPWMx\_CLK$  clock time. In the case shown in Figure 6.11-24, high pulse width is  $8+1-7 = 2$  BPWM counter time.

### 6.11.7 Register Description

**BPWM** **Control** **Register** **0**  
(BPWM\_CTL0)

Register	Offset	R/W	Description	Reset Value
BPWM_CTL0	BPWMx_BA+0x00	R/W	BPWM Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
DBGTRIOFF	DBGHALT	Reserved					
23	22	21	20	19	18	17	16
Reserved		IMMLDEN5	IMMLDEN4	IMMLDEN3	IMMLDEN2	IMMLDEN1	IMMLDEN0
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		CTRLD5	CTRLD4	CTRLD3	CTRLD2	CTRLD1	CTRLD0

Bits	Description
[31]	<b>DBGTRIOFF</b> <b>ICE Debug Mode Acknowledge Disable (Write Protect)</b> 0 = ICE debug mode acknowledgement effects BPWM output. BPWM pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement Disabled. BPWM pin will keep output no matter ICE debug mode acknowledged or not. <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.
[30]	<b>DBGHALT</b> <b>ICE Debug Mode Counter Halt (Write Protect)</b> If counter halt is enabled, BPWM all counters will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt Disabled. 1 = ICE debug mode counter halt Enabled. <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.
[29:22]	<b>Reserved</b> Reserved.
[16+n] n=0,1..5	<b>IMMLDENn</b> <b>Immediately Load Enable Bit(S)</b> Each bit n controls the corresponding BPWM channel n. 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLD bit. 1 = PERIOD/CMPDAT will load to PBUF and CMPBUF immediately when software update PERIOD/CMPDAT. <b>Note:</b> If IMMLDENn is enabled, CTRLDn will be invalid.
[15:6]	<b>Reserved</b> Reserved.
[n] n=0,1..5	<b>CTRLDn</b> <b>Center Re-load</b> Each bit n controls the corresponding BPWM channel n. In up-down counter type, PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the center point of a period.

## BPWM Control Register 1

**BPWM (BPWM\_CTL1)**

Register	Offset	R/W	Description	Reset Value
BPWM_CTL1	BPWMx_BA+0x04	R/W	BPWM Control Register 1	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						CNTTYPE0	

Bits	Description
[31:2]	Reserved
[1:0]	<b>BPWM Counter Behavior Type 0</b> Each bit n controls corresponding BPWM channel n. 00 = Up counter type (supports in capture mode). 01 = Down count type (supports in capture mode). 10 = Up-down counter type. 11 = Reserved.

**BPWM** **Clock** **Source** **Register**  
**(BPWM\_CLKSRC)**

Register	Offset	R/W	Description	Reset Value
BPWM_CLKSRC	BPWMx_BA+0x10	R/W	BPWM Clock Source Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					ECLKSRC0		

Bits	Description
[31:3]	Reserved
[2:0]	<b>ECLKSRC0</b> <b>BPWM_CH01 External Clock Source Select</b> 000 = BPWMx_CLK, x denotes 0 or 1. 001 = TIMER0 overflow. 010 = TIMER1 overflow. 011 = TIMER2 overflow. 100 = TIMER3 overflow. Others = Reserved.

**BPWM** **Clock** **Prescale** **Register**  
**(BPWM\_CLKPSC)**

Register	Offset	R/W	Description	Reset Value
BPWM_CLKPSC	BPWMx_BA+0x14	R/W	BPWM Clock Prescale Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				CLKPSC			
7	6	5	4	3	2	1	0
CLKPSC							

Bits	Description
[31:12]	<b>Reserved</b> Reserved.
[11:0]	<b>CLKPSC</b> <b>BPWM Counter Clock Prescale</b> The clock of BPWM counter is decided by clock prescaler. Each BPWM pair share one BPWM counter clock prescaler. The clock of BPWM counter is divided by (CLKPSC+ 1).

**BPWM Counter Enable Register**  
**(BPWM\_CNTEN)**

Register	Offset	R/W	Description	Reset Value
BPWM_CNTEN	BPWMx_BA+0x20	R/W	BPWM Counter Enable Register	0x0000_0000

31	30	29	28	27	26	25	24

## 6.12 PWM Generator and Capture Timer (PWM)

### 6.12.1 Overview

The chip provides two PWM generators — PWM0 and PWM1. Each PWM supports 6 channels of PWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit PWM counter with 16-bit comparator. The PWM counter supports up, down and up-down counter types. PWM uses comparator compared with counter to generate events. These events use to generate PWM pulse, interrupt and trigger signal for ADC to start conversion.

The PWM generator supports two standard PWM output modes: Independent mode and Complementary mode, they have difference architecture. In Complementary mode, there are two comparators to generate various PWM pulse with 12-bit dead-time generator. For PWM output control unit, it supports polarity output, independent pin mask and brake functions.

The PWM generator also supports input capture function to latch PWM counter value to the corresponding register when input channel has a rising transition, falling transition or both transition is happened. Capture function also support PDMA to transfer captured data to memory.

### 6.12.2 Features

#### 6.12.2.1 PWM function features

- Supports maximum clock frequency up to maximum PLL frequency
- Supports up to two PWM modules, each module provides 6 output channels
- Supports independent mode for PWM output/Capture input channel
- Supports complementary mode for 3 complementary paired PWM output channel
  - Dead-time insertion with 12-bit resolution
  - Two compared values during one period
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution PWM counter
  - Up, down and up/down counter operation type
- Supports mask function and tri-state enable for each PWM pin
- Supports brake function
  - Brake source from pin and system safety events (clock failed, Brown-out detection and CPU lockup)
  - Noise filter for brake source from pin
  - Edge detect brake source to control brake state until brake interrupt cleared
  - Level detect brake source to auto recover function after brake condition removed
- Supports interrupt on the following events:
  - PWM counter matches 0, period value or compared value
  - Brake condition happened
- Supports trigger ADC on the following events:
  - PWM counter matches 0, period value or compared value

#### 6.12.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution
- Supports rising or falling capture condition

- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option
- Supports PDMA transfer function for PWM all channels

### 6.12.3 Block Diagram

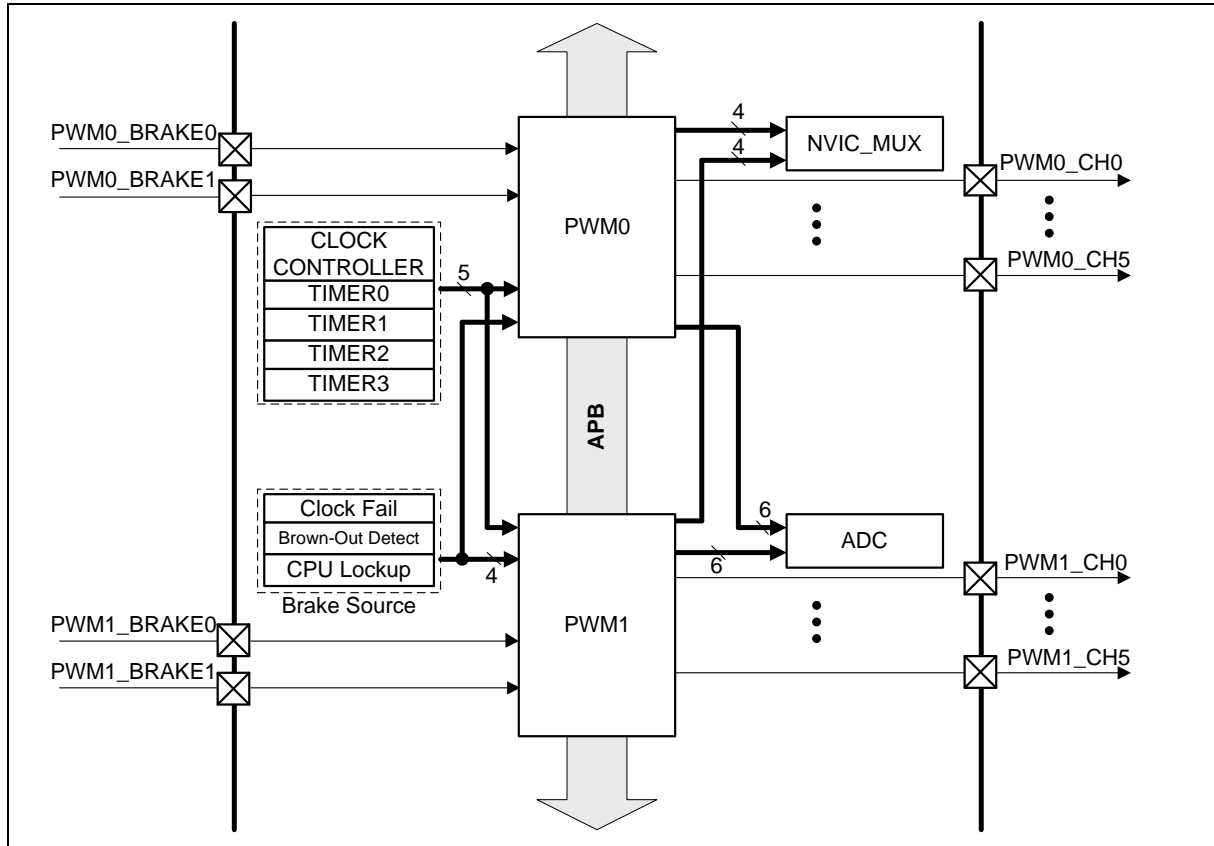

Figure 6.12-1 PWM Generator Overview Block Diagram

PWM Clock frequency can be set equal or double to PCLK frequency as Figure 6.12-2, For the detailed register setting, please refer to Table 6.12-1. Each PWM generator has three clock source inputs, each clock source can be selected from PWM Clock or four TIMER trigger PWM outputs as Figure 6.12-3 by ECLKSRC0 (PWM\_CLKSRC[2:0]) for PWM\_CLK0, ECLKSRC2 (PWM\_CLKSRC[10:8]) for PWM\_CLK2 and ECLKSRC4 (PWM\_CLKSRC[18:16]) for PWM\_CLK4.

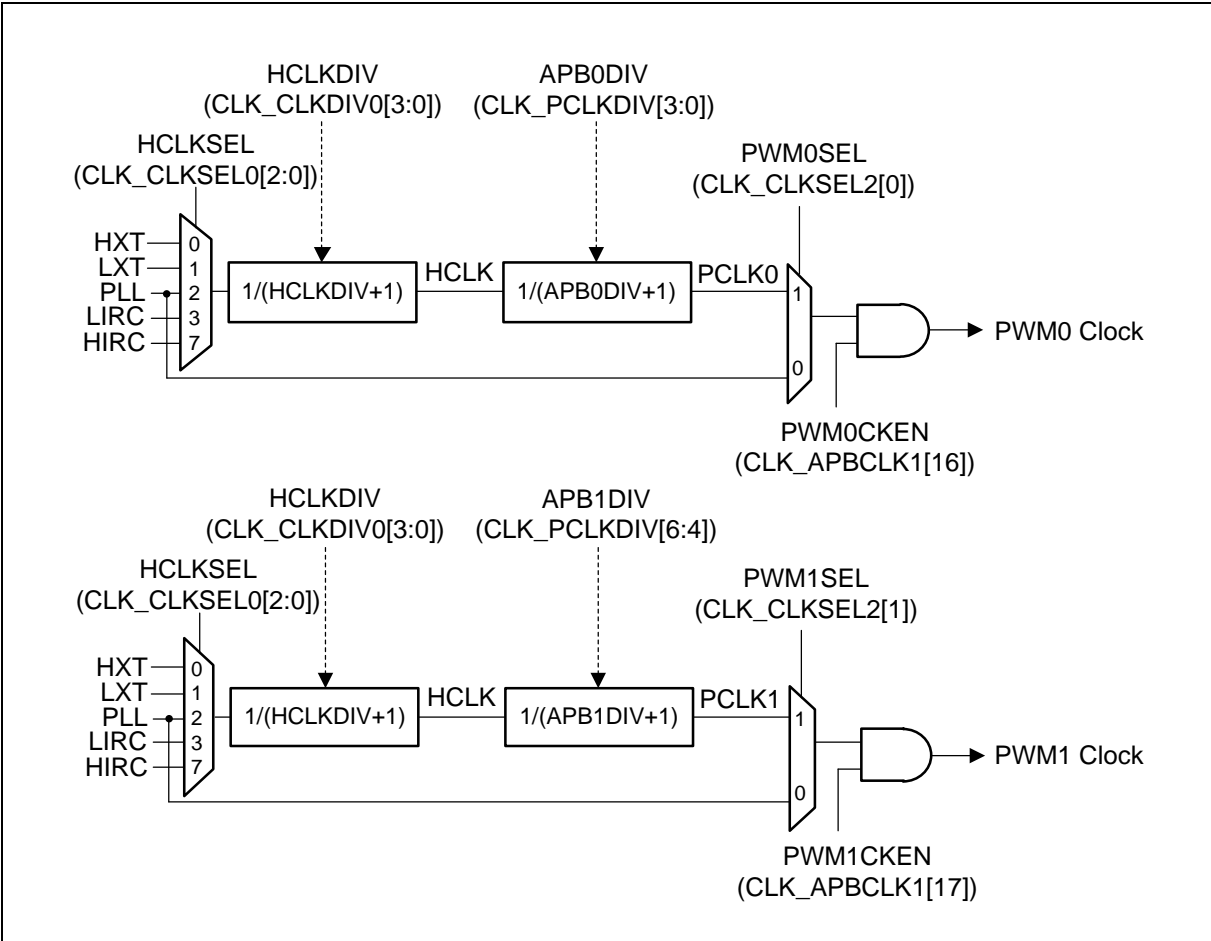

Figure 6.12-2 PWM System Clock Source Control

Frequency Ratio PCLK:PWM Clock	HCLK	PCLK	PWM Clock	HCLKSEL CLK_CLKSEL0[2:0]	HCLKDIV CLK_CLKDIV0[3:0]	APBnDIV (CLK_CLKDIVn [2+4n:4n]), N Denotes 0 Or 1	PWMnSEL (CLK_CLKSEL2[N ]), N Denotes 0 Or 1
1:1	HCLK	PCLK	PCLK	Don't care	Don't care	Don't care	1
1:2	PLL	PLL/ 2	PLL	2	0	1	0
1:2	PLL/ 2	PLL/ 2	PLL	2	1	0	0

Table 6.12-1 PWM Clock Source Control Registers Setting Table

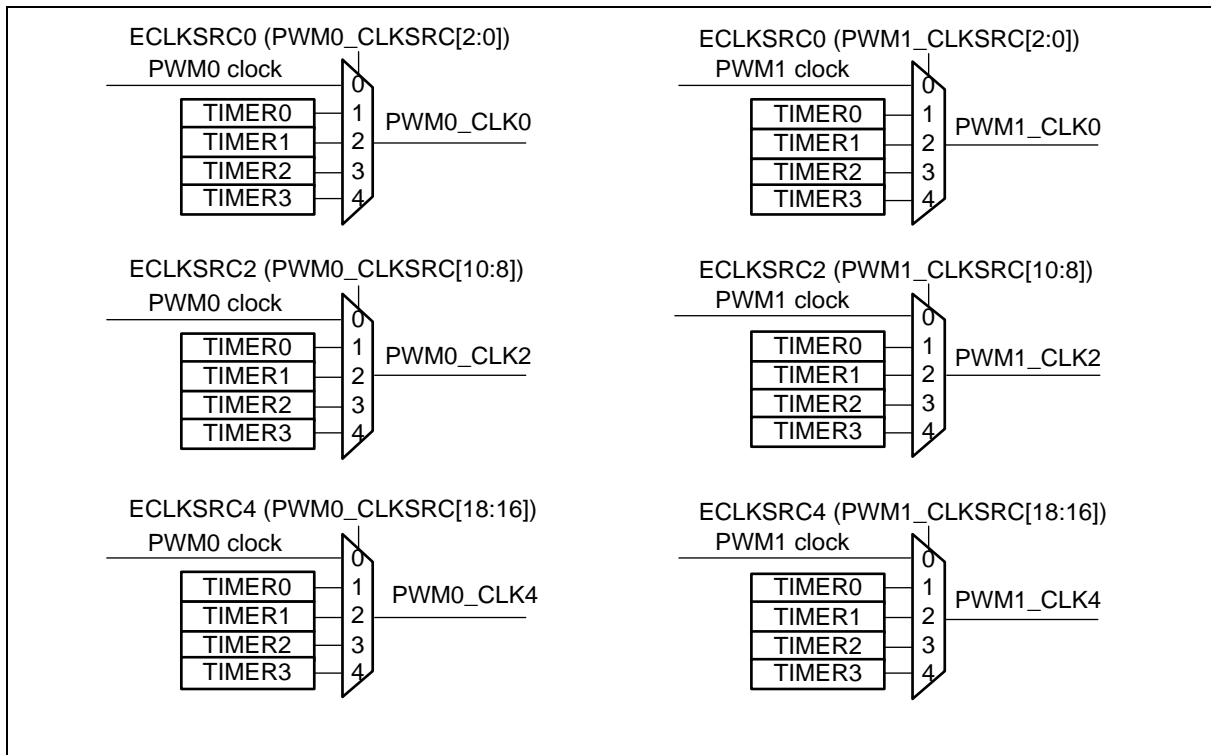

Figure 6.12-3 PWM Clock Source Control

Figure 6.12-4 and Figure 6.12-5 illustrate the architecture of PWM independent mode and complementary mode. No matter independent mode or complementary mode, paired channels' (PWM\_CH0 and PWM\_CH1, PWM\_CH2 and PWM\_CH3, PWM\_CH4 and PWM\_CH5) counters both come from the same clock source and prescaler. When counter count to 0, PERIOD (PWM\_PERIODn[15:0]) or equal to comparator, events will be generated. These events are passed to corresponding generators to generate PWM pulse, interrupt signal and trigger signal for ADC to start conversion. Output control is used to changing PWM pulse output state; brake function in output control also generates interrupt events. In complementary mode, even channel use odd channel comparator to generate events.

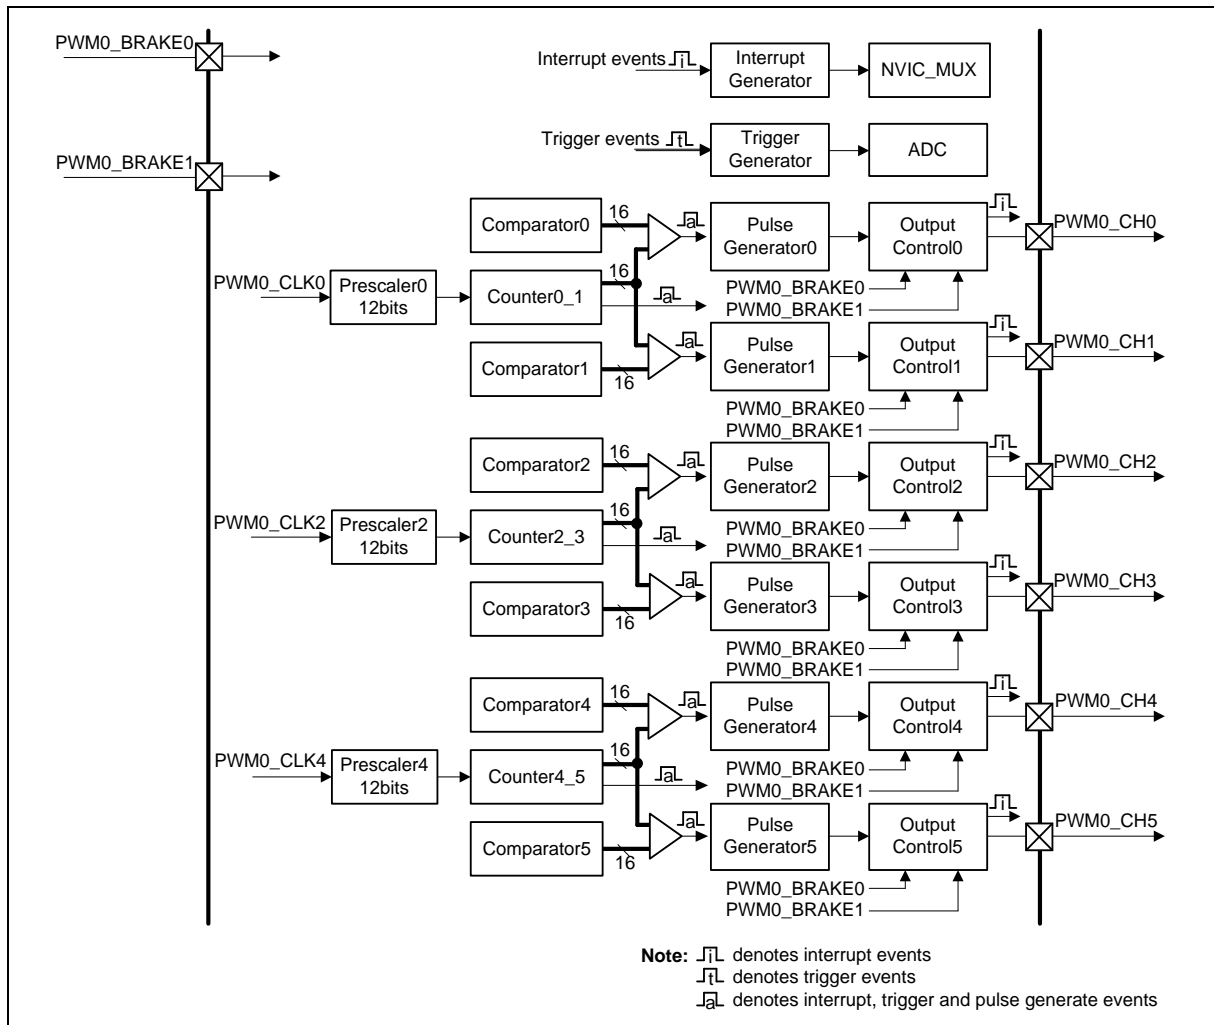

Figure 6.12-4 PWM Independent Mode Architecture Diagram

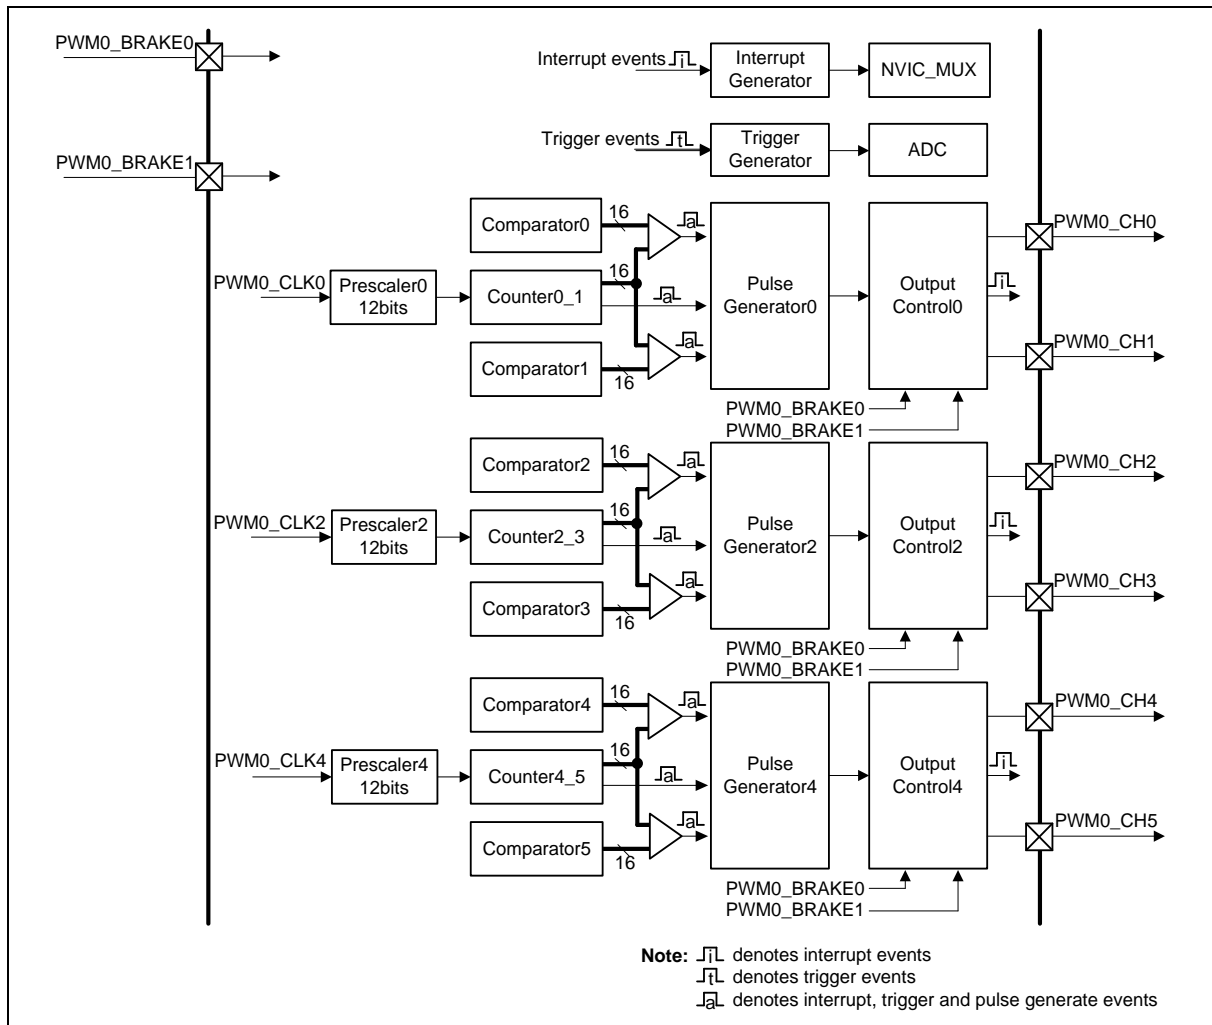

Figure 6.12-5 PWM Complementary Mode Architecture Diagram

## 6.12.4 Basic Configuration

### 6.12.4.1 PWM0 Basic Configuration

- Clock Source Configuration
  - Select the source of PWM0 peripheral clock on PWM0SEL (CLK\_CLKSEL2[0])
  - Enable PWM0 peripheral clock in PWM0CKEN CLK\_APBCLK1[16]).
- Reset Configuration
  - Reset PWM0 in PWM0RST SYS\_IPRST2[16]

### 6.12.4.2 PWM1 Basic Configuration

- Clock Source Configuration
  - Select the source of PWM1 peripheral clock on PWM1SEL (CLK\_CLKSEL2[1])
  - Enable PWM1 peripheral clock in PWM1CKEN (CLK\_APBCLK1[17]).
- Reset Configuration
  - Reset PWM1 in PWM1RST SYS\_IPRST2[17]

Figure 6.12-8 PWM Up Counter Type

#### 6.12.5.4 Down Counter Type

When PWM counter is set to down counter type, CNTTYPE<sub>n</sub> (PWM\_CTL1[2n+1:2n], n = 0,1..5) is 0x1, it starts down-counting from PERIOD to 0 to complete a PWM period. The current counter value can be read from CNT (PWM\_CNTn[15:0]) bits. PWM generates zero point event when the counter counts to 0 and prescale counts to 0. PWM generates period point event when the counter counts to PERIOD and prescale counts to 0. The Figure 6.12-9 shows an example of down counter, wherein

$$\text{PWM period time} = (\text{PERIOD}+1) * (\text{CLKPSC}+1) * \text{PWMx\_CLK}.$$

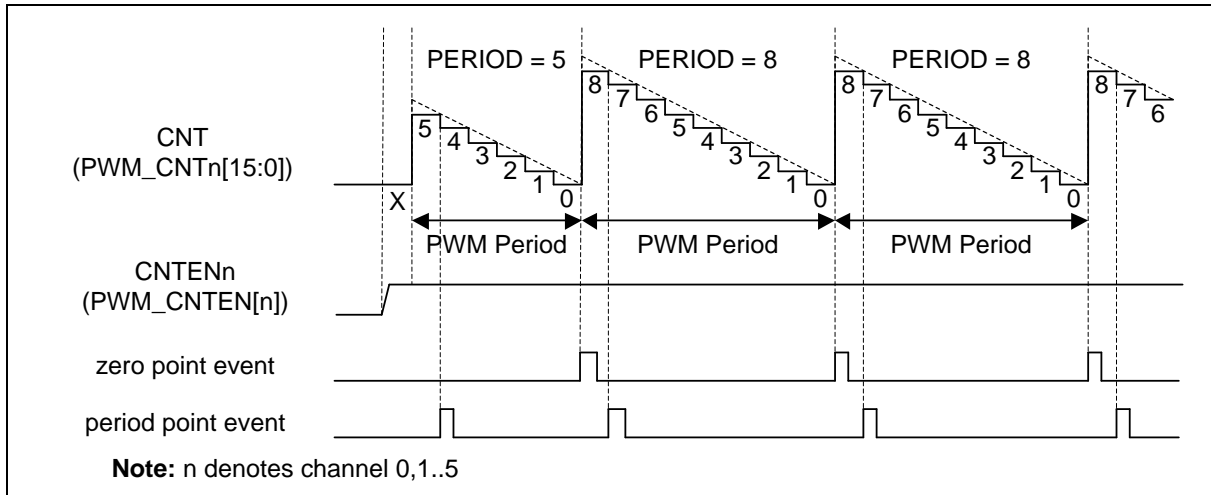

Figure 6.12-9 PWM Down Counter Type

#### 6.12.5.5 Up-Down Counter Type

When PWM counter is set to up-down count type, CNTTYPE<sub>n</sub> (PWM\_CTL1[2n+1:2n], n = 0,1..5) is 0x2, it starts counting-up from 0 to PERIOD and then starts counting down to 0 to complete a PWM period. The current counter value can be read from CNT (PWM\_CNTn[15:0]) bits. PWM generates zero point event when the counter counts to 0 and prescale counts to 0. PWM generates center point event which is equal to period point event when the counter counts to PERIOD. Figure 6.12-10 shows an example of up-down counter, wherein

$$\text{PWM period time} = (2 * \text{PERIOD}) * (\text{CLKPSC} + 1) * \text{PWMx\_CLK}.$$

The DIRF (PWM\_CNTn[16]) bit is counter direction indicator flag, where high is up counting, and low is down counting.

Figure 6.12-10 PWM Up-Down Counter Type

#### 6.12.5.6 PWM Comparator

CMPDATn is a basic comparator register of PWM channel n; In Independent mode each channel only has one comparator, the value of CMPDATn register is continuously compared to the corresponding channel's counter value. In Complementary mode each paired channels has two comparators, and the value of CMPDATn and CMPDATm (n = 0,2,4, m = 1,3,5) registers are continuously compared to the complementary even channel's counter value, because of odd channel's counter is useless. For example, channel 0 and channel 1 are complementary channels, in Complementary mode, channel 1's comparator is continuously compared to channel 0's counter, but not channel 1's. When the counter is equal to value of CMPDAT0 register, PWM generates a compared point event and uses the event to generate PWM pulse, interrupt or use to trigger ADC. In up-down counter type, two events will be generated in a PWM period as shown in Figure 6.12-11. The CMPU is up count compared point event and CMPD is down count compared point event.

Figure 6.12-11 PWM Compared point Events in Up-Down Counter Type

#### 6.12.5.7 PWM Double Buffering

The double buffering uses double buffers to separate software writing and hardware action operation timing. There are three loading modes for loading values to buffer: period loading mode, immediately loading mode, and center loading mode. After registers are modified through software, hardware will load register value to the buffer register according to the loading mode timing. The hardware action is based on the buffer value. This can prevent asynchronously operation problem due to software and hardware asynchronism.

The PWM provides PBUF (PWM\_PBUFn[15:0]) as the active PERIOD buffer register, CMPBUF (PWM\_CMPBUFn[15:0]) as the active CMPDAT buffer register. The concept of double buffering is used in loading modes, which are described in the following sections. For example, as shown Figure 6.12-12, in period loading mode, writing PERIOD and CMPDAT through software, PWM will load new values to their buffer PBUF (PWM\_PBUFn[15:0]) and CMPBUF (PWM\_CMPBUFn[15:0]) at start of the next period without affecting the current period counter operation.

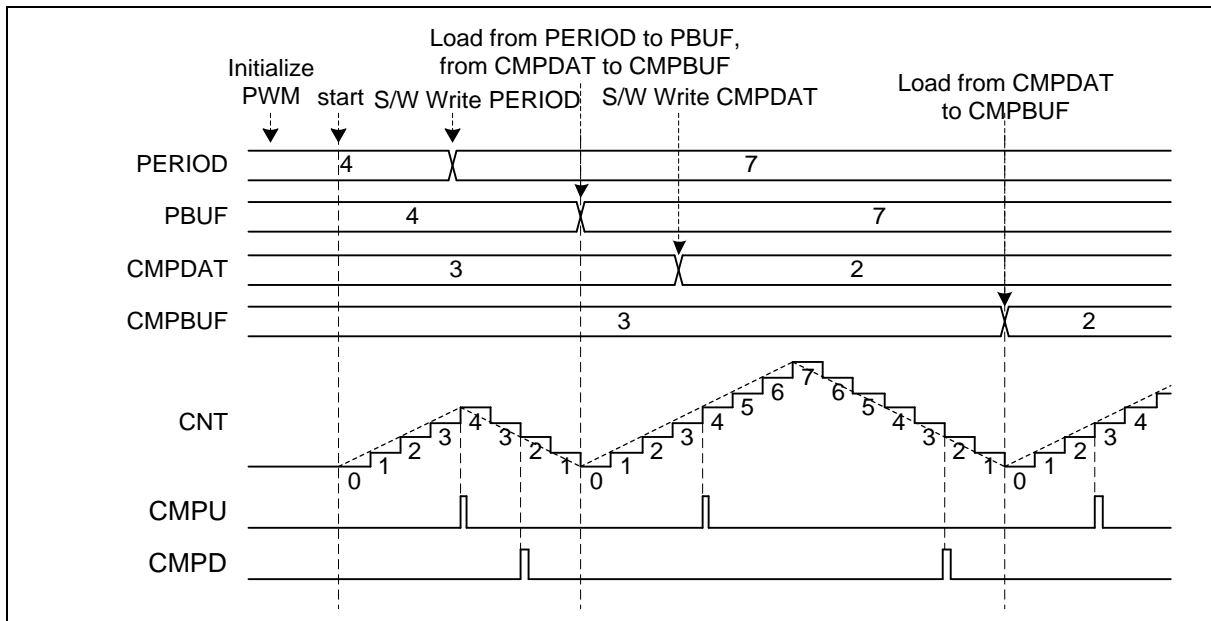

Figure 6.12-12 PWM Double Buffering Illustration

6.12.5.8 Period Loading Mode

When immediately loading mode, and center loading mode are disabled that IMMLDENn bits, and CTRLDN bits of PWM\_CTL0 register are set to 0, PWM operates at period Loading mode. In period Loading mode, PERIOD(PWM\_PERIODn[15:0]) and CMP(PWM\_CMPDATn[15:0]) will all load to their active PBUF and CMPBUF registers while each period is completed. For example, after PWM counter up counts from zero to PERIOD in the up-counter operation or down counts from PERIOD to zero in the down-counter operation or counts up from 0 to PERIOD and then counts down to 0 in the up-down counter operation.

Figure 6.12-13 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on. CMPDAT also follows this rule. The following describes steps sequence of Figure 6.12-13. User can know the PERIOD and CMPDAT update condition, by watching PWM period and CMPU event.

- 1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
- 2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of PWM period at point 2.
- 3. Software writes PERIOD DATA1 to PERIOD at point 3.
- 4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
- 5. Software writes PERIOD DATA2 to PERIOD at point 5.
- 6. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 6.

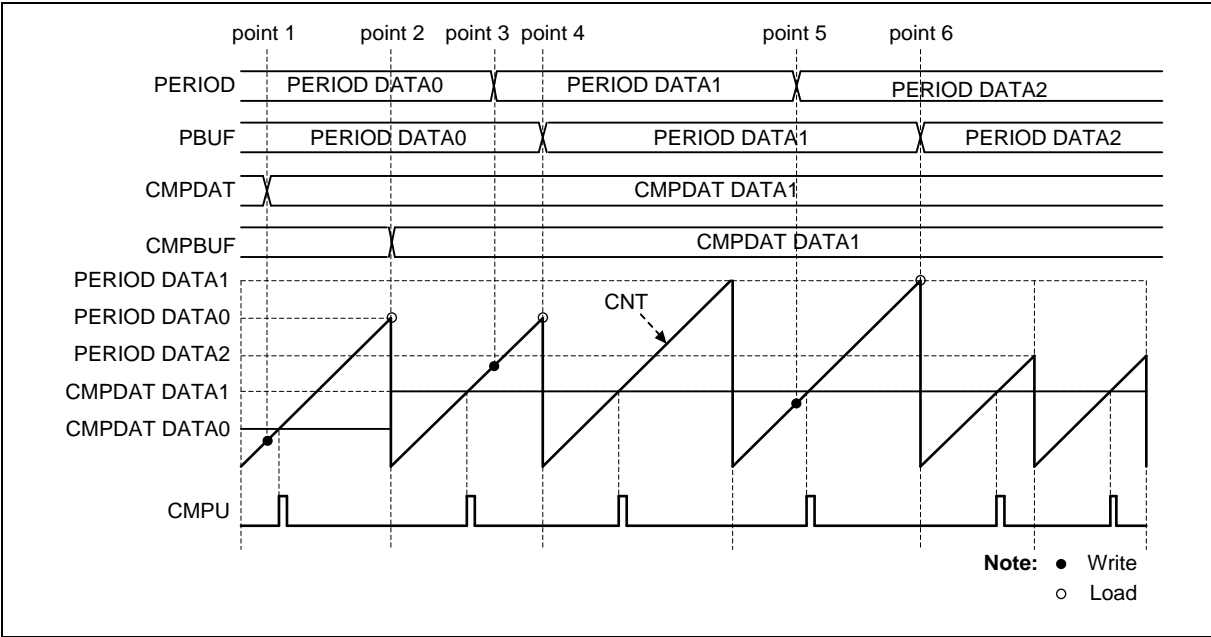

Figure 6.12-13 Period Loading in Up-Count Mode

6.12.5.9 Immediately Loading Mode

If the IMMLDENn (PWM\_CTL0[21:16]) bit is set to 1, PWM operates at immediately loading mode. In immediately loading mode, when user update PERIOD (PWM\_PERIODn[15:0]) or CMP (PWM\_CMPDATn[15:0]), PERIOD or CMPDAT will be load to active PBUF (PWM\_PBUFn[15:0]) or CMPBUF (PWM\_CMPBUFn[15:0]) after current counter count is completed. If the updated PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAXF(PWMx\_STATUS[5:0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDENn has been set, other

loading mode for channel n will become invalid. Figure 6.12-14 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loading CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than current counter value at point 2; counter will continue counting until equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

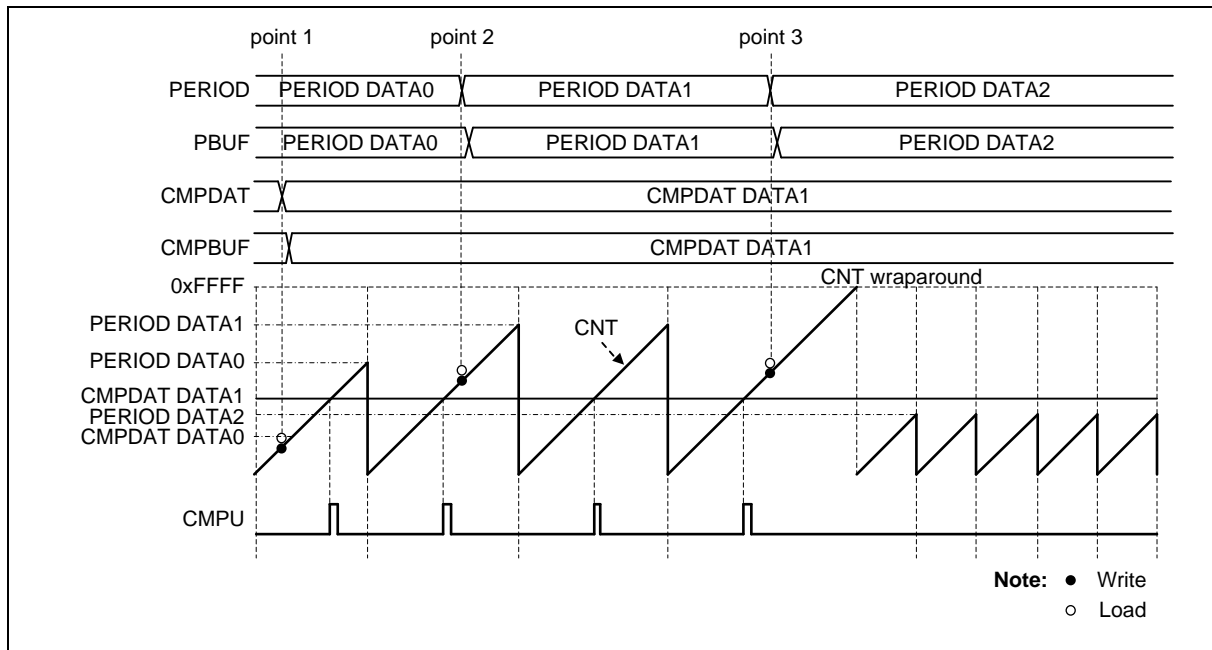

Figure 6.12-14 Immediately Loading in Up-Count Mode

#### 6.12.5.10 Center Loading Mode

When the CTRL<sub>Dn</sub> (PWM\_CTL0[5:0]) bit is set to 1 and PWM counter is set to up-down count type, CNTTYPE<sub>n</sub> (PWM\_CTL1[2n+1:2n], n = 0,1..5) is 0x2, PWM operates at center loading mode. In center loading mode, CMP(PWM\_CMPDAT<sub>n</sub>[15:0]) will load to active CMPBUF register in center of each period, that is, counter counts to PERIOD. PERIOD(PWM\_PERIOD<sub>n</sub>[15:0]) will all load to their active PBUF registers while each period is completed. Figure 6.12-15 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of PWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of PWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 8.

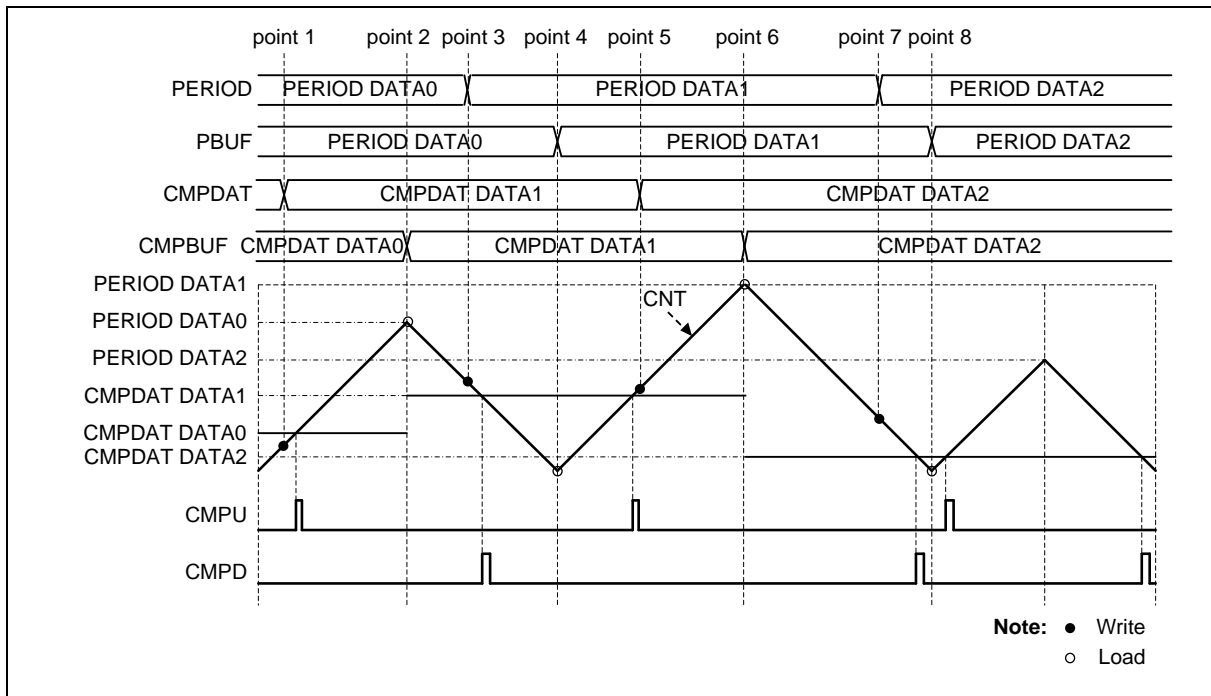

Figure 6.12-15 Center Loading in Up-Down-Count Mode

#### 6.12.5.11 PWM Counter Operation Mode

The PWM counter supports Auto-reload mode.

In Auto-reload mode, CMPDAT and PERIOD registers should be written first and then the CNTENn(PWM\_CNTEN[n]) bit is set to 1 to enable EPWM prescaler and start to run counter. The value of CLKPSC(PWM\_CLKPSCn\_m[11:0]), PERIOD(PWM\_PERIODn[15:0]) and CMP(EPWM\_CMPDATn[15:0]) will auto reload to their active buffer according different loading mode. If PERIOD(EPWM\_PERIODn[15:0]) is set to 0, PWM counter will be set to 0.

#### 6.12.5.12 PWM Pulse Generator

The PWM pulse generator uses counter and comparator events to generate PWM pulse. The events are: zero point, period point in up counter type and down counter type, center point in up-down counter type and counter equal to comparator point in three types. As to up-down counter type, there are two counter equal comparator points, one at up count and the other at down count. Besides, Complementary mode has two comparators compared with counter, and thus comparing equal points will become four in up-down counter type and two for up or down counter type.

Each event point can decide PWM waveform to do nothing (X), set Low (L), set High (H) or toggle (T) by setting the PWM\_WGCTL0 and PWM\_WGCTL1 registers. Using these points can easily generate asymmetric PWM pulse or variant waveform as shown in Figure 6.12-16. In the figure, PWM is in complementary mode, there are two comparators n and m to generate PWM pulse. n denotes even channel number 0, 2, or 4, and m denotes odd channel number 1, 3, or 5. n channel and m channel are complementary paired. Complementary mode uses two channels (CH0 and CH1, CH2 and CH3, or CH4 and CH5) as a pair of PWM outputs to generate complement paired waveforms. CMPU denotes CNT(PWM\_CNTn[15:0]) is equal to CMP(PWM\_CMPDATn[15:0]) when counting up. CMPD denotes CNT bits is equal to CMP bits when counting down.

Figure 6.12-16 PWM Pulse Generation

The generation events may sometimes set to the same value, as the reason, events priority between different counter types are list below, up counter type (Table 6.12-2), down counter type (Table 6.12-3) and up-down counter type (Table 6.12-4). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.12-17.

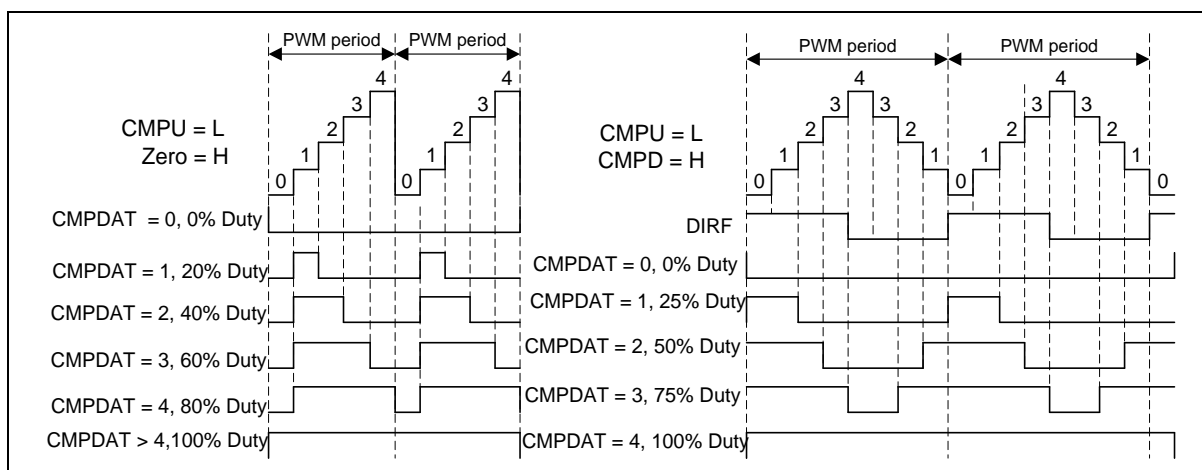

Figure 6.12-17 PWM 0% to 100% Pulse Generation

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)
2	Compare up event of odd channel (CNT = CMPUm)
3	Compare up event of even channel (CNT = CMPUn)
4 (Lowest)	Zero event (CNT = 0)

Table 6.12-2 PWM Pulse Generation Event Priority for Up-Counter

Priority	Down Event
1 (Highest)	Zero event (CNT = 0)
2	Compare down event of odd channel (CNT = CMPDm )
3	Compare down event of even channel (CNT = CMPDn )
4 (Lowest)	Period event (CNT = PERIOD)

Table 6.12-3 PWM Pulse Generation Event Priority for Down-Counter

Priority	Up Event	Down Event
1 (Highest)	Compare up event of odd channel (CNT = CMPUm)	Compare down event of odd channel (CNT = CMPDm)
2	Compare up event of even channel (CNT = CMPUn)	Compare down event of even channel (CNT = CMPDn)
3 (Lowest)	Zero event (CNT = 0)	Period (center) event (CNT = PERIOD)

Table 6.12-4 PWM Pulse Generation Event Priority for Up-Down-Counter

#### 6.12.5.13 PWM Output Mode

The PWM supports two output modes: Independent mode which may be applied to DC motor system, Complementary mode with dead-time insertion which may be used in the application of AC induction motor and permanent magnet synchronous motor.

#### 6.12.5.14 Independent mode

By default, the PWM is operating in independent mode, independent mode is enabled when channel n corresponding PWMMODEn (PWM\_CTL1[26:24]) bit is set to 0. In this mode six PWM channels: PWM\_CH0, PWM\_CH1, PWM\_CH2, PWM\_CH3, PWM\_CH4 and PWM\_CH5 are running off its own period and duty as shown in Figure 6.12-18.

Figure 6.12-18 PWM Independent Mode Waveform

#### 6.12.5.15 Complementary mode

Complementary mode is enabled when the pair channel corresponding PWMMODEn (PWM\_CTL1[26:24]) bit set to 1. In this mode there are 3 PWM generators utilized for complementary mode, with total of 3 PWM output paired pins in this module. In Complimentary modes, the internal odd

PWM signal must always be the complement of the corresponding even PWM signal. PWM\_CH1 will be the complement of PWM\_CH0. PWM\_CH3 will be the complement of PWM\_CH2 and PWM\_CH5 will be the complement of PWM\_CH4 as shown in Figure 6.12-19.

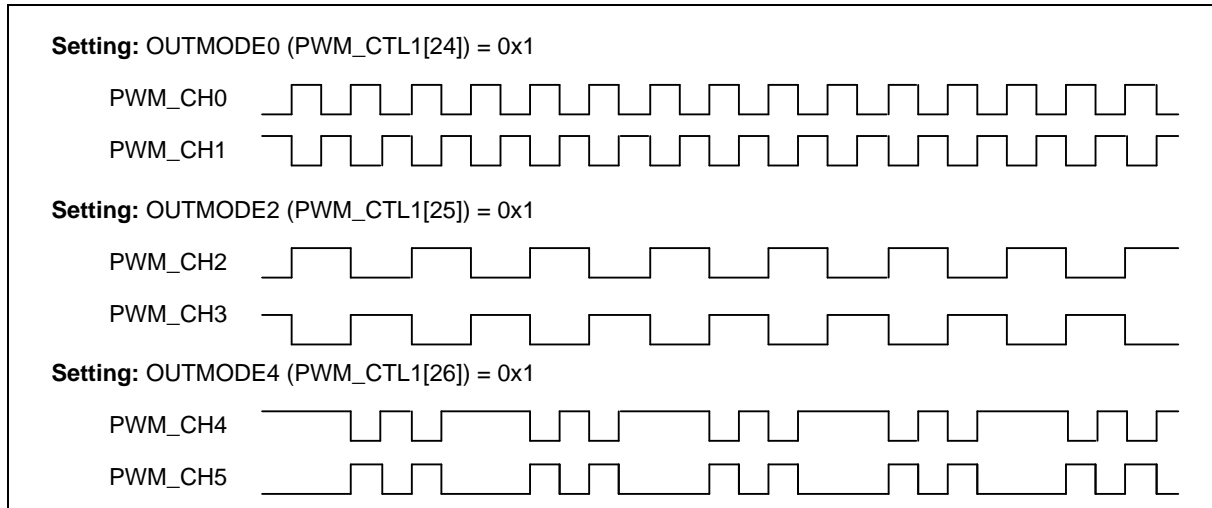

Figure 6.12-19 PWM Complementary Mode Waveform

#### 6.12.5.16 PWM Output Control

After PWM pulse generation, there are four to six steps to control the output of PWM channels. In independent mode, there are Mask, Brake, Pin Polarity and Output Enable four steps as shown in Figure 6.12-20. In complementary mode, it needs two more steps to precede these four steps, Complementary channels and Dead-Time Insertion as shown in Figure 6.12-21.

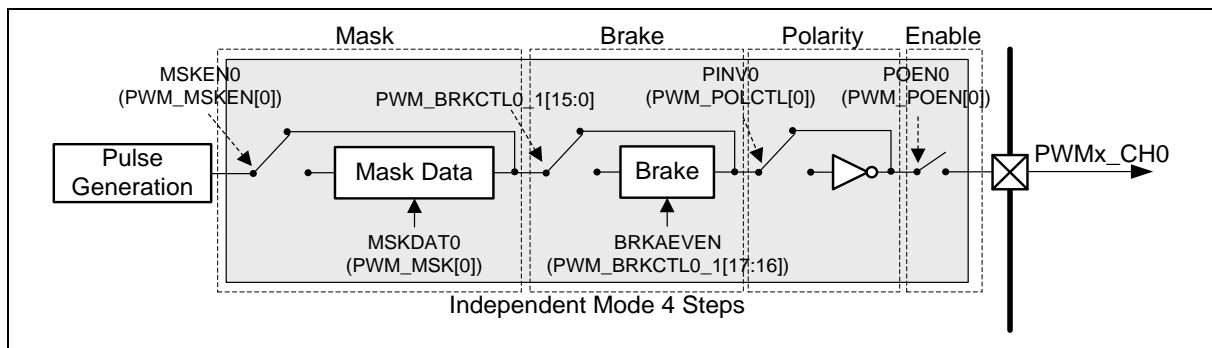

Figure 6.12-20 PWMx\_CH0 Output Control in Independent Mode

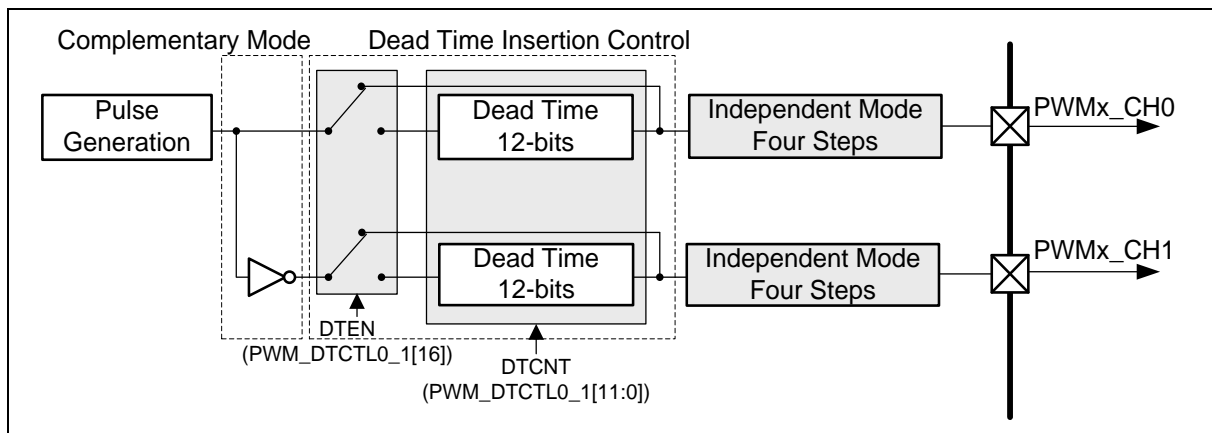

Figure 6.12-21 PWMx\_CH0 and PWMx\_CH1 Output Control in Complementary Mode

#### 6.12.5.17 Dead-Time Insertion

In the complementary application, the complement channels may drive the external devices like power switches. The dead-time generator inserts a low level period called “dead-time” between complementary outputs to drive these devices safely and to prevent system or devices from the burn-out damage. Hence the dead-time control is a crucial mechanism to the proper operation of the complementary system. By setting corresponding channel n DTEN (PWM\_DTCTLn\_m[16]) bit to enable dead-time function and DTCNT (PWM\_DTCTLn\_m[11:0]) to control dead-time period, the dead-time can be calculated from the following formula:

$$\text{Dead-time} = (\text{DTCNT}(\text{PWM\_DTCTLn}[11:0]) + 1) * \text{PWMx\_CLK period}$$

Dead-time insertion clock source can be selected from prescaler output by setting DTCKSEL (PWM\_DTCTLn\_m[24]) to 1. By default, clock source comes from PWM\_CLK, which is prescaler input. Then the dead-time can be calculated from the following formula:

$$\begin{aligned} \text{Dead-time} &= (\text{DTCNT}(\text{PWM\_DTCTLn}[11:0]) + 1) * \\ &(\text{CLKPSC}(\text{PWM\_CLKPSCn}[11:0]) + 1) * \text{PWMx\_CLK period} \end{aligned}$$

Please note that the PWM\_DTCTLn\_m are write-protected registers.

Figure 6.12-22 indicates the dead-time insertion for one pair of PWM signals.

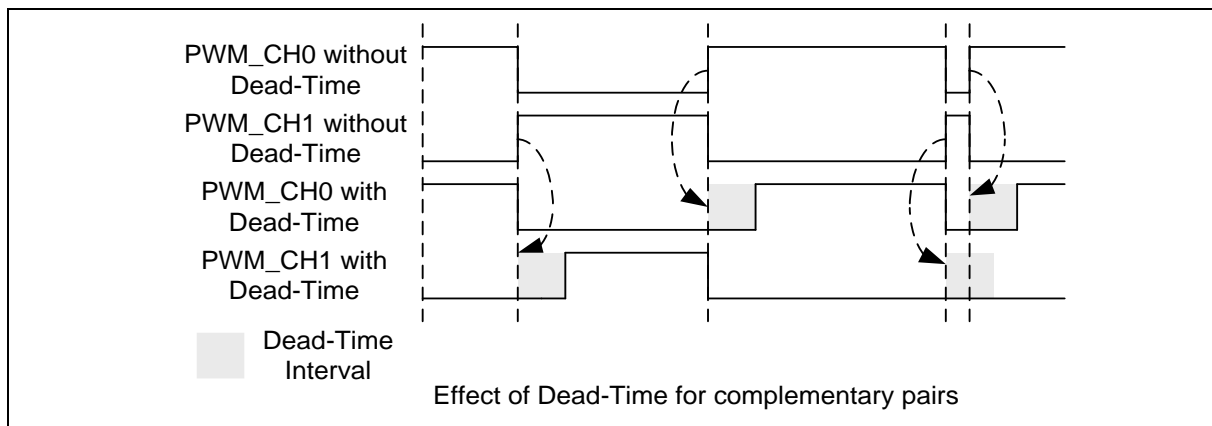

Figure 6.12-22 Dead-Time Insertion

#### 6.12.5.18 PWM Mask Output Function

Each of the PWM channel output value can be manually overridden with the settings in the PWM Mask Enable Control Register (PWM\_MSKEN) and the PWM Masked Data Register (PWM\_MSK). With these settings, the PWM channel outputs can be assigned to specified logic states independent of the duty cycle comparison units. The PWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The PWM\_MSKEN register contains six bits, MSKENn(PWM\_MSKEN[5:0]). If the MASKENn is set to active-high, the PWM channel n output will be overridden. The PWM\_MSK register contains six bits, MSKDATn(PWM\_MSK[5:0]). The bit value of the MSKDATn determines the state value of the PWM channel n output when the channel is overridden. Figure 6.12-23 shows an example of how PWM mask control can be used for the override feature.

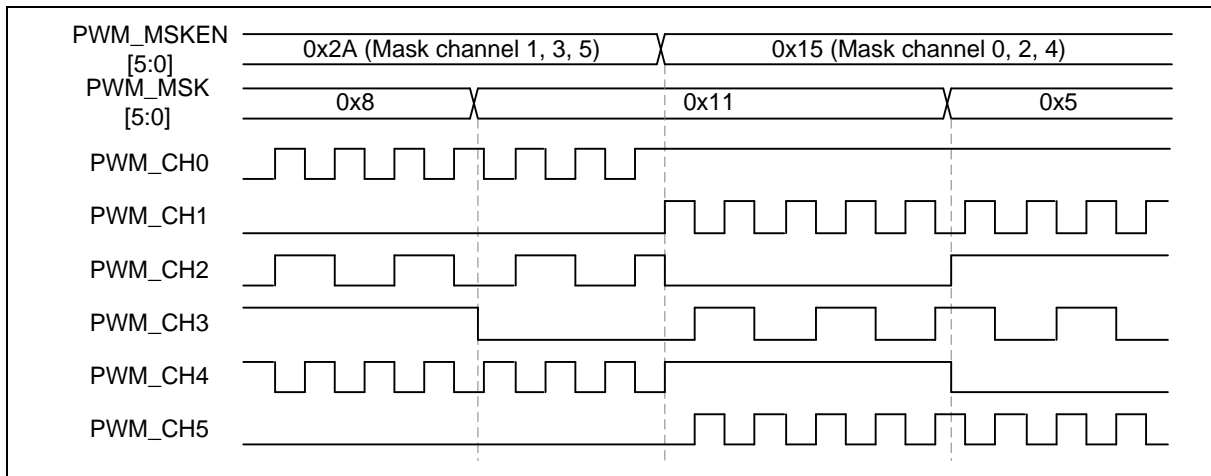

Figure 6.12-23 Illustration of Mask Control Waveform

#### 6.12.5.19 PWM Brake

Each PWM module has two external input brake control signals. User can select active brake pin source is from PWMx\_BRAKEy pin by BKxSRC bits of BNF register(x=0,1, y=0,1). The external signals will be filtered by a 3-bit noise filter. User can enable the noise filter function by BRKxNFEN bits of BNF register, and noise filter sampling clock can be selected by setting BRKxNFSEL bits of BNF register to fit different noise properties. Moreover, by setting the BRKxFCNT bits, user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake signal.

In addition, it can be inverted by setting the BRKxPINV (x denotes input external pin 0 or 1) bits of BNF register to realize the polarity setup for the brake control signals. Set BRKxPINV bit to 0, brake event will occurred when PWMx\_BRAKEy(x=0,1, y=0,1) pin status is from low to high; set BRKxPINV to 1, brake event will occurred when PWMx\_BRAKEy pin status is from high to low.

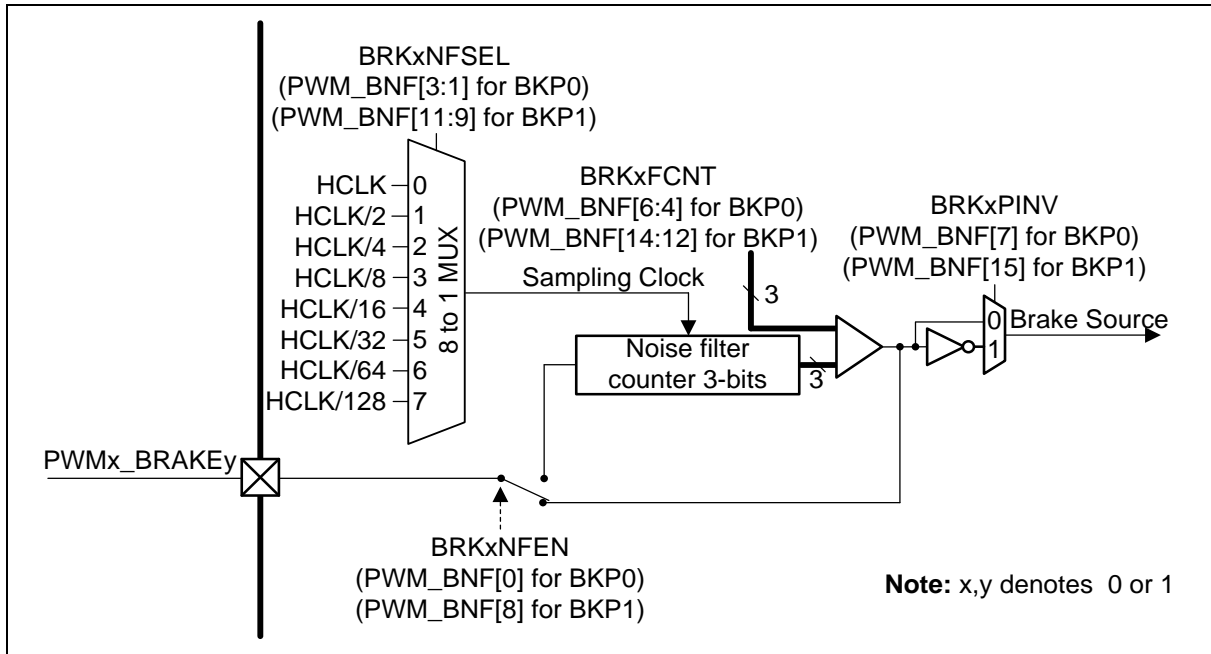

Figure 6.12-24 Brake Noise Filter Block Diagram

For Complementary mode, it is often necessary to set a safe output state to the complement output pairs once the brake event occurs.

Each complementary channel pair shares a PWM brake function, as shown Figure 6.12-25. To control paired channels to output safety state, user can setup BRKAEVEN (PWM\_BRKCTL0\_1[17:16]) for even channels and BRKAODD (PWM\_BRKCTL0\_1[19:18]) for odd channels when the fault brake event happens. There are two brake detectors: Edge detector and Level detector. When the edge detector detects the brake signal and BRKEIENn\_m (PWM\_INTEN1[2:0]) is enabled, the brake function generates BRK\_INT. This interrupt needs software to clear, and the BRKESTS0n (PWM\_INTSTS1[21:16]) brake state will keep until the next PWM period starts after the interrupt cleared. The brake function can also operate in another way through the level detector. Once the level detector detects the brake signal and the BRKLIENn\_m (PWM\_INTEN1[10:8]) is also enabled, the brake function will generate BRK\_INT, but BRKLSTS0n (PWM\_INTSTS1[29:24]) brake state will auto recovery to normal output while level brake source recovery to high level and pass through “Low Level Detection” at the PWM waveform period when brake condition removed without clear interrupt.

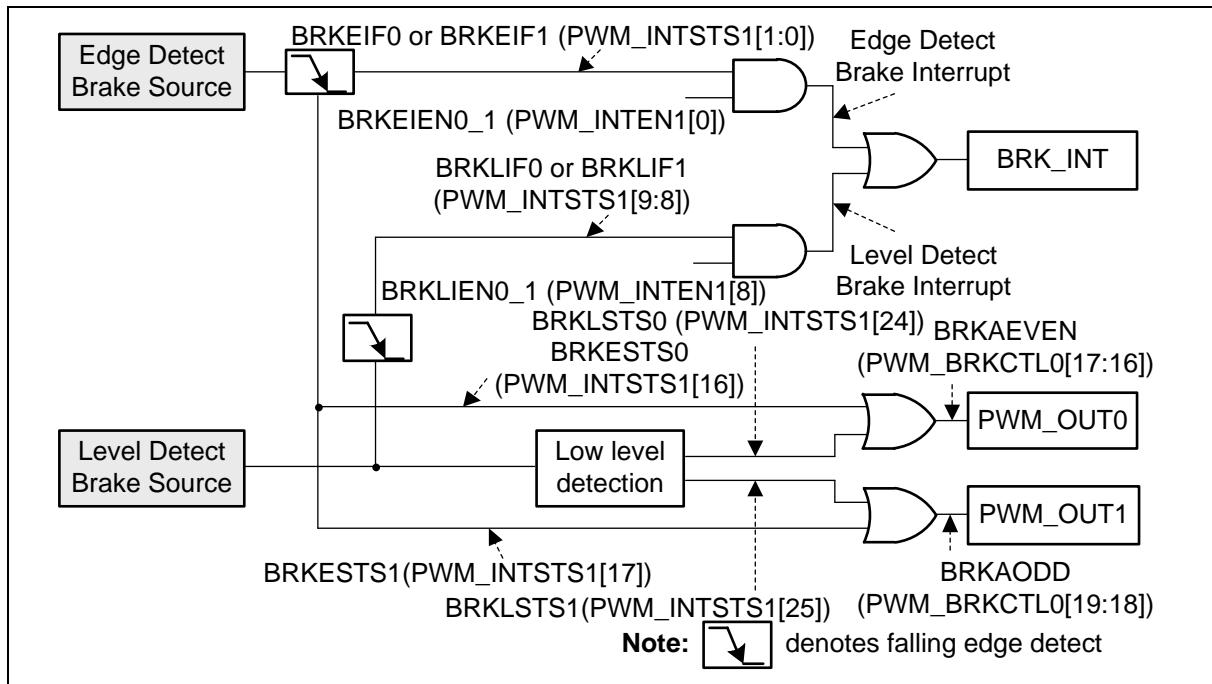

Figure 6.12-25 Brake Block Diagram for PWMx\_CH0 and PWMx\_CH1 Pair

Figure 6.12-26 illustrates the edge detector waveform for PWMx\_CH0 and PWMx\_CH1 pair. In this case, the edge detect brake source has occurred twice for the brake events. When the event occurs, both of the BRKEIF0 and BRKEIF1 flags are set and BRKESTS0 and BRKESTS1 bits are also set to indicate brake state of PWMx\_CH0 and PWMx\_CH1. For the first occurring event, software writes 1 to clear the BRKEIF0 flag. After that, the BRKESTS0 bit is cleared by hardware at the next start of the PWM period. At the same moment, the PWMx\_CH0 outputs the normal waveform even though the brake event is still occurring. The second event also triggers the same flags, but at this time, software writes 1 to clear the BRKEIF1 flag. Afterward, PWMx\_CH1 outputs normally at the next start of the PWM period.

As a contrast to the edge detector example, Figure 6.12-27 illustrates the level detector waveform for PWMx\_CH0 and PWMx\_CH1 pair. In this case, the BRKLIF0 and BRKLIF1 flags can only indicate the brake event having occurred. The BRKLSTS0 and BRKLSTS1 brake states will automatically recover at the start of the next PWM period no matter at what states the BRKLIF0 and BRKLIF1 flags are at that moment.

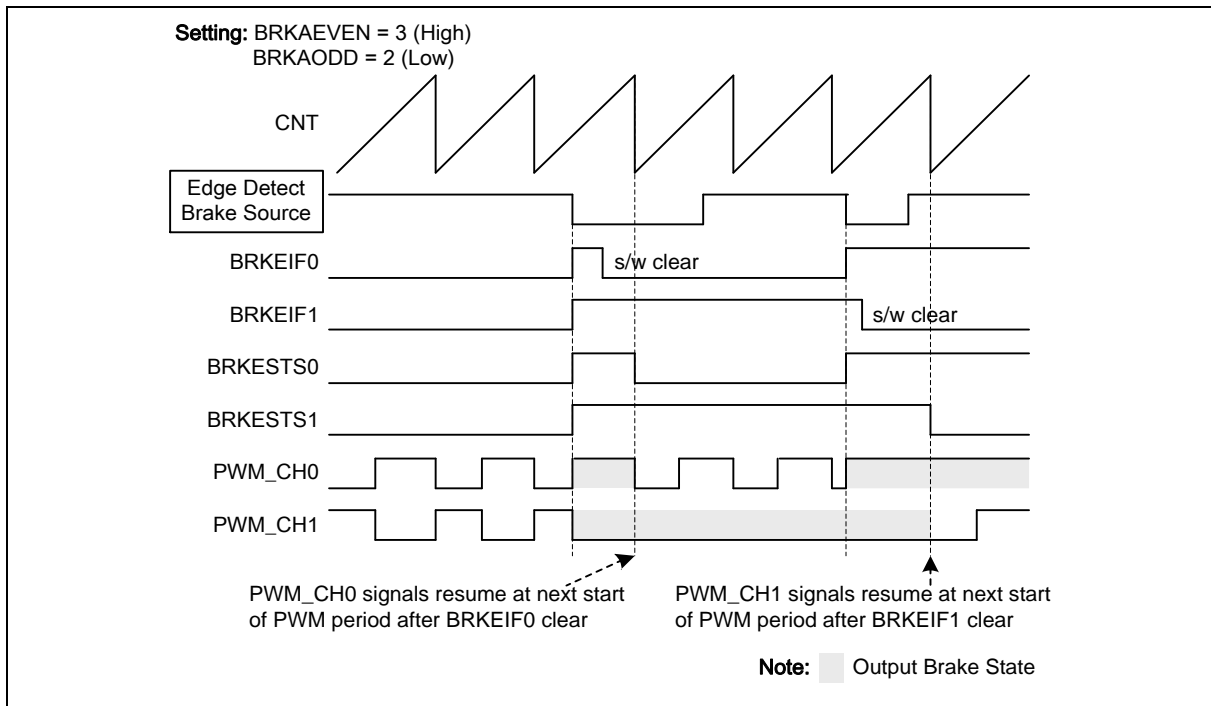

Figure 6.12-26 Edge Detector Waveform for PWMx\_CH0 and PWMx\_CH1 Pair

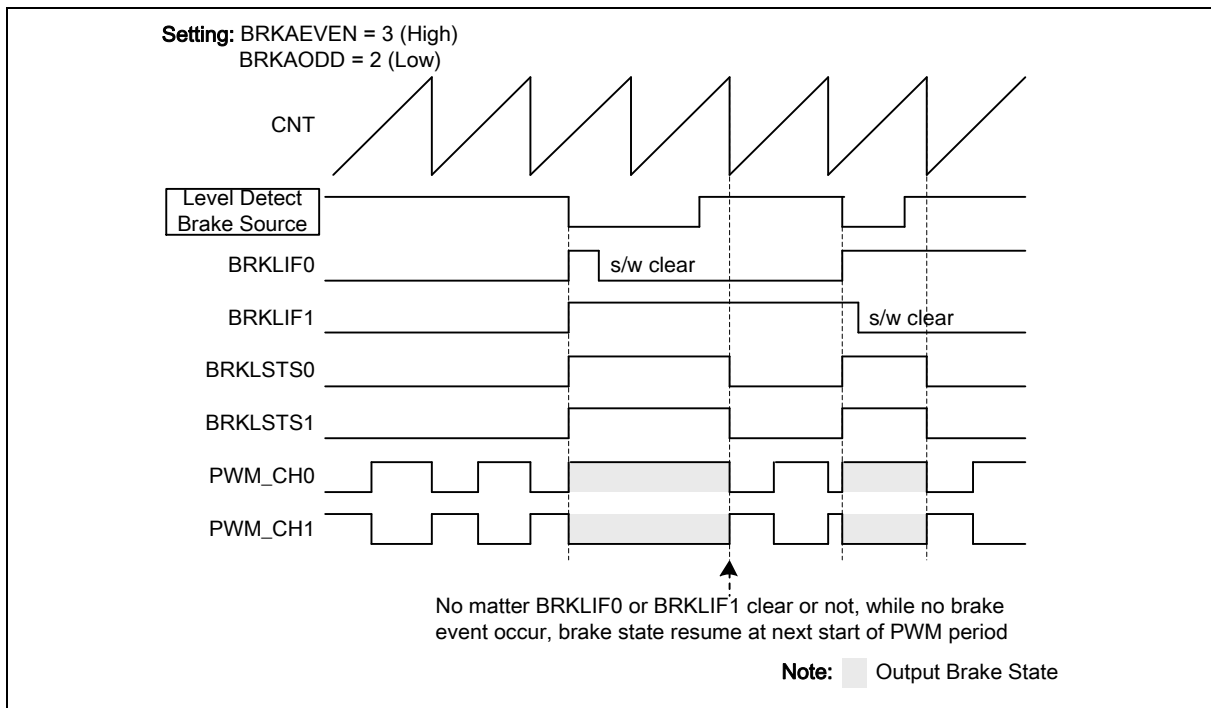

Figure 6.12-27 Level Detector Waveform for PWMx\_CH0 and PWMx\_CH1 Pair

The two kinds of detectors detect the same six brake sources: two from external input signals, two from analog comparators (ACMP), and one from system fail, and one from software triggered, that are shown in Figure 6.12-28. ACMP brake sources will be detected only when internal ACMP0\_O or ACMP1\_O signal from low to high.

Among the above described brake sources, the brake source coming from system fail can still be

specified to several different system fail conditions. These conditions include clock fail, Brown-out detect, and Core lockup. Figure 6.12-29 shows that by setting corresponding enable bits, the enabled system fail condition can be one of the sources to issue the Brake system fail to the PWM brake.

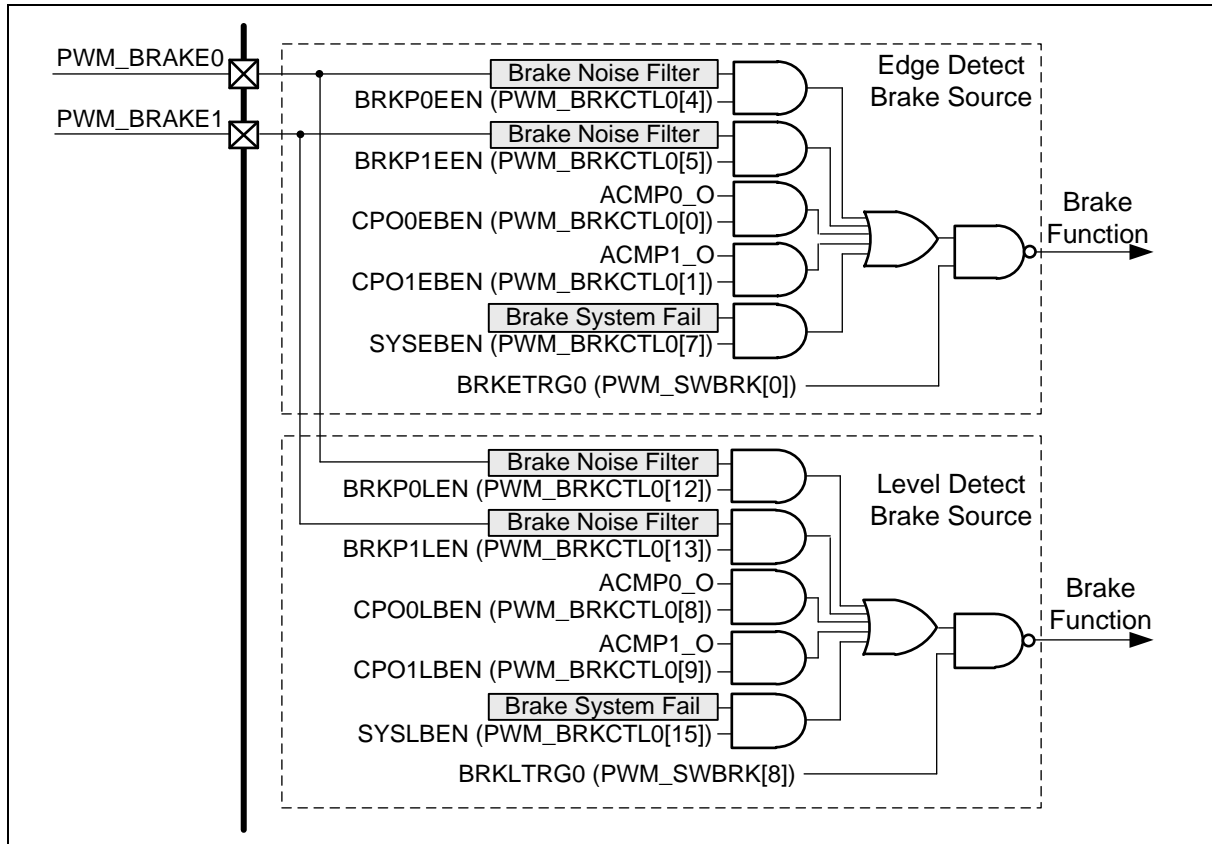

Figure 6.12-28 Brake Source Block Diagram

Figure 6.12-29 Brake System Fail Block Diagram

#### 6.12.5.20 Polarity Control

Each PWM port, from PWM\_CH0 to PWM\_CH5, has an independent polarity control module to configure the polarity of the active state of the PWM output. By default, the PWM output is active high. This implies the PWM OFF state is low and ON state is high. This definition is variable through setting the PWM Negative Polarity Control Register (PWM\_POLCTL), for each individual PWM channel. Figure 6.12-30 shows the initial state before PWM starting with different polarity settings.

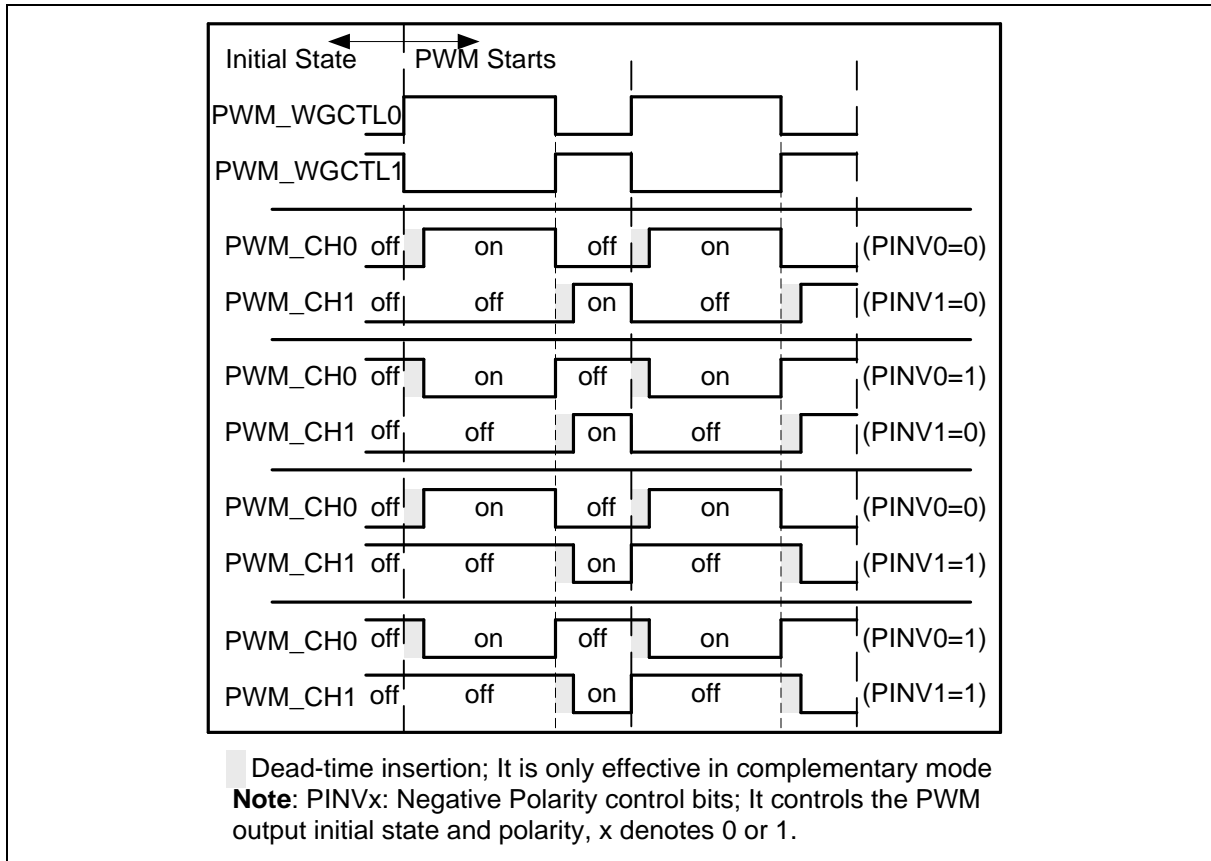

Figure 6.12-30 Initial State and Polarity Control with Rising Edge Dead-Time Insertion

#### 6.12.5.21 Synchronous start function

The synchronous start function can be enabled when SSSEN0 (PWM\_SSCTL[0]) is set. User can select synchronous source which is from PWM0 or PWM1 by SSRC (PWM\_SSCTL[9:8]). The selected PWM channels (include channel0 to channel5 of each PWM) will start counting at the same time once the synchronous start function is enabled and set CNTSEN (PWM\_SSTRG). It is noted that set CNTSEN (PWM\_SSTRG) will also set the counter enable bit (CNTENn, n denotes channel 0 to 5) to start counting.

#### 6.12.5.22 PWM Interrupt Generator.

There are three independent interrupts for each PWM as shown in Figure 6.12-31.

The 1<sup>st</sup> PWM interrupt (PWM\_INT) comes from PWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIFn (PWM\_INTSTS0[n], n=0,2,4) and the Period point Interrupt Flag PIFn (PWM\_INTSTS0[n+8], n=0,2,4). When PWM channel n's counter equals to the comparator value stored in PWM\_CMPDATn, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (PWM\_INTSTS0[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (PWM\_INTSTS0[29:24]) is set. If the corresponding interrupt enable bits are set, the trigger events will generate interrupt signals.

The 2<sup>nd</sup> interrupt is the capture interrupt (CAP\_INT). It shares the PWM\_INT vector in NVIC. The CAP\_INT can be generated when the CRLIFn (PWM\_CAPIF[5:0]) is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (PWM\_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CFLIFn (PWM\_CAPIF[13:8]) can be triggered when the Capture Falling Interrupt Enable bit CAPFIENn (PWM\_CAPIEN[13:8]) is set to 1.

The last one is the brake interrupt (BRK\_INT). The detail of the BRK\_INT is described in the PWM Brake

section.

Figure 6.12-31 demonstrates the architecture of the PWM interrupts.

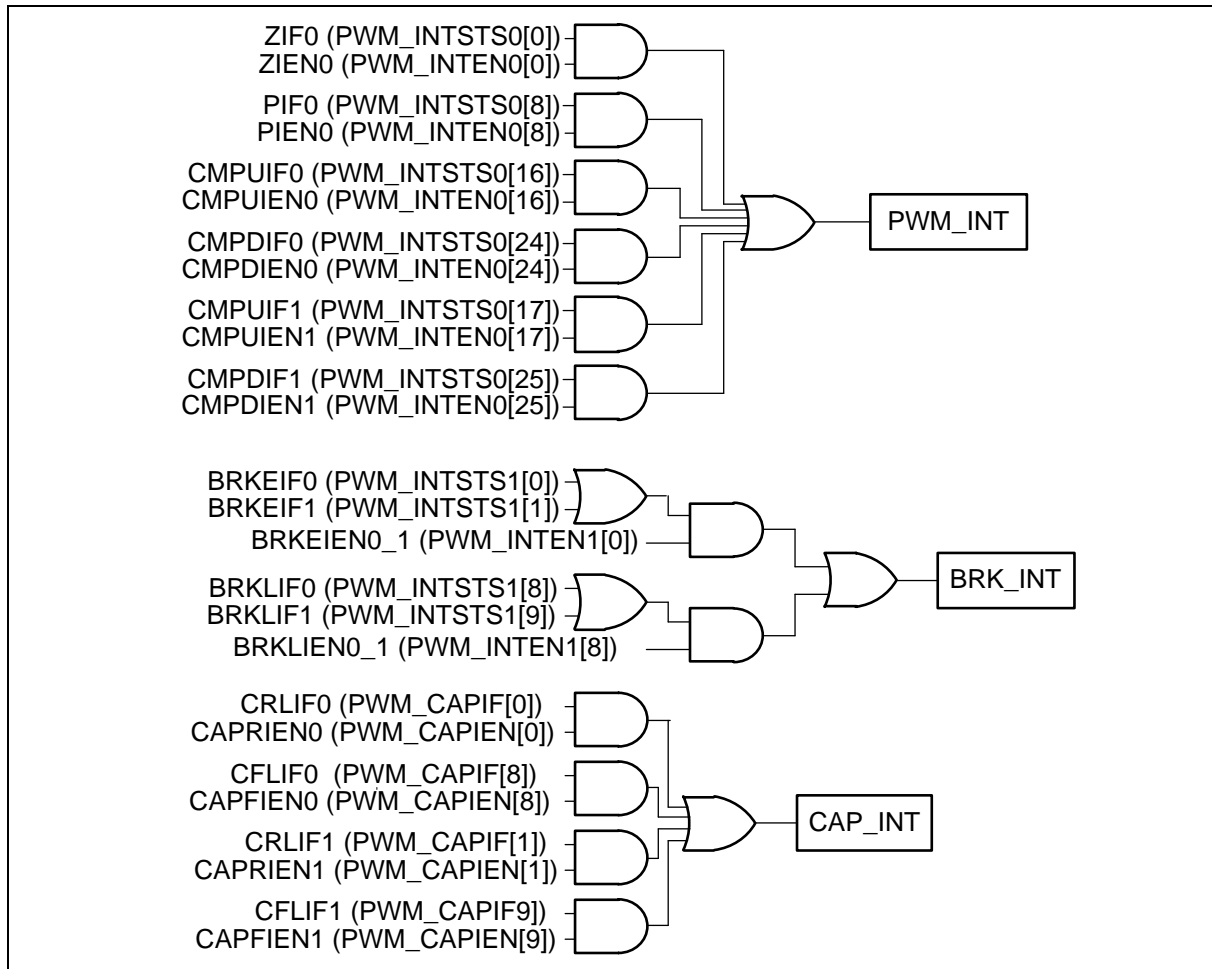

Figure 6.12-31 PWM\_CH0 and PWM\_CH1 Pair Interrupt Architecture Diagram

#### 6.12.5.23 PWM Trigger ADC Generator

PWM can be one of the ADC conversion trigger source. Each PWM pair channels share the same trigger source. Setting TRGSELn is to select the trigger sources, where TRGSELn is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in PWM\_ADCTS0[3:0], PWM\_ADCTS0[11:8], PWM\_ADCTS0[19:16], PWM\_ADCTS0[27:24], PWM\_ADCTS1[3:0] and PWM\_ADCTS1[11:8], respectively. Setting TRGENn is to enable the trigger output to ADC, where TRGENn is TRGEN0, TRGEN1, ..., TRGEN5, which are located in PWM\_ADCTS0[7], PWM\_ADCTS0[15], PWM\_ADCTS0[23], PWM\_ADCTS0[31], PWM\_ADCTS1[7] and PWM\_ADCTS1[15], respectively. The number n (n = 0,1, ...,5) denotes PWM channel number.

There are 7 PWM events can be selected as the trigger source for one pair of channels. Figure 6.12-32 is an example of PWM\_CH0 and PWM\_CH1. PWM can trigger ADC to start conversion in different timings by setting PERIOD and CMPDAT. Figure 6.12-33 is the trigger ADC timing waveform in the up-down counter type.

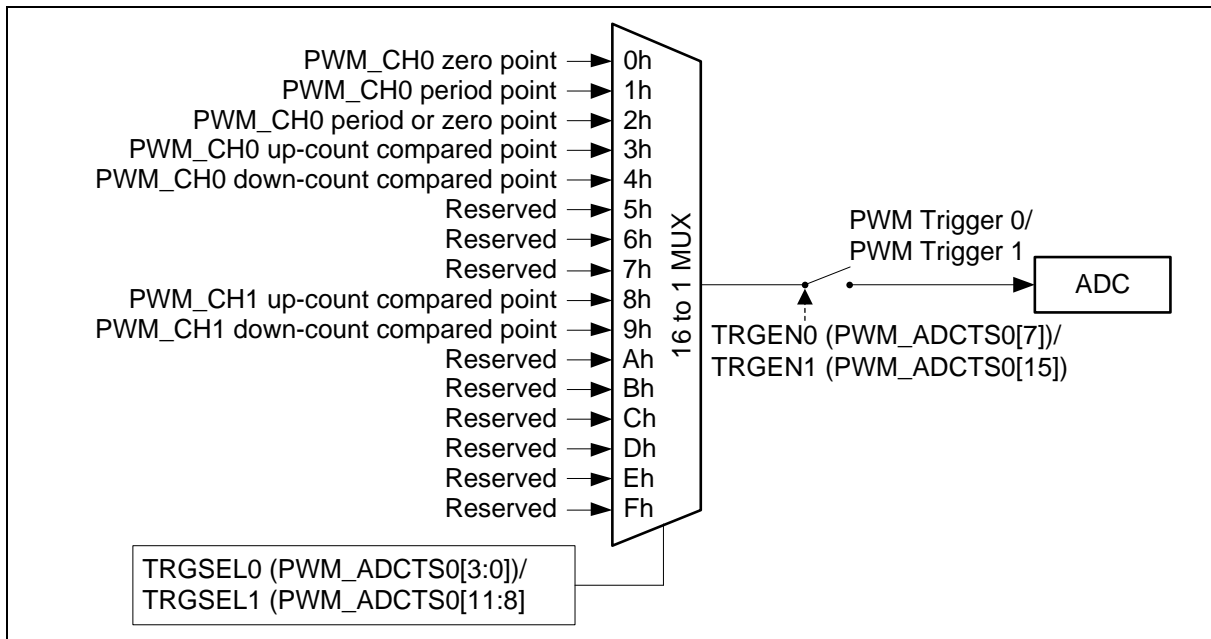

Figure 6.12-32 PWMx\_CH0 and PWMx\_CH1 Pair Trigger ADC Block Diagram

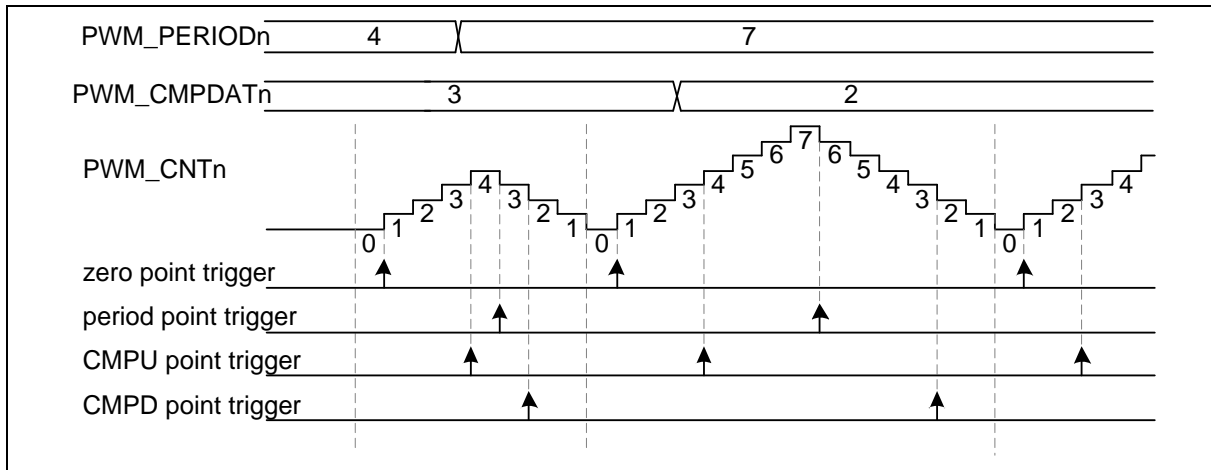

Figure 6.12-33 PWM Trigger ADC in Up-Down Counter Type Timing Waveform

#### 6.12.5.24 Capture Operation

The channels of the capture input and the PWM output share the same pin and counter. The counter can operating in up or down counter type. The capture function will always latch the PWM counter to the RCAPDATn (PWM\_RCAPDATn[15:0]) bits or the FCAPDATn (PWM\_FCAPDATn[15:0]) bits, if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP\_INT (using PWM\_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (PWM\_CAPIEN[5:0]) bit is for the rising edge and the CAPFIENn (PWM\_CAPIEN[13:8]) bit is for the falling edge. When rising or falling latch occurs, the corresponding PWM counter may be reloaded with the value of PWM\_PERIODn register, depending on the setting of RCRLDENn or FCRLDENn bits (where RCRLDENn and FCRLDENn are located at PWM\_CAPCTL[21:16] and PWM\_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (PWM\_CAPINEN[5:0]) bits for the corresponding capture channel n. Figure 6.12-34 is the capture block diagram of channel 0.

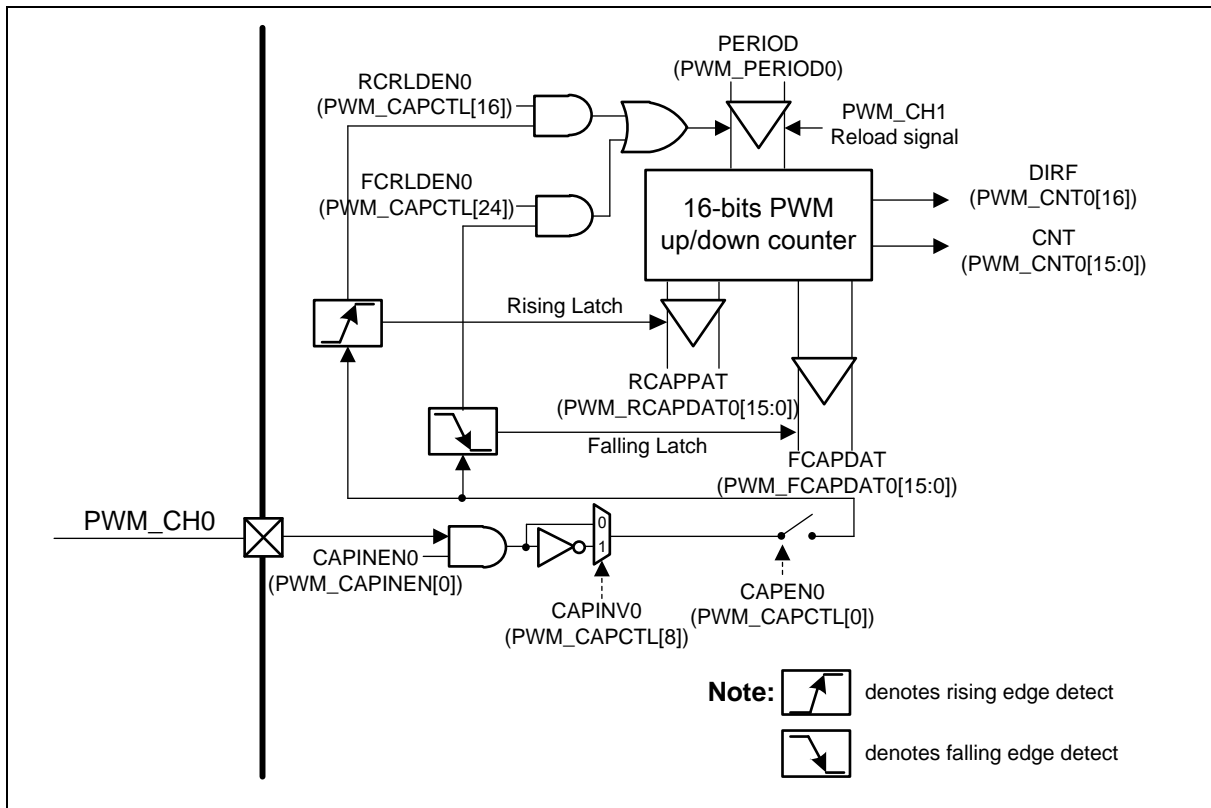

Figure 6.12-34 PWM\_CH0 Capture Block Diagram

Figure 6.12-35 illustrates the capture function timing. In this case, the capture counter is set as PWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches the counter value to the PWM\_FCAPDATn register. When detecting the rising edge, it latches the counter value to the PWM\_RCAPDATn register. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn bit is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn bit. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn bit is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD.

Figure 6.12-35 also illustrates the timing example for the interrupt and interrupt flag generation. When the rising edge at channel n is detected, the corresponding CRLIFn (PWM\_CAPIF[5:0]) bit is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding CFLIFn (PWM\_CAPIF[13:8]) bit is set by hardware. CRLIFn and CFLIFn bits can be cleared by software by writing '1'. If the CRLIFn bit is set and the CAPRIENn bit is enabled, the capture function generates an interrupt. If the CFLIFn bit is set and the CAPFIENn is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CRLIFn bit is already set, the Over run status CRLIFOVn (PWM\_CAPSTS[5:0]) bit will be set to 1 by hardware to indicate the CRLIF flag overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the CFLIF interrupt flag and the Over run status CFLIFOVn (PWM\_CAPSTS[13:8]).

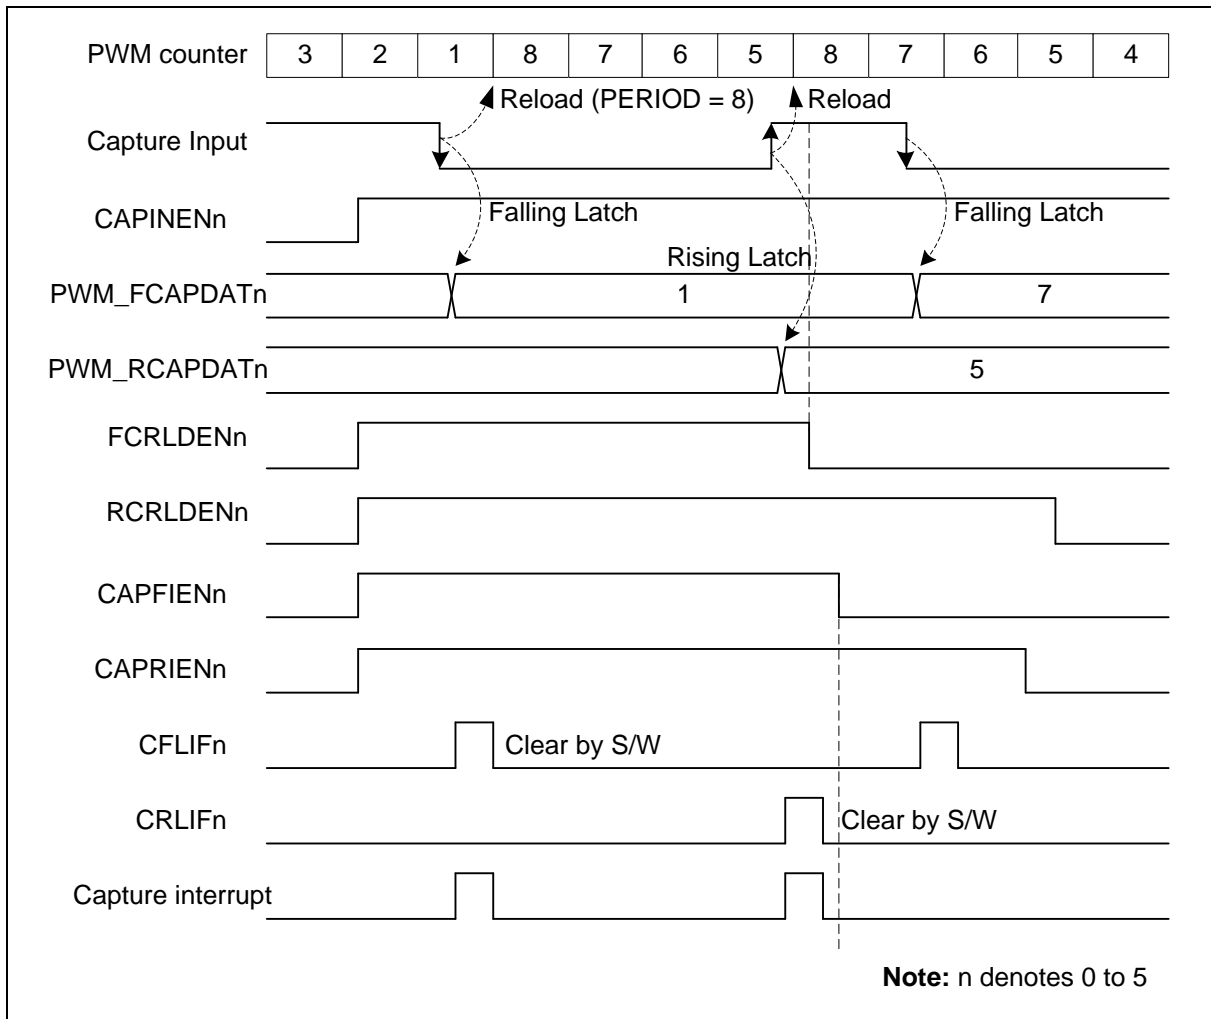

Figure 6.12-35 Capture Operation Waveform

The capture pulse width can be calculated according to the following formula:

For the negative pulse case, the channel low pulse width is calculated as  $(\text{PWM\_PERIODn} + 1 - \text{PWM\_RCAPDATn})$  PWM counter time, where one PWM counter time is  $(\text{CLKPSC} + 1) * \text{PWMx\_CLK}$  clock time. In Figure 6.12-35, the low pulse width is  $8 + 1 - 5 = 4$  PWM counter time.

For the positive pulse case, the channel high pulse width is calculated as  $(\text{PWM\_PERIODn} + 1 - \text{PWM\_FCAPDATn})$  PWM counter time, where one PWM counter time is  $(\text{CLKPSC} + 1) * \text{PWMx\_CLK}$  clock time. In Figure 6.12-35, the high pulse width is  $8 + 1 - 7 = 2$  PWM counter time.

#### 6.12.5.25 Capture PDMA Function

The PWM module supports the PDMA transfer function when operating in the capture mode. When the corresponding PDMA enable bit  $\text{CHENn\_m}$  ( $\text{CHEN0\_1}$  at  $\text{PWM\_PDMACTL}[0]$ ,  $\text{CHEN2\_3}$  at  $\text{PWM\_PDMACTL}[8]$  and  $\text{CHEN4\_5}$  at  $\text{PWM\_PDMACTL}[16]$ , where  $n$  and  $m$  denote complement pair channels) is set, the capture module will issue a request to PDMA controller when the preceding capture event has happened. The PDMA controller will issue an acknowledgement to the capture module after it has read back the  $\text{CAPBUF}$  ( $\text{PWM\_PDMACAPn\_m}[15:0]$ ,  $n, m$  denotes complement pair channels) register in the capture module and has sent the register value to the memory. By setting  $\text{CAPMODn\_m}$  ( $\text{CAPMOD0\_1}$  at  $\text{PWM\_PDMACTL}[2:1]$ ,  $\text{CAPMOD2\_3}$  at  $\text{PWM\_PDMACTL}[10:9]$  and  $\text{CAPMOD4\_5}$  at  $\text{PWM\_PDMACTL}[18:17]$ ) bits, the PDMA can transfer the rising edge captured data or falling edge captured data or both of them to the memory. When using the PDMA to transfer both of the falling and rising edge data, remember to set  $\text{CAPORDn\_m}$  ( $\text{CAPORD0\_1}$  at  $\text{PWM\_PDMACTL}[3]$ ,  $\text{CAPORD2\_3}$

at PWM\_PDMACTL[11] and CAPORD4\_5 at PWM\_PDMACTL[19]) bit to decide the order of the transferred data (falling edge captured is first or rising edge captured first). The complement pair channels share a PDMA channel. Therefore, a selection bit CHSELn\_m (CHSEL0\_1 (PWM\_PDMACTL[4]), CHSEL2\_3 (PWM\_PDMACTL[12]) and CHSEL4\_5 (PWM\_PDMACTL[20])) bit is used to decide either channel n or channel m can be serviced by the PDMA channel.

Figure 6.12-36 is capture PDMA waveform. In this case, the CHSEL0\_1 (PWM\_PDMACTL[4]) bit is set to 0. Hence the PDMA will service channel 0 for the capture data transfer. CAPMOD0\_1 (PWM\_PDMACTL[2:1]) bits are set to 3. That means both of the rising and falling edge captured data will be transferred to the memory. The CAPORD0\_1 (PWM\_PDMACTL[3]) is set to 1, so the rising edge data will be the first data to transfer and following is the falling edge data to transfer. As shown in Figure 6.12-36, the last assertions of the CAPRIF0 CRLIF0 and CAPFIF0 CFLIF0 signal have some overlap. The PWM\_RCAPDAT0 value 11 will be loaded to PWM\_PDMACAP0\_1 register to wait for transfer but not the PWM\_FCAPDAT0 value 6. The PWM\_PDMACAP0\_1 register saves the data which will be transferred to the memory by PDMA. The HWDATA in this figure denotes the data which are being transferred by PDMA.

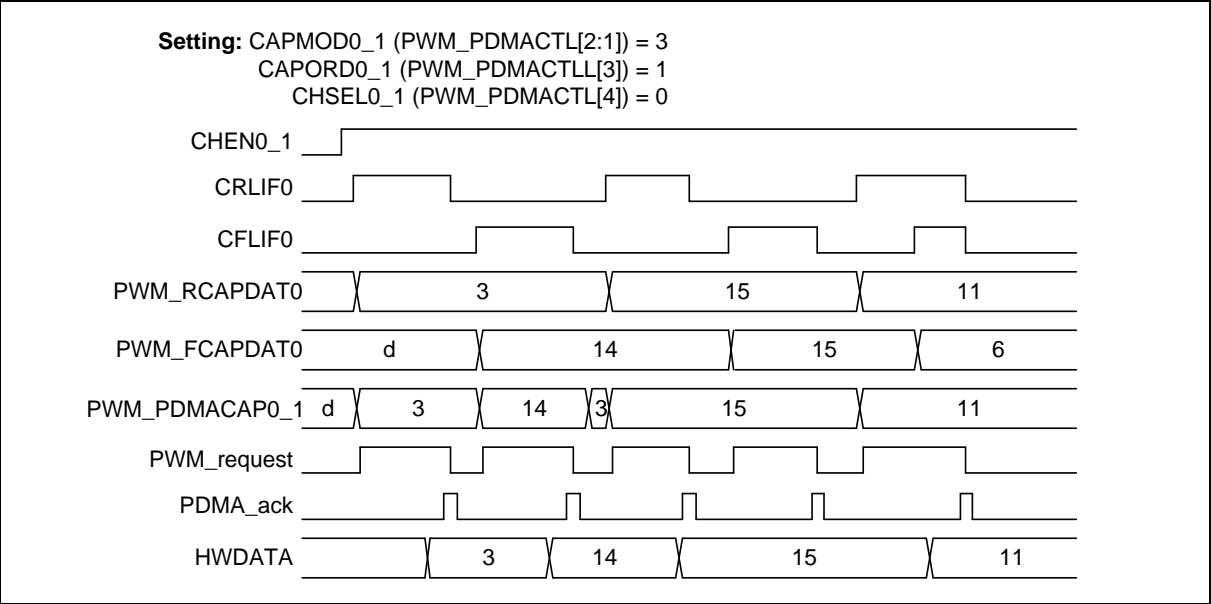

Figure 6.12-36 Capture PDMA Operation Waveform of Channel 0

## 6.12.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>PWM Base Address:</b> <b>PWM0_BA = 0x4005_8000</b> <b>PWM1_BA = 0x4005_9000</b>				
<b>PWM_CTL0</b> x=0, 1	PWMx_BA+0x00	R/W	PWM Control Register 0	0x0000_0000
<b>PWM_CTL1</b> x=0, 1	PWMx_BA+0x04	R/W	PWM Control Register 1	0x0000_0000
<b>PWM_CLKSRC</b> x=0, 1	PWMx_BA+0x10	R/W	PWM Clock Source Register	0x0000_0000

### 6.12.7 Register Description

**PWM** **Control** **Register** **0**  
(PWM\_CTL0)

Register	Offset	R/W	Description	Reset Value
PWM_CTL0	PWMx_BA+0x00	R/W	PWM Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
DBGTRIOFF	DBGHALT	Reserved					
23	22	21	20	19	18	17	16
Reserved		IMMLDEN5	IMMLDEN4	IMMLDEN3	IMMLDEN2	IMMLDEN1	IMMLDEN0
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		CTRLD5	CTRLD4	CTRLD3	CTRLD2	CTRLD1	CTRLD0

Bits	Description
[31]	<b>DBGTRIOFF</b> <b>ICE Debug Mode Acknowledge Disable Bit (Write Protect)</b> 0 = ICE debug mode acknowledgement effects PWM output. PWM pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement disabled. PWM pin will keep output no matter ICE debug mode acknowledged or not. <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.
[30]	<b>DBGHALT</b> <b>ICE Debug Mode Counter Halt (Write Protect)</b> If counter halt is enabled, PWM all counters will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt Disable. 1 = ICE debug mode counter halt Enable. <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.
[29:22]	Reserved.
[n+16] n=0,1...5	<b>IMMLDENn</b> <b>Immediately Load Enable Bits</b> 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLD bit. 1 = PERIOD/CMPDAT will load to PBUF and CMPBUF immediately when software update PERIOD/CMPDAT. <b>Note:</b> If IMMLDENn is enabled, WINLDENn and CTRLDN will be invalid.
[15:6]	Reserved.
[n] n=0,1...5	<b>CTRLDn</b> <b>Center Load Enable Bits</b> In up-down counter type, PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the center point of a period.

**PWM** **Control** **Register** **1**  
**(PWM\_CTL1)**

Register	Offset	R/W	Description	Reset Value
PWM_CTL1	PWMx_BA+0x04	R/W	PWM Control Register 1	0x0000_0000

31	30	29	28	27	26	25	24

DTCNT							

Bits	Description
[31:25]	<b>Reserved</b> Reserved.
[24]	<b>DTCKSEL</b> <b>Dead-time Clock Select (Write Protect)</b> 0 = Dead-time clock source from PWM_CLK. 1 = Dead-time clock source from prescaler output. <b>Note:</b> This bit is write protected. Refer to REGWRPROT register.
[23:17]	<b>Reserved</b> Reserved.
[16]	<b>DTEN</b> <b>Enable Dead-time Insertion for PWM Pair (PWM_CH0, PWM_CH1) (PWM_CH2, PWM_CH3) (PWM_CH4, PWM_CH5) (Write Protect)</b> Dead-time insertion is only active when this pair of complementary PWM is enabled. If dead-time insertion is inactive, the outputs of pin pair are complementary without any delay. 0 = Dead-time insertion Disabled on the pin pair. 1 = Dead-time insertion Enabled on the pin pair. <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.
[15:12]	<b>Reserved</b> Reserved.
[11:0]	<b>DTCNT</b> <b>Dead-time Counter (Write Protect)</b> The dead-time can be calculated from the following formula: DTCKSEL=0: Dead-time = (DTCNT[11:0]+1) * PWM_CLK period. DTCKSEL=1: Dead-time = (DTCNT[11:0]+1) * PWM_CLK period * (CLKPSC+1). <b>Note:</b> This bit is write protected. Refer to SYS_REGLCTL register.

**PWM Counter Register 0, 2, 4 (PWM\_CNT0, 2, 4)**

## 6.13 UART Interface Controller (UART)

### 6.13.1 Overview

The chip provides up to four channels of Universal Asynchronous Receiver/Transmitters (UART). The UART controller performs serial-to-parallel conversion on data received from the peripheral and parallel-to-serial conversion on data transmitted from the CPU. Each UART controller channel supports ten types of interrupts. The UART controller supports flow control function. The UART controller also supports IrDA SIR, LIN, RS-485 and Single-wire function modes and auto-baud rate measuring function.

### 6.13.2 Features

- Full-duplex asynchronous communications
- Separates receive and transmit 16/16 bytes entry FIFO for data payloads
- Supports hardware auto-flow control
- Programmable receiver buffer trigger level
- Supports programmable baud rate generator for each channel individually
- Supports nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function
- Supports 8-bit receiver buffer time-out detection function
- Programmable transmitting data delay time between the last stop and the next START bit by setting DLY (UART\_TOUT [15:8])
- Supports Auto-Baud Rate measurement and baud rate compensation function
  - Support 9600 bps for UART\_CLK is selected LXT.
- Supports break error, frame error, parity error and receive/transmit buffer overflow detection function
- Fully programmable serial-interface characteristics
  - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
  - Programmable PARITY bit, even, odd, no parity or stick PARITY bit generation and detection
  - Programmable STOP bit, 1, 1.5, or 2 STOP bit generation
- Supports IrDA SIR function mode
  - Supports for 3/16 bit duration for normal mode
- Supports LIN function mode (Only UART0 with LIN function)
  - Supports LIN master/slave mode
  - Supports programmable break generation function for transmitter
  - Supports break detection function for receiver
- Supports RS-485 function mode
  - Supports RS-485 9-bit mode
  - Supports hardware or software enables to program nRTS pin to control RS-485 transmission direction
- Supports PDMA transfer function
- Supports Single-wire function mode.

(UART\_FIFOSTS), and line control register (UART\_LINE) for transmitter and receiver. The time-out register (UART\_TOUT) identifies the condition of time-out interrupt.

#### Auto-Baud Rate Measurement

This block is responsible for auto-baud rate measurement.

#### Interrupt Control and Status Register

There are eleven types of interrupts. Interrupt enable register (UART\_INTEN) enables or disables the responding interrupt and interrupt status register (UART\_INTSTS) identifying the occurrence of the responding interrupt.

Interrupt	Description
RDAINT	Receive Data Available Interrupt.
THREINT	Transmit Holding Register Empty Interrupt.
TXENDINT	Transmitter Empty Interrupt.
RLSINT	Receive Line Status Interrupt (parity error or frame error or break error).
MODEMINT	MODEM Status Interrupt.
RXTOINT	Receiver Buffer Time-out Interrupt.
BUFERRINT	Buffer Error Interrupt.
LININT	LIN Bus Interrupt.
WKINT	Wake-up Interrupt.
ABRINT	Auto-Baud Rate Interrupt.
SWBEINT	Single-wire Bit Error Detect Interrupt.

Table 6.13-3 UART Interrupt

#### 6.13.4 Basic Configuration

The basic configurations of UART0 are as follows:

- Clock Source Configuration
  - Select the source of UART0 peripheral clock on UART0SEL (CLK\_CLKSEL1[26:24]).
  - Select the clock divider number of UART0 peripheral clock on UART0DIV (CLK\_CLKDIV0[11:8]).
  - Enable UART0 peripheral clock in UART0CKEN (CLK\_APBCLK0[16]).
- Reset UART0 controller in UART0RST (SYS\_IPRST1[16]).
- The basic configurations of UART1 are as follows:
- Clock Source Configuration
  - Select the source of UART1 peripheral clock on UART1SEL (CLK\_CLKSEL1[30:28]).
  - Select the clock divider number of UART1 peripheral clock on UART1DIV (CLK\_CLKDIV0[15:12]).
  - Enable UART1 peripheral clock in UART1CKEN (CLK\_APBCLK0[17]).
- Reset UART1 controller in UART1RST (SYS\_IPRST1[17]).

The basic configurations of UART2 are as follows:

- Clock Source Configuration

- Select the source of UART2 peripheral clock on UART2SEL (CLK\_CLKSEL3[26:24]).
- Select clock divider number of UART2 peripheral clock on UART2DIV (CLK\_CLKDIV4[3:0]).
- Enable UART2 peripheral clock in UART2CKEN (CLK\_APBCLK0[18]).
- Reset UART2 controller in UART2RST (SYS\_IPRST1[18]).

The basic configurations of UART3 are as follows:

- Clock Source Configuration
  - Select the source of UART3 peripheral clock on UART3SEL (CLK\_CLKSEL3[30:28]).
  - Select clock divider number of UART3 peripheral clock on UART3DIV (CLK\_CLKDIV4[7:4]).
  - Enable UART3 peripheral clock in UART3CKEN (CLK\_APBCLK0[19]).
- Reset UART3 controller in UART3RST (SYS\_IPRST1[19]).
- UART Interface Controller Pin description is shown in Table 6.13-4:

Pin	Type	Description
UARTx_TXD	Output	UARTx transmit
UARTx_RXD	Input	UARTx receive
UARTx_nCTS	Input	UARTx modem clear to send
UARTx_nRTS	Output	UARTx modem request to send

Table 6.13-4 UART Interface Controller Pin

### 6.13.5 Functional Description

The UART controller supports four function modes including UART, IrDA, LIN and RS-485 mode. User can select a function by setting the UART\_FUNCSEL register. The four function modes will be described in following section.

#### 6.13.5.1 UART Controller Baud Rate Generator

The UART controller includes a programmable baud rate generator capable of dividing clock input by divisors to produce the serial clock that transmitter and receiver need. Table 6.13-5 list the UART baud rate equations in the various conditions. Table 6.13-6 and Table 6.13-7 list the UART baud rate parameter and register setting example. In IrDA function mode, the baud rate generator must be set in mode 0. More detailed register description is shown in UART\_BAUD register. There are three setting modes. Mode 0 is set by UART\_BAUD[29:28] with 00. Mode 1 is set by UART\_BAUD[29:28] with 10. Mode 2 is set by UART\_BAUD[29:28] with 11.

Mode	BAUDM1	BAUDM0	Baud Rate Equation
Mode 0	0	0	$\text{UART\_CLK} / [16 * (\text{BRD}+2)]$ .
Mode 1	1	0	$\text{UART\_CLK} / [(\text{EDIVM1}+1) * (\text{BRD}+2)]$ , EDIVM1 must $\geq 8$ .
Mode 2	1	1	$\text{UART\_CLK} / (\text{BRD}+2)$ . If $\text{UART\_CLK} \leq 3 * \text{HCLK}$ , BRD must $\geq 8$ . If $\text{UART\_CLK} > 3 * \text{HCLK}$ , BRD must $\geq 3 * N - 1$ . N is the smallest integer larger than or equal to the ratio of $\text{UART\_CLK} / \text{HCLK}$ . For example, if $3 * \text{HCLK} < \text{UART\_CLK} \leq 4 * \text{HCLK}$ , BRD must $\geq 11$ . if $4 * \text{HCLK} < \text{UART\_CLK} \leq 5 * \text{HCLK}$ , BRD must $\geq 14$ .

			(If the UART_CLK is selected from LXT, BRD can be greater than or equal to 1)

Table 6.13-7 UART controller Baud Rate Register Setting Example Table

#### 6.13.5.2 UART Controller Baud Rate Compensation

The UART controller supports baud rate compensation function. It is used to optimize the precision in each bit. The precision of the compensation is half of UART module clock because there is BRCOMPDEC (UART\_BRCOMP[31]) to define the positive or negative compensation in each bit. If the BRCOMPDEC (UART\_BRCOMP[31]) = 0, it is positive compensation for each bit, one more module clock will be append in the compensated bit. If the BRCOMPDEC (UART\_BRCOMP[31]) = 1, it is negative compensation for each bit, decrease one module clock in the compensated bit.

There is 9-bits location, BRCOMP[8:0] (UART\_BRCOMP[8:0]), can be configured by user to define the relative bit is compensated or not. BRCOMP[7:0] is used to define the compensation of DAT (UART\_DAT[7:0]) and BRCOMP[8] is used to define PARITY (UART\_DAT[8]).

## Example:

1. UART's peripheral clock = 32.768 kHz and baud rate is 9600 bps

Baud rate is 9600 bps, UART peripheral clock is 32.768 kHz → 3.413 peripheral clock/bit

If the baud divider is set 1 (3 peripheral clock/bit), the inaccuracy of each bit is -0.413 peripheral clock and BRCOMPDEC (UART\_BRCOMP[31]) = 0, so that the BRCOMP (UART\_BRCOMP[8:0]) can be set as 9'b010100101 = 0xa5.

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	START	-0.413	x	-0.413
1	UART_DAT[0]	-0.826(-0.413-0.413)	1	0.174
2	UART_DAT[1]	-0.239(0.174-0.413)	0	-0.239
3	UART_DAT[2]	-0.652(-0.239-0.413)	1	0.348
4	UART_DAT[3]	-0.065(0.348-0.413)	0	-0.065
5	UART_DAT[4]	-0.478(-0.065-0.413)	0	-0.478
6	UART_DAT[5]	-0.891(-0.478-0.413)	1	0.109
7	UART_DAT[6]	-0.304(0.109-0.413)	0	-0.304
8	UART_DAT[7]	-0.717(-0.304-0.413)	1	0.283
9	PARITY	-0.130(0.283-0.413)	0	-0.13

Table 6.13-8 Baud Rate Compensation Example Table 1

2. UART's peripheral clock = 32.768 kHz and baud rate is 4800 bps

Baud rate is 4800 bps, UART peripheral clock is 32.768 kHz → 6.827 peripheral clock/bit

If the baud divider is set 5 (7 peripheral clock/bit), the inaccuracy of each bit is 0.173 peripheral clock and BRCOMPDEC (UART\_BRCOMP[31]) = 1, so that the BRCOMP (UART\_BRCOMP[8:0]) can be set as 9'b010000010 = 0x82.

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	START	0.173	x	0.173
1	UART_DAT[0]	0.346(0.173+0.173)	0	0.346
2	UART_DAT[1]	0.519(0.346+0.173)	1	-0.481
3	UART_DAT[2]	-0.308(-0.481+0.173)	0	-0.308
4	UART_DAT[3]	-0.135(-0.308+0.173)	0	-0.135
5	UART_DAT[4]	-0.038(-0.135+0.173)	0	0.038
6	UART_DAT[5]	0.211(0.038+0.173)	0	0.211
7	UART_DAT[6]	0.384(0.211+0.173)	0	0.384
8	UART_DAT[7]	0.557(0.384+0.173)	1	-0.443

9	PARITY	-0.270(-0.443+0.173)	0	-0.270
---	--------	----------------------	---	--------

Table 6.13-9 Baud Rate Compensation Example Table 2

#### UART Controller Auto-Baud Rate Function Mode:

Auto-Baud Rate function can measure baud rate of receiving data from UART RX pin automatically. When the Auto-Baud Rate measurement is finished, the measuring baud rate is loaded to BRD (UART\_BAUD[15:0]). Both of the BAUDM1 (UART\_BAUD[29]) and BAUDM0 (UART\_BAUD[28]) are set to 1 automatically. UART RX data from START bit to 1<sup>st</sup> rising edge time is set by  $2^{ABRDBITS}$  bit time in Auto-Baud Rate function detection frame.

The  $2^{ABRDBITS}$  bit time from START bit to the 1<sup>st</sup> rising edge is calculated by setting ABRDBITS (UART\_ALTCTL[20:19]). Set ABRDEN (UART\_ALTCTL[18]) to enable auto-baud rate function. In the beginning when no data is transferred, the UART RX is held high. Once the falling edge is detected, START bit is received. The auto-baud rate counter will be reset and then start counting. The auto-baud rate counter will be stopped when the 1<sup>st</sup> rising edge is detected. Then, the auto-baud rate counter value divided by ABRDBITS (UART\_ALTCTL[20:19]) is loaded to BRD (UART\_BAUD[15:0]) automatically. ABRDEN (UART\_ALTCTL[18]) is cleared. The Auto-Baud measurement is shown in Figure 6.13-3. Once the auto-baud rate measurement is finished, the ABRDIF (UART\_FIFOSTS[1]) is set. When auto-baud rate counter is overflow, ABRDIF (UART\_FIFOSTS[2]) is set. If ABRDIF (UART\_FIFOSTS[1]) or ABRDIF (UART\_FIFOSTS[2]) is set, the auto-baud rate flag ABRIF (UART\_ALTCTL[17]) is generated. If ABRIEN (UART\_INTEN[18]) is enabled, the auto-baud rate interrupt ABRINT (UART\_INTSTS[31]) is generated when ABRIF (UART\_ALTCTL[17]) is set.

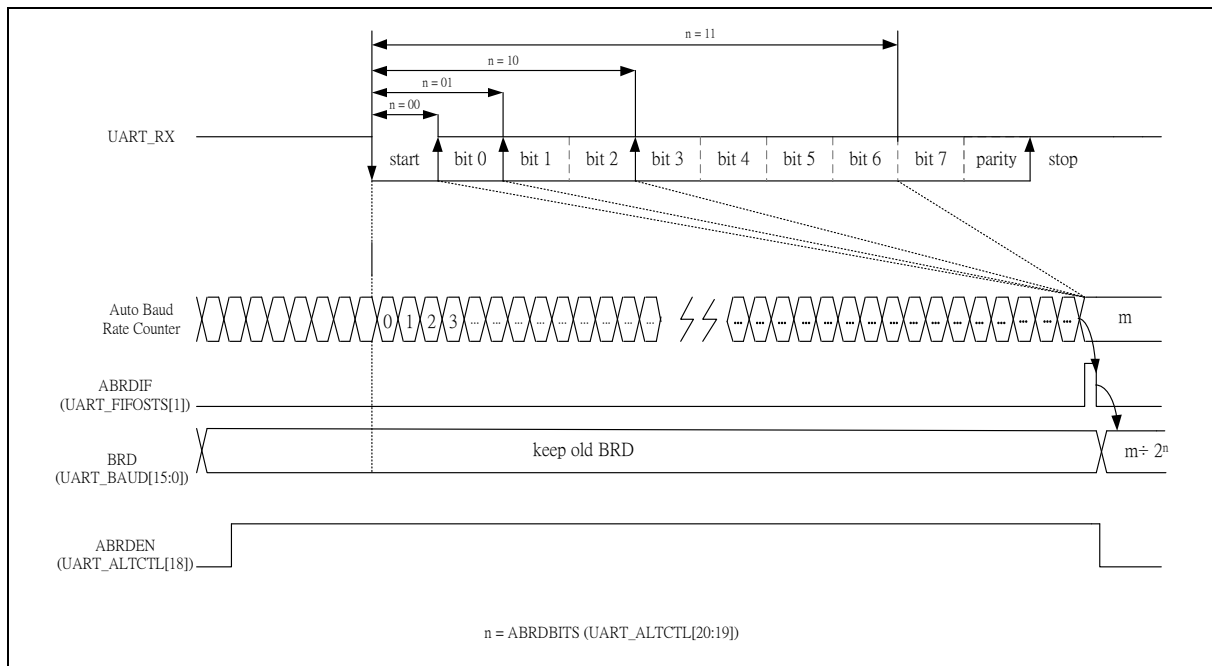

Figure 6.13-3 Auto-Baud Rate Measurement

#### 6.13.5.3 Programming Sequence Example

1. Program ABRDBITS (UART\_ALTCTL[20:19]) to determine UART RX data 1<sup>st</sup> rising edge time from Start by  $2^{ABRDBITS}$  bit time.
2. Set ABRIEN (UART\_INTEN[18]) to enable auto-baud rate function interrupt.
3. Set ABRDEN (UART\_ALTCTL[18]) to enable auto-baud rate function.

4. ABRDIF (UART\_FIFOSTS[1]) is set, the auto-baud rate measurement is finished.
5. Operate UART transmit and receive action.
6. ABRDTOIF (UART\_FIFOSTS[2]) is set, if auto-baud rate counter is overflow.
7. Go to Step 3.

#### 6.13.5.4 UART Controller Transmit Delay Time Value

The UART controller programs DLY (UART\_TOUT [15:8]) to control the transfer delay time between the last STOP bit and next START bit in transmission. The unit is baud. The operation is shown in Figure 6.13-4.

Figure 6.13-4 Transmit Delay Time Operation

#### 6.13.5.5 UART Controller FIFO Control and Status

The UART controller is built-in with a 16 bytes transmitter FIFO (TX\_FIFO) and a 16 bytes receiver FIFO (RX\_FIFO) that reduces the number of interrupts presented to the CPU. The CPU can read the status of the UART at any time during operation. The reported status information includes condition of the transfer operations being performed by the UART, as well as 3 error conditions (parity error, framing error, break interrupt) occur if receiving data has parity, frame or break error. UART, IrDA, LIN and RS-485 mode support FIFO control and status function.

#### 6.13.5.6 UART Controller Wake-up Function

The UART controller supports wake-up system function. The wake-up function includes nCTS pin, incoming data wake-up, Received Data FIFO reached threshold wake-up, RS-485 Address Match (AAD mode) wake-up and Received Data FIFO threshold time-out wake-up function. CTSWKF (UART\_WKSTS[0]), DATWKF (UART\_WKSTS[1]), RFRTWKF (UART\_WKSTS[2]), RS485WKF (UART\_WKSTS[3]) or TOUTWKF (UART\_WKSTS[4]) cause the wake-up interrupt flag WKIF(UART\_INTSTS[6]) generated. If the WKIEN (UART\_INTEN[6]) is enabled, the wake-up interrupt flag WKIF(UART\_INTSTS[6]) causes the wake-up interrupt WKINT (UART\_INTSTS[14]) generated.

nCTS pin wake-up :

When the system is in Power-down mode and WKCTSEN (UART\_WKCTL[0]) is set, the toggle of nCTS pin can wake-up system. If the WKCTSEN (UART\_WKCTL[0]) is enabled, the toggle of nCTS pin causes the nCTS wake-up flag CTSWKF (UART\_WKSTS[0]) generated. The nCTS wake-up is shown in Figure 6.13-5 and Figure 6.13-6.

#### nCTS Wake-up Case 1 (nCTS transition from low to high)

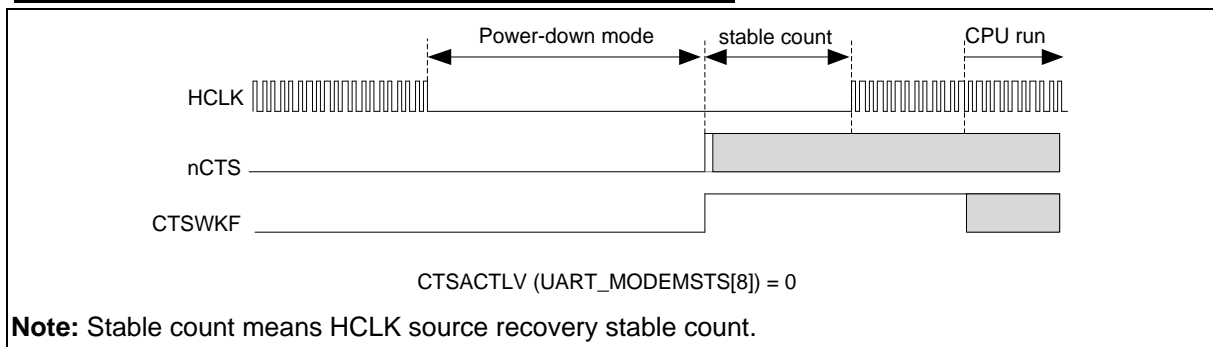

Figure 6.13-5 UART nCTS Wake-up Case1

**nCTS Wake-up Case 2 (nCTS transition from high to low)**

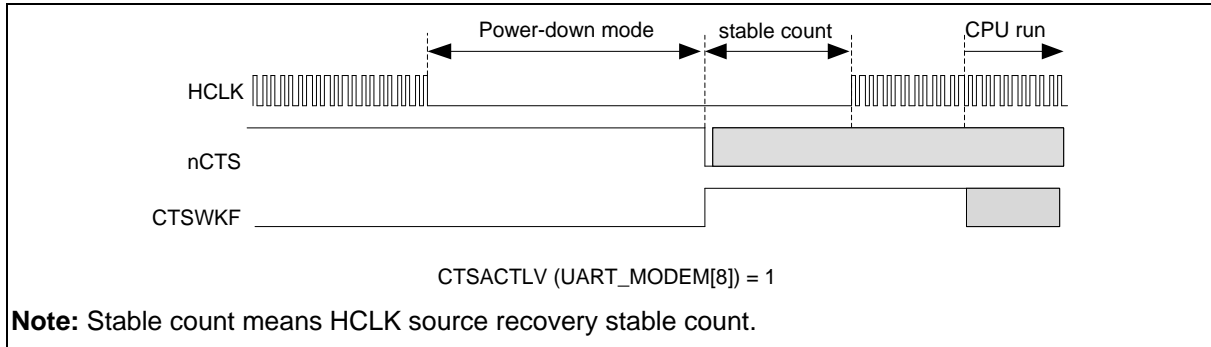

Figure 6.13-6 UART nCTS Wake-up Case2

**Incoming Data Wake-up**

When system is in Power-down mode and the WKDATEN (UART\_WKCTL [1]) is set, the toggle of incoming data (UART\_RXD) pin can wake-up the system. In order to receive the incoming data after the system wake-up, the STCOMP (UART\_DWKCOMP[15:0]) shall be set. These bits field of STCOMP indicate how many clock cycle selected by UART\_CLK do the UART controller can get the 1<sup>st</sup> bit (START bit) when the system is wake-up from Power-down mode.

When incoming data wakes system up, the incoming data will be received and stored in FIFO. If the WKDATEN (UART\_WKCTL[1]) is enabled, the toggle of incoming data (UART\_RXD) pin causes the incoming data wake-up flag DATWKF (UART\_WKSTS[1]) generated. The incoming data wake-up is shown in Figure 6.13-7.

**Note1:** The UART controller clock source should be selected as HIRC. As to the compensation time for START bit, refer to the M251/M252/M254/M256/M258 Datasheet for detailed information about wake-up time electrical characteristics. The STCOMP (UART\_DWKCOMP[15:0]) = (wake-up stable time) \* (HIRC frequency).

**Note2:** The value of BRD (UART\_BAUD[15:0]) should be greater than STCOMP (UART\_DWKCOMP[15:0]).

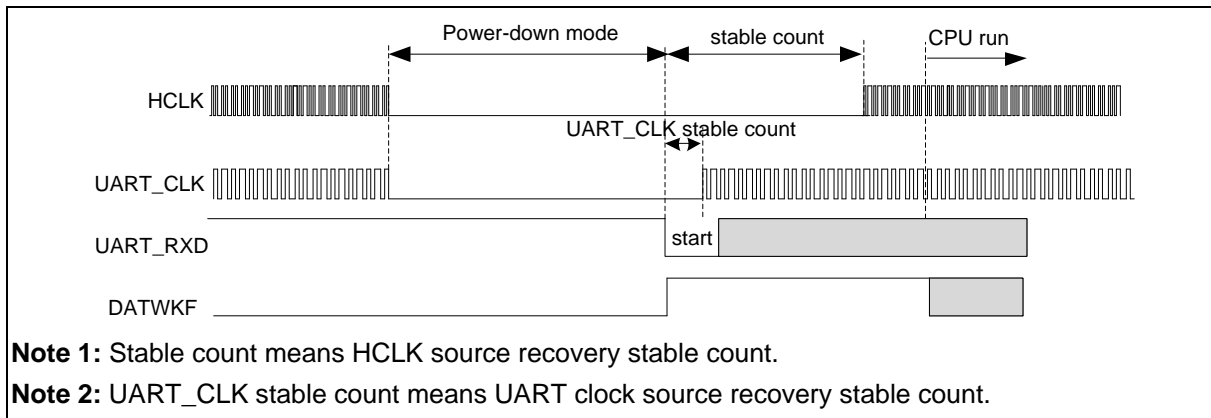

Figure 6.13-7 UART Data Wake-up

**Received Data FIFO Reached Threshold Wake-up**

The received data FIFO threshold reached wake-up function is enabled by setting WKFRFTEN (UART\_WKCTL[2]). In Power-down mode, when the number of received data in RX FIFO reaches the threshold value RFITL (UART\_FIFO[7:4]), it can wake-up the system. If the WKFRFTEN (UART\_WKCTL[2]) is enabled, the number of received data in RX FIFO reaches the threshold value RFITL (UART\_FIFO[7:4]) causes the received data FIFO reached threshold wake-up flag RFRTWK (UART\_WKSTS[2]) generated. The Received Data FIFO reached threshold wake-up is shown in Figure

6.13-8.

**Note:** The UART controller clock source should be selected as LXT in Power-down mode to receive data.

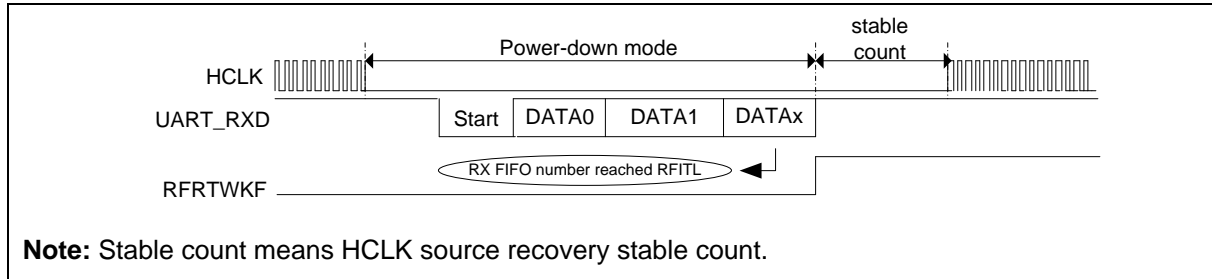

Figure 6.13-8 UART Received Data FIFO reached threshold wake-up

#### **RS-485 Address Match (AAD Mode) Wake-up**

The RS-485 address match wake-up function is enabled by setting WKFRFTEN (UART\_WKCTL[2]) and WKRS485EN (UART\_WKCTL[3]). This function is used for RS-485 Auto Address Detection (AAD) mode in RS-485 function mode and ADDRDN (UART\_ALTCTL[15]) is set to 1. In Power-down mode, when an address byte is detected and matches the ADDRNV (UART\_ALTCTL[31:24]) or the number of received data in RX FIFO reaches the threshold value RFITL (UART\_FIFO[7:4]), it can wake-up the system. If the WKRS485EN (UART\_WKCTL[3]) is enabled, when an address byte is detected and matches the ADDRNV (UART\_ALTCTL[31:24]), the RS485 address match (AAD mode) wake-up flag RS485WKF (UART\_WKSTS[3]) is generated. The RS-485 Address Match (AAD mode) wake-up is shown in Figure 6.13-9.

**Note:** The UART controller clock source should be selected as LXT in Power-down mode to receive data.

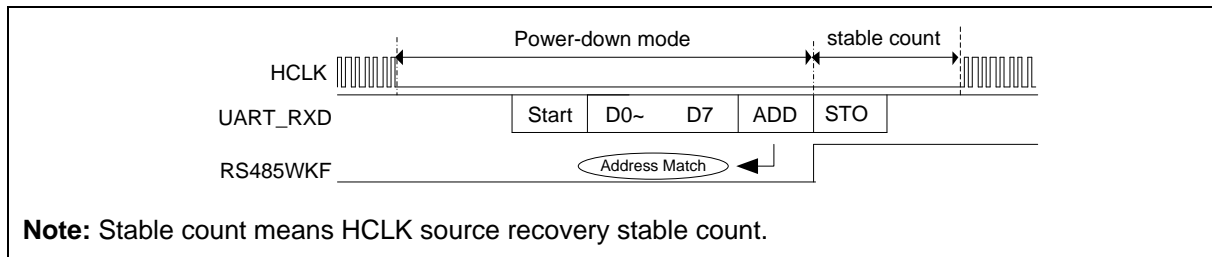

Figure 6.13-9 UART RS-485 AAD Mode Address Match Wake-up

#### **Received Data FIFO Threshold Time-out Wake-up**

The received data FIFO threshold time-out wake-up function is enabled by setting WKFRFTEN (UART\_WKCTL[2]) and WKOUTEN (UART\_WKCTL[4]). Setting TOCNTEN (UART\_INTEN[11]) to enable receiver buffer time-out counter. In Power-down mode, when the number of received data in RX FIFO does not reach the threshold value RFITL (UART\_FIFO[7:4]) and the time-out counter equals to the time-out value TOIC (UART\_TOUT[7:0]), it can wake-up the system. If the WKOUTEN (UART\_WKCTL[4]) is enabled, when the time-out counter equals to the time-out value TOIC (UART\_TOUT[7:0]), the Received Data FIFO threshold time-out wake-up flag TOUTWKF (UART\_WKSTS[4]) is generated. The Received Data FIFO threshold time-out wake-up is shown in Figure 6.13-10.

**Note:** The UART controller clock source should be selected as LXT in Power-down mode to receive data.

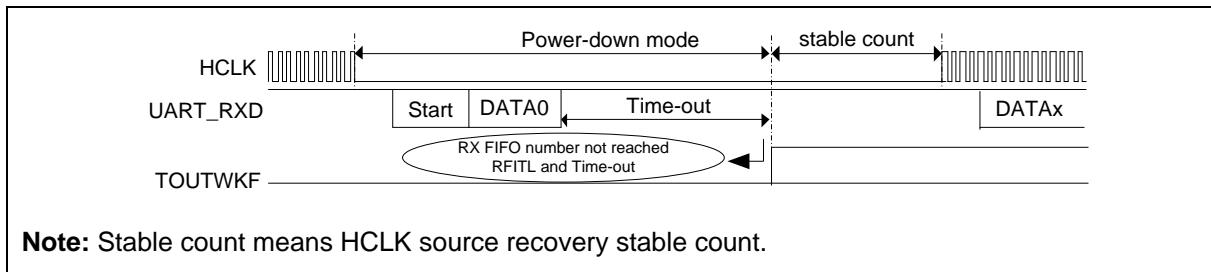

Figure 6.13-10 UART Received Data FIFO threshold time-out wake-up

#### 6.13.5.7 UART Controller Interrupt and Status

Each UART controller supports ten types of interrupts including:

- Receive Data Available Interrupt (RDAINT)
- Transmit Holding Register Empty Interrupt (THREINT)
- Transmitter Empty Interrupt (TXENDIF)
- Receive Line Status Interrupt (RLSINT)
  - Break Interrupt Flag (BIF)
  - Framing Error Flag (FEF)
  - Parity Error Flag (PEF)
  - RS-485 Address Byte Detect Flag (ADDRDETF)
- MODEM Status Interrupt (MODEMINT)
  - Detect nCTS State Change Flag (CTSDETF)
- Receiver Buffer Time-out Interrupt (RXTOINT)
- Buffer Error Interrupt (BUFERRINT)
  - TX Overflow Error Interrupt Flag (TXOVIF)
  - RX Overflow Error Interrupt Flag (RXOVIF)
- LIN Bus Interrupt (LININT)
  - LIN Break Detection Flag (BRKDETF)
  - Bit Error Detect Status Flag (BITEF)
  - LIN Slave ID Parity Error Flag (SLVIDPEF)
  - LIN Slave Header Error Flag (SLVHEF)
  - LIN Slave Header Detection Flag (SLVHDETF)
- Wake-up Interrupt (WKINT)
  - nCTS Wake-up Flag (CTSWKF)
  - Incoming Data Wake-up Flag (DATWKF)
  - Received Data FIFO Reached Threshold Wake-up Flag (RFRTWKF)
  - RS-485 Address Match (AAD mode) Wake-up Flag (RS485WKF)
  - Received Data FIFO Threshold Time-out Wake-up Flag (TOUTWKF)
- Auto-Baud Rate Interrupt (ABRINT)
  - Auto-baud Rate Detect Interrupt Flag (ABRDIF)

- Auto-baud Rate Detect Time-out Interrupt Flag (ABRDTOIF)
- Single-wire Bit Error Detect Interrupt (SWBEINT)

Table 6.13-10 describes the interrupt sources and flags. The interrupt is generated when the interrupt flag is generated and the interrupt enable bit is set. User must clear the interrupt flag after the interrupt is generated.

Interrupt Source	Interrupt Indicator	Interrupt Enable Bit	Interrupt Flag	Flag Caused By	Flag Cleared By
Receive Data Available Interrupt	RDAINT	RDAIEN	RDAIF	N/A	Read UART_DAT
Transmit Holding Register Empty Interrupt	THREINT	THREIEN	THREIF	N/A	Write UART_DAT
Transmitter Empty Interrupt	TXENDINT	TXENDIEN	TXENDIF	N/A	Write UART_DAT
Receive Line Status Interrupt	RLSINT	RLSIEN	RLSIF	RLSIF = BIF	Write '1' to BIF
				RLSIF = FEF	Write '1' to FEF
				RLSIF = PEF	Write '1' to PEF
				RLSIF = ADDRDETf	Write '1' to ADDRDETf
Modem Status Interrupt	MODEMINT	MODEMIEN	MODEMIF	MODEMIF CTSDETf	= Write '1' to CTSDETf
Receiver Buffer Time-out Interrupt	RXTOINT	RXTOIEN	RXTOIF	N/A	Read UART_DAT
Buffer Error Interrupt	BUFERRINT	BUFERRIEN	BUFERRIF	BUFERRIF TXOVIF	= Write '1' to TXOVIF
				BUFERRIF RXOVIF	= Write '1' to RXOVIF
LIN Bus Interrupt	LININT	LINIEN	LINIF	LINIF = BRKDETf	Write '1' to LINIF and Write '1' to BRKDETf
				LINIF = BITEF	Write '1' to LINIF and Write '1' to BITEF
				LINIF = SLVIDPEF	Write '1' to LINIF and Write '1' to SLVIDPEF
				LINIF = SLVHEF	Write '1' to LINIF and Write '1' to SLVHEF
				LINIF = SLVHDETf	Write '1' to LINIF and Write '1' to SLVHDETf
Wake-up Interrupt	WKINT	WKIEN	WKIF	WKIF = CTSWKf	Write '1' to CTSWKf
				WKIF = DATWKf	Write '1' to DATWKf

				WKIF = RFRTWKF	Write '1' to RFRTWKF	
				WKIF = RS485WKF	Write '1' to RS485WKF	
				WKIF = TOUTWKF	Write '1' to TOUTWKF	
Auto-Baud Interrupt	Rate	ABRINT	ABRIEN	ABRIF	ABRIF = ABRDIF	Write '1' to ABRDIF
					ABRIF = ABRDIOIF	Write '1' to ABRDIOIF
Single-wire Bit Detect Interrupt		SWBEINT	SWBEIEN	SWBEIF	N/A	Writing '1' to SWBEIF

Table 6.13-10 UART controller Interrupt Source and Flag List

#### 6.13.5.8 UART Function Mode

The UART controller provides UART function (Setting FUNCSEL (UART\_FUNCSEL [2:0]) to '00' to enable UART function mode).

The UART provides full-duplex and asynchronous communications. The transmitter and receiver contain 16 bytes FIFO for payloads. User can program receiver buffer trigger level and receiver buffer time-out detection for receiver. The transmitting data delay time between the last stop and the next START bit can be programmed by setting DLY (UART\_TOUT [15:8]) register. The UART supports hardware auto-flow control that provides programmable nRTS flow control trigger level. The number of data bytes in RX FIFO is equal to or greater than RTSTRGLV (UART\_FIFO[19:16]), the nRTS is de-asserted.

#### UART Line Control Function

The UART controller supports fully programmable serial-interface characteristics by setting the UART\_LINE register. User can program UART\_LINE register for the word length, STOP bit and PARITY bit setting. Table 6.13-11 and Table 6.13-12 list the UART word, STOP bit length and the PARITY bit settings.

NSB (UART_LINE[2])	WLS (UART_LINE[1:0])	Word Length (Bit)	Stop Length (Bit)
0	00	5	1
0	01	6	1
0	10	7	1
0	11	8	1
1	00	5	1.5
1	01	6	2
1	10	7	2
1	11	8	2

Table 6.13-11 UART Line Control of Word and Stop Length Setting

Parity Type	SPE (UART_LINE[5])	EPE (UART_LINE[4])	PSS (UART_LINE[7])	PBE (UART_LINE[3])	Description
No Parity	x	x	x	0	No PARITY bit output.
Parity source	x	x	1	1	PARITY bit is generated and checked by software.

from UART_DA T					
Odd Parity	0	0	0	1	Odd Parity is calculated by adding all the "1's" in a data stream and adding a PARITY bit to the total bits, to make the total count an odd number.
Even Parity	0	1	0	1	Even Parity is calculated by adding all the "1's" in a data stream and adding a PARITY bit to the total bits, to make the count an even number.
Forced Mask Parity	1	0	0	1	PARITY bit always logic 1. PARITY bit on the serial byte is set to "1" regardless of total number of "1's" (even or odd counts).
Forced Space Parity	1	1	0	1	PARITY bit always logic 0. PARITY bit on the serial byte is set to "0" regardless of total number of "1's" (even or odd counts).

Table 6.13-12 UART Line Control of PARITY Bit Setting

#### UART Auto-Flow Control Function

The UART supports auto-flow control function that uses two signals, nCTS (clear-to-send) and nRTS (request-to-send), to control the flow of data transfer between the UART and external devices (e.g. Modem). When auto-flow is enabled, the UART is not allowed to receive data until the UART asserts nRTS to external device. When the number of bytes stored in the RX FIFO equals the value of RTSTRGLV (UART\_FIFO [19:16]), the nRTS is de-asserted. The UART sends data out when UART detects nCTS is asserted from external device. If the valid asserted nCTS is not detected, the UART will not send data out. The auto flow control block diagram is shown in Figure 6.13-11.

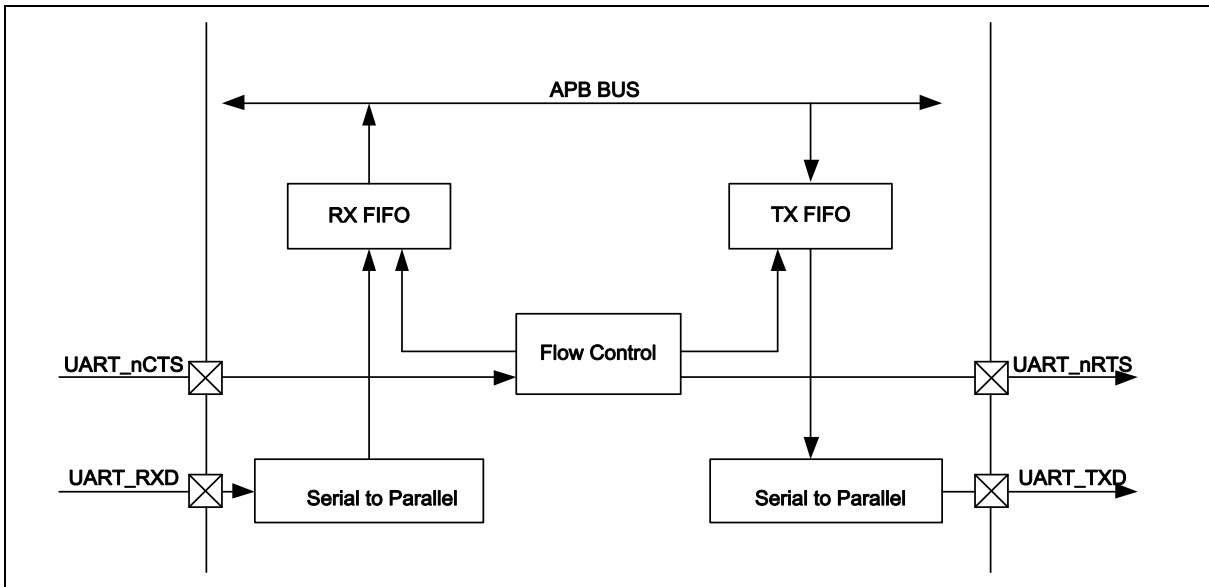

Figure 6.13-11 Auto-Flow Control Block Diagram

Figure 6.13-12 demonstrates the nCTS auto-flow control of UART function mode. User must set ATOCTSEN (UART\_INTEN [13]) to enable nCTS auto-flow control function. The CTSACTLV (UART\_MODEMSTS [8]) can set nCTS pin input active state. The CTSDETF (UART\_MODEMSTS[0]) is set when any state change of nCTS pin input has occurred, and then TX data will be automatically transmitted from TX FIFO.

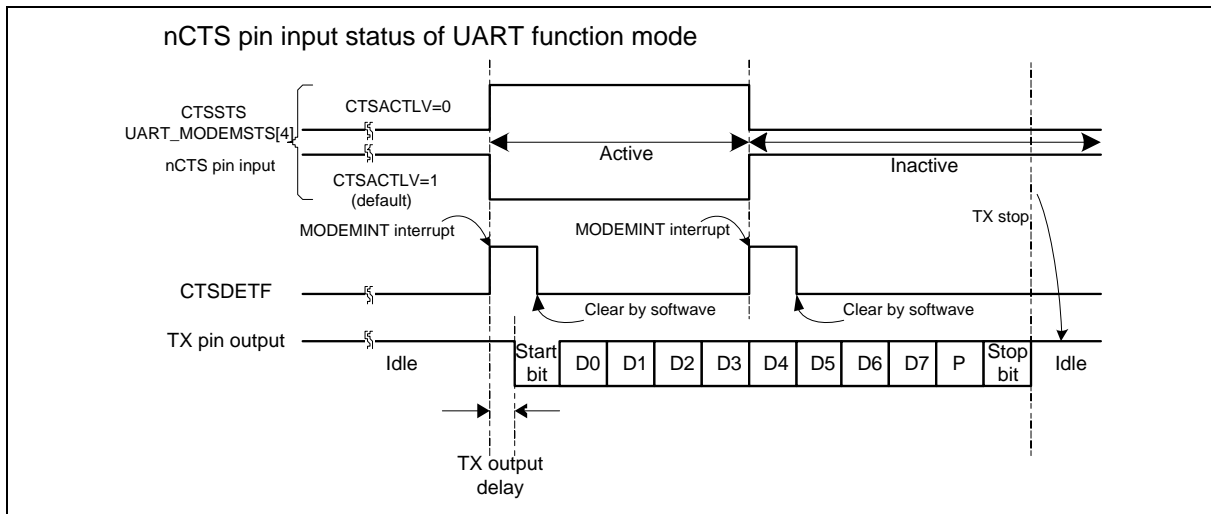

Figure 6.13-12 UART nCTS Auto-Flow Control Enabled

As shown in Figure 6.13-13, in UART nRTS auto-flow control mode ( $ATORTSEN(UART\_INTEN[12])=1$ ), the nRTS internal signal is controlled by UART FIFO controller with  $RTSTRGLV(UART\_FIFO[19:16])$  trigger level.

Setting  $RTSACTLV(UART\_MODEM[9])$  can control the nRTS pin output is inverse or non-inverse from nRTS signal. User can read the  $RTSSTS(UART\_MODEM[13])$  bit to get real nRTS pin output voltage logic status.

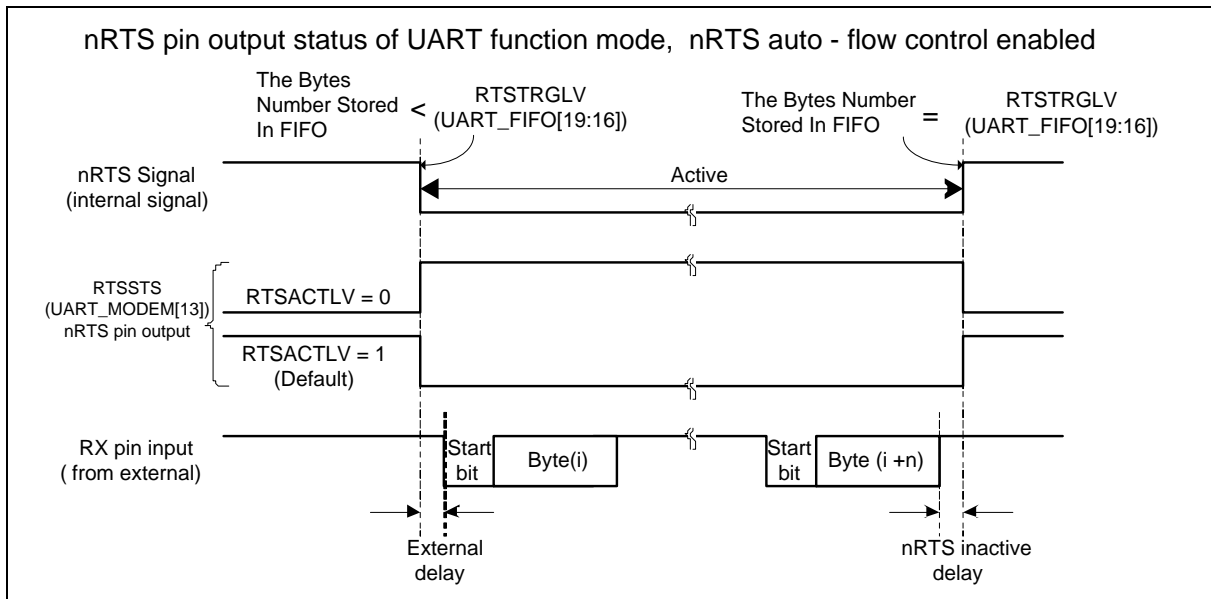

Figure 6.13-13 UART nRTS Auto-Flow Control Enabled

As shown in Figure 6.13-14, in software mode ( $ATORTSEN(UART\_INTEN[12])=0$ ), the nRTS flow is directly controlled by software programming of  $RTS(UART\_MODEM[1])$  control bit.

Setting  $RTSACTLV(UART\_MODEM[9])$  can control the nRTS pin output is inverse or non-inverse from  $RTS(UART\_MODEM[1])$  control bit. User can read the  $RTSSTS(UART\_MODEM[13])$  bit to get real nRTS pin output voltage logic status.

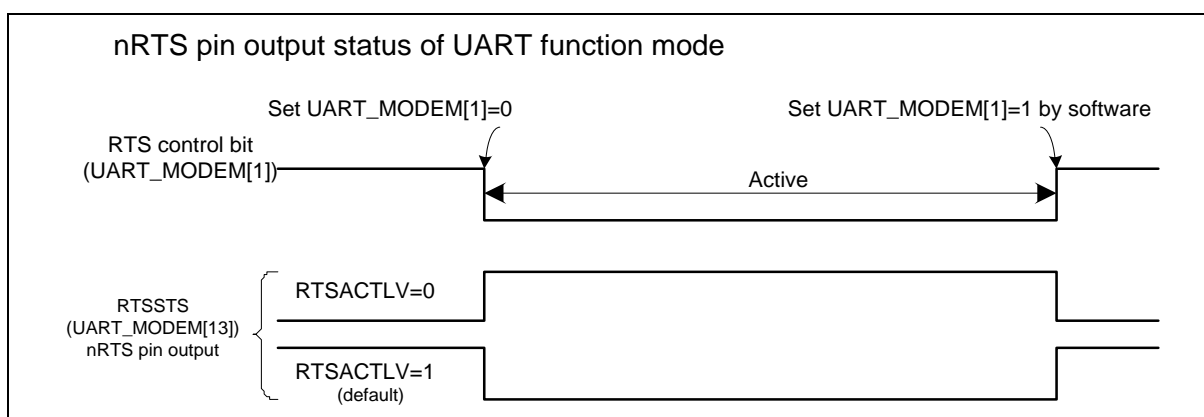

Figure 6.13-14 UART nRTS Auto-Flow with Software Control

#### 6.13.5.9 IrDA Function Mode

The UART controller also provides Serial IrDA (SIR, Serial Infrared) function (Setting UART\_FUNCSEL [2:0] to '010' to enable the IrDA function). The SIR specification defines a short-range infrared asynchronous serial transmission mode with one START bit, 8 data bits, and 1 STOP bit. The maximum data rate is 115.2 kbps. The IrDA SIR block contains an IrDA SIR protocol encoder/decoder. The IrDA SIR protocol is half-duplex only. So, it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10 ms transfer delay between transmission and reception, and this delay feature must be implemented by software.

In IrDA mode, the BAUDM1 (UART\_BAUD [29]) must be cleared.

**Baud Rate = Clock / (16 \* (BRD +2)),** where BRD (UART\_BAUD[15:0]) is Baud Rate Divider in UART BAUD register.

**Note:** The tolerance of baud-rate is  $\pm 5\%$  between IrDA master and IrDA slave.

The IrDA control block diagram is shown in Figure 6.13-15.

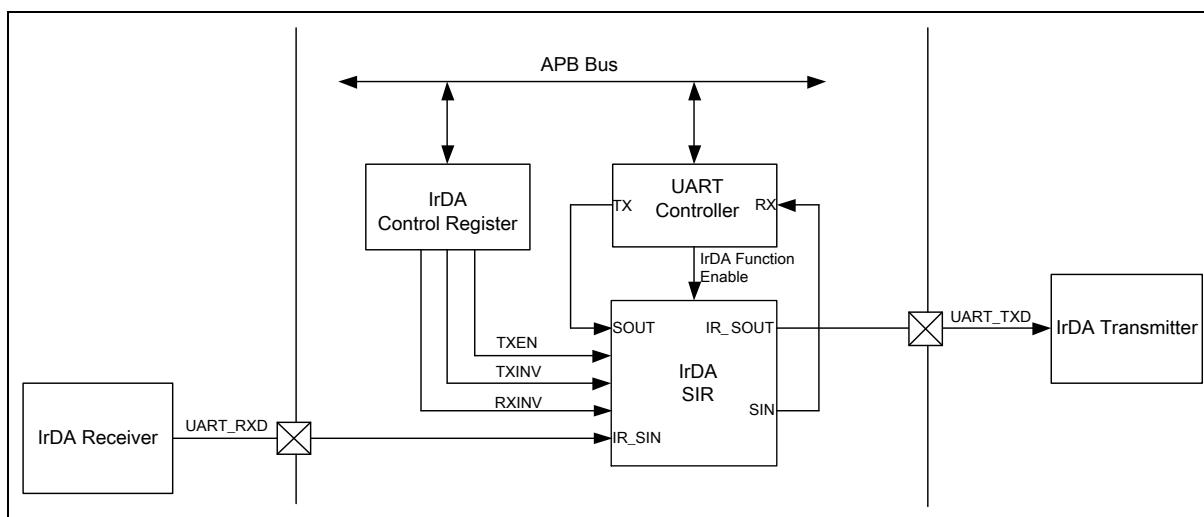

Figure 6.13-15 IrDA Control Block Diagram

### **IrDA SIR Transmit Encoder**

The IrDA SIR Transmit Encoder modulates Non-Return-to-Zero (NRZ) transmit bit stream output from UART. The IrDA SIR physical layer specifies the use of Return-to-Zero, Inverted (RZI) modulation scheme which represents logic 0 as an infra light pulse. The modulated output pulse stream is transmitted to an external output driver and infrared light emitting diode.

The transmitted pulse width is specified as 3/16 period of baud rate.

#### IrDA SIR Receive Decoder

The IrDA SIR Receive Decoder demodulates the Return-to-Zero bit stream from the input detector and outputs the NRZ serial bits stream to the UART received data input.

In idle state, the decoder input is high. A START bit is detected when the decoder input is LOW. In normal operation, the RXINV (UART\_IRDA[6]) is set to '1' and TXINV (UART\_IRDA[5]) is set to '0'.

#### IrDA SIR Operation

The IrDA SIR encoder/decoder provides functionality which converts between UART data stream and half-duplex serial SIR interface. Figure 6.13-16 is IrDA encoder/decoder waveform.

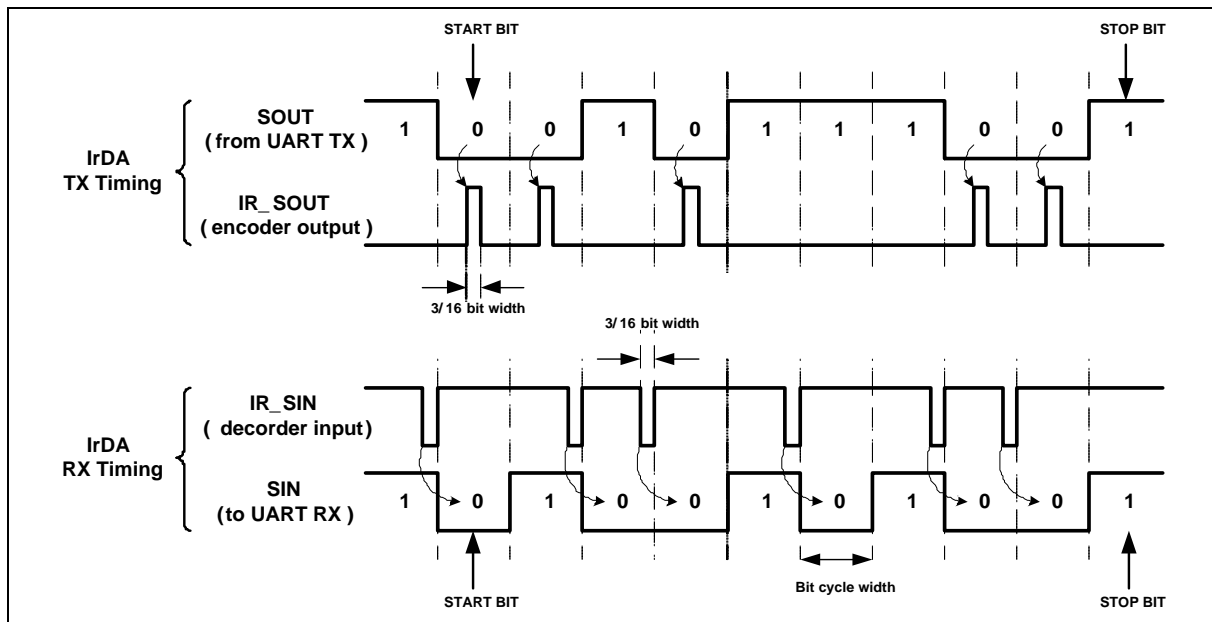

Figure 6.13-16 IrDA TX/RX Timing Diagram

#### 6.13.5.10 LIN Function Mode (Local Interconnection Network)

The UART Controller supports LIN function. Setting FUNCSEL (UART\_FUNCSEL[2:0]) to '001' to select LIN mode operation. The UART Controller supports LIN break/delimiter generation and break/delimiter detection in LIN master mode, and supports header detection and automatic resynchronization in LIN Slave mode.

#### Structure of LIN Frame

According to the LIN protocol, all information transmitted is packed as frames; a frame consists of a header (provided by the master task) and a response (provided by a slave task). The header (provided by the master task) consists of a break field and a sync field followed by a frame identifier (frame ID). The frame identifier uniquely defines the purpose of the frame. The slave task is appointed for providing the response associated with the frame ID. The response consists of a data field and a checksum field. Figure 6.13-17 is the structure of LIN Frame.

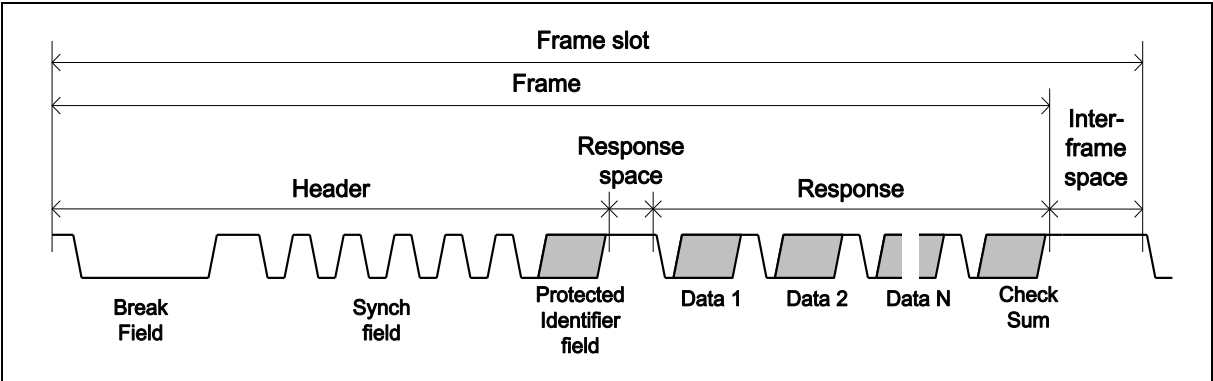

Figure 6.13-17 Structure of LIN Frame

**Structure of LIN Byte**

In LIN mode, each byte field is initiated by a START bit with value 0 (dominant), followed by 8 data bits and no PARITY bit, LSB is first and ended by 1 STOP bit with value 1 (recessive) in accordance with the LIN standard. The structure of Byte is shown in Figure 6.13-18.

Figure 6.13-18 Structure of LIN Byte

**LIN Master Mode**

The UART Controller supports LIN Master mode. To enable and initialize the LIN Master mode, the following steps are necessary:

1. Set the UART\_BAUD register to select the desired baud rate.
2. Set WLS (UART\_LINE[1:0]) to '11' to configure the word length with 8 bits, clearing PBE (UART\_LINE[3]) bit to disable parity check and clearing NSB (UART\_LINE[2]) bit to configure with one STOP bit.
3. Set FUNCSEL (UART\_FUNCSEL[2:0]) to '001' to select LIN function mode operation.

A complete header consists of a break field and sync field followed by a frame identifier (frame ID). The UART controller can be selected header sending by three header selected modes. The header selected mode can be “break field” or “break field and sync field” or “break field, sync field and frame ID field” by setting HSEL (UART\_LINCTL[23:22]). If the selected header is “break field”, software must handle the following sequence to send a complete header to bus by filling sync data (0x55) and frame ID data to the UART\_DAT register. If the selected header is “break field and sync field”, software must handle the sequence to send a complete header to bus by filling the frame ID data to UART\_DAT register, and if the selected header is “break field, sync field and frame ID field”, hardware will control the header sending sequence automatically but software must filled frame ID data to PID (UART\_LINCTL [31:24]). When operating in header selected mode in which the selected header is “break field, sync field and frame ID field”, the frame ID PARITY bit can be calculated by software or hardware depending whether the IDPEN (UART\_LINCTL[9]) bit is set or not.

HSEL	Break Field	Sync Field	ID Field
0	Generated by Hardware	Handled by Software	Handled by Software
1	Generated by Hardware	Generated by Hardware	Handled by Software

2	Generated by Hardware	Generated by Hardware	Generated by Hardware (But Software needs to fill ID to PID (UART_LINCTL[31:24]) first)
---	-----------------------	-----------------------	---

Table 6.13-13 LIN Header Selection in Master Mode

When UART is operated in LIN data transmission, LIN bus transfer state can be monitored by hardware or software. User can enable hardware monitoring by setting BITERREN (UART\_LINCTL [12]) to “1”, if the input pin (UART\_RX) state is not equal to the output pin (UART\_TX) state in LIN transmitter state that hardware will generate an interrupt to CPU. Software can also monitor the LIN bus transfer state by checking the read back data in UART\_DAT register. The following sequence is a program sequence example.

**The procedure without software error monitoring in Master mode:**

1. Fill Protected Identifier to PID (UART\_LINCTL[31:24]).
2. Select the hardware transmission header field including “break field + sync field + protected identifier field” by setting HSEL (UART\_LINCTL [23:22]) to “10”.
3. Set SENDH (UART\_LINCTL[8]) bit to 1 for requesting header transmission.
4. Wait until SENDH (UART\_LINCTL[8]) bit cleared by hardware.
5. Wait until TXEMPTYF (UART\_FIFOSTS[28]) set to 1 by hardware.

**Note1:** The default setting of break field is 12 dominant bits (break field) and 1 recessive bit break/sync delimiter. Setting BRKFL (UART\_LINCTL [19:16]) and BSL (UART\_LINCTL[21:20]) to change the LIN break field length and break/sync delimiter length.

**Note2:** The default setting of break/sync delimiter length is 1-bit time and the inter-byte spaces default setting is also 1-bit time. Setting BSL (UART\_LINCTL[21:20]) and DLY(UART\_TOUT[15:8]) can change break/sync delimiter length and inter-byte spaces.

**Note3:** If the header includes the “break field, sync field and frame ID field”, software must fill frame ID to PID (UART\_LINCTL[31:24]) before trigger header transmission (setting the SENDH (UART\_LINCTL[8])). The frame ID parity can be generated by software or hardware depending on IDPEN (UART\_LINCTL[9]) setting. If the parity generated by software with IDPEN (UART\_LINCTL[9]) is set to ‘0’, software must fill 8 bit data (include 2 bit parity) in this field. If the parity generated by hardware with IDPEN (UART\_LINCTL[9]) is set to ‘1’, software fills ID0~ID5 and hardware calculates P0 and P1.

**Procedure with software error monitoring in Master mode:**

1. Choose the hardware transmission header field to only include “break field” by setting HSEL (UART\_LINCTL [23:22]) to ‘00’.
2. Enable break detection function by setting BRKDETEN (UART\_LINCTL[10]).
3. Request break + break/sync delimiter transmission by setting the SENDH (UART\_LINCTL[8]).
4. Wait until the BRKDETF (UART\_LINSTS[8]) flag is set to “1” by hardware.
5. Request sync field transmission by writing 0x55 into UART\_DAT register.
6. Wait until the RDAIF (UART\_INTSTS[0]) is set to “1” by hardware and then read back the UART\_DAT register.
7. Request header frame ID transmission by writing the protected identifier value to UART\_DAT register.
8. Wait until the RDAIF (UART\_INTSTS[0]) is set to “1” by hardware and then read back the UART\_DAT register.

**LIN Break and Delimiter Detection**

When software enables the break detection function by setting BRKDETEN (UART\_LINCTL[10]), the break detection circuit is activated. The break detection circuit is totally independent from the UART receiver.

When the break detection function is enabled, the circuit looks at the input UART\_RX pin for a start signal. If UART LIN controller detects consecutive dominant is greater than 11 bits dominant followed by a recessive bit (delimiter), the BRKDETF (UART\_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART\_INTEN[8]) bit is set to 1, an interrupt LININT (UART\_INTSTS[15]) will be generated. The behavior of the break detection and break flag are shown in Figure 6.13-19.

Figure 6.13-19 Break Detection in LIN Mode

**LIN Frame ID and Parity Format**

The LIN frame ID value in LIN function mode is shown, the frame ID parity can be generated by software or hardware depends on IDPEN (UART\_LINCTL[9]).

If the parity generated by hardware (IDPEN (UART\_LINCTL[9]) = 1), user fill ID0~ID5 (UART\_LINCTL [29:24]) hardware will calculate P0 (UART\_LINCTL[30]) and P1 (UART\_LINCTL[31]) otherwise user must filled frame ID and parity in this field.

Figure 6.13-20 LIN Frame ID and Parity Format

**LIN Slave Mode**

The UART Controller supports LIN Slave mode. To enable and initialize the LIN Slave mode, the following steps are necessary:

1. Set the UART\_BAUD register to select the desired baud rate.
2. Configure the data length to 8 bits by setting WLS (UART\_LINE[1:0]) to '11' and disable parity check by clearing PBE (UART\_LINE[3]) bit and configure with one STOP bit by clearing NSB

(UART\_LINE[2]) bit.

3. Select LIN function mode by setting FUNCSEL (UART\_FUNCSEL[2:0]) to '001'.
4. Enable LIN slave mode by setting the SLVEN (UART\_LINCTL[0]) to 1.

#### **LIN Header Reception**

According to the LIN protocol, a slave node must wait for a valid header which comes from the master node. Next the slave task will take one of following actions (depend on the master header frame ID value).

- Receive the response.
- Transmit the response.
- Ignore the response and wait for next header.

In LIN Slave mode, user can enable the slave header detection function by setting the SLVHDEN (UART\_LINCTL[1]) to detect complete frame header (receive "break field", "sync field" and "frame ID field"). When a LIN header is received, the SLVHDET (UART\_LINSTS[0]) flag will be set. If the LINIEN (UART\_INTEN[8]) bit is set to 1, an interrupt will be generated. User can enable the frame ID parity check function by setting IDPEN (UART\_LINCTL[9]). If only received frame ID parity is not correct (break and sync field are correct), the SLVIDPEF (UART\_LINSTS[2]) flag is set to '1'. If the LINIEN (UART\_INTEN[8]) is set to 1, an interrupt will be generated and SLVHDET (UART\_LINSTS[0]) is set to '1'. User can also put LIN in mute mode by setting MUTE (UART\_LINCTL[4]) to '1'. This mode allows detection of headers only (break + sync + frame ID) and prevents the reception of any other characters. In order to avoid bit rate tolerance, the controller supports automatic resynchronization function to avoid clock deviation error, user can enable this feature by setting SLVAREN (UART\_LINCTL[2]).

#### **LIN Response Transmission**

The LIN slave node can transmit response and receive response. When slave node is the publisher of the response, the slave node sends response by filling data to the UART\_DAT register. If the slave node is the subscriber of the response, the slave node receives data from LIN bus.

#### **LIN Header Time-out Error**

The LIN slave controller contains a header time-out counter. If the entire header is not received within the maximum time limit of 57 bit times, the header error flag SLVHEF (UART\_LINSTS [1]) will be set. The time-out counter is enabled at each break detect edge and stopped in the following conditions.

- A LIN frame ID field has been received.
- The header error flag asserts.
- Writing 1 to the SLVSYNCF (UART\_LINSTS[3]) to re-search a new frame header.

#### **Mute Mode and LIN Exit from Mute Mode Condition**

In Mute mode, a LIN slave node will not receive any data until specified condition occurred. It allows header detection only and prevents the reception of any other characters. User can enable Mute mode by setting the MUTE (UART\_LINCTL[4]) and exiting from Mute mode condition can be selected by HSEL (UART\_LINCTL[23:22]).

**Note:** It is recommended to set LIN slave node to Mute mode after checksum transmission.

The LIN slave controller exiting from Mute mode is described as follows: If HSEL (UART\_LINCTL[23:22]) is set to "break field", when LIN slave controller detects a valid LIN break and delimiter, the controller will enable the receiver (exit from Mute mode) and subsequent data (sync data, frame ID data, response data) are received in RX FIFO.

If HSEL (UART\_LINCTL[23:22]) is set to "break field and sync field", when the LIN slave controller detects a valid LIN break and delimiter followed by a valid sync field without frame error, the controller

will enable the receiver (exit from mute mode) and subsequent data (ID data, response data) are received in RX FIFO. If HSEL (UART\_LINCTL[23:22]) is set to “break field, sync field and ID field”, when the LIN slave controller detects a valid LIN break and delimiter and valid sync field without frame error followed by ID data without frame error and received ID data matched PID (UART\_LINCTL[31:24]) value. The controller will enable the receiver (exit from mute mode) and subsequent data (response data) are received in RX FIFO.

#### **Slave Mode Non-automatic Resynchronization (NAR)**

User can disable the automatic resynchronization function to fix the communication baud rate. When operating in Non-Automatic Resynchronization mode, software needs some initial process, and the initialization process flow of Non-Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART\_BAUD register.
2. Select LIN function mode by setting FUNCSEL (UART\_FUNCSEL[2:0]) to ‘001’.
3. Disable automatic resynchronization function by setting SLVAREN (UART\_LINCTL[2]) is set to 0.
4. Enable LIN slave mode by setting the SLVEN (UART\_LINCTL[0]) is set to 1.

#### **Slave Mode with Automatic Resynchronization (AR)**

In Automatic Resynchronization (AR) mode, the controller will adjust the baud rate generator after each sync field reception. The initialization process flow of Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART\_BAUD register.
2. Select LIN function mode by setting UART\_FUNCSEL (UART\_FUNCSEL[2:0]) to ‘001’.
3. Enable automatic resynchronization function by setting SLVAREN (UART\_LINCTL[2]) to ‘1’.
4. Enable LIN slave mode by setting the SLVEN (UART\_LINCTL[0]) is set to ‘1’.

When the automatic resynchronization function is enabled, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register and the UART\_BAUD register value will be automatically updated at the end of the fifth falling edge. If the measure timer (13-bit) overflows before five falling edges, then the header error flag SLVHEF (UART\_LINSTS [1]) will be set.

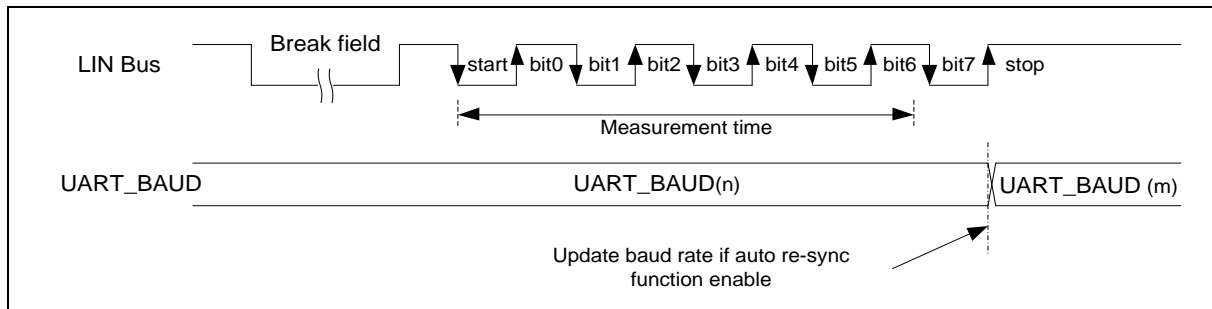

Figure 6.13-21 LIN Sync Field Measurement

When operating in Automatic Resynchronization (AR) mode, software must select the desired baud rate by setting the UART\_BAUD register and hardware will store it at internal TEMP\_REG register, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register BAUD\_LIN and the result will be updated to UART\_BAUD register automatically.

To guarantee the transmission baud rate, the baud rate generator must reload the initial value before each new break reception. The initial value is programmed by the application during initialization (TEMP\_REG). User can set SLVDUEN (UART\_LINCTL [3]) to enable auto reload initial baud rate value

function. If the SLVDUEN (UART\_LINCTL [3]) is set, when received the next character, hardware will auto reload the initial value to UART\_BAUD, and when the UART\_BAUD be updated, the SLVDUEN (UART\_LINCTL [3]) will be cleared automatically. The behavior of LIN updated method as shown Figure 6.13-22.

**Note1:** It is recommended to set the SLVDUEN bit before every checksum reception.

**Note2:** When a header error is detected, user must write 1 to SLVSYNCF (UART\_LINSTS[3]) to re-search new frame header. When writing 1 to it, hardware will reload the initial baud rate TEMP\_REG and re-search new frame header.

**Note3:** When operating in Automatic Resynchronization mode, the baud rate setting must be operated at mode2 (BAUDM1 (UART\_BAUD [29]) and BAUDM0 (UART\_BAUD[28]) must be 1).

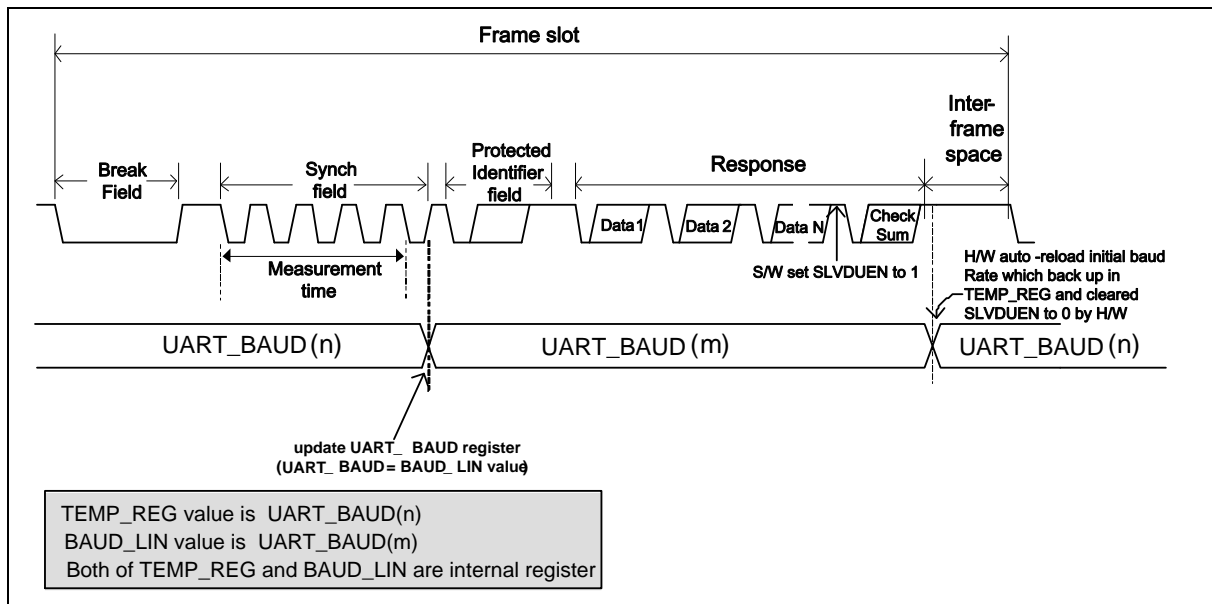

Figure 6.13-22 UART\_BAUD Update Sequence in AR mode if SLVDUEN is 1

Figure 6.13-23 UART\_BAUD Update Sequence in AR mode if SLVDUEN is 0

### **Deviation Error on the Sync Field**

When operating in Automatic Resynchronization mode, the controller will check the deviation error on the sync field. The deviation error is checked by comparing the current baud rate with the received sync field. Two checks are performed in parallel.

Check1: Based on measurement between the first falling edge and the last falling edge of the sync field.

- If the difference is more than 14.84%, the header error flag SLVHEF (UART\_LINSTS[1]) will be set.
- If the difference is less than 14.06%, the header error flag SLVHEF (UART\_LINSTS[1]) will not be set.
- If the difference is between 14.84% and 14.06%, the header error flag SLVHEF (UART\_LINSTS[1]) may either set or not.

Check2: Based on measurement of time between each falling edge of the sync field.

- If the difference is more than 18.75%, the header error flag SLVHEF (UART\_LINSTS[1]) will be set.
- If the difference is less than 15.62%, the header error flag SLVHEF (UART\_LINSTS[1]) will not be set.
- If the difference is between 18.75% and 15.62%, the header error flag SLVHEF (UART\_LINSTS[1]) may either set or not.

**Note:** The deviation check is based on the current baud rate clock. Therefore, in order to guarantee correct deviation checking, the baud rate must reload the nominal value before each new break reception by setting SLVDUEN (UART\_LINCTL[3]) register (It is recommend setting the SLVDUEN (UART\_LINCTL[3]) bit before every checksum reception).

### **LIN Header Error Detection**

In LIN Slave function mode, when user enables the header detection function by setting the SLVHDEN (UART\_LINCTL[1]), hardware will handle the header detect flow. If the header has an error, the LIN header error flag SLVHEF (UART\_LINSTS[1]) will be set and an interrupt is generated if the LINIEN (UART\_INTEN[8]) bit is set. When header error is detected, user must reset the detect circuit to re-search a new frame header by writing 1 to SLVSYNCF (UART\_LINSTS[3]) to re-search a new frame header.

The LIN header error flag SLVHEF (UART\_LINSTS[1]) is set if one of the following conditions occurs:

- Break Delimiter is too short (less than 0.5-bit time).
- Frame error in sync field or Identifier field.
- The sync field data is not 0x55 (Non-Automatic Resynchronization mode).
- The sync field deviation error (With Automatic Resynchronization mode).
- The sync field measure time-out (With Automatic Resynchronization mode).
- LIN header reception time-out.

#### **6.13.5.11 RS-485 Function Mode**

Another alternate function of UART controller is RS-485 function (user must set UART\_FUNCSEL [2:0] to '011' to enable RS-485 function), and direction control provided by nRTS pin from an asynchronous serial port. The RS-485 transceiver control is implemented by using the nRTS control signal to enable the RS-485 driver. Many characteristics of the RX and TX are same as UART in RS-485 mode.

The UART controller can be configured as a RS-485 addressable slave or a RS-485 master. RS-485 master transmitter will identify an address character by setting the parity (9<sup>th</sup> bit) to 1. For data characters, the parity is set to 0. Software can use UART\_LINE register to control the 9<sup>th</sup> bit (When the PBE, EPE and SPE are set, the 9<sup>th</sup> bit is transmitted 0 and when PBE and SPE are set and EPE is

cleared, the 9<sup>th</sup> bit is transmitted 1).

The controller supports three operation modes: RS-485 Normal Multidrop Operation Mode (NMM), RS-485 Auto Address Detection Operation Mode (AAD) and RS-485 Auto Direction Control Operation Mode (AUD). Software can choose any operation mode by programming the UART\_ALTCTL register, and drive the transfer delay time between the last STOP bit leaving the TX FIFO and the de-assertion of by setting DLY (UART\_TOUT [15:8]) register.

#### **RS-485 Normal Multidrop Operation Mode (NMM)**

In RS-485 Normal Multidrop Operation Mode (RS485NMM (UART\_ALTCTL[8]) = 1), in first, software must decide the data which before the address byte be detected will be stored in RX FIFO or not. If software wants to ignore any data before address byte detected, the flow is set RXOFF (UART\_FIFO [8]) then enable RS485NMM (UART\_ALTCTL [8]) and the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data will be stored in the RX FIFO. If software wants to receive any data before address byte detected, the flow is disables RXOFF (UART\_FIFO [8]) then enable RS485NMM (UART\_ALTCTL [8]) and the receiver will received any data.

If an address byte is detected (bit 9 = 1), it will generate an interrupt to CPU and RXOFF (UART\_FIFO [8]) can decide whether accepting the following data bytes are stored in the RX FIFO. If software disables receiver by setting RXOFF (UART\_FIFO [8]) register, when a next address byte is detected, the controller will clear the RXOFF (UART\_FIFO [8]) bit and the address byte data will be stored in the RX FIFO.

#### **RS-485 Auto Address Detection Operation Mode (AAD)**

In RS-485 Auto Address Detection Operation Mode (RS485AAD (UART\_ALTCTL[9]) = 1), the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data matches the ADDRNV (UART\_ALTCTL[31:24]) value. The address byte data will be stored in the RX FIFO. The all received byte data will be accepted and stored in the RX FIFO until an address byte data not match the ADDRNV (UART\_ALTCTL[31:24]) value.

#### **RS-485 Auto Direction Function (AUD)**

Another option function of RS-485 controllers is RS-485 auto direction control function (RS485AUD (UART\_ALTCTL[10]) = 1). The RS-485 transceiver control is implemented by using the nRTS control signal from an asynchronous serial port. The nRTS line is connected to the RS-485 transceiver enable pin such that setting the nRTS line to high (logic 1) enables the RS-485 transceiver. Setting the nRTS line to low (logic 0) puts the transceiver into the tri-state condition. User can set RTSACTLV in UART\_MODEM register to change the nRTS driving level.

Figure 6.13-24 demonstrates the RS-485 nRTS driving level in AUD mode. The nRTS pin will be automatically driven during TX data transmission.

Setting RTSACTLV(UART\_MODEM[9]) can control nRTS pin output driving level. User can read the RTSSTS(UART\_MODEM[13]) bit to get real nRTS pin output voltage logic status.

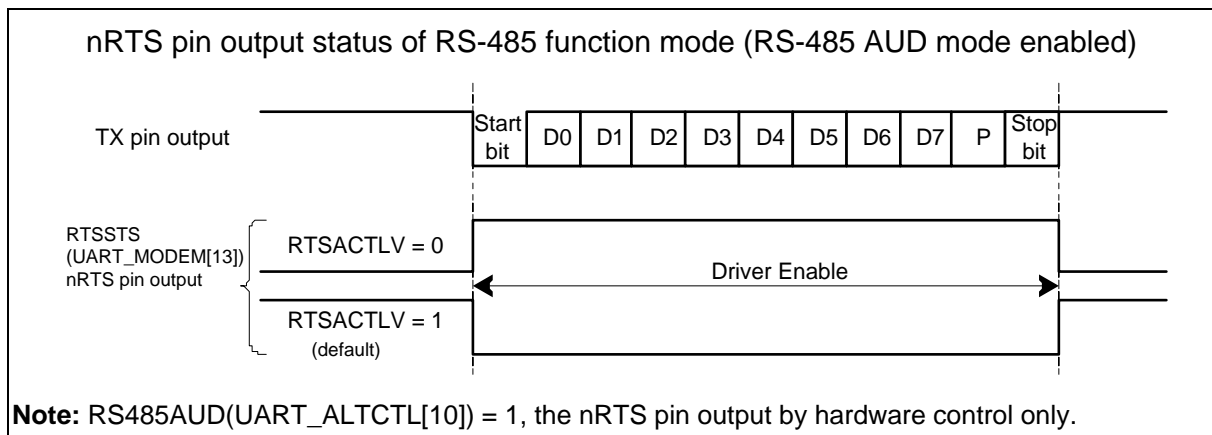

Figure 6.13-24 RS-485 nRTS Driving Level in Auto Direction Mode

Figure 6.13-25 demonstrates the RS-485 nRTS driving level in software control (RS485AUD (UART\_ALTCTL[10])=0). The nRTS driving level is controlled by programing the RTS(UART\_MODEM[1]) control bit.

Setting RTSACTLV (UART\_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from RTS(UART\_MODEM[1]) control bit. User can read the RTSSTS (UART\_MODEM[13]) bit to get real nRTS pin output voltage logic status. The structure of RS-485 frame is shown in Figure 6.13-26.

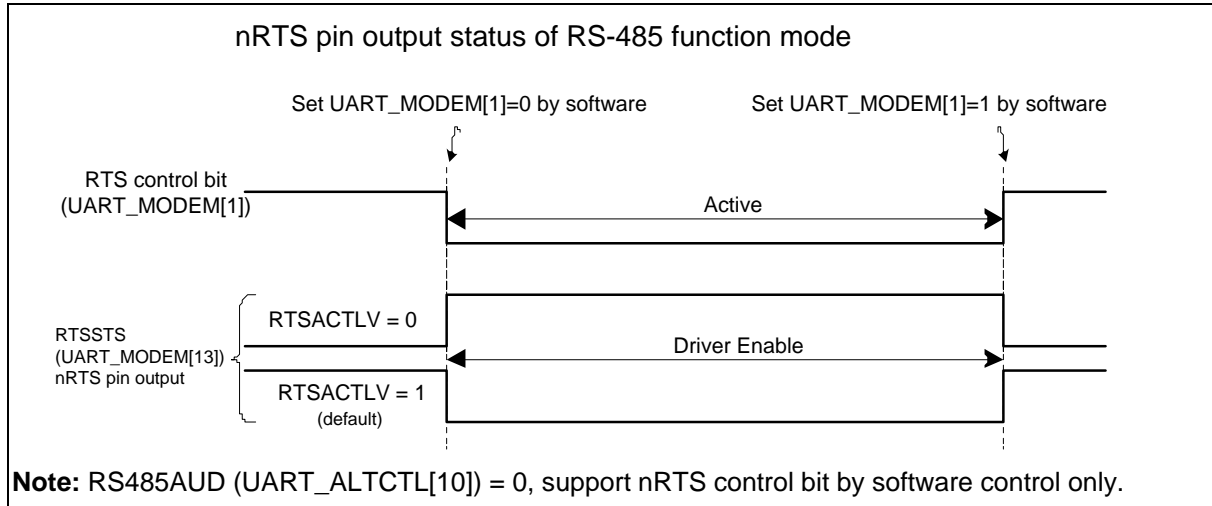

Figure 6.13-25 RS-485 nRTS Driving Level with Software Control

**Programming Sequence Example:**

1. Program FUNCSEL (UART\_FUNCSEL[2:0]) to select RS-485 function.
2. Program the RXOFF (UART\_FIFO[8]) to determine enable or disable the receiver RS-485 receiver.
3. Program the RS485NMM (UART\_ALTCTL[8]) or RS485AAD (UART\_ALTCTL[9]) mode.
4. If the RS485AAD (UART\_ALTCTL[9]) mode is selected, the ADDRMMV (UART\_ALTCTL[31:24]) is programmed for auto address match value.
5. Determine auto direction control by programming RS485AUD (UART\_ALTCTL[10]).

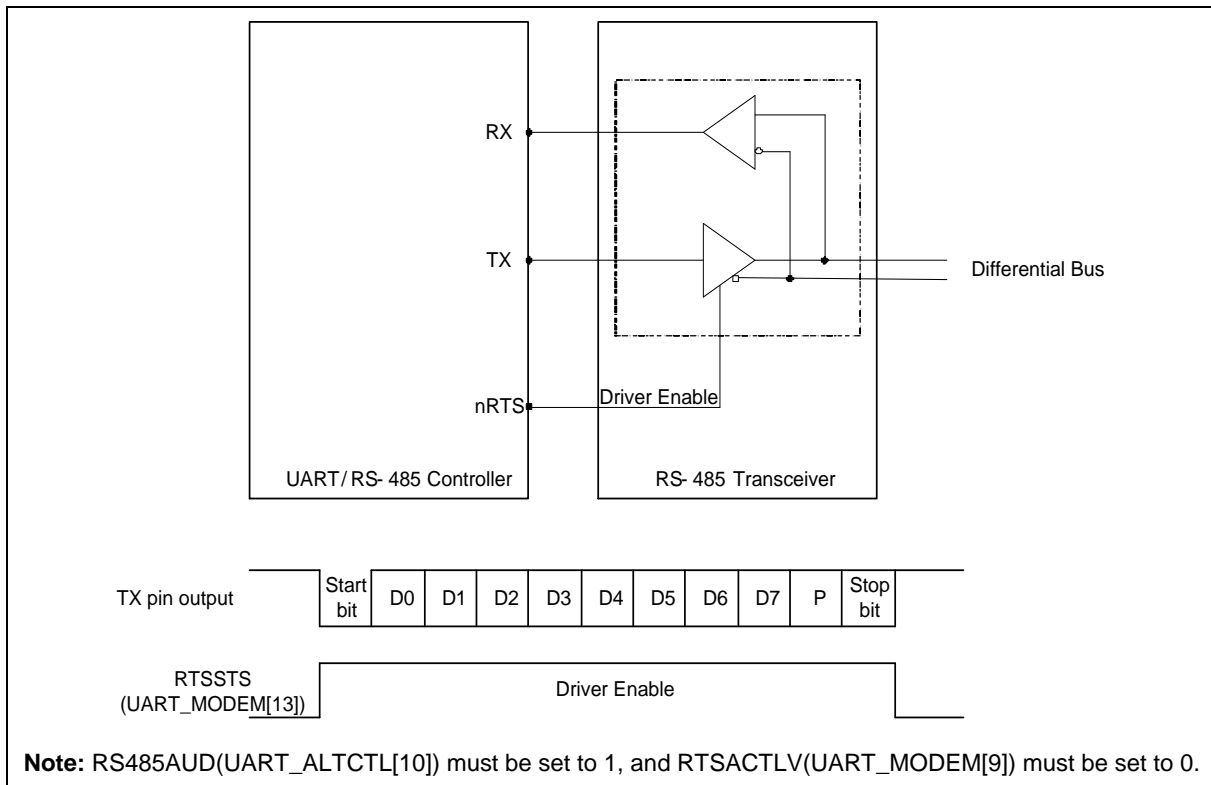

Figure 6.13-26 Structure of RS-485 Frame

#### 6.13.5.12 UART Single-wire Half Duplex

The UART controller provides single-wire half duplex function in UART function mode. Setting FUNCSEL (UART\_FUNCSEL[2:0]) to '100' to enable the UART Single-wire function. The single-wire bus is idle (RXIDLE (UART\_FIFOSTS[29]) = 1) in RX state. Before writing data to transmit buffer (UART\_DAT[7:0]), the bus state should be checked in idle (RXIDLE (UART\_FIFOSTS[29])). By writing data to transmit buffer, the bus state transfers to TX state immediately. After the transmission, the bus state transfers from TX state to RX state.

The UART will not allowed to receive data in single-wire half duplex function TX mode. If nRTS is asserted in TX mode, nRTS will make the docking UART device send out data and cause bus confliction. To reduce the bus confliction, the UART controller supports flow control function and bit error detection but does not support auto-flow control function. The nRTS is automatically inactivated in single-wire TX state. In TX state, the UART controller will monitor bus state. If the bus state is not equal to TX state, the SWBEIF (UART\_INTSTS[16]) is set.

#### 6.13.5.13 PDMA Transfer Function

The UART controller supports PDMA transfer function.

By configuring PDMA parameter and set UART\_DAT as the PDMA destination address. When TXPDMAEN (UART\_INTEN[14]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

By configuring PDMA parameter and set UART\_DAT as the PDMA source address. When RXPDMAEN (UART\_INTEN[15]) is set to 1, the controller will start the PDMA reception process. UART controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

## 6.13.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>UART Base Address:</b> $\text{UARTx\_BA} = 0x4007\_0000 + (0x1000 * x)$ $x=0,1,2,3$				
<b>UART_DAT</b> $x=0,1,2,3$	UARTx_BA+0x00	R/W	UART Receive/Transmit Buffer Register	Undefined
<b>UART_INTEN</b> $x=0,1,2,3$	UARTx_BA+0x04	R/W	UART Interrupt Enable Register	0x0000_0000
<b>UART_FIFO</b> $x=0,1,2,3$	UARTx_BA+0x08	R/W	UART FIFO Control Register	0x0000_0101
<b>UART_LINE</b> $x=0,1,2,3$	UARTx_BA+0x0C	R/W	UART Line Control Register	0x0000_0000

### 6.13.7 Register Description

UART                      Receive/Transmit                      Buffer                      Register  
(UART\_DAT)

Register	Offset	R/W	Description	Reset Value
UART_DAT x=0,1,2,3	UARTx_BA+0x00	R/W	UART Receive/Transmit Buffer Register	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							PARITY
7	6	5	4	3	2	1	0
DAT							

Bits	Description
[31:9]	<b>Reserved</b> Reserved.
[8]	<b>PARITY</b> <b>PARITY Bit Receive/Transmit Buffer</b> Write Operation: By writing to this bit, the PARITY bit will be stored in transmitter FIFO. If PBE (UART_LINE[3]) and PSS (UART_LINE[7]) are set, the UART controller will send out this bit follow the DAT (UART_DAT[7:0]) through the UART_TXD. Read Operation: If PBE (UART_LINE[3]) and PSS (UART_LINE[7]) are enabled, the PARITY bit can be read by this bit. <b>Note:</b> This bit has effect only when PBE (UART_LINE[3]) and PSS (UART_LINE[7]) are set.
[7:0]	<b>DAT</b> <b>Data Receive/Transmit Buffer</b> Write Operation: By writing one byte to this register, the data byte will be stored in transmitter FIFO. The UART controller will send out the data stored in transmitter FIFO top location through the UART_TXD. Read Operation: By reading this register, the UART controller will return an 8-bit data received from receiver FIFO.

## UART Interrupt Enable Register (UART\_INTEN)

Register	Offset	R/W	Description	Reset Value
UART_INTEN x=0,1,2,3	UARTx_BA+0x04	R/W	UART Interrupt Enable Register	0x0000_0000

Bits	Description
[31:10]	<b>Reserved</b> Reserved.
[9]	<b>RXDINV</b> <b>RX Data Inverted</b> 0 = Received data signal inverted Disabled. 1 = Received data signal inverted Enabled. <b>Note 1:</b> Before setting this bit, TXRXDIS (UART_FUNCSEL[3]) should be set then waited for TXRXACT (UART_FIFOSTS[31]) is cleared. When the configuration is done, cleared TXRXDIS (UART_FUNCSEL[3]) to activate UART controller. <b>Note 2:</b> This bit is valid when FUNCSEL (UART_FUNCSEL[2:0]) is select UART, LIN or RS485 function.
[8]	<b>TXDINV</b> <b>TX Data Inverted</b> 0 = Transmitted data signal inverted Disabled. 1 = Transmitted data signal inverted Enabled. <b>Note 1:</b> Before setting this bit, TXRXDIS (UART_FUNCSEL[3]) should be set then waited for TXRXACT (UART_FIFOSTS[31]) is cleared. When the configuration is done, cleared TXRXDIS (UART_FUNCSEL[3]) to activate UART controller. <b>Note 2:</b> This bit is valid when FUNCSEL (UART_FUNCSEL[2:0]) is select UART, LIN or RS485 function.
[7]	<b>PSS</b> <b>PARITY Bit Source Selection</b> The PARITY bit can be selected to be generated and checked automatically or by software. 0 = PARITY bit is generated by EPE (UART_LINE[4]) and SPE (UART_LINE[5]) setting and checked automatically. 1 = PARITY bit generated and checked by software. <b>Note 1:</b> This bit has effect only when PBE (UART_LINE[3]) is set. <b>Note 2:</b> If PSS is 0, the PARITY bit is transmitted and checked automatically. If PSS is 1, the transmitted PARITY bit value can be determined by writing PARITY (UART_DAT[8]) and the PARITY bit can be read by reading PARITY (UART_DAT[8]).
[6]	<b>BCB</b> <b>Break Control Bit</b> 0 = Break Control Disabled. 1 = Break Control Enabled.

		<b>Note:</b> When this bit is set to logic 1, the transmitted serial data output (TX) is forced to the Spacing State (logic 0). This bit acts only on TX line and has no effect on the transmitter logic.
[5]	<b>SPE</b>	<b>Stick Parity Enable Bit</b> 0 = Stick parity Disabled. 1 = Stick parity Enabled. <b>Note:</b> If PBE (UART_LINE[3]) and EPE (UART_LINE[4]) are logic 1, the PARITY bit is transmitted and checked as logic 0. If PBE (UART_LINE[3]) is 1 and EPE (UART_LINE[4]) is 0 then the PARITY bit is transmitted and checked as 1.
[4]	<b>EPE</b>	<b>Even Parity Enable Bit</b> 0 = Odd number of logic 1's is transmitted and checked in each word. 1 = Even number of logic 1's is transmitted and checked in each word. <b>Note:</b> This bit has effect only when PBE (UART_LINE[3]) is set.
[3]	<b>PBE</b>	<b>PARITY Bit Enable Bit</b> 0 = PARITY bit generated Disabled. 1 = PARITY bit generated Enabled. <b>Note:</b> PARITY bit is generated on each outgoing character and is checked on each incoming data.
[2]	<b>NSB</b>	<b>Number of "STOP Bit"</b> 0 = One "STOP bit" is generated in the transmitted data. 1 = When select 5-bit word length, 1.5 "STOP bit" is generated in the transmitted data. When select 6-, 7- and 8-bit word length, 2 "STOP bit" is generated in the transmitted data.
[1:0]	<b>WLS</b>	<b>Word Length Selection</b> This field sets UART word length. 00 = 5 bits. 01 = 6 bits. 10 = 7 bits. 11 = 8 bits.

Bits	Description
[31]	<b>TXRXACT</b> <b>TX and RX Active Status (Read Only)</b> This bit indicates TX and RX are active or inactive. 0 = TX and RX are inactive. 1 = TX and RX are active. (Default) <b>Note:</b> When TXRXDIS (UART_FUNCSEL[3]) is set and both TX and RX are in idle state, this bit is cleared. The UART controller cannot transmit or receive data at this moment. Otherwise this bit is set.
[30]	<b>Reserved</b> Reserved.
[29]	<b>RXIDLE</b> <b>RX Idle Status (Read Only)</b> This bit is set by hardware when RX is idle. 0 = RX is busy. 1 = RX is idle. (Default)
[28]	<b>TXEMPTYF</b> <b>Transmitter Empty Flag (Read Only)</b> This bit is set by hardware when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted. 0 = TX FIFO is not empty or the STOP bit of the last byte has been not transmitted. 1 = TX FIFO is empty and the STOP bit of the last byte has been transmitted. <b>Note:</b> This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[27:25]	<b>Reserved</b> Reserved.
[24]	<b>TXOVIF</b> <b>TX Overflow Error Interrupt Flag</b> If TX FIFO (UART_DAT) is full, an additional write to UART_DAT will cause this bit become logic 1. 0 = TX FIFO is not overflow. 1 = TX FIFO is overflow. <b>Note:</b> This bit can be cleared by writing “1” to it.
[23]	<b>TXFULL</b> <b>Transmitter FIFO Full (Read Only)</b>

		<p>This bit indicates TX FIFO full or not.</p> <p>0 = TX FIFO is not full.</p> <p>1 = TX FIFO is full.</p> <p><b>Note:</b> This bit is set when the number of usage in TX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.</p>
[22]	<b>TXEMPTY</b>	<p><b>Transmitter FIFO Empty (Read Only)</b></p> <p>This bit indicates TX FIFO empty or not.</p> <p>0 = TX FIFO is not empty.</p> <p>1 = TX FIFO is empty.</p> <p><b>Note:</b> When the last byte of TX FIFO has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into UART_DAT (TX FIFO not empty).</p>
[21:16]	<b>TXPTR</b>	<p><b>TX FIFO Pointer (Read Only)</b></p> <p>This field indicates the TX FIFO Buffer Pointer. When CPU writes one byte into UART_DAT, TXPTR increases one. When one byte of TX FIFO is transferred to Transmitter Shift Register, TXPTR decreases one.</p> <p>The Maximum value shown in TXPTR is 15. When the using level of TX FIFO Buffer equal to 16, the TXFULL bit is set to 1 and TXPTR will show 0. As one byte of TX FIFO is transferred to Transmitter Shift Register, the TXFULL bit is cleared to 0 and TXPTR will show 15.</p>
[15]	<b>RXFULL</b>	<p><b>Receiver FIFO Full (Read Only)</b></p> <p>This bit initiates RX FIFO full or not.</p> <p>0 = RX FIFO is not full.</p> <p>1 = RX FIFO is full.</p> <p><b>Note:</b> This bit is set when the number of usage in RX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.</p>
[14]	<b>RXEMPTY</b>	<p><b>Receiver FIFO Empty (Read Only)</b></p> <p>This bit initiate RX FIFO empty or not.</p> <p>0 = RX FIFO is not empty.</p> <p>1 = RX FIFO is empty.</p> <p><b>Note:</b> When the last byte of RX FIFO has been read by CPU, hardware sets this bit high. It will be cleared when UART receives any new data.</p>
[13:8]	<b>RXPTR</b>	<p><b>RX FIFO Pointer (Read Only)</b></p> <p>This field indicates the RX FIFO Buffer Pointer. When UART receives one byte from external device, RXPTR increases one. When one byte of RX FIFO is read by CPU, RXPTR decreases one.</p> <p>The Maximum value shown in RXPTR is 15. When the using level of RX FIFO Buffer equal to 16, the RXFULL bit is set to 1 and RXPTR will show 0. As one byte of RX FIFO is read by CPU, the RXFULL bit is cleared to 0 and RXPTR will show 15.</p>
[7]	<b>Reserved</b>	Reserved.
[6]	<b>BIF</b>	<p><b>Break Interrupt Flag</b></p> <p>This bit is set to logic 1 whenever the received data input (RX) is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "START bit" + data bits + parity + STOP bits).</p> <p>0 = No Break interrupt is generated.</p> <p>1 = Break interrupt is generated.</p> <p><b>Note:</b> This bit can be cleared by writing "1" to it.</p>
[5]	<b>FEF</b>	<p><b>Framing Error Flag</b></p> <p>This bit is set to logic 1 whenever the received character does not have a valid "STOP bit" (that is, the STOP bit following the last data bit or PARITY bit is detected as logic 0).</p> <p>0 = No framing error is generated.</p> <p>1 = Framing error is generated.</p> <p><b>Note:</b> This bit can be cleared by writing "1" to it.</p>

[4]	PEF	<b>Parity Error Flag</b> This bit is set to logic 1 whenever the received character does not have a valid "PARITY bit". 0 = No parity error is generated. 1 = Parity error is generated. <b>Note:</b> This bit can be cleared by writing "1" to it.
[3]	ADDRDET	<b>RS-485 Address Byte Detect Flag</b> 0 = Receiver detects a data that is not an address bit (bit 9 = '0'). 1 = Receiver detects a data that is an address bit (bit 9 = '1'). <b>Note 1:</b> This field is used for RS-485 function mode and ADDRDEN (UART_ALTCTL[15]) is set to 1 to enable Address detection mode. <b>Note 2:</b> This bit can be cleared by writing "1" to it.
[2]	ABRDTOIF	<b>Auto-baud Rate Detect Time-out Interrupt Flag</b> This bit is set to logic "1" in Auto-baud Rate Detect mode when the baud rate counter is overflow. 0 = Auto-baud rate counter is underflow. 1 = Auto-baud rate counter is overflow. <b>Note:</b> This bit can be cleared by writing "1" to it.
[1]	ABRDIF	<b>Auto-baud Rate Detect Interrupt Flag</b> This bit is set to logic "1" when auto-baud rate detect function is finished. 0 = Auto-baud rate detect function is not finished. 1 = Auto-baud rate detect function is finished. <b>Note:</b> This bit can be cleared by writing "1" to it.
[0]	RXOVIF	<b>RX Overflow Error Interrupt Flag</b> This bit is set when RX FIFO overflow. If the number of bytes of received data is greater than RX_FIFO (UART_DAT) size 16 bytes, this bit will be set. 0 = RX FIFO is not overflow. 1 = RX FIFO is overflow. <b>Note:</b> This bit can be cleared by writing "1" to it.

LINIF	WKIF	BUFERRIF	RXTOIF	MODEMIF	RLSIF	THREIF	RDAIF

Bits	Description
[31] ABRINT	<b>Auto-baud Rate Interrupt Indicator (Read Only)</b> This bit is set if ABRIEN (UART_INTEN[18]) and ABRIF (UART_ALTCTL[17]) are both set to 1. 0 = No Auto-baud Rate interrupt is generated. 1 = The Auto-baud Rate interrupt is generated.
[30] TXENDINT	<b>Transmitter Empty Interrupt Indicator (Read Only)</b> This bit is set if TXENDIEN (UART_INTEN[22]) and TXENDIF (UART_INTSTS[22]) are both set to 1. 0 = No Transmitter Empty interrupt is generated. 1 = Transmitter Empty interrupt is generated.
[29] HWBUFEINT	<b>PDMA Mode Buffer Error Interrupt Indicator (Read Only)</b> This bit is set if BUFERRIEN (UART_INTEN[5]) and HWBUFEIF (UART_INTSTS[21]) are both set to 1. 0 = No buffer error interrupt is generated in PDMA mode. 1 = Buffer error interrupt is generated in PDMA mode.
[28] HWTOINT	<b>PDMA Mode RX Time-out Interrupt Indicator (Read Only)</b> This bit is set if RXTOIEN (UART_INTEN[4]) and HWTOIF (UART_INTSTS[20]) are both set to 1. 0 = No RX time-out interrupt is generated in PDMA mode. 1 = RX time-out interrupt is generated in PDMA mode.
[27] HWMODINT	<b>PDMA Mode MODEM Status Interrupt Indicator (Read Only)</b> This bit is set if MODEMIEN (UART_INTEN[3]) and HWMODIF (UART_INTSTS[19]) are both set to 1. 0 = No Modem interrupt is generated in PDMA mode. 1 = Modem interrupt is generated in PDMA mode.
[26] HWRLSINT	<b>PDMA Mode Receive Line Status Interrupt Indicator (Read Only)</b> This bit is set if RLSIEN (UART_INTEN[2]) and HWRLSIF (UART_INTSTS[18]) are both set to 1. 0 = No RLS interrupt is generated in PDMA mode. 1 = RLS interrupt is generated in PDMA mode.

[25]	<b>Reserved</b>	Reserved.
[24]	<b>SWBEINT</b>	<b>Single-wire Bit Error Detect Interrupt Indicator (Read Only)</b> This bit is set if SWBEIEN (UART_INTEN[16]) and SWBEIF (UART_INTSTS[16]) are both set to 1. 0 = No Single-wire Bit Error Detection Interrupt generated. 1 = Single-wire Bit Error Detection Interrupt generated.
[23]	<b>Reserved</b>	Reserved.
[22]	<b>TXENDIF</b>	<b>Transmitter Empty Interrupt Flag</b> This bit is set when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted (TXEMPTYF (UART_FIFOSTS[28]) is set). If TXENDIEN (UART_INTEN[22]) is enabled, the Transmitter Empty interrupt will be generated. 0 = No transmitter empty interrupt flag is generated. 1 = Transmitter empty interrupt flag is generated. <b>Note:</b> This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[21]	<b>HWBUFEIF</b>	<b>PDMA Mode Buffer Error Interrupt Flag (Read Only)</b> This bit is set when the TX or RX FIFO overflows (TXOVIF (UART_FIFOSTS [24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUFERRIF (UART_INTSTS[5]) is set, the transfer maybe is not correct. If BUFERRIEN (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated. 0 = No buffer error interrupt flag is generated in PDMA mode. 1 = Buffer error interrupt flag is generated in PDMA mode. <b>Note:</b> This bit is cleared when both TXOVIF (UART_FIFOSTS[24]) and RXOVIF (UART_FIFOSTS[0]) are cleared.
[20]	<b>HWTIOF</b>	<b>PDMA Mode RX Time-out Interrupt Flag (Read Only)</b> This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated. 0 = No RX time-out interrupt flag is generated in PDMA mode. 1 = RX time-out interrupt flag is generated in PDMA mode. <b>Note:</b> This bit is read only and user can read UART_DAT (RX is in active) to clear it.
[19]	<b>HWMODIF</b>	<b>PDMA Mode MODEM Interrupt Flag (Read Only)</b> This bit is set when the nCTS pin has state change (CTSDETF (UART_MODEMSTS [0] =1)). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated. 0 = No Modem interrupt flag is generated in PDMA mode. 1 = Modem interrupt flag is generated in PDMA mode. <b>Note:</b> This bit is read only and reset to 0 when the bit CTSDETF (UART_MODEMSTS[0]) is cleared by writing 1 on CTSDETF (UART_MODEMSTS [0]).
[18]	<b>HWRLSIF</b>	<b>PDMA Mode Receive Line Status Flag (Read Only)</b> This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]) and PEF (UART_FIFOSTS[4]) is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated. 0 = No RLS interrupt flag is generated in PDMA mode. 1 = RLS interrupt flag is generated in PDMA mode. <b>Note 1:</b> In RS-485 function mode, this field includes "receiver detect any address byte received address byte character (bit9 = '1') bit". <b>Note 2:</b> In UART function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are cleared. <b>Note 3:</b> In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDETF (UART_FIFOSTS[3]) are cleared.
[17]	<b>Reserved</b>	Reserved.

[16]	SWBEIF	<b>Single-wire Bit Error Detection Interrupt Flag</b> This bit is set when the single wire bus state not equals to UART controller TX state in Single-wire mode. 0 = No single-wire bit error detection interrupt flag is generated. 1 = Single-wire bit error detection interrupt flag is generated. <b>Note 1:</b> This bit is active when FUNCSEL (UART_FUNCSEL[2:0]) is select UART Single-wire mode. <b>Note 2:</b> This bit can be cleared by writing "1" to it.
[15]	LININT	<b>LIN Bus Interrupt Indicator (Read Only)</b> This bit is set if LINIEN (UART_INTEN[8]) and LINIF(UART_INTSTS[7]) are both set to 1. 0 = No LIN Bus interrupt is generated. 1 = The LIN Bus interrupt is generated.
[14]	WKINT	<b>UART Wake-up Interrupt Indicator (Read Only)</b> This bit is set if WKIEN (UART_INTEN[6]) and WKIF (UART_INTSTS[6]) are both set to 1. 0 = No UART wake-up interrupt is generated. 1 = UART wake-up interrupt is generated.
[13]	BUFERRINT	<b>Buffer Error Interrupt Indicator (Read Only)</b> This bit is set if BUFERRIEN(UART_INTEN[5]) and BUFERRIF(UART_INTSTS[5]) are both set to 1. 0 = No buffer error interrupt is generated. 1 = Buffer error interrupt is generated.
[12]	RXTPOINT	<b>RX Time-out Interrupt Indicator (Read Only)</b> This bit is set if RXTOIEN (UART_INTEN[4]) and RXTOIF(UART_INTSTS[4]) are both set to 1. 0 = No RX time-out interrupt is generated. 1 = RX time-out interrupt is generated.
[11]	MODEMINT	<b>MODEM Status Interrupt Indicator (Read Only)</b> This bit is set if MODEMIEN(UART_INTEN[3]) and MODEMIF(UART_INTSTS[3]) are both set to 1. 0 = No Modem interrupt is generated. 1 = Modem interrupt is generated..
[10]	RLSINT	<b>Receive Line Status Interrupt Indicator (Read Only)</b> This bit is set if RLSIEN (UART_INTEN[2]) and RLSIF(UART_INTSTS[2]) are both set to 1. 0 = No RLS interrupt is generated. 1 = RLS interrupt is generated.
[9]	THREINT	<b>Transmit Holding Register Empty Interrupt Indicator (Read Only)</b> This bit is set if THREIEN (UART_INTEN[1]) and THREIF(UART_INTSTS[1]) are both set to 1. 0 = No THRE interrupt is generated. 1 = THRE interrupt is generated.
[8]	RDAINT	<b>Receive Data Available Interrupt Indicator (Read Only)</b> This bit is set if RDAIEN (UART_INTEN[0]) and RDAIF (UART_INTSTS[0]) are both set to 1. 0 = No RDA interrupt is generated. 1 = RDA interrupt is generated.
[7]	LINIF	<b>LIN Bus Interrupt Flag</b> This bit is set when LIN slave header detect (SLVHDET(UART_LINSTS[0] = 1)), LIN break detect (BRKDET(UART_LINSTS[8] = 1)), bit error detect (BITEF(UART_LINSTS[9] = 1)), LIN slave ID parity error (SLVIDPEF(UART_LINSTS[2] = 1)) or LIN slave header error detect (SLVHEF (UART_LINSTS[1])). If LINIEN (UART_INTEN [8]) is enabled the LIN interrupt will be generated. 0 = None of SLVHDET, BRKDET, BITEF, SLVIDPEF and SLVHEF is generated. 1 = At least one of SLVHDET, BRKDET, BITEF, SLVIDPEF and SLVHEF is generated. <b>Note:</b> This bit is cleared when SLVHDET(UART_LINSTS[0]), BRKDET(UART_LINSTS[8]), BITEF(UART_LINSTS[9]), SLVIDPEF (UART_LINSTS[2]) and SLVHEF(UART_LINSTS[1]) all are cleared

		and software writing '1' to LINIF(UART_INTSTS[7]).
[6]	WKIF	<p><b>UART Wake-up Interrupt Flag (Read Only)</b></p> <p>This bit is set when TOUTWKF (UART_WKSTS[4]), RS485WKF (UART_WKSTS[3]), RFRTWKF (UART_WKSTS[2]), DATWKF (UART_WKSTS[1]) or CTSWKF(UART_WKSTS[0]) is set to 1.</p> <p>0 = No UART wake-up interrupt flag is generated.</p> <p>1 = UART wake-up interrupt flag is generated.</p> <p><b>Note:</b> This bit is cleared if all of TOUTWKF, RS485WKF, RFRTWKF, DATWKF and CTSWKF are cleared to 0 by writing 1 to the corresponding interrupt flag.</p>
[5]	BUFERRIF	<p><b>Buffer Error Interrupt Flag (Read Only)</b></p> <p>This bit is set when the TX FIFO or RX FIFO overflows (TXOVIF (UART_FIFOSTS[24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUFERRIF (UART_INTSTS[5]) is set, the transfer is not correct. If BUFERRIFEN (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated.</p> <p>0 = No buffer error interrupt flag is generated.</p> <p>1 = Buffer error interrupt flag is generated.</p> <p><b>Note:</b> This bit is cleared if both of RXOVIF(UART_FIFOSTS[0]) and TXOVIF(UART_FIFOSTS[24]) are cleared to 0 by writing 1 to RXOVIF(UART_FIFOSTS[0]) and TXOVIF(UART_FIFOSTS[24]).</p>
[4]	RXTOIF	<p><b>RX Time-out Interrupt Flag (Read Only)</b></p> <p>This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated.</p> <p>0 = No RX time-out interrupt flag is generated.</p> <p>1 = RX time-out interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and user can read UART_DAT (RX is in active) to clear it.</p>
[3]	MODEMIF	<p><b>MODEM Interrupt Flag (Read Only)</b></p> <p>This bit is set when the nCTS pin has state change (CTSDETF (UART_MODEMSTS[0]) = 1). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated.</p> <p>0 = No Modem interrupt flag is generated.</p> <p>1 = Modem interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and reset to 0 when bit CTSDETF is cleared by a write 1 on CTSDETF(UART_MODEMSTS[0]).</p>
[2]	RLSIF	<p><b>Receive Line Interrupt Flag (Read Only)</b></p> <p>This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]), is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated.</p> <p>0 = No RLS interrupt flag is generated.</p> <p>1 = RLS interrupt flag is generated.</p> <p><b>Note 1:</b> In RS-485 function mode, this field is set include "receiver detect and received address byte character (bit9 = '1') bit". At the same time, the bit of ADDRDETF (UART_FIFOSTS[3]) is also set.</p> <p><b>Note 2:</b> This bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are cleared.</p> <p><b>Note 3:</b> In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDETF (UART_FIFOSTS[3]) are cleared.</p>
[1]	THREIF	<p><b>Transmit Holding Register Empty Interrupt Flag</b></p> <p>This bit is set when the last data of TX FIFO is transferred to Transmitter Shift Register. If THREIEN (UART_INTEN[1]) is enabled, the THRE interrupt will be generated.</p> <p>0 = No THRE interrupt flag is generated.</p> <p>1 = THRE interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and it will be cleared when writing data into UART_DAT (TX FIFO not empty).</p>
[0]	RDAIF	<p><b>Receive Data Available Interrupt Flag</b></p> <p>When the number of bytes in the RX FIFO equals the RFITL then the RDAIF(UART_INTSTS[0]) will be set.</p>

		<p>If RDAIEN (UART_INTEN [0]) is enabled, the RDA interrupt will be generated.</p> <p>0 = No RDA interrupt flag is generated.</p> <p>1 = RDA interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and it will be cleared when the number of unread bytes of RX FIFO drops below the threshold level (RFITL(UART_FIFO[7:4])).</p>

7	6	5	4	3	2	1	0
TOIC							

Bits	Description
[31:16]	<b>Reserved</b> Reserved.
[15:8]	<b>DLY</b> <b>TX Delay Time Value</b> This field is used to program the transfer delay time between the last STOP bit and next START bit. The unit is bit time.
[7:0]	<b>TOIC</b> <b>Time-out Interrupt Comparator</b> The time-out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word if time out counter is enabled by setting TOCNTEN (UART_INTEN[11]). Once the content of time-out counter is equal to that of time-out interrupt comparator (TOIC (UART_TOUT[7:0])), a receiver time-out interrupt (RXTOINT(UART_INTSTS[12])) is generated if RXTOIEN (UART_INTEN [4]) enabled. A new incoming data word or RX FIFO empty will clear RXTOIF (UART_INTSTS[4]). In order to avoid receiver time-out interrupt generation immediately during one character is being received, TOIC value should be set between 40 and 255. So, for example, if TOIC is set with 40, the time-out interrupt is generated after four characters are not received when 1 STOP bit and no parity check is set for UART transfer.

UART                      Baud                      Rate                      Divider                      Register  
(UART BAUD)

7	6	5	4	3	2	1	0
Reserved			MUTE	SLVDUEN	SLVAREN	SLVHDEN	SLVEN

Bits	Description
[31:24] <b>PID</b>	<b>LIN PID Bits</b> This field contains the LIN frame ID value in LIN function mode, and the frame ID parity can be generated by software or hardware depends on IDPEN (UART_LINCTL[9]) = 1. If the parity generated by hardware, user fill ID0~ID5 (PID [29:24]), hardware will calculate P0 (PID[30]) and P1 (PID[31]), otherwise user must filled frame ID and parity in this field. <b>Note 1:</b> User can fill any 8-bit value to this field and the bit 24 indicates ID0 (LSB first). <b>Note 2:</b> This field can be used for LIN master mode or slave mode.
[23:22] <b>HSEL</b>	<b>LIN Header Select</b> 00 = The LIN header includes "break field". 01 = The LIN header includes "break field" and "sync field". 10 = The LIN header includes "break field", "sync field" and "frame ID field". 11 = Reserved. <b>Note:</b> This bit is used to master mode for LIN to send header field (SENDH (UART_LINCTL [8]) = 1) or used to slave to indicates exit from mute mode condition (MUTE (UART_LINCTL[4] = 1).
[21:20] <b>BSL</b>	<b>LIN Break/Sync Delimiter Length</b> 00 = The LIN break/sync delimiter length is 1-bit time. 01 = The LIN break/sync delimiter length is 2-bit time. 10 = The LIN break/sync delimiter length is 3-bit time. 11 = The LIN break/sync delimiter length is 4-bit time. <b>Note:</b> This bit used for LIN master to sending header field.
[19:16] <b>BRKFL</b>	<b>LIN Break Field Length</b> This field indicates a 4-bit LIN TX break field count. <b>Note 1:</b> These registers are shadow registers of BRKFL (UART_ALTCTL[3:0]), User can read/write it by setting BRKFL (UART_ALTCTL[3:0]) or BRKFL (UART_LINCTL[19:16]). <b>Note 2:</b> This break field length is BRKFL + 1. <b>Note 3:</b> According to LIN spec, the reset value is 12 (break field length = 13).

[15:13]	Reserved	Reserved.
[12]	BITERREN	<b>Bit Error Detect Enable Bit</b> 0 = Bit error detection function Disabled. 1 = Bit error detection function Enabled. <b>Note:</b> In LIN function mode, when occur bit error, the BITEF (UART_LINSTS[9]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.
[11]	LINRXOFF	<b>LIN Receiver Disable Bit</b> If the receiver is enabled (LINRXOFF (UART_LINCTL[11]) = 0), all received byte data will be accepted and stored in the RX FIFO, and if the receiver is disabled (LINRXOFF (UART_LINCTL[11]) = 1), all received byte data will be ignore. 0 = LIN receiver Enabled. 1 = LIN receiver Disabled. <b>Note:</b> This bit is only valid when operating in LIN function mode (FUNCSEL (UART_FUNCSEL[2:0]) = '001').
[10]	BRKDETEN	<b>LIN Break Detection Enable Bit</b> When detect consecutive dominant greater than 11 bits, and are followed by a delimiter character, the BRKDETF (UART_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART_INTEN [8])=1, an interrupt will be generated. 0 = LIN break detection Disabled. 1 = LIN break detection Enabled.
[9]	IDPEN	<b>LIN ID Parity Enable Bit</b> 0 = LIN frame ID parity Disabled. 1 = LIN frame ID parity Enabled. <b>Note 1:</b> This bit can be used for LIN master to sending header field (SENDH (UART_LINCTL[8])) = 1 and HSEL (UART_LINCTL[23:22]) = 10 or be used for enable LIN slave received frame ID parity checked. <b>Note 2:</b> This bit is only used when the operation header transmitter is in HSEL (UART_LINCTL[23:22]) = 10.
[8]	SENDH	<b>LIN TX Send Header Enable Bit</b> The LIN TX header can be "break field" or "break and sync field" or "break, sync and frame ID field", it is depend on setting HSEL (UART_LINCTL[23:22]). 0 = Send LIN TX header Disabled. 1 = Send LIN TX header Enabled. <b>Note 1:</b> This bit is shadow bit of LINTXEN (UART_ALTCTL [7]); user can read/write it by setting LINTXEN (UART_ALTCTL [7]) or SENDH (UART_LINCTL [8]). <b>Note 2:</b> When transmitter header field (it may be "break" or "break + sync" or "break + sync + frame ID" selected by HSEL (UART_LINCTL[23:22]) field) transfer operation finished, this bit will be cleared automatically.
[7:5]	Reserved	Reserved.
[4]	MUTE	<b>LIN Mute Mode Enable Bit</b> 0 = LIN mute mode Disabled. 1 = LIN mute mode Enabled. <b>Note:</b> The exit from mute mode condition and each control and interactions of this field are explained in 6.13.5.10 (LIN slave mode).
[3]	SLVDUEN	<b>LIN Slave Divider Update Method Enable Bit</b> 0 = UART_BAUD updated is written by software (if no automatic resynchronization update occurs at the same time). 1 = UART_BAUD is updated at the next received character. User must set the bit before checksum reception. <b>Note 1:</b> This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). <b>Note 2:</b> This bit used for LIN Slave Automatic Resynchronization mode. (for Non-Automatic

		Resynchronization mode, this bit should be kept cleared) <b>Note 3:</b> The control and interactions of this field are explained in 6.13.5.10 (Slave mode with automatic resynchronization).
[2]	<b>SLVAREN</b>	<b>LIN Slave Automatic Resynchronization Mode Enable Bit</b> 0 = LIN automatic resynchronization Disabled. 1 = LIN automatic resynchronization Enabled. <b>Note 1:</b> This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). <b>Note 2:</b> When operation in Automatic Resynchronization mode, the baud rate setting must be mode2 (BAUDM1 (UART_BAUD [29]) and BAUDM0 (UART_BAUD [28]) must be 1). <b>Note 3:</b> The control and interactions of this field are explained in 6.13.5.10 (Slave mode with automatic resynchronization).
[1]	<b>SLVHDEN</b>	<b>LIN Slave Header Detection Enable Bit</b> 0 = LIN slave header detection Disabled. 1 = LIN slave header detection Enabled. <b>Note 1:</b> This bit is only valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). <b>Note 2:</b> In LIN function mode, when detect header field (break + sync + frame ID), SLVHDET (UART_LINSTS [0]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.
[0]	<b>SLVEN</b>	<b>LIN Slave Mode Enable Bit</b> 0 = LIN slave mode Disabled. 1 = LIN slave mode Enabled.

## 6.14 Smart Card Host Interface (SC)

### 6.14.1 Overview

The Smart Card Interface controller (SC controller) is based on ISO/IEC 7816-3 standard and fully compliant with PC/SC Specifications. It also provides status of card insertion/removal.

### 6.14.2 Features

- ISO 7816-3 T = 0, T = 1 compliant
- EMV2000 compliant
- One ISO 7816-3 port
- Separates receive/transmit 4 byte entry FIFO for data payloads
- Programmable transmission clock frequency
- Programmable receiver buffer trigger level
- Programmable guard time selection (11 ETU ~ 267 ETU)
- One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
- Supports auto direct / inverse convention function
- Supports transmitter and receiver error retry and error number limiting function
- Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
- Supports hardware warm reset sequence process
- Supports hardware deactivation sequence process
- Supports hardware auto deactivation sequence when detected the card removal
- Supports UART mode
  - Full duplex, asynchronous communications
  - Separates receiving / transmitting 4 bytes entry FIFO for data payloads
  - Supports programmable baud rate generator
  - Supports programmable receiver buffer trigger level
  - Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion by setting EGT (SCn\_EGT[7:0])
  - Programmable even, odd or no parity bit generation and detection
  - Programmable stop bit, 1- or 2- stop bit generation

### 6.14.3 Block Diagram

The SC clock control and block diagram are shown in SC Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller) and SC Controller Block Diagram. The SC controller is completely asynchronous design with two clock domains, PCLK and engine clock. Note that the PCLK should be higher than or equal to the frequency of SC engine clock.

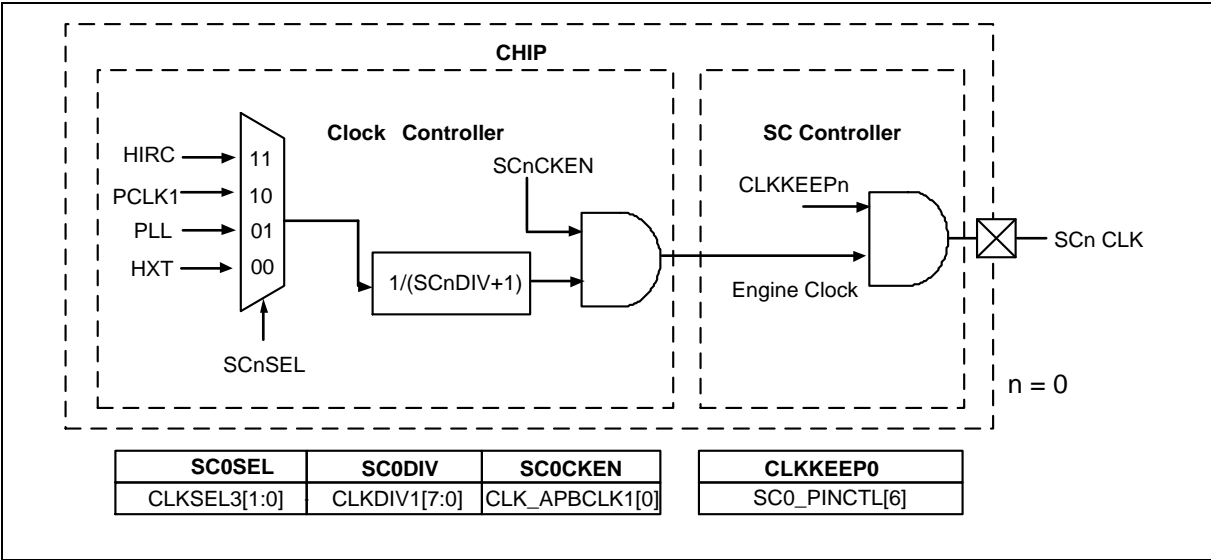

Figure 6.14-1 SC Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller)

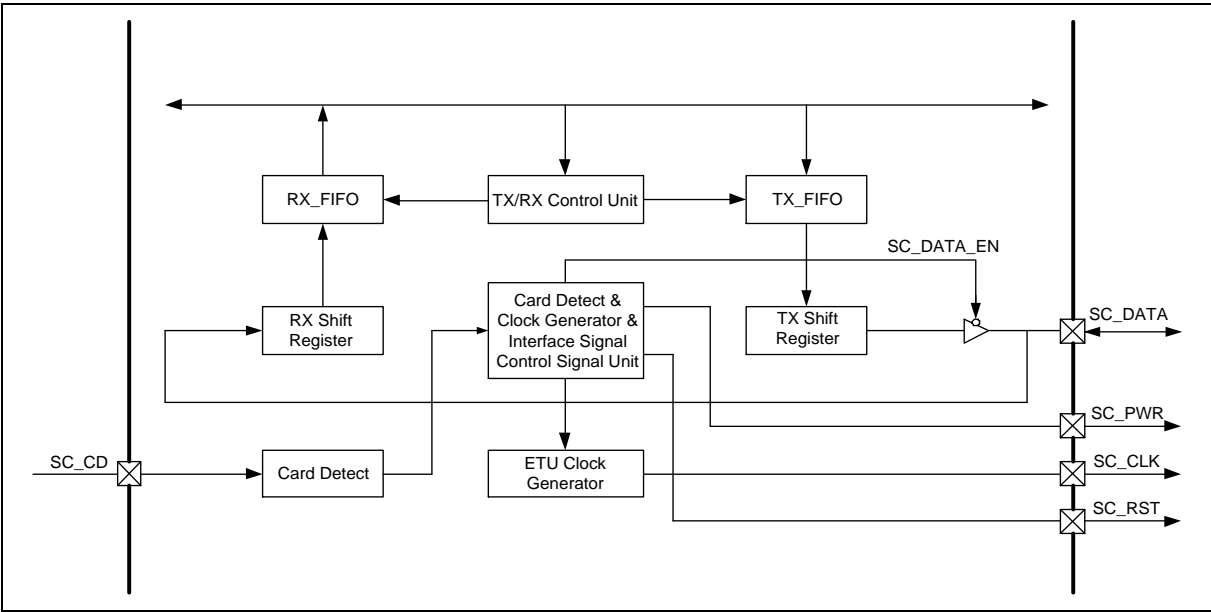

Figure 6.14-2 SC Controller Block Diagram

#### 6.14.4 Basic Configuration

SC Host Controller Pin description is shown in:

Pin	Type	Description
SCn_DATA	Bi-direction	SC Host Controller DATA
SCn_CD	Input	SC Host Controller Card Detect
SCn_PWR	Output	SC Host Controller Power ON/OFF
SCn_CLK	Output	SC Host Controller Clock
SCn_RST	Output	SC Host Controller Reset

Table 6.14-1 SC Host Controller Pin Description

UART Mode Pin description is shown in UART Pin Description:

Pin	Type	Description
SCn_DATA	Input	UART Receive Data
SCn_CLK	Output	UART Transmit Data

Table 6.14-2 UART Pin Description

##### 6.14.4.1 SC0 Basic Configuration

- Clock Source Configuration
  - Select the source of SC0 peripheral clock on SC0SEL (CLK\_CLKSEL3[1:0]).
  - Select the clock divider number of SC0 peripheral clock on SC0DIV(CLK\_CLKDIV1[7:0]).
  - Enable SC0 peripheral clock in SC0CKEN (CLK\_APBCLK1[0]).
- Reset Configuration
  - Reset SC0 controller in SC0RST (SYS\_IPRST2[0]).

#### 6.14.5 Functional Description

Basically, the smart card interface acts as a half-duplex asynchronous communication port and its data format is composed of ten consecutive bits which is shown in SC Data Character.

Figure 6.14-3 SC Data Character

The Smart Card Interface controller supports hardware activation, warm reset and deactivation sequence. The activation, warm reset and deactivation sequence are shown as follows.

##### 6.14.5.1 Smart Card Pin Configuration

The Smart Card Interface pin status can be observed by polling following registers.

1. SCn\_RST is a output pin. Its status can be observed by RSTSTS (SCn\_PINCTL[18]). Programming RSTEN (SCn\_PINCTL[1]) '0' or '1' can drive this output pin low or high.
2. SCn\_PWR is a output pin. Its status can be observed by PWRSTS (SCn\_PINCTL[17]).

Programming PWREN (SCn\_PINCTL[0]) to '0' or '1' can drive this output pin low or high. PWRINV (SCn\_PINCTL[11]) can inverse the SCn\_PWR output. User must select PWRINV (SCn\_PINCTL[11]) before smart card is enabled by SCEN (SCn\_CTL[0]).

3. SCn\_DATA is a bidirectional pin, DATASTS(SCn\_PINCTL[16]) shows the pin status when SC is receiving data. Programming SCDATA (SCn\_PINCTL[9]) to '0' or '1' can drive this pin output low or high.
4. SCn\_CLK is a output pin. It outputs Smart card clock SCn CLK. Programming CLKKEEP (SCn\_PINCTL[6]) '0' or '1' to disable or enable this pin. Programming CSTOPLV (SCn\_PINCTL[5]) can determine the SCn\_CLK is stopped at high or low when this pin is disable.
5. SCn\_CD(Card Detect Pin) state represent the status of the card is inserted or not. SCn\_CD pin status can be observed by CDPINSTS(SCn\_STATUS[13]). SCn\_CD related function can be set by CDLV(SCn\_CTL[26]), CDDBSSEL(SCn\_CTL[25:24]), CDIF(SCn\_INTSTS[7]), CDIEN(SCn\_INTEN[7]).
6. CDLV(SCn\_CTL[26]) determines what kind of pin level change represents the card insertion. CDDBSSEL(SCn\_CTL[25:24]) determines the de-bounce cycles. When the card status CINSERT (SCn\_STATUS[12]) or CREMOVE (SCn\_STATUS[11]) is detected, CDIF will set to 1. If CDIEN is enable, SC will deliver a interrupt to CPU when CDIF is set to 1. Card Detect Pin is recommend setting before enable SC.

#### 6.14.5.2 Activation, Warm Reset and Deactivation Sequence

##### **Activation**

The activation sequence is shown in Figure 6.14-4:

1. Set SCn\_RST to low by programming RSTEN (SCn\_PINCTL[1]) to '0', and wait SYNC (SCn\_PINCTL[31]) is cleared to 0.
2. Set SCn\_PWR at high level by programming PWREN (SCn\_PINCTL[0]) to '1' and SCn\_DATA at high level (reception mode) by programming SCDATA (SCn\_PINCTL[9]) to '1', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
3. Enable SCn\_CLK clock by programming CLKKEEP (SCn\_PINCTL[6]) to '1', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
4. De-assert SCn\_RST to high by programming RSTEN (SCn\_PINCTL[1]) to '1', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.

The activation sequence can be controlled in two ways. The procedure is shown as follows:

- **Software Timing Control:**

Set SCn\_PINCTL and SCn\_TMRCTLx (x = 0, 1, 2) to process the activation sequence. SCn\_PWR, SCn\_CLK, SCn\_RST and SCn\_DATA pin state can be programmed by SCn\_PINCTL. The programming method is shown in activation sequence. The activation sequence timing can be controlled by setting SCn\_TMRCTLx (x = 0, 1, 2). This programming procedure provides user with a flexible timing setting for activation sequence.

- **Hardware Timing Control:**

Set ACTEN (SCn\_ALTCTL[3]) to '1' and the interface will perform the activation sequence by hardware. The SCn\_PWR to SCn\_CLK start (T1) and SCn\_CLK\_start to SCn\_RST assert (T2) can be selected by programming INITSEL (SCn\_ALTCTL[9:8]). The SCn\_PWR to SCn\_CLK length can be configure by setting T1EXT(SCn\_ACTCTL[4:0]). This programming procedure provides user with a simple setting for activation sequence. During the hardware activation, RX receive is disabled and can not receive data.

##### **The following is activation control sequence in hardware activation mode:**

1. Set activation timing by setting INITSEL (SCn\_ALTCTL[9:8]).

2. Timer0 can be selected by setting TMRSEL (SCn\_CTL[14:13]) is 11.
3. Set operation mode OPMODE (SCn\_TMRCTL0[27:24]) to 0011 and give an Answer to Request (ATR) value by setting CNT (SCn\_TMRCTL0[23:0]) register.
4. When hardware de-asserts SCn\_RST to high, hardware will generator an interrupt INITIF (SCn\_INTSTS[8]) to CPU at the same time if INITIEN (SCn\_INTEN[8]) is 1.
5. If the Timer0 decreases the counter to "0" (started from SCn\_RST de-assert) and the card does not response ATR before that time, hardware will generate an interrupt flag TMR0IF (SCn\_INTSTS[3]).

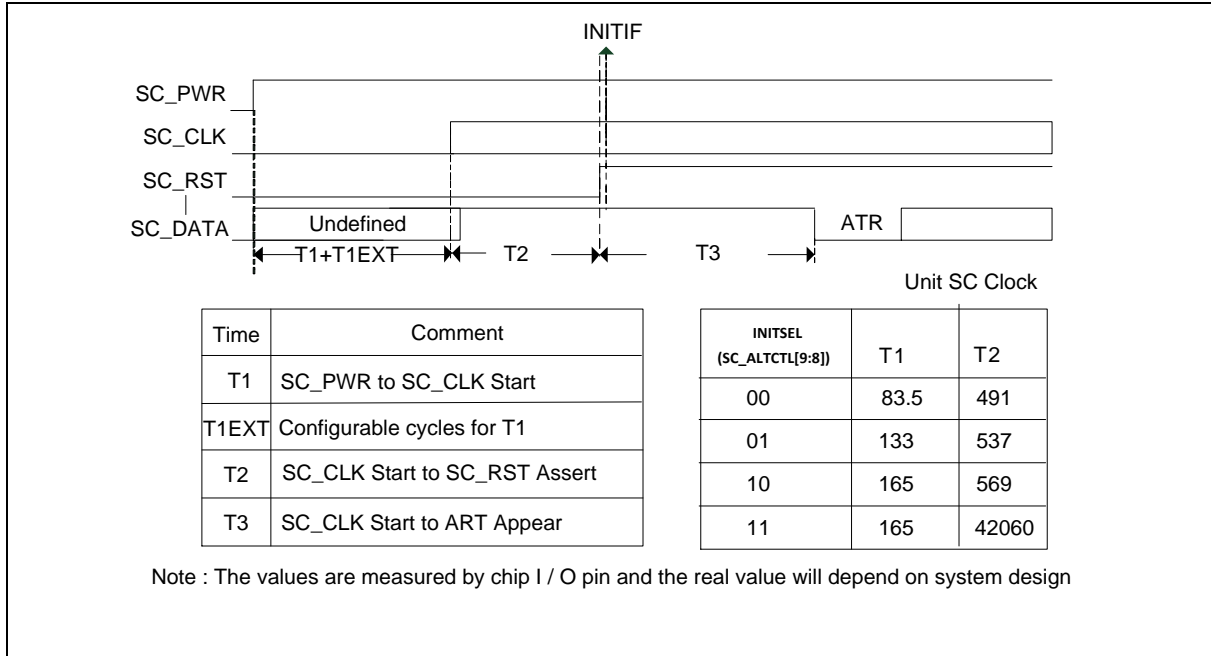

Figure 6.14-4 SC Activation Sequence

### Warm Reset

The warm reset sequence is shown in Figure 6.14-5 :

1. Set SCn\_RST to low by programming RSTEN (SCn\_PINCTL[1]) to '0', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
2. Set SCn\_DATA to high by programming SCDATA (SCn\_PINCTL[9]) to '1', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
3. Set SCn\_RST to high by programming RSTEN (SCn\_PINCTL[1]) to '1', and wait SYNC(SCn\_PINCTL[31]) is cleared to 0.

The warm reset sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn\_PINCTL and SCn\_TMRCTLx (x = 0, 1, 2) to process the warm reset sequence. The SCn\_RST and SCn\_DATA pin state can be programmed by SCn\_PINCTL. The warm reset sequence timing can be controlled by setting SCn\_TMRCTLx (x = 0, 1, 2). This programming procedure provides user with a flexible timing setting for warm reset sequence.

- Hardware Timing Control:

Set WARSTEN (SCn\_ALTCTL[4]) to '1' and the interface will perform the warm reset sequence by hardware. The SCn\_RST to SCn\_DATA reception mode (T4) and SCn\_DATA

reception mode to SCn\_RST assert (T5) can be selected by programming INITSEL (SCn\_ALTCTL[9:8]). This programming procedure provides user with a simple setting for warm reset sequence. During the hardware warm reset, RX receive is disabled and can not receive data.

The following is the warm reset control sequence by hardware:

1. Set warm reset timing by setting INITSEL (SCn\_ALTCTL[9:8]).
2. Select Timer0 by setting TMRSEL (SCn\_CTL[14:13]) to 11.
3. Set operation mode OPMODE (SCn\_TMRCTL0[27:24]) to 0011 and give an Answer to Request (ATR) value by setting CNT (SCn\_TMRCTL0[23:0]) register.
4. Set CNTEN0 (SCn\_ALTCTL[5]) and WARSTEN (SCn\_ALTCTL[4]) to start counting.
5. When hardware de-asserts SCn\_RST to high, hardware will generate an interrupt INITIF (SCn\_INTSTS[8]) to CPU at the same time if INITIEN (SCn\_INTEN[8]) is 1.
6. If the Timer0 decreases the counter to '0' (start from SCn\_RST) and the card does not response ATR before that time, hardware will generate an interrupt flag TMROIF (SCn\_INTSTS[3]).

Figure 6.14-5 SC Warm Reset Sequence

### Deactivation

The deactivation sequence is shown in Figure 6.14-6.

1. Set SCn\_RST to low by programming RSTEN (SCn\_PINCTL[1]) to '0', wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
2. Stop SCn\_CLK by programming CLKKEEP (SCn\_PINCTL[6]) to '0', wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
3. Set SCn\_DATA to low by programming SCDATA (SCn\_PINCTL[9]) to '0', wait SYNC(SCn\_PINCTL[31]) is cleared to 0.
4. Deactivate SCn\_PWR by programming PWREN (SCn\_PINCTL[0]) to '0', wait SYNC(SCn\_PINCTL[31]) is cleared to 0.

The deactivation sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn\_PINCTL and SCn\_TMRCTL0 to process the deactivation sequence. SCn\_PWR, SCn\_CLK, SCn\_RST and SCn\_DATA pin state can be programmed by SCn\_PINCTL. The deactivation sequence timing can be controlled by setting SCn\_TMRCTL0. This programming procedure provides user with a flexible timing setting for deactivation sequence.

- Hardware Timing Control:  
DACTEN (SCn\_ALTCTL[2]) to '1' and the interface will perform the deactivation sequence by hardware. The Deactivation Trigger to SCn\_RST low (T7), SMC\_RST low to SCn\_CLK (T8) and stop SCn\_CLK to stop SCn\_PWR (T9) time can be selected by programming INITSEL (SCn\_ALTCTL[9:8]). This programming procedure provides user with a simple setting for deactivation sequence.

When hardware de-asserts SCn\_PWR to low, the SC controller will generate an interrupt INITIF (SCn\_INTSTS[8]) to CPU at the same time if INITIEN (SCn\_INTEN[8]) is 1.

The SC controller also supports auto deactivation sequence when the card removal detection is enabled by setting ADACEN (SCn\_ALTCTL[11]).

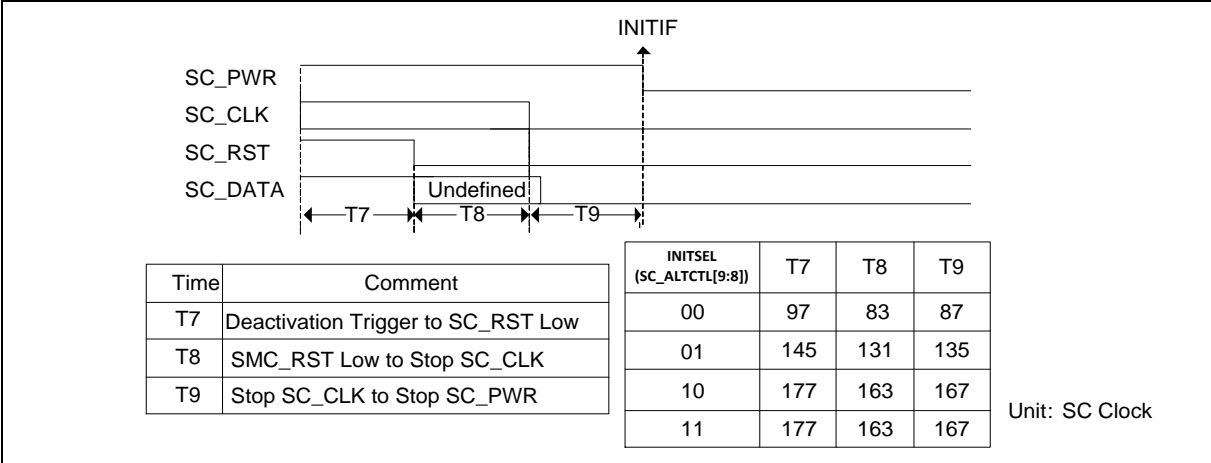

Figure 6.14-6 SC Deactivation Sequence

6.14.5.3 Basic Operation Flow

Basic operation flow of smartcard can be referenced from ISO 7816-3 & EMV.

The Program Sequence Flow is shown as follows:

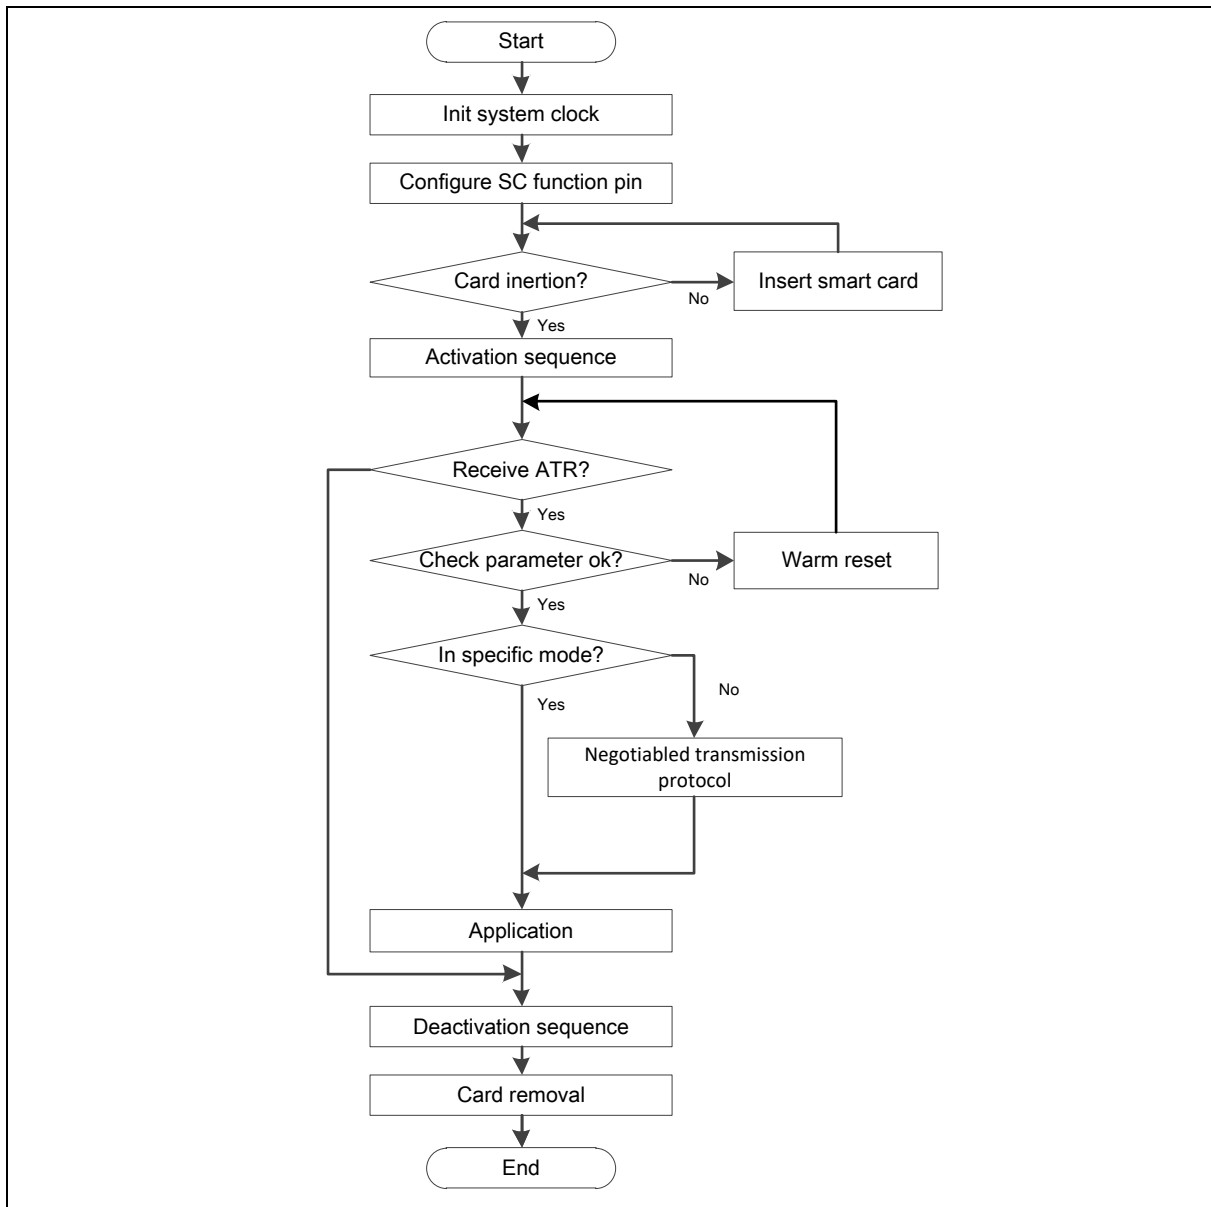

Figure 6.14-7 Basic Operation Flow

#### 6.14.5.4 Initial Character TS

According to ISO 7816-3, the initial character TS has two possible patterns shown in Figure 6.14-8. If the TS pattern is 1100\_0000, it is inverse convention. When decoded by inverse convention, the conveyed byte is equal to 0x3F. If the TS pattern is 1101\_1100, it is direct convention. When decoded by direct convention, the conveyed byte is equal to 0x3B. User can set AUTOCEN (SCn\_CTL[3]) and then the operating convention will be decided by hardware. User can also set the CONSEL (SCn\_CTL[5:4]) register (set to '00' or '11') to change the operating convention after SC received TS of answer to request (ATR).

If auto convention function is enabled by setting AUTOCEN (SCn\_CTL[3]) register, the setting step must be done before Answer to Request (ATR) state and the received first data must be 0x3B or 0x3F. After hardware received first data and stored it at SCn\_DAT, the hardware will decide the convention and change the CONSEL (SCn\_CTL[5:4]) register automatically. If the received first data is neither 0x3B nor 0x3F, ACERRIF (SCn\_INTSTS[10] Auto Convention Error Interrupt Status Flag) will be set and the hardware will generate an interrupt to CPU if ACERRIEN (SCn\_INTEN[10]) is 1.

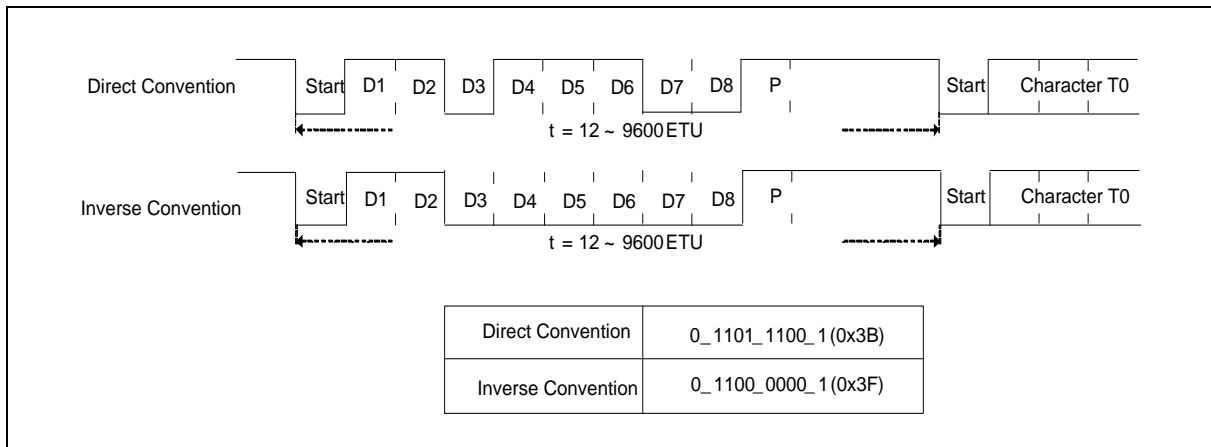

Figure 6.14-8 Initial Character TS

#### 6.14.5.5 Transfer Data Flow and Data Buffer Status

After setting initial sequence, SC can start transferring data which format is corresponding to ISO 7816-3. Set ETURDIV(SCn\_ETUCTL[11:0]) to 273 to make ETU(Element Timing Unit) meet ISO 7816-3. Writing data to SCn\_DAT, SC will send out an 8-bit data to smart card. Reading data from SCn\_DAT, SC will return an 8-bit received data from smart card.

Data buffer status show in SCn\_STATUS. TXPOINT(SCn\_STATUS[26:24]) and RXPOINT(SCn\_STATUS[18:16]) represent how many data in transmit buffer and received buffer. TXEMPTY(SCn\_STATUS[9]), TXFULL(SCn\_STATUS[10]), TXOV(SCn\_STATUS[8]), RXEMPTY(SCn\_STATUS[1]), RXFULL(SCn\_STATUS[2]), RXOV(SCn\_STATUS[0]), represent the transmitted/received buffer status is full, empty, or overflow. SC even can generate interrupt for the transmit buffer empty situation by setting TBEIEN(SCn\_INTEN[1]) bit. After interrupt status flag TBEIF(SCn\_INTSTS[1]) is generated, user can decide to transfer data or not by polling these flag and it only can be cleared automatically when write data to SCn\_DAT again.

TX and RX can be disabled separately by setting TXOFF(SCn\_CTL[2]) and RXOFF(SCn\_CTL[1]). TXACT(SCn\_STATUS[31]) and RXACT(SCn\_STATUS[23]) represent the TX transfer/RX transfer is active or not.

#### 6.14.5.6 Receiver Buffer Time-out

The time-out down counter resets and starts counting whenever the RX buffer received a new data. Once the counter decrease to 1 and no new data is received or CPU does not read data by reading SCn\_DAT, a receiver time-out flag RXTOIF (SCn\_INTSTS[9]) will be set, and hardware will generate an interrupt to CPU when RXTOIEN (SCn\_INTEN[9]) is enabled.

#### 6.14.5.7 Error Signal and Character Repetition

According to ISO 7816-3 T=0 mode description, as shown in Figure 6.14-9, if the receiver receives a wrong parity bit, it will pull the SCn\_DAT to low by 1.5 bit period to inform the transmitter parity error. Then the transmitter will retransmit the character. The SC interface controller supports hardware error detection function in receiver and supports hardware re-transmit function in transmitter.

User can enable re-transmit function by setting TXRTYEN (SCn\_CTL[23]). User can also define the retry (re-transmit) number limitation in TXRTY (SCn\_CTL[22:20]). If the re-transmit number is between 1 and TXRTY, TXRERR (SCn\_STATUS[29]) flag will be set by hardware. The re-transmit number is up to TXRTY +1 and if the re-transmit number is equal to TXRTY +1, TXOVERR (SCn\_STATUS[30]) flag will be set by hardware and if TERRIEN (SCn\_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SCn\_INTSTS[2]) flag will also be set.

User can also enable re-received function by setting RXRTYEN (SCn\_CTL[19]).The received retry number limitation is defined in RXRTY (SCn\_CTL[18:16]). If the re-received number is between 1 and RXRTY, RXRERR (SCn\_STATUS[21]) flag will be set by hardware. The receiver retry number is up to

RXRTY +1, if the number of received errors by receiver is equal to RXRTY +1, receiver will receive this error data to buffer and RXOVERR (SCn\_STATUS[22]) flag will be set by hardware and if TERRIEN (SCn\_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SC\_INTSTS[2]) flag will also be set.

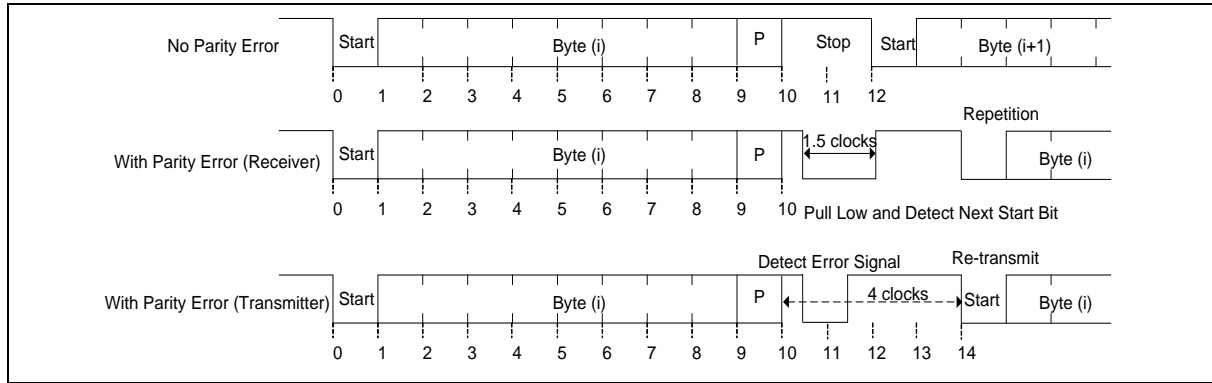

Figure 6.14-9 SC Error Signal

#### 6.14.5.8 Internal Timer Operation Mode

The smart card interface includes a 24-bit time-out counter and two 8 bit time-out counters. These counters help the controller in processing different real-time interval. Each counter can be set to start counting once the trigger enable bit (CNTENx in SCn\_ALTCTL[7:5], x = 0, 1, 2) has been written or a START bit has been detected.

The following is the programming flow:

1. Enable counter by setting TMRSEL (SCn\_CTL[14:13]) to 11.
2. Select operation mode OPMODE (SCn\_TMRCTLx[27:24], x = 0, 1, 2).
3. Give a count value CNT for Timer0, Timer1 and Timer2 by setting CNT0(SCn\_TMRCTL0[23:0]), CNT1(SCn\_TMRCTL1[7:0]) and CNT2(SCn\_TMRCTL2[7:0] register).
4. Set CNTEN0 (SCn\_ALTCTL [5]), CNTEN1 (SCn\_ALTCTL [6]) or CNTEN2 (SCn\_ALTCTL [7]) to enable timer. ACTSTS0(SCn\_ALTCTL[13]), ACTSTS1(SCn\_ALTCTL[14]) and ACTSTS2(SCn\_ALTCTL[15]) represent the status that timer is enable or not.
5. Wait until the counting condition is satisfied, the timer start counting.
6. When internal timer counter satisfied interrupt conditions in different modes and TMR0IEN(SCn\_INTEN[3]), TMR1IEN(SCn\_INTEN[4]), TMR2IEN(SCn\_INTEN[5]) are enable, SC will generate a interrupt to CPU.

The SCn\_TMRCTL0, SCn\_TMRCTL1 and SCn\_TMRCTL2 timer operation mode are listed in Table 6.14-3.

**Note1:** Only Timer0 (SCn\_TMRCTL0 register) supports mode 0011.

**Note2:** START bit can only be detected when Tx or Rx is idle or finish the last transmission.

OPMODE (SCn_TMRCTLx[27:24]), X = 0, 1, 2)	Operation Mode Description	
0000	The down counter is started when CNTENx (SCn_ALTCTL[7:5]) enabled and ended when counter time-out. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when CNTENx (SCn_ALTCTL[7:5]) enabled.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0001	The down counter is started when the first START bit (reception or transmission) detected and ended when counter time-out. It takes 2 ETU to detect first START bit after writing data to Tx or receiving data from Rx. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0010	The down counter is started when the first START bit (reception) detected and ended when counter time-out. It takes 2 ETU to detect first START bit after receiving data from Rx. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when the first START bit (reception) detected bit after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0011	The down counter is only used for hardware activation, warm reset sequence to measure ATR timing. The timing starts when SCn_RST de-assertion and ends when ATR response received or time-out. If the counter decreases to 0 before ATR response received, hardware will set TMR0IF (SCn_INTSTS[3]) and generate an interrupt to CPU if TMR0IEN (SCn_INTEN[3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0]) +1.	
	Start	Start counting when SCn_RST de-assertion after CNTEN0 (SCn_ALTCTL[5]) set to 1. It is only used for hardware activation, warm reset mode.
	End	When the down counter equals 0 before ATR response received, hardware will set TMR0IF and clear CNTEN0 (SCn_ALTCTL[5]) automatically. When ATR received and down counter does not equal to 0, hardware will clear CNTEN0 (SCn_ALTCTL[5]) automatically.
0100	Start	Start down counter counting when CNTENx (SCn_ALTCTL[7:5]) enabled.
	Recount & reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0. Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value and start to recount.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when use clears CNTENx (SCn_ALTCTL[7:5]) bit.

0101	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0.  Only when the down counter equals 0, counter will reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.
	Recount	After down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
0110	Start	The down counter is started when the first START bit (reception) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter counts to 0.  Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.
	Recount	After the down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0])+1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
0111	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
1111	Start	The down counter starts counting when user sets CNTENx (SCn_ALTCTL[7:5]) bit and it will count to time-out.
	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will generate time-out interrupt flag TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]). The time-out value will be CNTx (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0],

		SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.

Table 6.14-3 Timer0/Timer1/Timer2 Operation Mode

6.14.5.9 Block Guard Time and Extra Guard Time

Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it.

In transmit direction, the smart card sends data to smart card host controller, first. After the period is greater than BGT (SCn\_CTL[12:8]), the smart card host controller begin to send the data.

Figure 6.14-10 Transmit Direction Block Guard Time Operation

In receive direction, the smart card host controller sends data to smart card, first. If the smart card responses data to smart card host controller at the time which is less than BGT (SCn\_CTL[12:8]), the block guard time interrupt BGTIF (SC\_INTSTS[6]) is generated when RXBGTEN (SCn\_ALTCTL[12]) and BGTIEN(SCn\_INTEN[6]) is enabled.

Figure 6.14-11 Receive Direction Block Guard Time Operation

Extra Guard Time is EGT (SCn\_EGT[7:0]), it only affects the data transmitted by smart card interface, the format is shown as Figure 6.14-12Figure 6.14-11.

Figure 6.14-12 Extra Guard Time Operation

6.14.5.10 UART Mode

When the UARTEN (SCn\_UARTCTL[0]) bit is set, the Smart Card Interface controller can also be used as basic UART function. The following is the program example for UART mode.

**Programming example:**

1. Set UARTEN (SCn\_UARTCTL[0]) bit to enter UART mode.

2. Do user reset by setting RXRST (SCn\_ALTCTL[1]) and TXRST(SCn\_ALTCTL[0]) bit to ensure that all state machine return idle state.
3. Fill "0" to CONSEL (SCn\_CTL[5:4]) and AUTOCEN (SCn\_CTL[3]) field. In UART mode, those fields must be "0".
4. Select the UART baud rate by setting ETURDIV (SCn\_ETUCTL[11:0]) fields. For example, if smartcard module clock is 12 MHz and target baud rate is 115200 bps, ETURDIV should fill with  $((12000000 / 115200) - 1)$ .
5. Select the data format include data length (by setting WLS (SCn\_UARTCTL[5:4]), parity format (by setting OPE (SCn\_UARTCTL[7]) and PBOFF (SCn\_UARTCTL[6])) and stop bit length (by setting NSB (SCn\_CTL[15] or EGT (SCn\_EGT[7:0])).
6. Select the receiver buffer number trigger level by setting RXTRGLV (SCn\_CTL[7:6]) field and select the receiver buffer time-out interval by setting RFTM (SCn\_RXTOUT[8:0]) field.
7. Write the SCn\_DAT (SCn\_DAT[7:0]) (TX) register or read the SCn\_DAT (SCn\_DAT[7:0]) (RX) register can perform UART function.

## 6.14.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>SC Base Address:</b> $SCn\_BA = 0x4009\_0000 + (0x1000 * n)$ $n=0$

23	22	21	20	19	18	17	16
TXRTYEN	TXRTY			RXRTYEN	RXRTY		
15	14	13	12	11	10	9	8
NSB	TMRSEL			BGT			
7	6	5	4	3	2	1	0
RXTRGLV		CONSEL		AUTOGEN	TXOFF	RXOFF	SCEN

Bits	Description
[31]	<b>Reserved</b> Reserved.
[30]	<b>SYNC</b> <b>SYNC Flag Indicator (Read Only)</b> Due to synchronization, user should check this bit before writing a new value to RXRTY and TXRTY fields. 0 = Synchronizing is completion, user can write new data to RXRTY and TXRTY. 1 = Last value is synchronizing.
[29:27]	<b>Reserved</b> Reserved.
[26]	<b>CDLV</b> <b>Card Detect Level Selection</b> 0 = When hardware detects the card detect pin (SCn_CD) from high to low, it indicates a card is detected. 1 = When hardware detects the card detect pin (SCn_CD) from low to high, it indicates a card is detected. <b>Note:</b> User must select card detect level before Smart Card controller enabled.
[25:24]	<b>CDDBSSEL</b> <b>Card Detect De-bounce Selection</b> This field indicates the card detect de-bounce selection. 00 = De-bounce sample card insert once per 384 (128 * 3) SC module clocks and de-bounce sample card removal once per 128 SC module clocks. Other configurations are reserved.
[23]	<b>TXRTYEN</b> <b>TX Error Retry Enable Bit</b> This bit enables transmitter retry function when parity error has occurred. 0 = TX error retry function Disabled. 1 = TX error retry function Enabled.
[22:20]	<b>TXRTY</b> <b>TX Error Retry Count Number</b> This field indicates the maximum number of transmitter retries that are allowed when parity error has occurred. <b>Note 1:</b> The real retry number is TXRTY + 1, so 8 is the maximum retry number. <b>Note 2:</b> This field cannot be changed when TXRTYEN enabled. The change flow is to disable TXRTYEN first and then fill in new retry value.

[19]	<b>RXRTYEN</b>	<b>RX Error Retry Enable Bit</b> This bit enables receiver retry function when parity error has occurred. 0 = RX error retry function Disabled. 1 = RX error retry function Enabled. <b>Note:</b> User must fill in the RXRTY value before enabling this bit.
[18:16]	<b>RXRTY</b>	<b>RX Error Retry Count Number</b> This field indicates the maximum number of receiver retries that are allowed when parity error has occurred <b>Note 1:</b> The real retry number is RXRTY + 1, so 8 is the maximum retry number. <b>Note 2:</b> This field cannot be changed when RXRTYEN enabled. The change flow is to disable RXRTYEN first and then fill in new retry value.
[15]	<b>NSB</b>	<b>Stop Bit Length</b> This field indicates the length of stop bit. 0 = The stop bit length is 2 ETU. 1 = The stop bit length is 1 ETU. <b>Note 1:</b> The default stop bit length is 2. SC and UART adopts NSB to program the stop bit length. <b>Note 2:</b> In UART mode, RX can receive the data sequence in 1 stop bit or 2 stop bits with NSB is set to 0.
[14:13]	<b>TMRSEL</b>	<b>Timer Channel Selection</b> 00 = All internal timer function Disabled. 11 = Internal 24 bit timer and two 8 bit timers Enabled. User can configure them by setting SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0] and SCn_TMRCTL2[7:0]. Other configurations are reserved
[12:8]	<b>BGT</b>	<b>Block Guard Time (BGT)</b> Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO 7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it. <b>Note:</b> The real block guard time is BGT + 1.
[7:6]	<b>RXTRGLV</b>	<b>Rx Buffer Trigger Level</b> When the number of bytes in the receiving buffer equals the RXTRGLV, the RDAIF will be set. If RDAIEN (SCn_INTEN[0]) is enabled, an interrupt will be generated to CPU. 00 = Rx Buffer Trigger Level with 01 bytes. 01 = Rx Buffer Trigger Level with 02 bytes. 10 = Rx Buffer Trigger Level with 03 bytes. 11 = Reserved.
[5:4]	<b>CONSEL</b>	<b>Convention Selection</b> 00 = Direct convention. 01 = Reserved. 10 = Reserved. 11 = Inverse convention. <b>Note:</b> If AUTOCEN (SCn_CTL[3]) is enabled, this field is ignored.
[3]	<b>AUTOCEN</b>	<b>Auto Convention Enable Bit</b> This bit is used for enable auto convention function. 0 = Auto-convention Disabled. 1 = Auto-convention Enabled. <b>Note 1:</b> If user enables auto convention function, the setting step must be done before Answer to Reset (ATR) state and the first data must be 0x3B or 0x3F. After hardware received first data and stored it at buffer, hardware will decided the convention and change the CONSEL (SCn_CTL[5:4]) bits automatically when received first data is 0x3B or 0x3F. If received first byte is 0x3B, TS is direct convention, CONSEL

		<p>(SCn_CTL[5:4]) will be set to 00 automatically, otherwise the TS is inverse convention, and CONSEL (SCn_CTL[5:4]) will be set to 11.</p> <p><b>Note 2:</b> If the first data is not 0x3B or 0x3F, hardware will set ACERRIF (SCn_INTSTS[10]) and generate an interrupt to CPU when ACERRIEN (SCn_INTEN[10]) is enabled.</p>
[2]	<b>TXOFF</b>	<p><b>TX Transition Disable Control Bit</b></p> <p>This bit is used for disable Tx transition function.</p> <p>0 = The transceiver Enabled.</p> <p>1 = The transceiver Disabled.</p>
[1]	<b>RXOFF</b>	<p><b>RX Transition Disable Control Bit</b></p> <p>This bit is used for disable Rx transition function.</p> <p>0 = The receiver Enabled.</p> <p>1 = The receiver Disabled.</p> <p><b>Note:</b> If AUTOCEN (SCn_CTL[3]) is enabled, this field is ignored.</p>
[0]	<b>SCEN</b>	<p><b>SC Controller Enable Bit</b></p> <p>Set this bit to 1 to enable SC operation. If this bit is cleared,</p> <p>0 = SC will force all transition to IDLE state.</p> <p>1 = SC controller is enabled and all function can work correctly.</p> <p><b>Note:</b> SCEN must be set to 1 before filling in other SC registers, or smart card will not work properly.</p>

SC Alternate Control Register

(SC\_ALTCTL)

Register	Offset	R/W	Description	Reset Value
SC_ALTCTL	SCn_BA+0x08	R/W	SC Alternate Control Register	0x0000_0000

31	30	29	28	27	26	25	24
SYNC	Reserved						
23	22	21	20	19	18	17	16
Reserved

ACTSTS2	ACTSTS1	ACTSTS0	RXBGTEN	ADACEN	Reserved	INITSEL	
7	6	5	4	3	2	1	0
CNTEN2	CNTEN1	CNTEN0	WARSTEN	ACTEN	DACTEN	RXRST	TXRST

Bits	Description
[31]	<b>SYNC</b> <b>SYNC Flag Indicator (Read Only)</b> Due to synchronization, user should check this bit when writing a new value to SCn_ALTCTL register. 0 = Synchronizing is completion, user can write new data to SCn_ALTCTL register. 1 = Last value is synchronizing.
[30:16]	<b>Reserved</b> Reserved.
[15]	<b>ACTSTS2</b> <b>Internal Timer2 Active Status (Read Only)</b> This bit indicates the timer counter status of timer2. 0 = Timer2 is not active. 1 = Timer2 is active. <b>Note:</b> Timer2 is active does not always mean timer2 is counting the CNT (SCn_TMRCTL2[7:0]).
[14]	<b>ACTSTS1</b> <b>Internal Timer1 Active Status (Read Only)</b> This bit indicates the timer counter status of timer1. 0 = Timer1 is not active. 1 = Timer1 is active. <b>Note:</b> Timer1 is active does not always mean timer1 is counting the CNT (SCn_TMRCTL1[7:0]).
[13]	<b>ACTSTS0</b> <b>Internal Timer0 Active Status (Read Only)</b> This bit indicates the timer counter status of timer0. 0 = Timer0 is not active. 1 = Timer0 is active. <b>Note:</b> Timer0 is active does not always mean timer0 is counting the CNT (SCn_TMRCTL0[23:0]).
[12]	<b>RXBGTEN</b> <b>Receiver Block Guard Time Function Enable Bit</b> This bit enables the receiver block guard time function. 0 = Receiver block guard time function Disabled. 1 = Receiver block guard time function Enabled.
[11]	<b>ADACEN</b> <b>Auto Deactivation When Card Removal</b>

		<p>This bit is used for enable hardware auto deactivation when smart card is removed.</p> <p>0 = Auto deactivation Disabled.</p> <p>1 = Auto deactivation Enabled.</p> <p><b>Note:</b> When the card is removed, hardware will stop any process and then do deactivation sequence if this bit is set. If auto deactivation process completes, hardware will set INITIF (SCn_INTSTS[8]) also.</p>
[10]	Reserved	Reserved.
[9:8]	INITSEL	<p><b>Initial Timing Selection</b></p> <p>This fields indicates the initial timing of hardware activation, warm-reset or deactivation.</p> <p>The unit of initial timing is SC module clock.</p> <p><b>Activation:</b> refer to SC Activation Sequence in Figure 6.14-4.</p> <p><b>Warm-reset:</b> refer to Warm-Reset Sequence in Figure 6.14-5.</p> <p><b>Deactivation:</b> refer to Deactivation Sequence in Figure 6.14-6.</p> <p><b>Note:</b> When set activation and warm reset in Timer0 operation mode 0011, it may have deviation at most 128 SC module clock cycles.</p>
[7]	CNTEN2	<p><b>Internal Timer2 Start Enable Bit</b></p> <p>This bit enables Timer 2 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note 1:</b> This field is used for internal 8 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only. Do not fill in CNTEN2 when TMRSEL (SCn_CTL[14:13]) is not equal to 11.</p> <p><b>Note 2:</b> If the operation mode is not in auto-reload mode (SCn_TMRCTL2[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[6]	CNTEN1	<p><b>Internal Timer1 Start Enable Bit</b></p> <p>This bit enables Timer 1 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note 1:</b> This field is used for internal 8 bit timer when TMRSEL(SCn_CTL[14:13]) is 11 only. Do not fill CNTEN1 when TMRSEL (SCn_CTL[14:13]) is not equal to 11.</p> <p><b>Note 2:</b> If the operation mode is not in auto-reload mode (SCn_TMRCTL1[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[5]	CNTEN0	<p><b>Internal Timer0 Start Enable Bit</b></p> <p>This bit enables Timer 0 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note 1:</b> This field is used for internal 24 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only.</p> <p><b>Note 2:</b> If the operation mode is not in auto-reload mode (SCn_TMRCTL0[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[4]	WARSTEN	<p><b>Warm Reset Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by warm reset sequence.</p> <p>0 = No effect.</p> <p>1 = Warm reset sequence generator Enabled.</p> <p><b>Note 1:</b> When the warm reset sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p><b>Note 2:</b> This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not</p>

		<p>fill in this bit WARSTEN, TXRST and RXRST at the same time.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p><b>Note 4:</b> During the warm reset sequence, RX is disabled automatically and can not receive data. After the warm reset sequence completion, RXOFF (SCn_CTL[1]) keeps the state before perform warm reset sequence.</p>
[3]	ACTEN	<p><b>Activation Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by activation sequence.</p> <p>0 = No effect.</p> <p>1 = Activation sequence generator Enabled.</p> <p><b>Note 1:</b> When the activation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p><b>Note 2:</b> This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit ACTEN, TXRST and RXRST at the same time.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p><b>Note 4:</b> During the activation sequence, RX is disabled automatically and can not receive data. After the activation sequence completion, RXOFF (SCn_CTL[1]) keeps the state before hardware activation.</p>
[2]	DACTEN	<p><b>Deactivation Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by deactivation sequence.</p> <p>0 = No effect.</p> <p>1 = Deactivation sequence generator Enabled.</p> <p><b>Note 1:</b> When the deactivation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p><b>Note 2:</b> This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit DACTEN, TXRST and RXRST at the same time.</p> <p><b>Note 3:</b> If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[1]	RXRST	<p><b>Rx Software Reset</b></p> <p>When RXRST is set, all the bytes in the receive buffer and Rx internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the Rx internal state machine and pointers.</p> <p><b>Note:</b> This bit will be auto cleared after reset is complete.</p>
[0]	TXRST	<p><b>TX Software Reset</b></p> <p>When TXRST is set, all the bytes in the transmit buffer and TX internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the TX internal state machine and pointers.</p> <p><b>Note:</b> This bit will be auto cleared after reset is complete.</p>

SC Extra Guard Time Register

7	6	5	4	3	2	1	0
RFTM							

Bits	Description
[31:9]	<b>Reserved</b> Reserved.
[8:0]	<b>RFTM</b> <b>SC Receiver FIFO Time-out Counter</b> The time-out down counter resets and starts counting whenever the RX buffer received a new data. Once the counter decrease to 1 and no new data is received or CPU does not read data by reading SCn_DAT, a receiver time-out flag RXTOIF (SCn_INTSTS[9]) will be set, and hardware will generate an interrupt to CPU when RXTOIEN (SCn_INTEN[9]) is enabled. <b>Note 1:</b> The counter unit is ETU based and the interval of time-out is RFTM + 0.5. <b>Note 2:</b> Filling in all 0 to this field indicates to disable this function.

Bits	Description
[31]	<b>TXACT</b> <b>Transmit in Active Status Flag (Read Only)</b> This bit indicates Tx transmit status. 0 = This bit is cleared automatically when Tx transfer is finished or the last byte transmission has completed. 1 = Transmit is active and this bit is set by hardware when Tx transfer is in active and the STOP bit of the last byte has not been transmitted.
[30]	<b>TXOVERR</b> <b>Transmitter over Retry Error</b> This bit is used for transmitter retry counts over than retry number limitation. 0 = Transmitter retries counts is less than TXRTY (SCn_CTL[22:20]) + 1. 1 = Transmitter retries counts is equal or over to TXRTY (SCn_CTL[22:20]) + 1. <b>Note:</b> This bit can be cleared by writing 1 to it.
[29]	<b>TXRERR</b> <b>Transmitter Retry Error</b> This bit is used for indicate transmitter error retry and set by hardware.. 0 = No Tx retry transfer. 1 = Tx has any error and retries transfer. <b>Note 1:</b> This bit can be cleared by writing 1 to it. <b>Note 2:</b> This bit is a flag and cannot generate any interrupt to CPU.
[28:27]	<b>Reserved</b> Reserved.
[26:24]	<b>TXPOINT</b> <b>Transmit Buffer Pointer Status (Read Only)</b> This field indicates the Tx buffer pointer status. When CPU writes data into SCn_DAT, TXPOINT increases one. When one byte of Tx buffer is transferred to transmitter shift register, TXPOINT decreases one.
[23]	<b>RXACT</b> <b>Receiver in Active Status Flag (Read Only)</b> This bit indicates Rx transfer status. 0 = This bit is cleared automatically when Rx transfer is finished. 1 = This bit is set by hardware when Rx transfer is in active.
[22]	<b>RXOVERR</b> <b>Receiver over Retry Error</b>

		<p>This bit is used for receiver retry counts over than retry number limitation.</p> <p>0 = Receiver retries counts is less than RXRTY (SCn_CTL[18:16]) + 1.</p> <p>1 = Receiver retries counts is equal or over than RXRTY (SCn_CTL[18:16]) + 1.</p> <p><b>Note 1:</b> This bit can be cleared by writing 1 to it.</p> <p><b>Note 2:</b> If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[21]	RXRERR	<p><b>Receiver Retry Error</b></p> <p>This bit is used for receiver error retry and set by hardware.</p> <p>0 = No Rx retry transfer.</p> <p>1 = Rx has any error and retries transfer.</p> <p><b>Note 1:</b> This bit can be cleared by writing 1 to it.</p> <p><b>Note 2:</b> This bit is a flag and cannot generate any interrupt to CPU.</p> <p><b>Note 3:</b> If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[20:19]	Reserved	Reserved.
[18:16]	RXPOINT	<p><b>Receive Buffer Pointer Status (Read Only)</b></p> <p>This field indicates the Rx buffer pointer status. When SC controller receives one byte from external device, RXPOINT increases one. When one byte of Rx buffer is read by CPU, RXPOINT decreases one.</p>
[15:14]	Reserved	Reserved.
[13]	CDPINSTS	<p><b>Card Detect Pin Status (Read Only)</b></p> <p>This bit is the pin status of SCn_CD.</p> <p>0 = The SCn_CD pin state at low.</p> <p>1 = The SCn_CD pin state at high.</p>
[12]	CINSERT	<p><b>Card Insert Status of SCn_CD Pin</b></p> <p>This bit is set whenever card has been inserted.</p> <p>0 = No effect.</p> <p>1 = Card insert.</p> <p><b>Note 1:</b> This bit can be cleared by writing "1" to it.</p> <p><b>Note 2:</b> The card detect function will start after SCEN (SCn_CTL[0]) set.</p>
[11]	CREMOVE	<p><b>Card Removal Status of SCn_CD Pin</b></p> <p>This bit is set whenever card has been removal.</p> <p>0 = No effect.</p> <p>1 = Card removed.</p> <p><b>Note 1:</b> This bit can be cleared by writing "1" to it.</p> <p><b>Note 2:</b> Card detect function will start after SCEN (SCn_CTL[0]) set.</p>
[10]	TXFULL	<p><b>Transmit Buffer Full Status Flag (Read Only)</b></p> <p>This bit indicates Tx buffer full or not.</p> <p>0 = Tx buffer count is less than 4.</p> <p>1 = Tx buffer count equals to 4.</p>
[9]	TXEMPTY	<p><b>Transmit Buffer Empty Status Flag (Read Only)</b></p> <p>This bit indicates TX buffer empty or not.</p> <p>0 = Tx buffer is not empty.</p> <p>1 = Tx buffer is empty, it means the last byte of Tx buffer has been transferred to Transmitter Shift Register.</p> <p><b>Note:</b> This bit will be cleared when writing data into DAT (SCn_DAT[7:0]).</p>
[8]	TXOV	<p><b>Transmit Overflow Error Interrupt Status Flag</b></p> <p>This bit is set when Tx buffer overflow.</p>

		<p>0 = Tx buffer is not overflow.  1 = Tx buffer is overflow when Tx buffer is full and an additional write operation to DAT (SCn_DAT[7:0]).  <b>Note:</b> This bit can be cleared by writing 1 to it.</p>
[7]	<b>Reserved</b>	Reserved.
[6]	<b>BEF</b>	<p><b>Receiver Break Error Status Flag</b>  This bit is set to logic 1 whenever the received data input (Rx) held in the "spacing state" (logic 0) is longer than a full word transmission time (that is, the total time of "start bit" + "data bits" + "parity bit" + "stop bits").  0 = Receiver break error flag did not occur.  1 = Receiver break error flag occurred.  <b>Note 1:</b> This bit can be cleared by writing 1 to it.  <b>Note 2:</b> If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[5]	<b>FEF</b>	<p><b>Receiver Frame Error Status Flag</b>  This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as logic 0).  0 = Receiver frame error flag did not occur.  1 = Receiver frame error flag occurred.  <b>Note 1:</b> This bit can be cleared by writing 1 to it.  <b>Note 2:</b> If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[4]	<b>PEF</b>	<p><b>Receiver Parity Error Status Flag</b>  This bit is set to logic 1 whenever the received character does not have a valid "parity bit".  0 = Receiver parity error flag did not occur.  1 = Receiver parity error flag occurred.  <b>Note 1:</b> This bit can be cleared by writing 1 to it.  <b>Note 2:</b> If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[3]	<b>Reserved</b>	Reserved.
[2]	<b>RXFULL</b>	<p><b>Receive Buffer Full Status Flag (Read Only)</b>  This bit indicates Rx buffer full or not.  0 = Rx buffer count is less than 4.  1 = Rx buffer count equals to 4.</p>
[1]	<b>RXEMPTY</b>	<p><b>Receive Buffer Empty Status Flag (Read Only)</b>  This bit indicates Rx buffer empty or not.  0 = Rx buffer is not empty.  1 = Rx buffer is empty, it means the last byte of Rx buffer has read from DAT (SCn_DAT[7:0]) by CPU.</p>
[0]	<b>RXOV</b>	<p><b>Receive Overflow Error Status Flag</b>  This bit is set when Rx buffer overflow.  0 = Rx buffer is not overflow.  1 = Rx buffer is overflow when the number of received bytes is greater than Rx buffer size (4 bytes).  <b>Note:</b> This bit can be cleared by writing 1 to it.</p>

## 6.15 Serial Peripheral Interface (SPI)

### 6.15.1 Overview

The Serial Peripheral Interface (SPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The chip contains one SPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. The SPI controller can be configured as a master or a slave device and supports the PDMA function to access the data buffer. The SPI controller also supports I<sup>2</sup>S mode to connect external audio CODEC. Please refer to the M251/M252/M254/M256/M258 Datasheet for detailed information about maximum SPI clock frequency of SPI master mode and SPI slave mode and range of SPI operation voltage.

### 6.15.2 Features

- SPI Mode
  - Supports one SPI controller
  - Supports Master or Slave mode operation
  - Configurable bit length of a transaction word from 8 to 32-bit
  - Provides separate 4-level depth transmit and receive FIFO buffers
  - Supports MSB first or LSB first transfer sequence
  - Supports Byte Reorder function
  - Supports Byte or Word Suspend mode
  - Supports PDMA transfer
  - Supports one data channel half-duplex transfer
  - Supports receive-only mode
- I<sup>2</sup>S Mode
  - Supports Master or Slave
  - Capable of handling 8-, 16-, 24- and 32-bit word sizes
  - Provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
  - Supports monaural and stereo audio data
  - Supports PCM mode A, PCM mode B, I<sup>2</sup>S and MSB justified data format
  - Supports two PDMA requests, one for transmitting and the other for receiving

### 6.15.3 Block Diagram

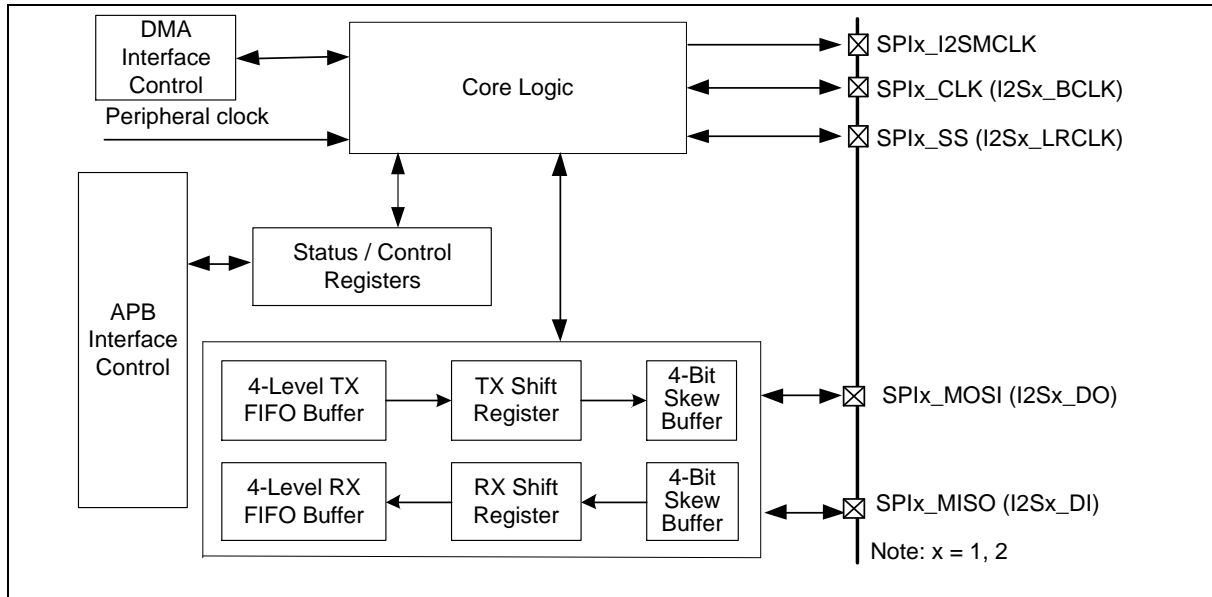

Figure 6.15-1 SPI Block Diagram

#### **TX FIFO Buffer:**

The transmit FIFO buffer is a 4-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the SPIx\_TX register. In SPI mode, the transmit FIFO will be configured as 8-level while data length is set as 8~16 bits.

#### **RX FIFO Buffer:**

The receive FIFO buffer is also a 4-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from SPIx\_RX register by software. In SPI mode, the receive FIFO will be configured as 8-level while data length is set as 8~16 bits.

#### **TX Shift Register:**

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

#### **RX Shift Register:**

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

#### **Skew Buffer:**

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from SPI bus. In transmitting side, it is used to shift bits into SPI bus from TX shift register.

### 6.15.4 Basic Configuration

#### 6.15.4.1 SPI0 Basic Configuration

- Clock source Configuration
  - Select the source of SPI0 peripheral clock on SPI0SEL (CLK\_CLKSEL2[5:4]).
  - Enable SPI0 peripheral clock in SPI0CKEN (CLK\_APBCLK0[13]).

- Reset Configuration
  - Reset SPI0 controller in SPI0RST (SYS\_IPRST1[13]).

SPI/I<sup>2</sup>S (SPI0) Interface Controller Pin description is shown as follows:

Pin	SPI Mode	I <sup>2</sup> S Mode
SPIx_SS	SPI slave selection pin	I <sup>2</sup> S left/right channel synchronization clock pin (I2Sx_LRCLK)
SPIx_CLK	SPI clock pin	I <sup>2</sup> S bit clock pin (I2Sx_BCLK)
SPIx_MISO	SPI master input or slave output pin	I <sup>2</sup> S data input pin (I2Sx_DI)
SPIx_MOSI	SPI master output or slave input pin	I <sup>2</sup> S data output pin (I2Sx_DO)
SPIx_I2SMCLK	Not available	I <sup>2</sup> S Master clock output pin

Table 6.15-2 SPI/I<sup>2</sup>S Interface Controller Pin Description (SPI0)

## 6.15.5 Functional Description

### 6.15.5.1 Terminology

#### SPI Peripheral Clock and SPI Bus Clock

The SPI controller needs the peripheral clock to drive the SPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (SPIx\_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. SPIxSEL of CLK\_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (SPIx\_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

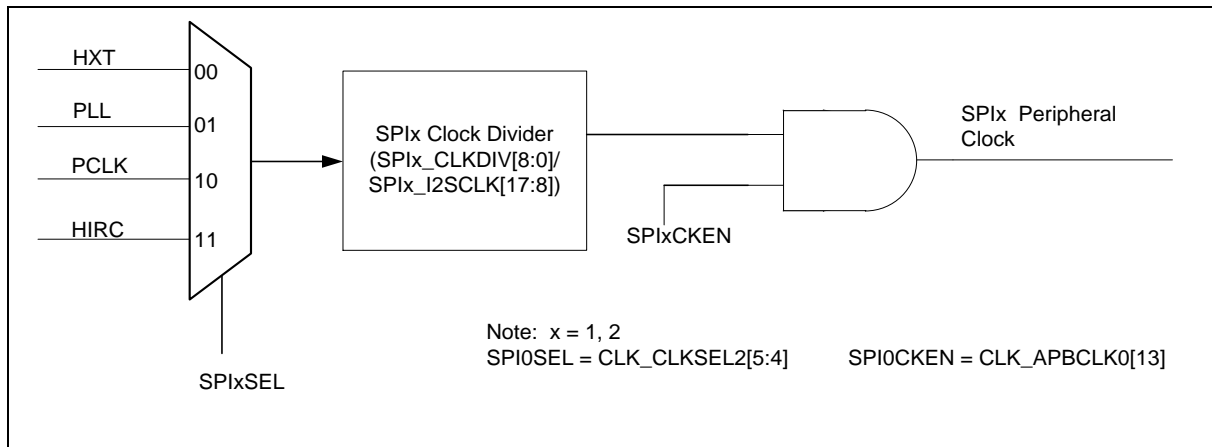

Figure 6.15-2 SPI Peripheral Clock

In Master mode, the frequency of the SPI bus clock is equal to the peripheral clock rate. In general, the SPI bus clock is denoted as SPI clock. In Slave mode, the SPI bus clock is provided by a master device. The frequency of SPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode.

In I<sup>2</sup>S mode, the peripheral clock rate is equal to I<sup>2</sup>S bit clock rate determined by SPIx\_I2SCLK register.

#### Master/Slave mode

The SPI controllers can be set as Master or Slave mode by setting the SLAVE (SPIx\_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (SPIx\_CTL[14]) can be used to select the full-duplex or half-duplex in SPI transmission. The application block diagrams in Master and Slave mode are shown below.

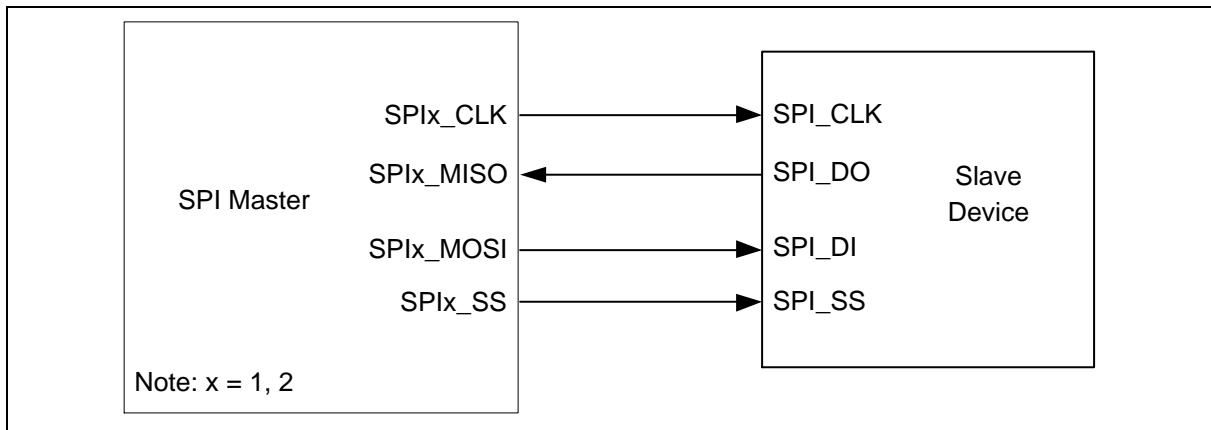

Figure 6.15-3 SPI Full-Duplex Master Mode Application Block Diagram

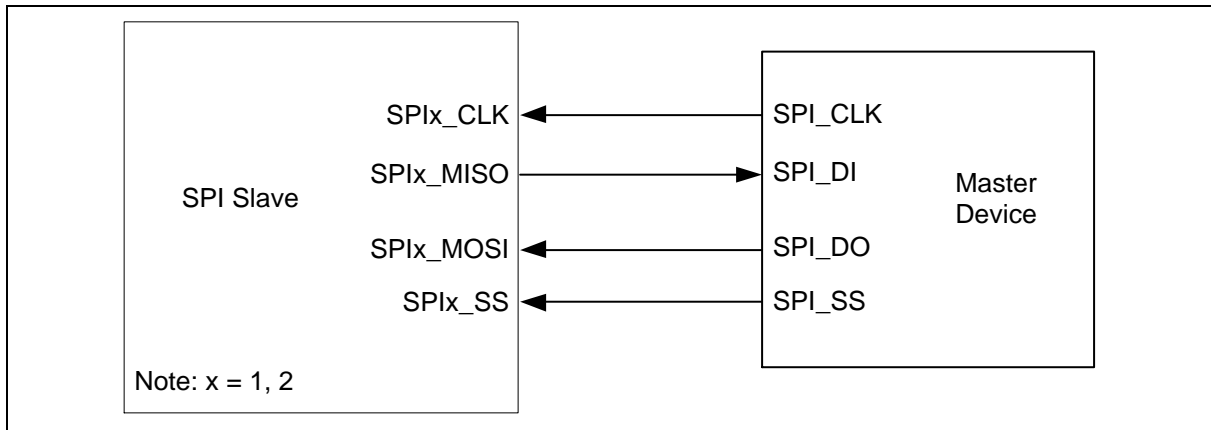

Figure 6.15-4 SPI Full-Duplex Slave Mode Application Block Diagram

### **Slave Selection**

In Master mode, the SPI controller can drive off-chip slave device through the slave select output pin SPIx\_SS. In Slave mode, the off-chip master device drives the slave selection signal from the SPIx\_SS input port to this SPI controller. The duration between the slave select active edge and the first SPI clock input shall over 3 SPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (SPIx\_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

### **Timing Condition**

The CLKPOL (SPIx\_CTL[3]) defines the SPI clock idle state. If CLKPOL = 1, the output SPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (SPIx\_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of SPI clock. RXNEG (SPIx\_CTL[1]) defines the data received either on negative edge or on positive edge of SPI clock.

**Note:** The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

### **Transmit/Receive Bit Length**

The bit length of a transaction word is defined in DWIDTH (SPIx\_CTL[12:8]) and can be configured up to 32-bit length in a transaction word for transmitting and receiving.

When SPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (SPIx\_CTL[12:8]), the unit transfer interrupt flag UNITIF (SPIx\_STATUS[1]) will be set to 1.

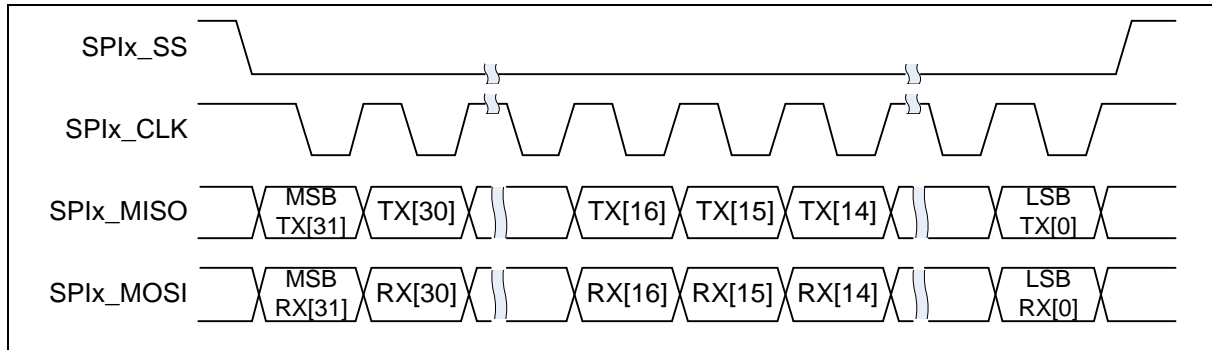

Figure 6.15-532-bit in One Transaction

#### **LSB/MSB First**

LSB (SPIx\_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (SPIx\_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (SPIx\_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

#### **Suspend Interval**

SUSPITV (SPIx\_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 SPI clock cycles).

#### **6.15.5.2 Automatic Slave Selection**

In Master mode, if AUTOSS (SPIx\_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the SPIx\_SS pin according to whether SS (SPIx\_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the SPI controller when the SPI data transfer is started by writing to FIFO. It will be set to inactive state when SPI bus is idle. If SPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (SPIx\_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (SPIx\_SSCTL[2]).

The duration between the slave selection signal active edge and the first SPI bus clock edge is 1 SPI bus clock cycle and the duration between the last SPI bus clock and the slave selection signal inactive edge is 1.5 SPI bus clock cycle.

Figure 6.15-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

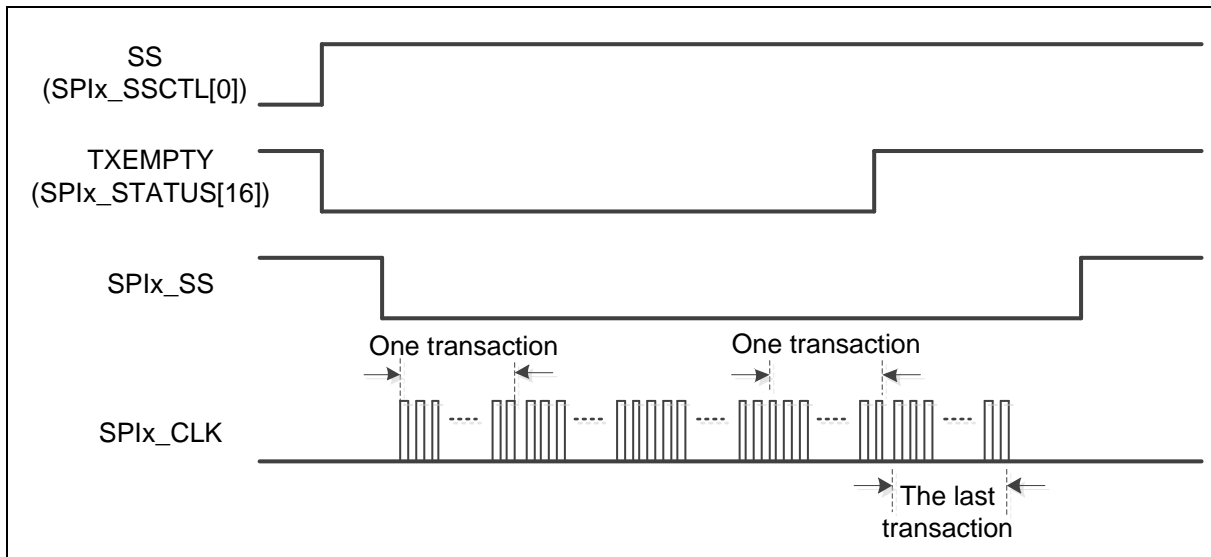

Figure 6.15-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

### 6.15.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (SPIx\_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The SPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

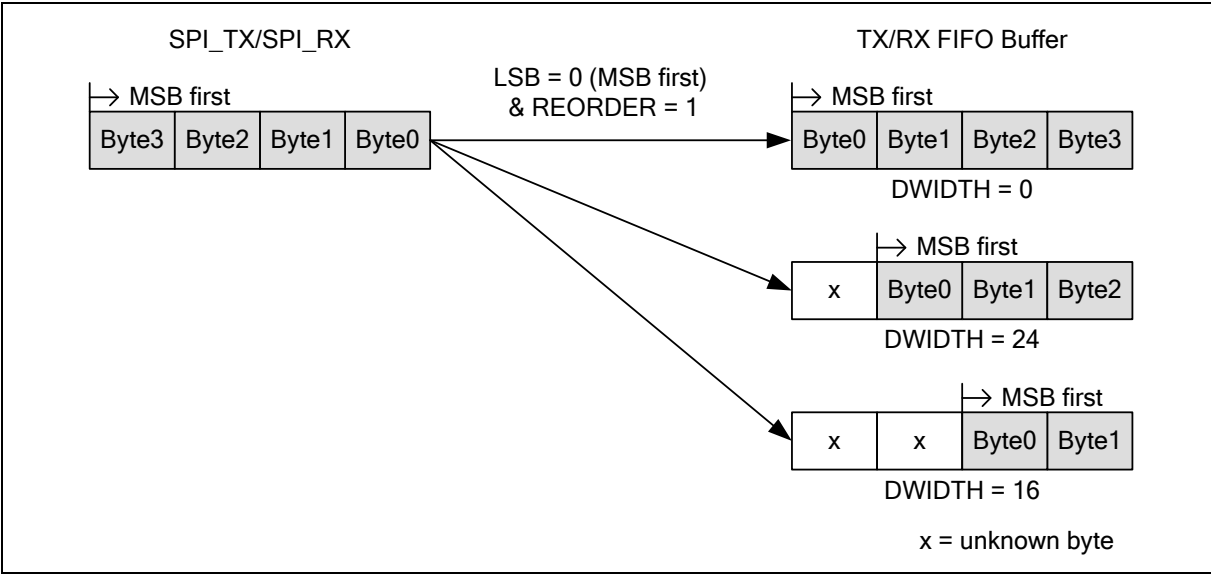

Figure 6.15-8 Byte Reorder Function

In Master mode, if REORDER (SPIx\_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 SPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (SPIx\_CTL[7:4]).

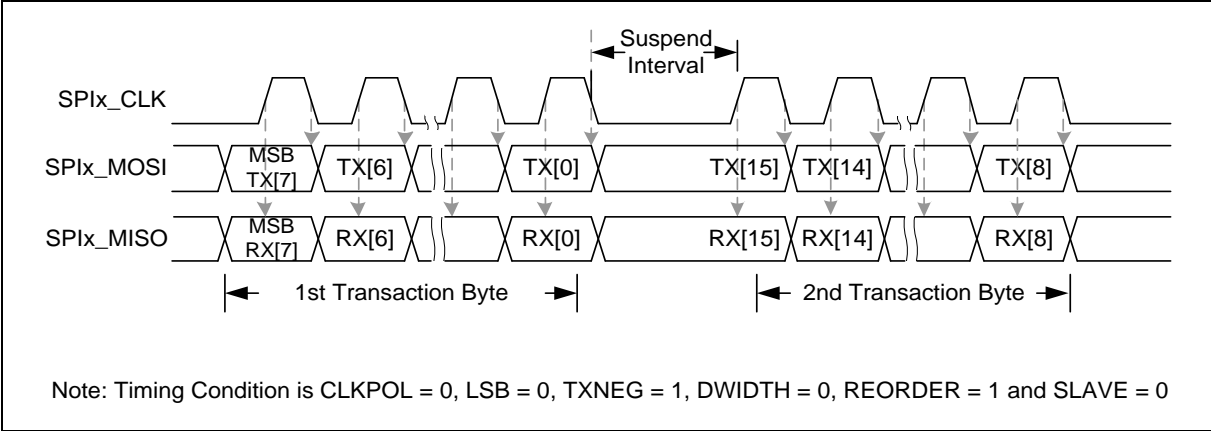

Figure 6.15-9 Timing Waveform for Byte Suspend

6.15.5.4 Half-Duplex Communication

The SPI controller can communicate in half-duplex mode by setting HALFDPX (SPIx\_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (SPIx\_CTL[20]). In half-duplex configuration, the SPIx\_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (SPIx\_CTL[14]) will produce TXFBCLR (SPIx\_FIFOCCTL[9]) and RXFBCLR (SPIx\_FIFOCCTL[8]) at the same time automatically.

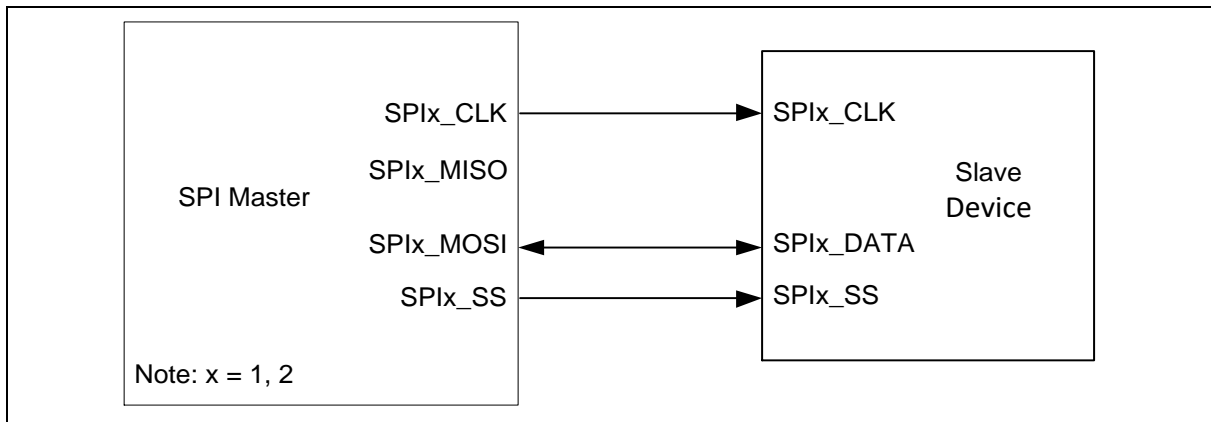

Figure 6.15-10 SPI Half-Duplex Master Mode Application Block Diagram

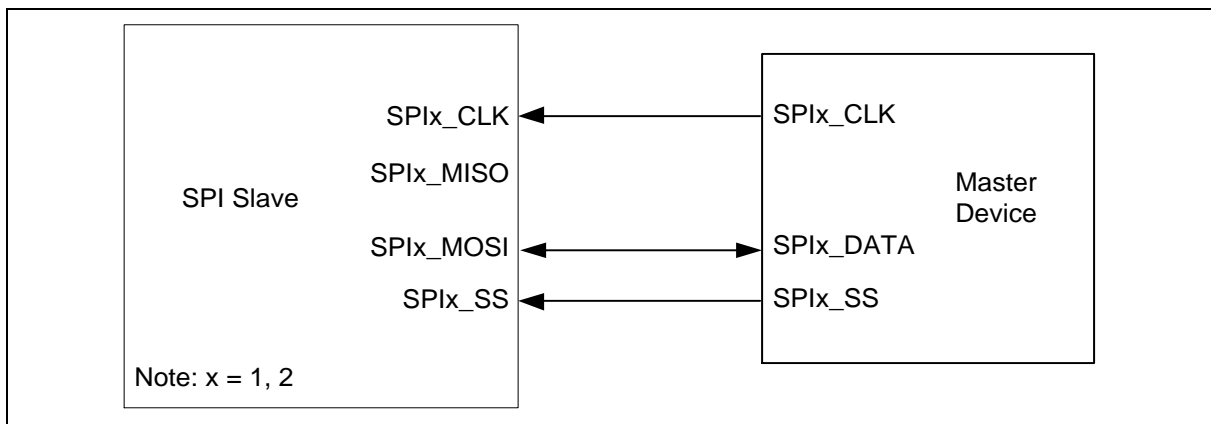

Figure 6.15-11 SPI Half-Duplex Slave Mode Application Block Diagram

#### 6.15.5.5 Receive-Only Mode

In SPI Master device, it can communicate in receive-only mode by setting RXONLY (SPIx\_CTL[15]). In this configuration, the SPI Master device will generate SPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (SPIx\_SSCTL[3]) is enabled in receive-only mode, SPI Master will keep activating the slave select signal.

The remaining SPIx\_MOSI pin of SPI Master device is not used for communication and can be configured as GPIO. The status BUSY (SPIx\_STATUS[0]) will be asserted in receive-only mode due to the generation of SPI bus clock. Entering this mode will produce the TXFBCLR (SPIx\_FIFCTL[9]) and RXFBCLR (SPIx\_FIFCTL[8]) at the same time automatically. When user enables this mode, the output SPI bus clock will be sent out after 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

When user sets RXONLY (SPIx\_CTL[15]) enable, SPI RX data with data bit width of DWIDTH (SPIx\_CTL[12:8]) will be received into RX FIFO and SPI clock will be sent to SPI slave device until RX FIFO is full.

For data bit width of 8~16 bits, the SPI master will send SPI output clock to SPI slave and receive RX data when RX FIFO counter RXCNT (SPIx\_STATUS[27:24]) is less than or equal to 6.

For data bit width of 17~32 bits, the SPI master will send SPI output clock to SPI slave and receive RX data when RX FIFO counter RXCNT (SPIx\_STATUS[27:24]) is less than or equal to 2.

#### 6.15.5.6 PDMA Transfer Function

The SPI controller supports PDMA transfer function.

When TXPDMAEN (SPIx\_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (SPIx\_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. The SPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

When PDMA transfer is done, user needs to disable TXPDMAEN/RXPDMAEN. After re-setting control registers of PDMA, user enables TXPDMAEN/RXPDMAEN again.

**Note:** The SPI supports single request PDMA (Read/Write) only, and burst request PDMA is not supported.

#### 6.15.5.7 FIFO Buffer Operation

The SPI controllers equip with four 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (SPIx\_STATUS[17]) will be set to 1. When the SPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (SPIx\_STATUS[16]) will be set to 1. Note that the TXEMPTY (SPIx\_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (SPIx\_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the SPI bus. (e.g. the slave selection signal is active and the SPI controller is receiving data in Slave mode). It will be set to 0 when the transmit FIFO is empty and the current transaction is done. Thus, the status of BUSY (SPIx\_STATUS[0]) should be checked by software to make sure whether the SPI is in idle or not.

The receive control logic will store the SPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (SPIx\_STATUS[8]) and RXFULL (SPIx\_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (SPIx\_FIFCTL[30:28]) and RXTH (SPIx\_FIFCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (SPIx\_FIFCTL[30:28]) setting, TXTHIF (SPIx\_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (SPIx\_FIFCTL[26:24]) setting, RXTHIF (SPIx\_STATUS[10]) will be set to 1.

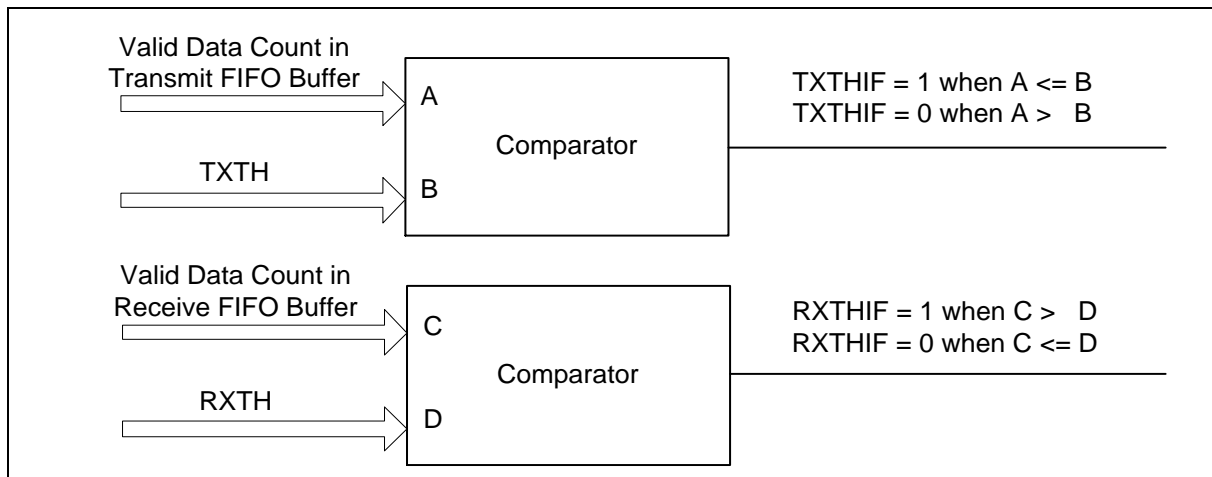

Figure 6.15-12 FIFO Threshold Comparator

In Master mode, when the first datum is written to the SPIx\_TX register, the TXEMPTY flag (SPIx\_STATUS[16]) will be cleared to 0. The transmission will start after 1 PCLK clock cycles and 6 peripheral clock cycles. User can write the next data into SPIx\_TX register immediately. The SPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (SPIx\_CTL[7:4]). If the SUSPITV (SPIx\_CTL[7:4]) equals 0, SPI controller can perform continuous transfer. User can write data into SPIx\_TX register as long as

the TXFULL (SPIx\_STATUS[17]) is 0.

When user sets DWIDTH (SPIx\_CTL[12:8]) to 8 bits ~ 16 bits, the FIFO structure will be configured to eight 16-bit wide transmit and receive FIFO buffers automatically.

The Example 1 of Figure 6.15-13 indicates the updated condition of TXEMPTY (SPIx\_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer for 8~16 bits of data length. The TXEMPTY (SPIx\_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (SPIx\_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

The Example 2 of Figure 6.15-13 indicates the updated condition of TXFULL (SPIx\_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the TXFULL = 1.

The example 1 of Figure 6.15-13 indicates the updated condition of TXEMPTY (SPIx\_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer for 17~32 bits of data length.

The Example 2 of Figure 6.15-14 indicates the updated condition of TXFULL (SPIx\_STATUS[17]) when there are 4 data in the FIFO buffer and the next data of Data5 is not written into the FIFO buffer when TXFULL = 1.

Figure 6.15-13 Transmit FIFO Buffer Example for 8~16 Bits of Data Length

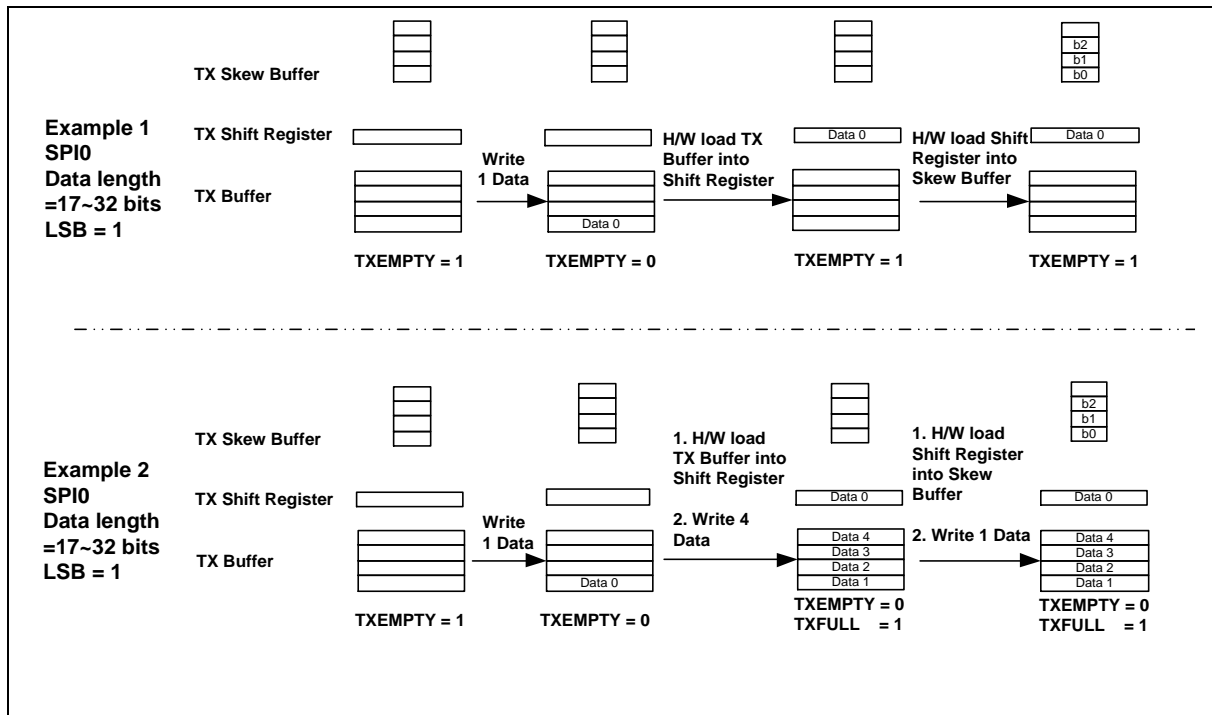

Figure 6.15-14 Transmit FIFO Buffer Example for 17~32 Bits of Data Length

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the SPIx\_TX register does not be updated after all data transfers are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from SPIx\_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (SPIx\_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reaches the value of DWIDTH (SPIx\_CTL[12:8]).

The RXEMPTY (SPIx\_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example in Figure 6.15-15). The received data can be read by software from SPIx\_RX register as long as the RXEMPTY (SPIx\_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (SPIx\_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example in Figure 6.15-15).

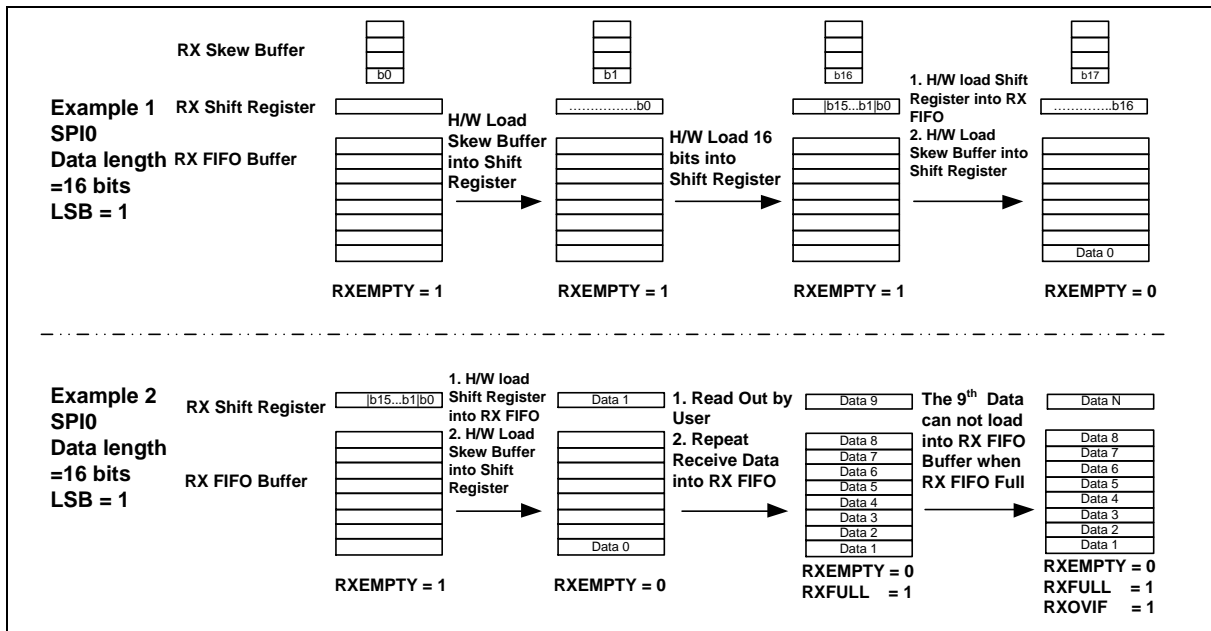

Figure 6.15-15 Receive FIFO Buffer Example for 16 Bits of Data Length

The RXEMPTY (SPIx\_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example in Figure 6.15-16). The received data can be read by software from SPIx\_RX register as long as the RXEMPTY (SPIx\_STATUS[8]) is 0. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx\_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example in Figure 6.15-16).

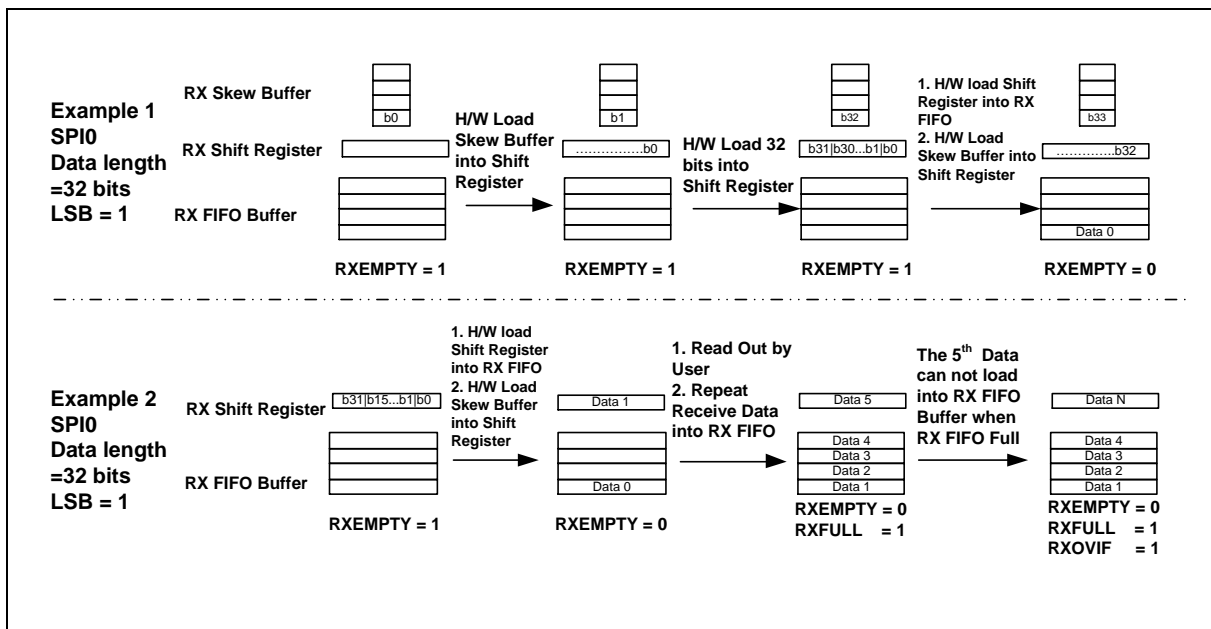

Figure 6.15-16 Receive FIFO Buffer Example for 32 Bits of Data Length

In Slave mode, during transmission operation, when data is written to the SPIx\_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (SPIx\_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to SPIx\_TX register as long as the TXFULL (SPIx\_STATUS[17]) is 0. After all data have been drawn out by the SPI transmission logic unit and the SPIx\_TX register is not updated by software, the

TXEMPTY (SPIx\_STATUS[16]) will be set to 1.

If there is no any data written to the SPIx\_TX register, the transmit underflow interrupt flag, TXUFIF (SPIx\_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (SPIx\_FIFCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (SPIx\_STATUS[7]), will be set to 1 as SPIx\_SS goes to inactive state.

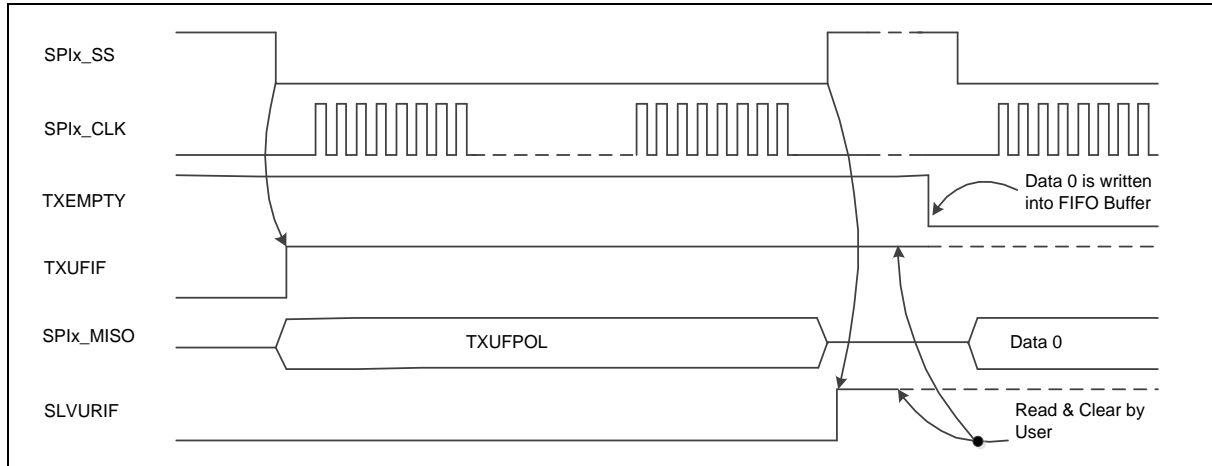

Figure 6.15-17 TX Underflow Event and Slave Under Run Event

In SPI Slave 3-Wire mode, the first 2-bit data is un-predicted (keeping on the level of last bit in previously transfer) if the data is written into TX FIFO among 3 peripheral clock cycles before the SPI bus clock is presented. The other bits are held by TXUFPOL (SPIx\_FIFCTL[6]) because there is TX underflow event. The written data will be transmitted in the next transfer.

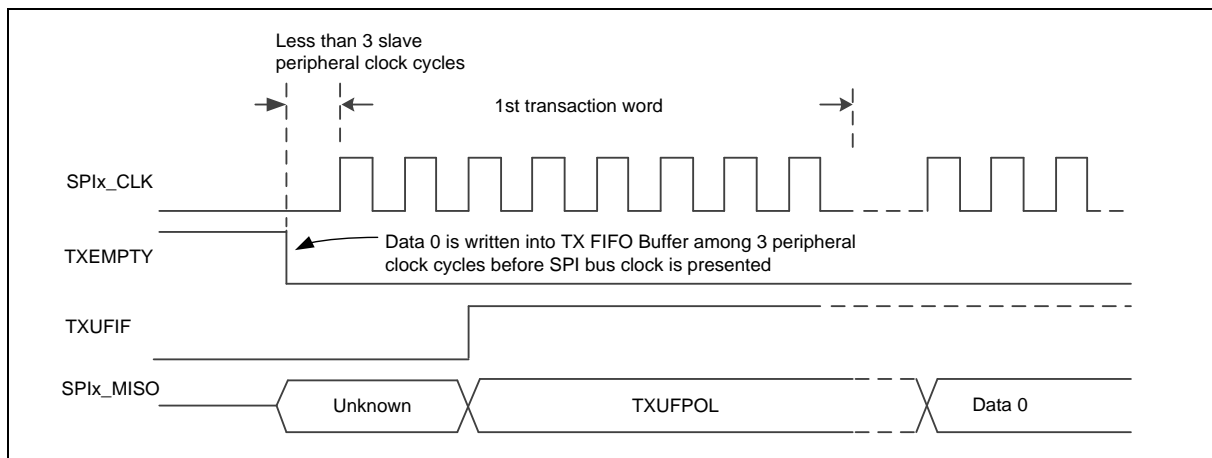

Figure 6.15-18 TX Underflow Event (SPI Slave 3-Wire Mode Enabled) (for M254/M256/M258 support)

In Slave mode, during receiving operation, the serial data is received from SPIx\_MOSI pin and stored to SPIx\_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx\_STATUS[9]) will be set to 1 and the RXOVIF (SPIx\_STATUS[11]) will be set to 1 if there is more serial data received from SPIx\_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Examples in Figure 6.15-15 and Figure 6.15-16). When the receive bit count is mismatched with the DWIDTH (SPIx\_CTL[12:8]) and the slave selection line goes to inactive state, the SLVBEIF (SPIx\_STATUS[6]) will be set to 1.

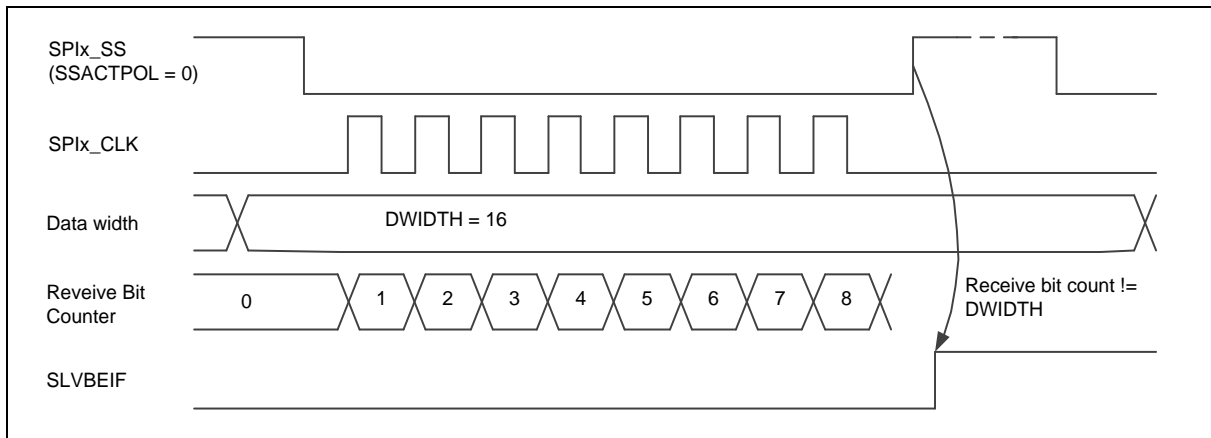

Figure 6.15-19 Slave Mode Bit Count Error

In Slave mode, during receiving operation, the serial data is received from SPIx\_MOSI pin and stored to SPIx\_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx\_STATUS[9]) will be set to 1 and the RXOVIF (SPIx\_STATUS[11]) will be set to 1 if there is more serial data received from SPIx\_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Examples in Figure 6.15-15 and Figure 6.15-16).

When the receive bit count is mismatched with the DWIDTH (SPIx\_CTL[12:8]) and the slave selection line goes to inactive state, the SLVBEIF (SPIx\_STATUS[6]) will be set to 1. RX data will be written into RX FIFO and SLVBENUM (SPIx\_STATUS2[29:24]) will be updated when SLVBERX (SPIx\_FIFCTL[10]) is enabled and the error event of SPI slave bit count happened. The RX data will be dropped and SLVBENUM (SPIx\_STATUS2[29:24]) will be fixed to 0x0 when the control register SLVBERX (SPIx\_FIFCTL[10]) is disabled and the error event of SPI slave bit count happened.

The status register SLVBENUM (SPIx\_STATUS2[29:24]) indicates the effective bit number of uncompleted RX data when an error event of SPI slave bit count happened. Figure 6.15-20 shows the timing diagram of SPI slave bit count error and SLVBENUM. SLVBENUM is updated to 0x8 when SPI slave device receives 8 bits data and DWIDTH (SPIx\_CTL[12:8]) is set to 16 bits. After the flag of SPI slave bit count error (SLVBEIF) generates the pulse of RX FIFO write operation to write RX data from RX shift register to RX FIFO, the RX FIFO count (RXCNT) updates to 1.

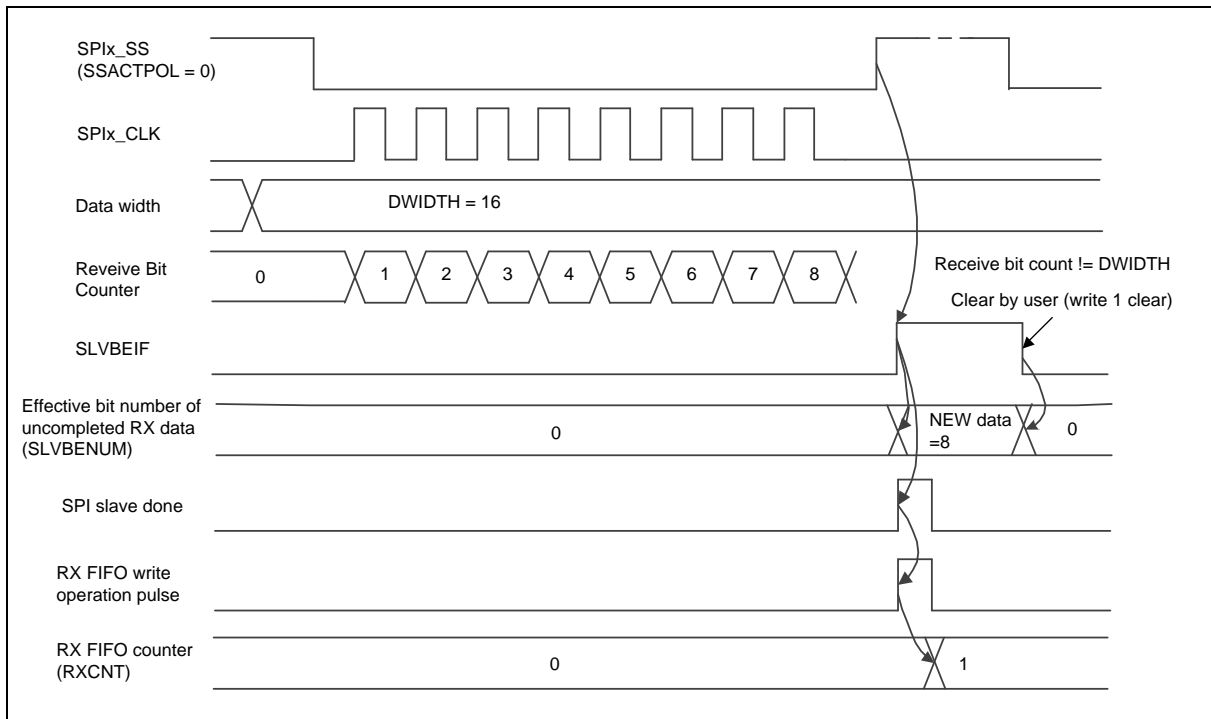

Figure 6.15-20 Slave Mode Bit Count Error and Effective Bit Number of Uncompleted RX Data

The SPI controller has the receive time-out function. When the receive FIFO is not empty and no read operation in receive FIFO over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTOIF (SPIx\_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

#### 6.15.5.8 Interrupt

- SPI unit transfer interrupt

As the SPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (SPIx\_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (SPIx\_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- SPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (SPIx\_STATUS[2]) and SSINAIF (SPIx\_STATUS[3]), will be set to 1 when the SPIEN (SPIx\_CTL[0]) and SLAVE (SPIx\_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The SPI controller will issue an interrupt if the SSINAIF (SPIx\_SSCTL[13]) or SSACTIEN (SPIx\_SSCTL[12]), are set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count is mismatched with the DWIDTH (SPIx\_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx\_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The SPI controller will issue an interrupt if the SLVBEIEN (SPIx\_SSCTL[8]) is set to 1.

In Slave mode, if the transmit/receive bit count is mismatched with the DWIDTH (SPIx\_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx\_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX shift register. When the control register SLVBERX (SPIx\_FIFCTL[10]) is disabled and SPI slave bit count error event happened, the uncompleted transaction data will be dropped from RX shift registers. When control register SLVBERX (SPIx\_FIFCTL[10]) is enabled and SPI slave bit count error event happened, the uncompleted transaction data will be written from RX shift registers into RX FIFO. The SPI controller will issue an interrupt if the SLVBEIEN (SPIx\_SSCTL[8]) is set to 1.

**Note:** If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (SPIx\_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In SPI Slave mode, if there is no any data is written to the SPIx\_TX register, the TXUFIF (SPIx\_STATUS[19]) will be set to 1 when the slave selection signal is active. The SPI controller will issue a TX underflow interrupt if the TXUFIEN (SPIx\_FIFCTL[7]) is set to 1.

**Note:** If underflow event occurs in SPI Slave mode, there are two conditions which make SPI Slave mode return to idle state and then goes for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (SPIx\_STATUS[7]) will be set to 1 when SPIx\_SS goes to inactive state. The SPI controller will issue a TX under run interrupt if the SLVURIEN (SPIx\_SSCTL[9]) is set to 1.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 4 unread data for 17~32 bits of data length, the RXFULL (SPIx\_STATUS[9]) will be set to 1 and the RXOVIF (SPIx\_STATUS[11]) will be set to 1 if there is more serial data is received from SPI bus and the follow-up data will be dropped. The SPI controller will issue an interrupt if the RXOVIEN (SPIx\_FIFCTL[5]) is set to 1.

If the receive FIFO buffer contains 8 unread data for 8~16 bits of data length, the RXFULL (SPIx\_STATUS[9]) will be set to 1 and the RXOVIF (SPIx\_STATUS[11]) will be set to 1 if there is more serial data received from SPI bus and the follow-up data will be dropped. The SPI controller will issue an interrupt if the RXOVIEN (SPIx\_FIFCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (SPIx\_FIFCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (SPIx\_FIFCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (SPIx\_STATUS[18]) will be set to 1. The SPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (SPIx\_FIFCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (SPIx\_FIFCTL[26:24]), the receive FIFO interrupt flag RXTHIF (SPIx\_STATUS[10]) will be set to 1. The SPI controller will generate a receive FIFO

interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (SPIx\_FIFCTL[2]), is set to 1.

6.15.5.9 I<sup>2</sup>S Mode

The SPI0 controllers support I<sup>2</sup>S mode with PCM mode A, PCM mode B, MSB justified and I<sup>2</sup>S data format. The bit count of an audio channel is determined by WDWIDTH (SPIx\_I2SCTL[5:4]). The transfer sequence is always first from the most significant bit, MSB. Data are read on rising clock edge and are driven on falling clock edge.

In I<sup>2</sup>S data format, the MSB is sent and latched on the second clock of an audio channel. The I2Sx\_LRCLK signal indicates which audio channel is in transferring.

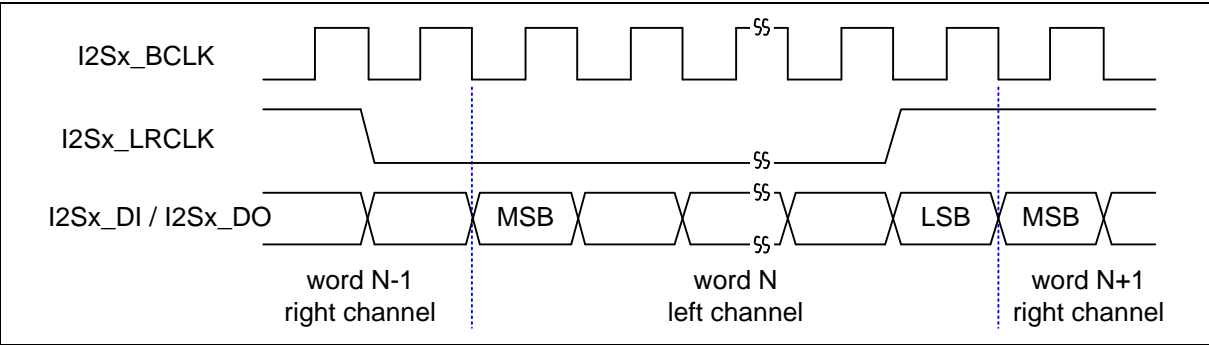

Figure 6.15-21 I<sup>2</sup>S Data Format Timing Diagram

In MSB justified data format, the MSB is sent and latched on the first clock of an audio channel.

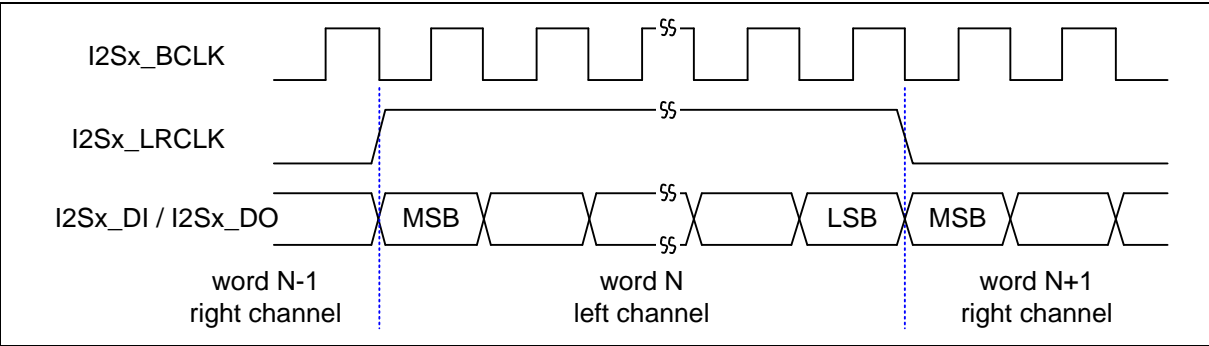

Figure 6.15-22 MSB Justified Data Format Timing Diagram

The I2Sx\_LRCLK signal also supports PCM mode A and PCM mode B. The I2Sx\_LRCLK signal in PCM mode indicates the beginning of an audio frame.

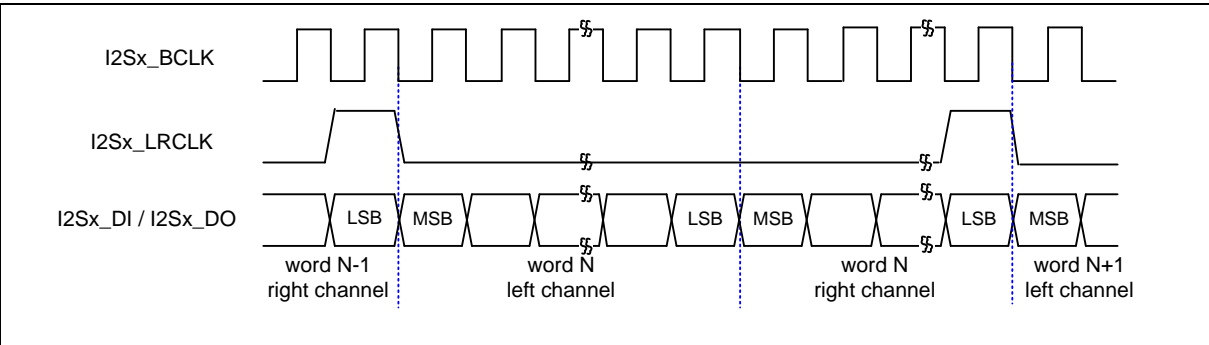

Figure 6.15-23 PCM Mode A Timing Diagram

#### 6.15.5.11 Dummy Data Number for I<sup>2</sup>S / PCM Master Mode and Monaural Mode

Before I<sup>2</sup>S / PCM master starts to send TX data to external slave device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, and write TX data to TX FIFO. After master sends dummy data (data with zero value) to external slave device, master will send TX FIFO data to external slave device. Table 6.15-3 shows number of dummy data for monaural mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	0
16 bits	0
24 bits	1
32 bits	1

Table 6.15-3 Dummy Data Number for I<sup>2</sup>S / PCM Master Mode and Monaural Mode

#### 6.15.5.12 Dummy Data Number for I<sup>2</sup>S / PCM Master Mode and Stereo Mode

Before I<sup>2</sup>S / PCM master starts to send TX data to external slave device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, and write TX data to TX FIFO. After master sends dummy data (data with zero value) to external slave device, master will send TX FIFO data to external slave device. Table 6.15-4 shows number of dummy data for stereo mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	0
16 bits	0
24 bits	1
32 bits	1

Table 6.15-4 Dummy Data Number for I<sup>2</sup>S / PCM Master Mode and Stereo Mode

#### 6.15.5.13 Dummy Data Number for I<sup>2</sup>S Slave mode and Monaural Mode

Before I<sup>2</sup>S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, SLAVE mode (SPIx\_I2SCTL[8]), and write TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-5 shows the number of dummy data for I<sup>2</sup>S slave monaural mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	3
16 bits	2
24 bits	2
32 bits	2

Table 6.15-5 Dummy Data Number for I<sup>2</sup>S Slave Mode and Monaural Mode

#### 6.15.5.14 Dummy Data Number for PCM Slave mode and Monaural Mode

Before I<sup>2</sup>S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, SLAVE mode (SPIx\_I2SCTL[8]), and write

TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-6 shows number of dummy data for PCM slave monaural mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	2
16 bits	1
24 bits	1
32 bits	1

Table 6.15-6 Dummy Data Number for PCM Slave Mode and Monaural Mode

#### 6.15.5.15 Dummy Data Number for I<sup>2</sup>S Slave mode and Stereo Mode

Before I<sup>2</sup>S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, SLAVE mode (SPIx\_I2SCTL[8]), and write TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-7 shows number of dummy data for I<sup>2</sup>S slave stereo mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	3
16 bits	2
24 bits	2
32 bits	2

Table 6.15-7 Dummy Data Number for I<sup>2</sup>S Slave Mode and Stereo Mode

#### 6.15.5.16 Dummy Data Number for PCM Slave mode and Stereo Mode

Before I<sup>2</sup>S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx\_I2SCTL[0]) enable, TXEN (SPIx\_I2SCTL[1]) enable, SLAVE mode (SPIx\_I2SCTL[8]), and write TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-8 shows number of dummy data for PCM slave stereo mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	2
16 bits	1
24 bits	1
32 bits	1

Table 6.15-8 Dummy Data Number for PCM Slave Mode and Stereo Mode

### 6.15.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (SPIx\_SSCTL[2]). The SPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (SPIx\_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (SPIx\_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (SPIx\_CTL[13]). User can also select which edge of SPI clock to transmit/receive data in TXNEG/RXNEG (SPIx\_CTL[2:1]). Four SPI timing

diagrams for master/slave operations and the related settings are shown below.

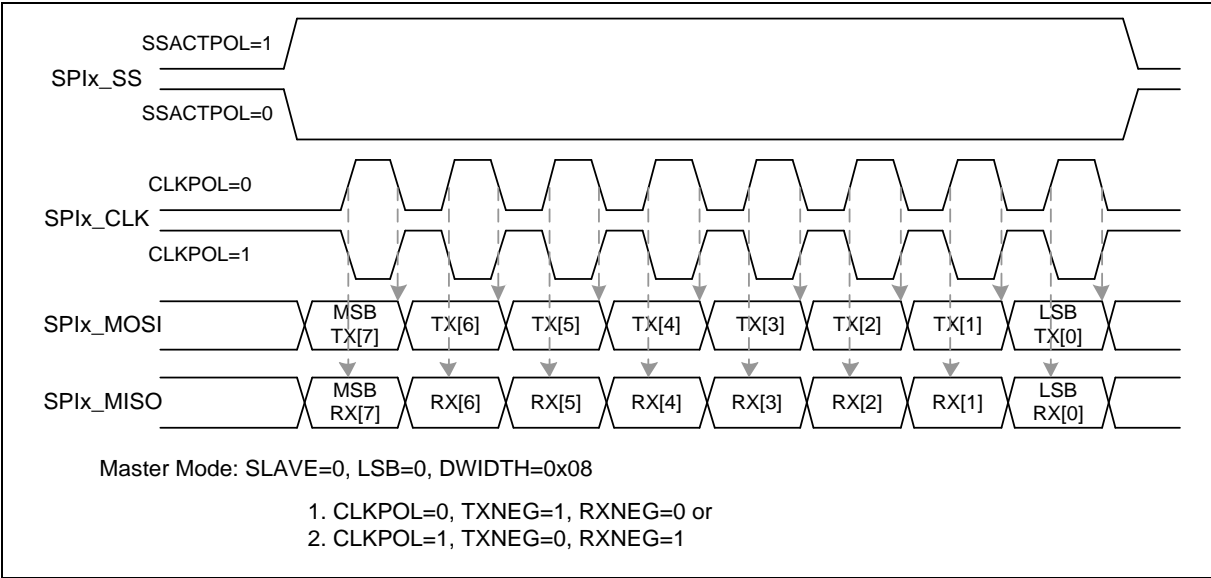

Figure 6.15-27 SPI Timing in Master Mode

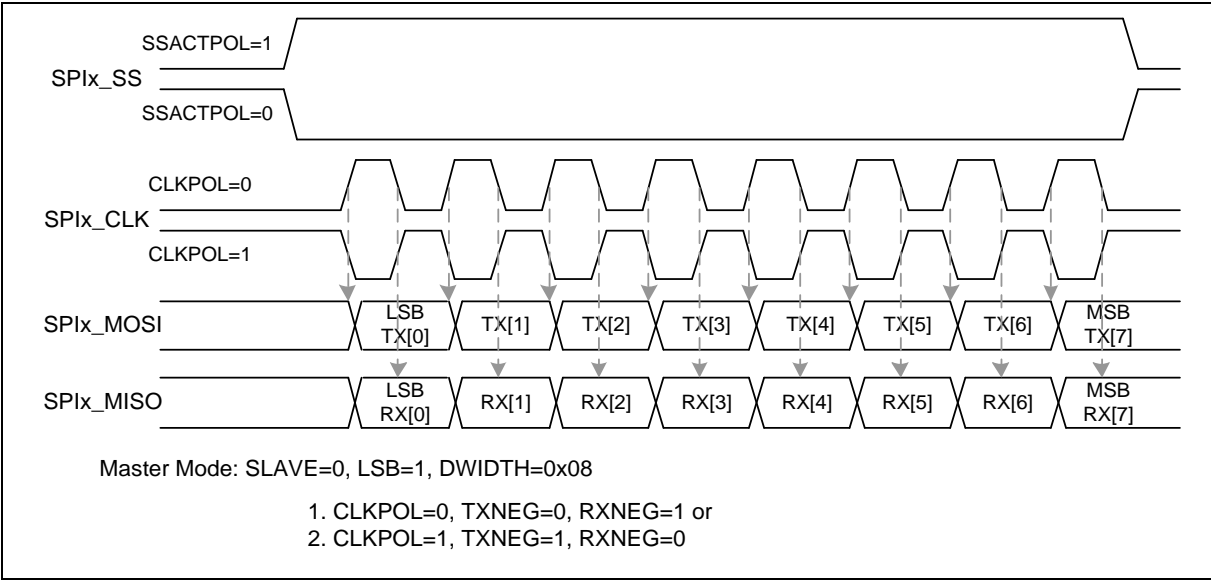

Figure 6.15-28 SPI Timing in Master Mode (Alternate Phase of SPIx\_CLK)

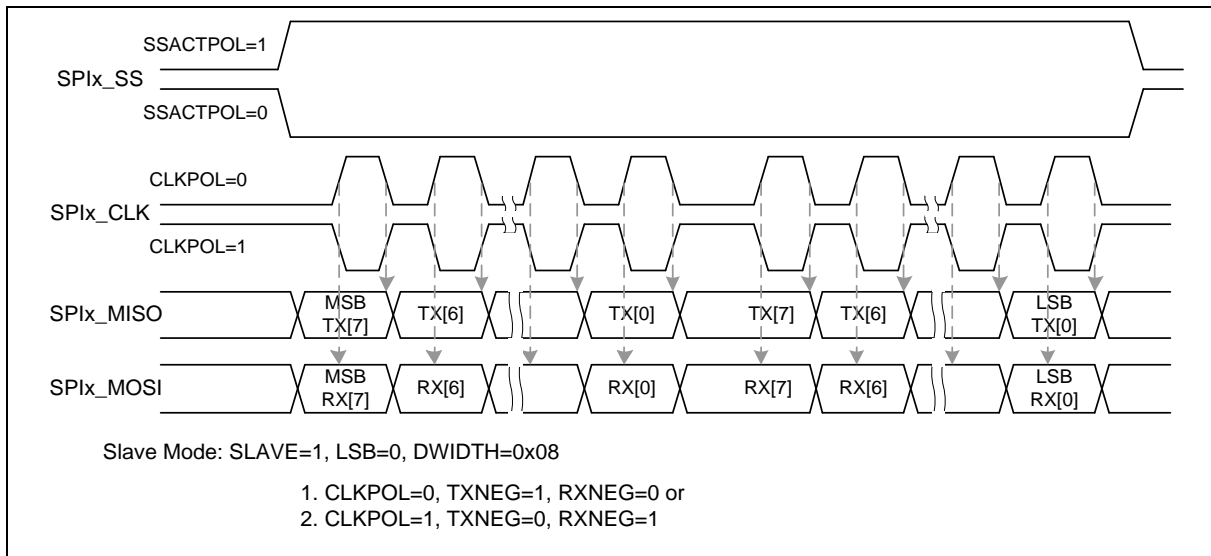

Figure 6.15-29 SPI Timing in Slave Mode

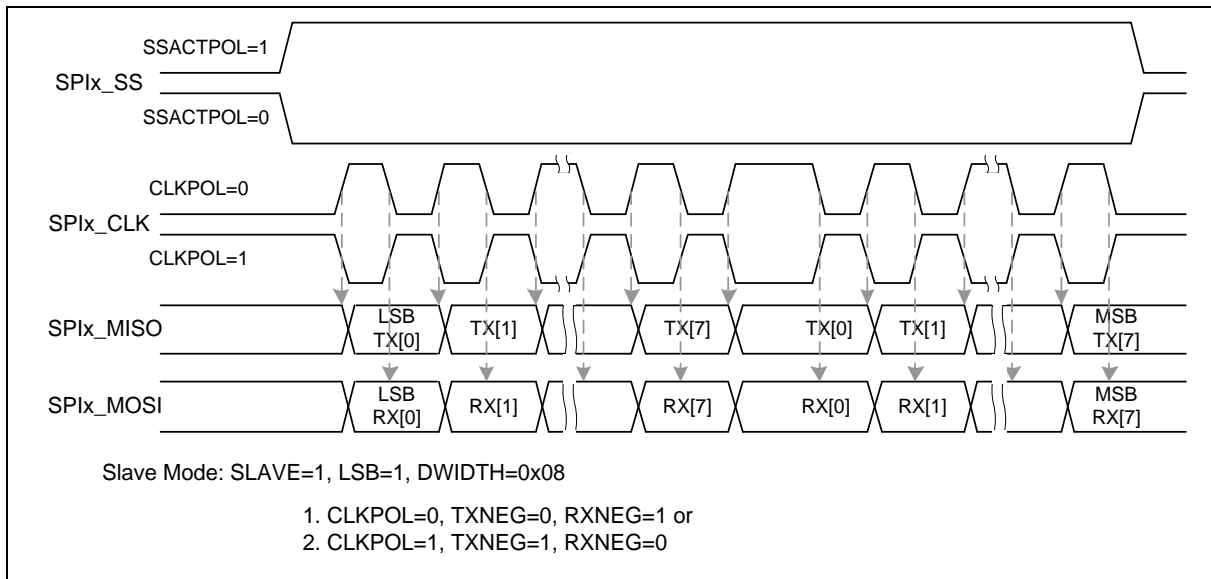

Figure 6.15-30 SPI Timing in Slave Mode (Alternate Phase of SPIx\_CLK)

### 6.15.7 Programming Examples

#### **Example 1:**

The SPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from MSB first.
- SPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Use the first SPI slave select pin to connect with an off-chip slave device. The slave

selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (SPIx\_CLKDIV [8:0]) to determine the output frequency of SPI clock.
2. Write the SPIx\_SSCTL register a proper value for the related settings of Master mode:
  - 1) Clear AUTOSS (SPIx\_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
  - 2) Configure slave selection signal as active low by clearing SSACTPOL (SPIx\_SSCTL[2]) to 0.
  - 3) Enable slave selection signal by setting SS (SPIx\_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the SPIx\_CTL register to control the SPI master actions.
  - 1) Configure this SPI controller as master device by setting SLAVE (SPIx\_CTL[18]) to 0.
  - 2) Force the SPI clock idle state at low by clearing CLKPOL (SPIx\_CTL[3]) to 0.
  - 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx\_CTL[2]) to 1.
  - 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx\_CTL[1]) to 0.
  - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx\_CTL[12:8] = 0x08).
  - 6) Set MSB transfer first by clearing LSB (SPIx\_CTL[13]) to 0.
4. Set SPIEN (SPIx\_CTL[0]) to 1 to enable the data transfer with the SPI interface.
5. If this SPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the SPIx\_TX register.
6. Waiting for SPI interrupt if the UNITIEN (SPIx\_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx\_STATUS[1]).
7. Read out the received one byte data from SPIx\_RX register.
8. Go to 5) to continue another data transfer or set SS (SPIx\_SSCTL[0]) to 0 to inactivate the off-chip slave device.

**Example 2:**

The SPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip SPI slave controller through the SPI interface with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from LSB first.
- SPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the SPIx\_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (SPIx\_SSCTL[2]) to 1.
3. Write the related settings into the SPIx\_CTL register to control this SPI slave actions

- 1) Set the SPI controller as slave device by setting SLAVE (SPIx\_CTL[18]) to 1.
- 2) Select the SPI clock idle state at high by setting CLKPOL (SPIx\_CTL[3]) to 1.
- 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx\_CTL[2]) to 1.
- 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx\_CTL[1]) to 0.
- 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx\_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (SPIx\_CTL[13]) to 1.
5. Set the SPIEN (SPIx\_CTL[0]) to 1. Wait for the slave select trigger input and SPI clock input from the off-chip master device to start the data transfer.
6. If this SPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the SPIx\_TX register.
7. If this SPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the SPIx\_TX register does not need to be updated by software.
8. Waiting for SPI interrupt if the UNITIEN (SPIx\_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx\_STATUS[1]).
9. Read out the received one byte data from SPIx\_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

### 6.15.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>SPI Base Address:</b> $\text{SPIx\_BA} = 0x4006\_0000 + (0x0000\_1000 * x)$ $x=1, 2$				
<b>SPIx_CTL</b>	SPIx_BA+0x00	R/W	SPI Control Register	0x0000_0034

x=1, 2, for M258xG

### 6.15.9 Register Description

SPI (SPIx_CTL)	Control	Register
-------------------	---------	----------

Register	Offset	R/W	Description	Reset Value
SPIx_CTL	SPIx_BA+0x00	R/W	SPI Control Register	0x0000_0034

**Note:** Not supported in I<sup>2</sup>S mode.

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved			DATDIR	REORDER	SLAVE	UNITIEN	Reserved
15	14	13	12	11	10	9	8
RXONLY	HALFDPX	LSB	DWIDTH				
7	6	5	4	3	2	1	0
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN

Bits	Description
[31:21]	<b>Reserved</b> Reserved.
[20]	<b>DATDIR</b> <b>Data Port Direction Control</b> This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer 0 = SPI data is input direction. 1 = SPI data is output direction.
[19]	<b>REORDER</b> <b>Byte Reorder Function Enable Bit</b> 0 = Byte Reorder Function Disabled. 1 = Byte Reorder Function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV. <b>Note:</b> Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.
[18]	<b>SLAVE</b> <b>Slave Mode Control</b> 0 = Master mode. 1 = Slave mode.
[17]	<b>UNITIEN</b> <b>Unit Transfer Interrupt Enable Bit</b> 0 = SPI unit transfer interrupt Disabled. 1 = SPI unit transfer interrupt Enabled.
[16]	<b>Reserved</b> Reserved.
[15]	<b>RXONLY</b> <b>Receive-only Mode Enable Bit for Master Only</b> This bit field is only available in Master mode. In receive-only mode, SPI Master will generate SPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status. 0 = Receive-only mode Disabled. 1 = Receive-only mode Enabled.
[14]	<b>HALFDPX</b> <b>SPI Half-Duplex Transfer Enable Bit</b> This bit is used to select full-duplex or half-duplex for SPI transfer. The bit field DATDIR (SPIx_CTL[20])

		<p>can be used to set the data direction in half-duplex transfer.</p> <p>0 = SPI operates in full-duplex transfer.</p> <p>1 = SPI operates in half-duplex transfer.</p>
[13]	<b>LSB</b>	<p><b>Send LSB First</b></p> <p>0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first.</p> <p>1 = The LSB, bit 0 of the SPI TX register, is sent first to the SPI data output pin, and the first bit received from the SPI data input pin will be put in the LSB position of the RX register (bit 0 of SPI_RX).</p>
[12:8]	<b>DWIDTH</b>	<p><b>Data Width</b></p> <p>This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits.</p> <p>DWIDTH = 0x08 .... 8 bits.</p> <p>DWIDTH = 0x09 .... 9 bits.</p> <p>.....</p> <p>DWIDTH = 0x1F .... 31 bits.</p> <p>DWIDTH = 0x00 .... 32 bits.</p> <p><b>Note:</b> This bit field will decide the depth of TX/RX FIFO configuration in SPI mode. Therefore, changing this bit field will clear TX/RX FIFO by hardware automatically.</p>
[7:4]	<b>SUSPITV</b>	<p><b>Suspend Interval for Master Only</b></p> <p>The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation.</p> <p><math>(\text{SUSPITV} + 0.5) * \text{period of SPICLK clock cycle}</math></p> <p>Example:</p> <p>SUSPITV = 0x0 .... 0.5 SPICLK clock cycle.</p> <p>SUSPITV = 0x1 .... 1.5 SPICLK clock cycle.</p> <p>.....</p> <p>SUSPITV = 0xE .... 14.5 SPICLK clock cycle.</p> <p>SUSPITV = 0xF .... 15.5 SPICLK clock cycle.</p>
[3]	<b>CLKPOL</b>	<p><b>Clock Polarity</b></p> <p>0 = SPI bus clock is idle low.</p> <p>1 = SPI bus clock is idle high.</p>
[2]	<b>TXNEG</b>	<p><b>Transmit on Negative Edge</b></p> <p>0 = Transmitted data output signal is changed on the rising edge of SPI bus clock.</p> <p>1 = Transmitted data output signal is changed on the falling edge of SPI bus clock.</p>
[1]	<b>RXNEG</b>	<p><b>Receive on Negative Edge</b></p> <p>0 = Received data input signal is latched on the rising edge of SPI bus clock.</p> <p>1 = Received data input signal is latched on the falling edge of SPI bus clock.</p>
[0]	<b>SPIEN</b>	<p><b>SPI Transfer Control Enable Bit</b></p> <p>In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1.</p> <p>0 = Transfer control Disabled.</p> <p>1 = Transfer control Enabled.</p> <p><b>Note:</b> Before changing the configurations of SPIx_CTL, SPIx_CLKDIV, SPIx_SSCTL and SPIx_FIFOCTL registers, user shall clear the SPIEN (SPIx_CTL[0]) and confirm the SPIENSTS (SPIx_STATUS[15]) is 0.</p>

**SPI** **Clock** **Divider** **Register**

Bits	Description	
[31]	<b>Reserved</b>	Reserved.
[30:28]	<b>TXTH</b>	<b>Transmit FIFO Threshold</b> If the valid data count of the transmit FIFO buffer is less than or equal to the TXTH setting, the TXTHIF bit will be set to 1, else the TXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[27]	<b>Reserved</b>	Reserved.
[26:24]	<b>RXTH</b>	<b>Receive FIFO Threshold</b> If the valid data count of the receive FIFO buffer is larger than the RXTH setting, the RXTHIF bit will be set to 1, else the RXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[23:11]	<b>Reserved</b>	Reserved.
[10]	<b>SLVBERX</b>	<b>RX FIFO Write Data Enable Bit When Slave Mode Bit Count Error for SPI Slave Mode Only</b> 0 = Uncompleted RX data will be dropped from RX FIFO when bit count error event happens in SPI slave mode. 1 = Uncompleted RX data will be written into RX FIFO when bit count error event happens in SPI slave mode. User can read SLVBENUM (SPIx_STATUS2[29:24]) to know the effective bit number of uncompleted RX data when SPI slave bit count error happened.
[9]	<b>TXFBCLR</b>	<b>Transmit FIFO Buffer Clear</b> 0 = No effect. 1 = Clear transmit FIFO pointer. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. <b>Note:</b> The TX shift register will not be cleared.
[8]	<b>RXFBCLR</b>	<b>Receive FIFO Buffer Clear</b> 0 = No effect. 1 = Clear receive FIFO pointer. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. <b>Note:</b> The RX shift register will not be cleared.

[7]	TXUFIE	<b>TX Underflow Interrupt Enable Bit</b> When TX underflow event occurs in Slave mode, TXUFIF (SPIx_STATUS[19]) will be set to 1. This bit is used to enable the TX underflow interrupt. 0 = Slave TX underflow interrupt Disabled. 1 = Slave TX underflow interrupt Enabled.
[6]	TXUFPOL	<b>TX Underflow Data Polarity</b> 0 = The SPI data out is keep 0 if there is TX underflow event in Slave mode. 1 = The SPI data out is keep 1 if there is TX underflow event in Slave mode. <b>Note 1:</b> The TX underflow event occurs if there is no any data in TX FIFO when the slave selection signal is active. <b>Note 2:</b> This bit should be set as 0 in I <sup>2</sup> S mode. <b>Note 3:</b> When TX underflow event occurs, SPIx_MISO pin state will be determined by this setting even though TX FIFO is not empty afterward. Data stored in TX FIFO will be sent through SPIx_MISO pin in the next transfer frame.
[5]	RXOVIE	<b>Receive FIFO Overrun Interrupt Enable Bit</b> 0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.
[4]	RXTIOEN	<b>Slave Receive Time-out Interrupt Enable Bit</b> 0 = Receive time-out interrupt Disabled. 1 = Receive time-out interrupt Enabled.
[3]	TXTHIE	<b>Transmit FIFO Threshold Interrupt Enable Bit</b> 0 = TX FIFO threshold interrupt Disabled. 1 = TX FIFO threshold interrupt Enabled.
[2]	RXTHIE	<b>Receive FIFO Threshold Interrupt Enable Bit</b> 0 = RX FIFO threshold interrupt Disabled. 1 = RX FIFO threshold interrupt Enabled.
[1]	TXRST	<b>Transmit Reset</b> 0 = No effect. 1 = Reset transmit FIFO pointer and transmit circuit. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not. <b>Note:</b> If TX underflow event occurs in SPI Slave mode, this bit can be used to make SPI return to idle state.
[0]	RXRST	<b>Receive Reset</b> 0 = No effect. 1 = Reset receive FIFO pointer and receive circuit. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not.

# SPI Status Register

Register	Offset	R/W	Description	Reset Value
SPIx_STATUS	SPIx_BA+0x14	R/W	SPI Status Register	0x0005_0110

Note: Not supported in I<sup>2</sup>S mode.

31	30	29	28	27	26	25	24
TXCNT				RXCNT			
23	22	21	20	19	18	17	16
TXRXRST	Reserved			TXUFIF	TXTHIF	TXFULL	TXEMPTY
15	14	13	12	11	10	9	8
SPIENSTS	Reserved			RXTOIF	RXOVIF	RXTHIF	RXFULL
7	6	5	4	3	2	1	0
SLVURIF	SLVBEIF	Reserved	SSLINE	SSINAIF	SSACTIF	UNITIF	BUSY

Bits	Description
[31:28] TXCNT	<b>Transmit FIFO Data Count (Read Only)</b> This bit field indicates the valid data count of transmit FIFO buffer.
[27:24] RXCNT	<b>Receive FIFO Data Count (Read Only)</b> This bit field indicates the valid data count of receive FIFO buffer.
[23] TXRXRST	<b>TX or RX Reset Status (Read Only)</b> 0 = The reset function of TXRST or RXRST is done. 1 = Doing the reset function of TXRST or RXRST. <b>Note:</b> Both the reset operations of TXRST and RXRST need 3 system clock cycles + 2 peripheral clock cycles. User can check the status of this bit to monitor the reset function is doing or done.
[22:20] Reserved	Reserved.
[19] TXUFIF	<b>TX Underflow Interrupt Flag</b> When the TX underflow event occurs, this bit will be set to 1, the state of data output pin depends on the setting of TXUFPOL. 0 = No effect. 1 = No data in Transmit FIFO and TX shift register when the slave selection signal is active. <b>Note 1:</b> This bit will be cleared by writing 1 to it. <b>Note 2:</b> If reset slave's transmission circuit when slave selection signal is active, this flag will be set to 1 after 2 peripheral clock cycles + 3 system clock cycles since the reset operation is done.
[18] TXTHIF	<b>Transmit FIFO Threshold Interrupt Flag (Read Only)</b> 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TXTH. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TXTH.
[17] TXFULL	<b>Transmit FIFO Buffer Full Indicator (Read Only)</b> 0 = Transmit FIFO buffer is not full. 1 = Transmit FIFO buffer is full.
[16] TXEMPTY	<b>Transmit FIFO Buffer Empty Indicator (Read Only)</b>

		0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[15]	<b>SPIENSTS</b>	<b>SPI Enable Status (Read Only)</b> 0 = SPI controller Disabled. 1 = SPI controller Enabled. <b>Note:</b> The SPI peripheral clock is asynchronous with the system clock. In order to make sure the SPI control logic is disabled, this bit indicates the real status of SPI controller.
[14:13]	<b>Reserved</b>	Reserved.
[12]	<b>RXTOIF</b>	<b>Receive Time-out Interrupt Flag</b> 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. <b>Note:</b> This bit will be cleared by writing 1 to it.
[11]	<b>RXOVIF</b>	<b>Receive FIFO Overrun Interrupt Flag</b> When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. 0 = No FIFO is overrun. 1 = Receive FIFO is overrun. <b>Note:</b> This bit will be cleared by writing 1 to it.
[10]	<b>RXTHIF</b>	<b>Receive FIFO Threshold Interrupt Flag (Read Only)</b> 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH.
[9]	<b>RXFULL</b>	<b>Receive FIFO Buffer Full Indicator (Read Only)</b> 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	<b>RXEMPTY</b>	<b>Receive FIFO Buffer Empty Indicator (Read Only)</b> 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7]	<b>SLVURIF</b>	<b>Slave Mode TX Under Run Interrupt Flag</b> In Slave mode, if TX underflow event occurs and the slave select line goes to inactive state, this interrupt flag will be set to 1. 0 = No Slave TX under run event. 1 = Slave TX under run event occurred. <b>Note:</b> This bit will be cleared by writing 1 to it.
[6]	<b>SLVBEIF</b>	<b>Slave Mode Bit Count Error Interrupt Flag</b> In Slave mode, when the slave select line goes to inactive state, if bit counter is mismatch with DWIDTH, this interrupt flag will be set to 1. 0 = No Slave mode bit count error event. 1 = Slave mode bit count error event occurred. <b>Note:</b> If the slave select active but there is no any bus clock input, the SLVBEIF also active when the slave select goes to inactive state. This bit will be cleared by writing 1 to it.
[5]	<b>Reserved</b>	Reserved.
[4]	<b>SSLIN</b>	<b>Slave Select Line Bus Status (Read Only)</b> 0 = The slave select line status is 0. 1 = The slave select line status is 1. <b>Note:</b> This bit is only available in Slave mode. If SSACTPOL (SPIx_SSCTL[2]) is set 0, and the SSLIN is

		1, the SPI slave select is in inactive status.
[3]	SSINAIF	<b>Slave Select Inactive Interrupt Flag</b> 0 = Slave select inactive interrupt was cleared or not occurred. 1 = Slave select inactive interrupt event occurred. <b>Note:</b> Only available in Slave mode. This bit will be cleared by writing 1 to it.
[2]	SSACTIF	<b>Slave Select Active Interrupt Flag</b> 0 = Slave select active interrupt was cleared or not occurred. 1 = Slave select active interrupt event occurred. <b>Note:</b> Only available in Slave mode. This bit will be cleared by writing 1 to it.
[1]	UNITIF	<b>Unit Transfer Interrupt Flag</b> 0 = No transaction has been finished since this bit was cleared to 0. 1 = SPI controller has finished one unit transfer. <b>Note:</b> This bit will be cleared by writing 1 to it.
[0]	BUSY	<b>Busy Status (Read Only)</b> 0 = SPI controller is in idle state. 1 = SPI controller is in busy state. The following lists the bus busy conditions: a. SPIEN (SPIx_CTL[0]) = 1 and TXEMPTY = 0. b. For SPI Master mode, SPIEN (SPIx_CTL[0]) = 1 and TXEMPTY = 1 but the current transaction is not finished yet. c. For SPI Master mode, SPIEN (SPIx_CTL[0]) = 1 and RXONLY = 1. d. For SPI Slave mode, SPIEN (SPIx_CTL[0]) = 1 and there is serial clock input into the SPI core logic when slave select is active. e. For SPI Slave mode, SPIEN (SPIx_CTL[0]) = 1 and the transmit buffer or transmit shift register is not empty even if the slave select is inactive.

## SPI Status2 Register

## 6.16 Quad Serial Peripheral Interface (QSPI)

### 6.16.1 Overview

The Quad Serial Peripheral Interface (QSPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The chip contains one QSPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device.

The QSPI controller supports 2-bit Transfer mode to perform full-duplex 2-bit data transfer and also supports Dual and Quad I/O Transfer mode and the controller supports the PDMA function to access the data buffer. Please refer to the M251/M252/M254/M256/M258 Datasheet for detailed information about maximum QSPI clock frequency of QSPI master mode and QSPI slave mode and range of QSPI operation voltage.

### 6.16.2 Features

- Supports one QSPI controller
- Supports Master or Slave mode operation
- Supports 2-bit Transfer mode
- Supports Dual and Quad I/O Transfer mode
- Configurable bit length of a transaction word from 8 to 32-bit
- Provides separate 8-level depth transmit and receive FIFO buffers
- Supports MSB first or LSB first transfer sequence
- Supports Byte Reorder function
- Supports Byte or Word Suspend mode
- Supports PDMA transfer
- Supports 3-Wire, no slave selection signal, bi-direction interface
- Supports one data channel half-duplex transfer
- Supports receive-only mode

### 6.16.3 Block Diagram

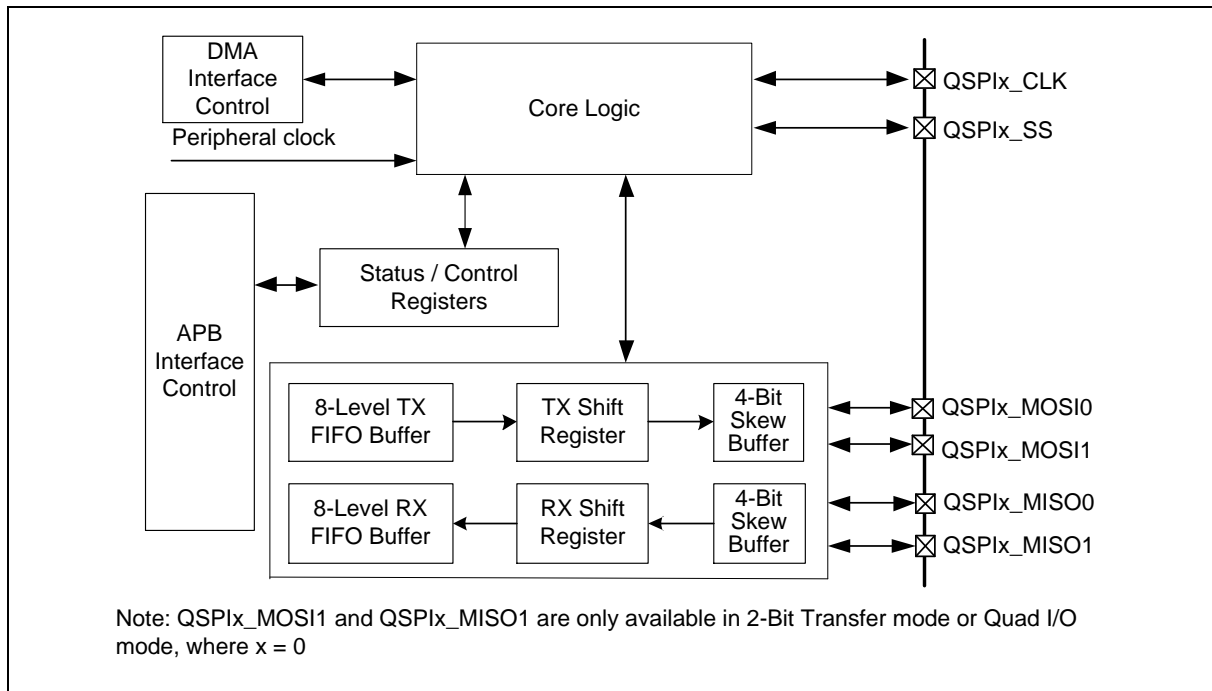

Figure 6.16-1 QSPI Block Diagram

#### **TX FIFO Buffer:**

The transmit FIFO buffer is a 8-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the QSPIx\_TX register.

#### **RX FIFO Buffer:**

The receive FIFO buffer is also a 8-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from QSPIx\_RX register by software.

#### **TX Shift Register:**

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

#### **RX Shift Register:**

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

#### **Skew Buffer:**

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from QSPI bus. In transmitting side, it is used to shift bits into QSPI bus from TX shift register.

### **6.16.4 Basic Configuration**

#### **6.16.4.1 QSPI0 Basic Configuration**

- Clock source Configuration
  - Select the source of QSPI0 peripheral clock on QSPI0SEL (CLK\_CLKSEL2[3:2]).
  - Enable QSPI0 peripheral clock in QSPI0CKEN (CLK\_APBCLK0[12]).

- Reset Configuration
  - Reset QSPI0 controller in QSPI0RST (SYS\_IPRST1[12]).

### 6.16.5 Functional Description

#### 6.16.5.1 Terminology

##### QSPI Peripheral Clock and QSPI Bus Clock

The QSPI controller needs the peripheral clock to drive the QSPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (QSPi<sub>x</sub>\_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. QSPi<sub>x</sub>SEL of CLK\_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (QSPi<sub>x</sub>\_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

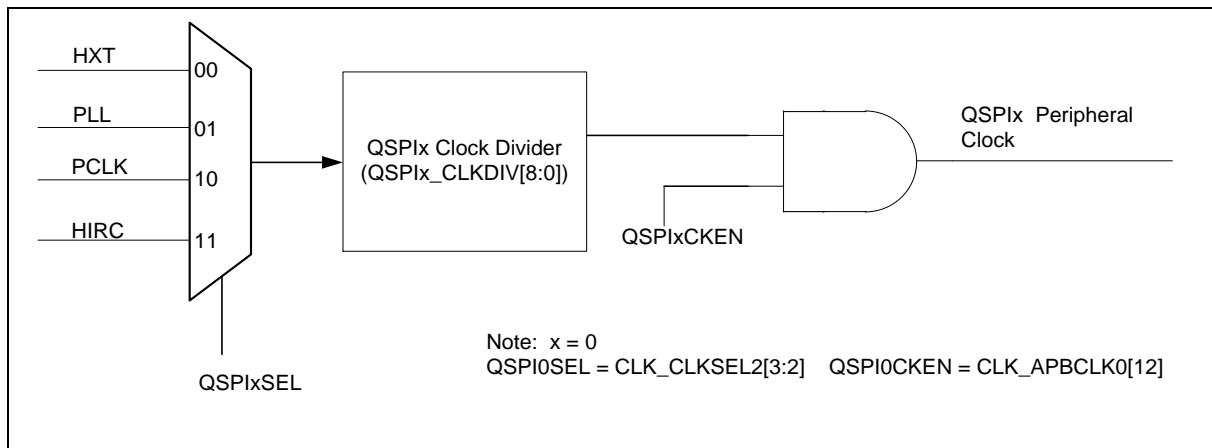

Figure 6.16-2 QSPI Peripheral Clock

In Master mode, the frequency of the QSPI bus clock is equal to the peripheral clock rate. In general, the QSPI bus clock is denoted as QSPI clock. In Slave mode, the QSPI bus clock is provided by a master device. The frequency of QSPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode.

##### Master/Slave mode

The QSPI controllers can be set as Master or Slave mode by setting the SLAVE (QSPi<sub>x</sub>\_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (QSPi<sub>x</sub>\_CTL[14]) can be used to select the full-duplex or half-duplex in QSPI transmission. The application block diagrams in Master and Slave mode are shown below.

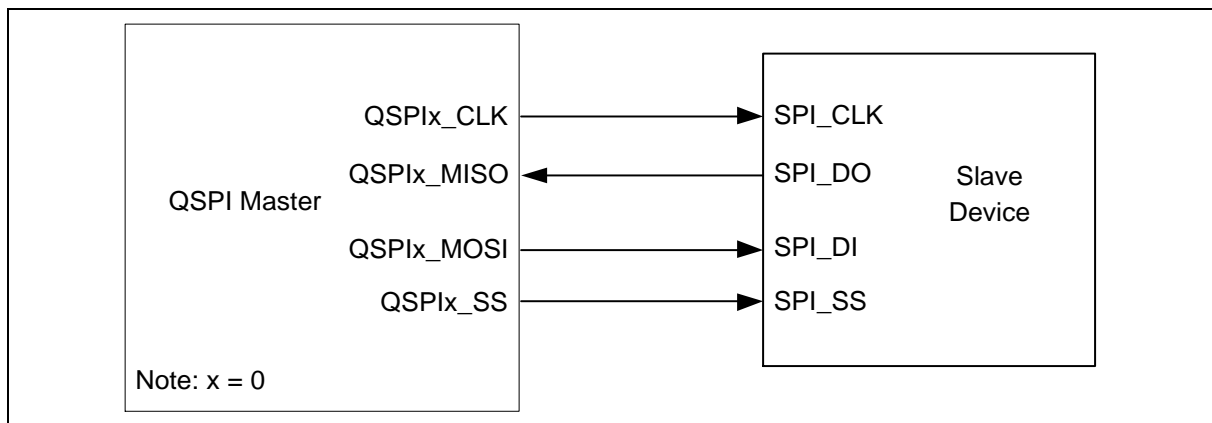

Figure 6.16-3 QSPI Full-Duplex Master Mode Application Block Diagram

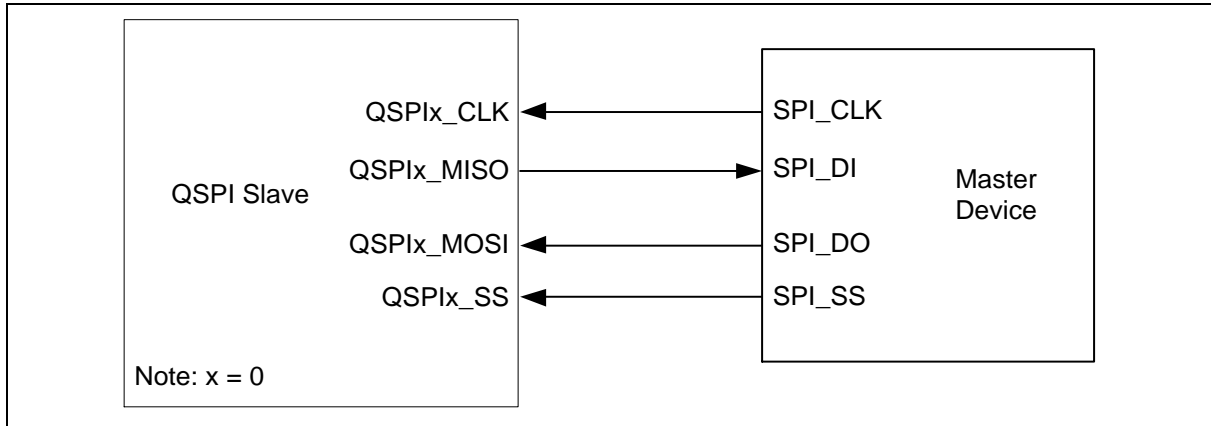

Figure 6.16-4 QSPI Full-Duplex Slave Mode Application Block Diagram

### **Slave Selection**

In Master mode, the QSPI controller can drive off-chip slave device through the slave select output pin QSPi\_x\_SS. In Slave mode, the off-chip master device drives the slave selection signal from the QSPi\_x\_SS input port to this QSPI controller. The duration between the slave select active edge and the first QSPI clock input shall over 3 QSPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (QSPi\_x\_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

### **Timing Condition**

The CLKPOL (QSPi\_x\_CTL[3]) defines the QSPI clock idle state. If CLKPOL = 1, the output QSPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (QSPi\_x\_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of QSPI clock. RXNEG (QSPi\_x\_CTL[1]) defines the data received either on negative edge or on positive edge of QSPI clock.

**Note:** The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

### **Transmit/Receive Bit Length**

The bit length of a transaction word is defined in DWIDTH (QSPi\_x\_CTL[12:8]) and can be configured up to 32-bit length in a transaction word for transmitting and receiving.

When QSPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (QSPi\_x\_CTL[12:8]), the unit transfer interrupt flag UNITIF (QSPi\_x\_STATUS[1]) will be set to 1.

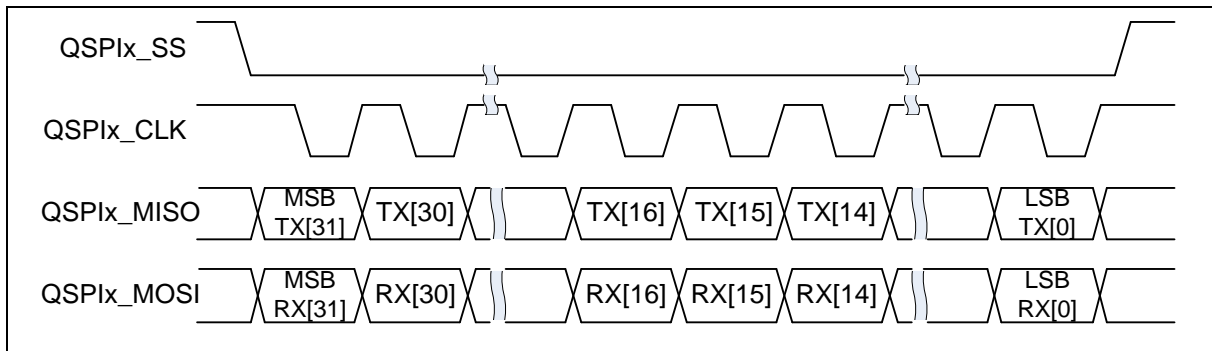

Figure 6.16-5 32-bit in One Transaction

#### **LSB/MSB First**

LSB (QSPi\_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (QSPi\_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (QSPi\_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

#### **Suspend Interval**

SUSPITV (QSPi\_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 QSPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 QSPI clock cycles).

#### **6.16.5.2 Automatic Slave Selection**

In Master mode, if AUTOSS (QSPi\_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the QSPi\_SS pin according to whether SS (QSPi\_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the QSPI controller when the QSPI data transfer is started by writing to FIFO. It will be set to inactive state when QSPI bus is idle. If QSPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (QSPi\_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (QSPi\_SSCTL[2]).

The duration between the slave selection signal active edge and the first QSPI bus clock edge is 1 QSPI bus clock cycle and the duration between the last QSPI bus clock and the slave selection signal inactive edge is 1.5 QSPI bus clock cycle.

Figure 6.16-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

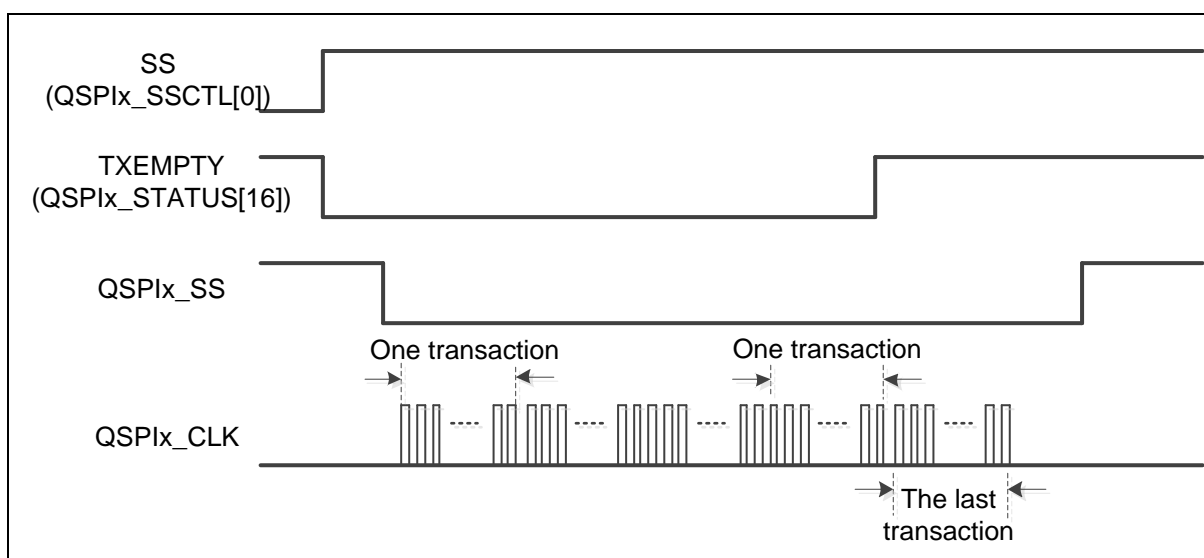

Figure 6.16-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

### 6.16.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (QSPIx\_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The QSPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

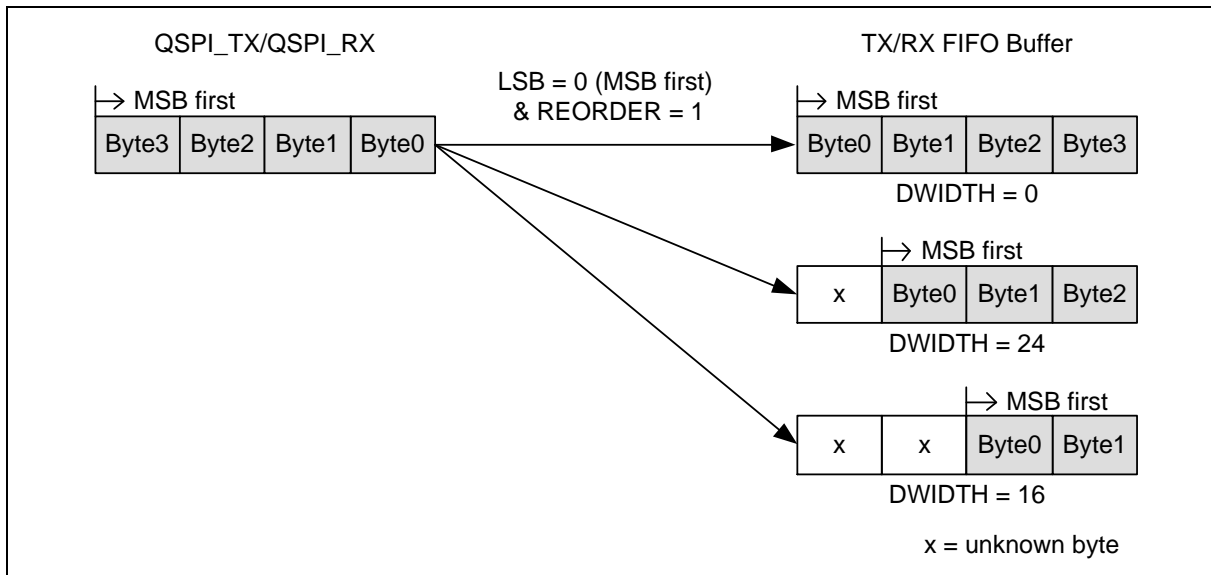

Figure 6.16-8 Byte Reorder Function

In Master mode, if REORDER (QSPIx\_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 QSPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (QSPIx\_CTL[7:4]).

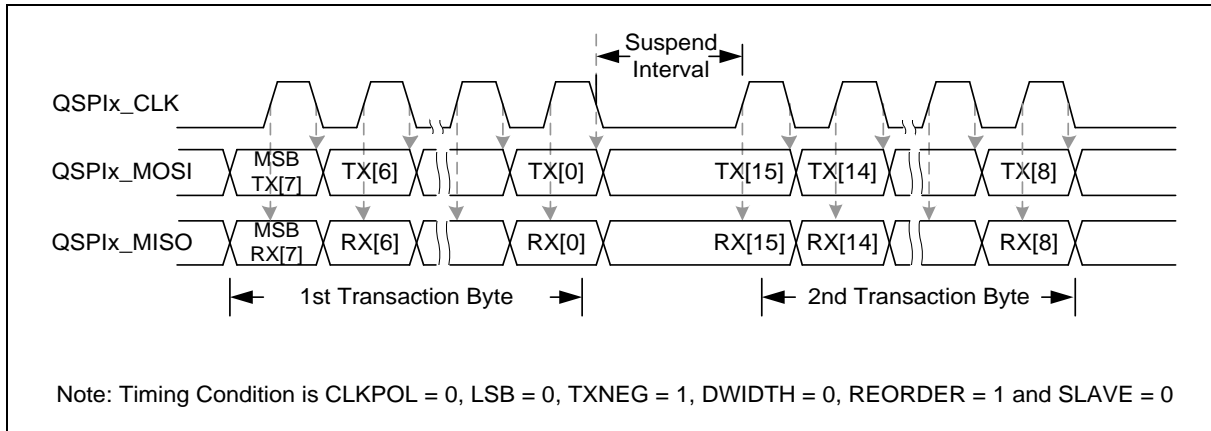

Figure 6.16-9 Timing Waveform for Byte Suspend

#### 6.16.5.4 Half-Duplex Communication

The QSPI controller can communicate in half-duplex mode by setting HALFDPX (QSPIx\_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (QSPIx\_CTL[20]). In half-duplex configuration, the QSPIx\_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (QSPIx\_CTL[14]) will produce TXFBCLR (QSPIx\_FIFOCCTL[9]) and RXFBCLR (QSPIx\_FIFOCCTL[8]) at the same time automatically.

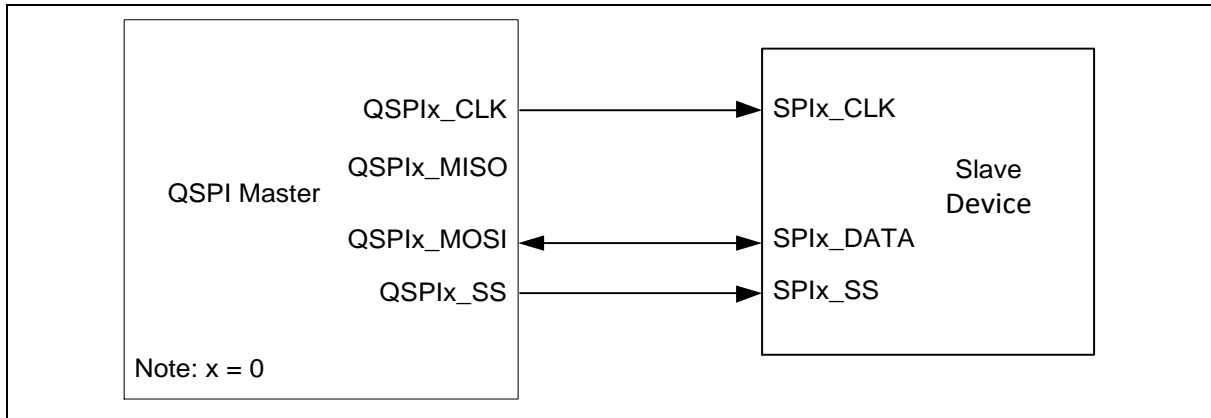

Figure 6.16-10 QSPI Half-Duplex Master Mode Application Block Diagram

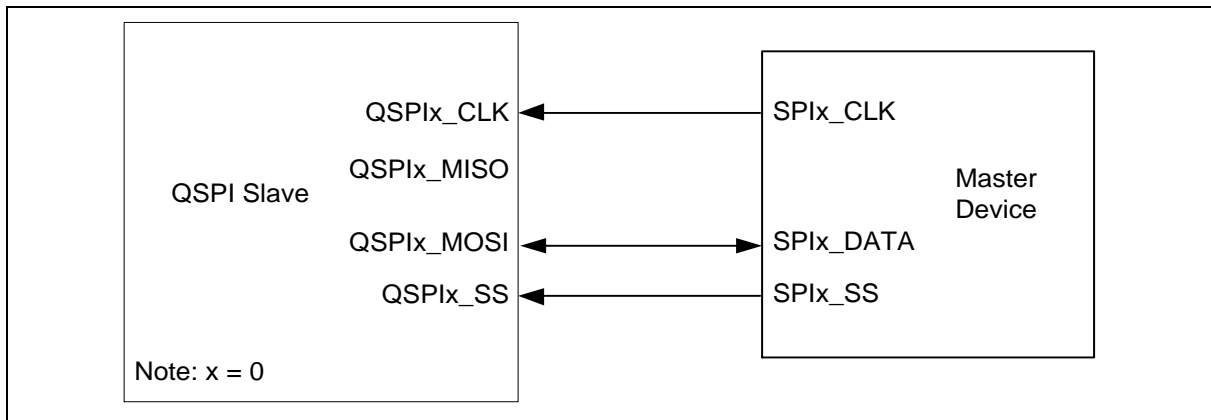

Figure 6.16-11 QSPI Half-Duplex Slave Mode Application Block Diagram

#### 6.16.5.5 Receive-Only Mode

In QSPI Master device, it can communicate in receive-only mode by setting RXONLY (QSPi<sub>x</sub>\_CTL[15]). In this configuration, the QSPI Master device will generate QSPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (QSPi<sub>x</sub>\_SSCTL[3]) is enabled in receive-only mode, QSPI Master will keep activating the slave select signal.

The remaining QSPi<sub>x</sub>\_MOSI pin of QSPI Master device is not used for communication and can be configured as GPIO. The status BUSY (QSPi<sub>x</sub>\_STATUS[0]) will be asserted in receive-only mode due to the generation of QSPI bus clock. Entering this mode will produce the TXFBCLR (QSPi<sub>x</sub>\_FIFOCTL[9]) and RXFBCLR (QSPi<sub>x</sub>\_FIFOCTL[8]) at the same time automatically. When user enables this mode, the output QSPI bus clock will be sent out after 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

When user sets RXONLY (QSPi<sub>x</sub>\_CTL[15]) enable, QSPI RX data with data bit width of DWIDTH (QSPi<sub>x</sub>\_CTL[12:8]) will be received into RX FIFO and QSPI clock will be sent to SPI slave device until RX FIFO is full.

For two-bit transfer mode TWOBIT (QSPi<sub>x</sub>\_CTL[16]) disable, the QSPI master will send QSPI output clock to SPI slave and receive RX data when RX FIFO counter RXCNT (QSPi<sub>x</sub>\_STATUS[27:24]) is less than or equal to 6.

For two-bit transfer mode TWOBIT (QSPi<sub>x</sub>\_CTL[16]) enable, the QSPI master will send QSPI output clock to SPI slave and receive RX data when RX FIFO counter RXCNT (QSPi<sub>x</sub>\_STATUS[27:24]) is less than or equal to 4.

#### 6.16.5.6 Slave 3-Wire Mode

When SLV3WIRE (QSPIx\_SSCTL[4]) is set by software to enable the Slave 3-Wire mode, the QSPI controller can work with no slave selection signal in Slave mode. The SLV3WIRE (QSPIx\_SSCTL[4]) only takes effect in Slave mode. Only three pins, QSPIx\_CLK, QSPIx\_MISO, and QSPIx\_MOSI, are required to communicate with a SPI master. The QSPIx\_SS pin can be configured as a GPIO. When the SLV3WIRE (QSPIx\_SSCTL[4]) is set to 1, the QSPI slave will be ready to transmit/receive data after the SPIEN (QSPIx\_CTL[0]) is set to 1.

#### 6.16.5.7 PDMA Transfer Function

QSPI controller supports PDMA transfer function.

When TXPDMAEN (QSPIx\_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (QSPIx\_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. QSPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

When PDMA transfer is done, user needs to disable TXPDMAEN/RXPDMAEN. After re-setting control registers of PDMA, user enables TXPDMAEN/RXPDMAEN again.

**Note:** QSPI supports single request PDMA (Read/Write) only, burst request PDMA is not supported.

#### 6.16.5.8 Two-bit Transfer Mode

The QSPI controller also supports 2-bit Transfer mode when setting TWOBIT (QSPIx\_CTL[16]) to 1. In 2-bit Transfer mode, the QSPI controller performs full duplex data transfer. In other words, the two serial data bits can be transmitted and received simultaneously.

For example, in Master mode, the even data (TX Data (n)) stored in the QSPIx\_TX register will be transmitted through the QSPIx\_MOSI0 pin and the odd data (TX Data (n+1)) stored in the QSPIx\_TX register will be transmitted through the QSPIx\_MOSI1 pin respectively. In the meanwhile, the even data received from QSPIx\_MISO0 pin will be written to RX FIFO prior to the odd data received from QSPIx\_MISO1 pin.

In Slave mode, the even and odd data stored in the QSPIx\_TX register will be transmitted through the QSPIx\_MISO0 pin and QSPIx\_MISO1 pin respectively. In the meanwhile, the QSPIx\_RX register will store the even data received from the QSPIx\_MOSI0 pin and the odd data from QSPIx\_MOSI1 pin respectively. The data sequence of FIFO buffers is the same as the Master mode.

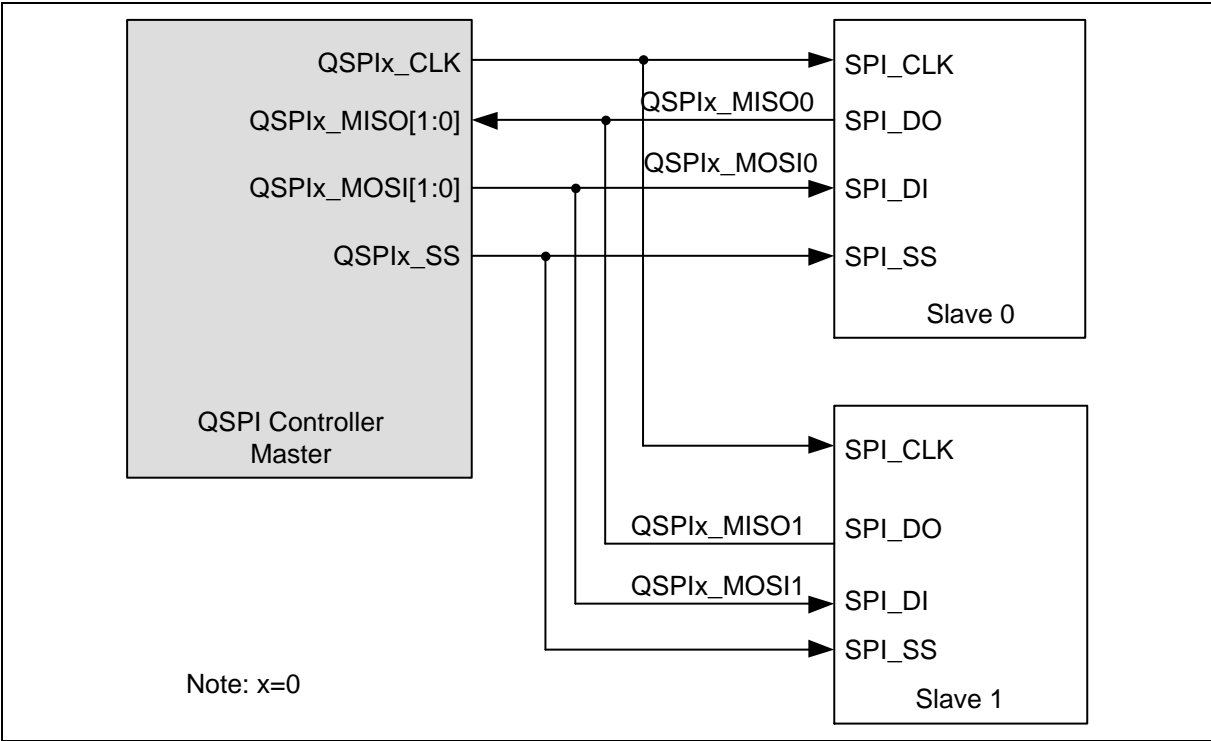

Figure 6.16-12 Two-bit Transfer Mode System Architecture

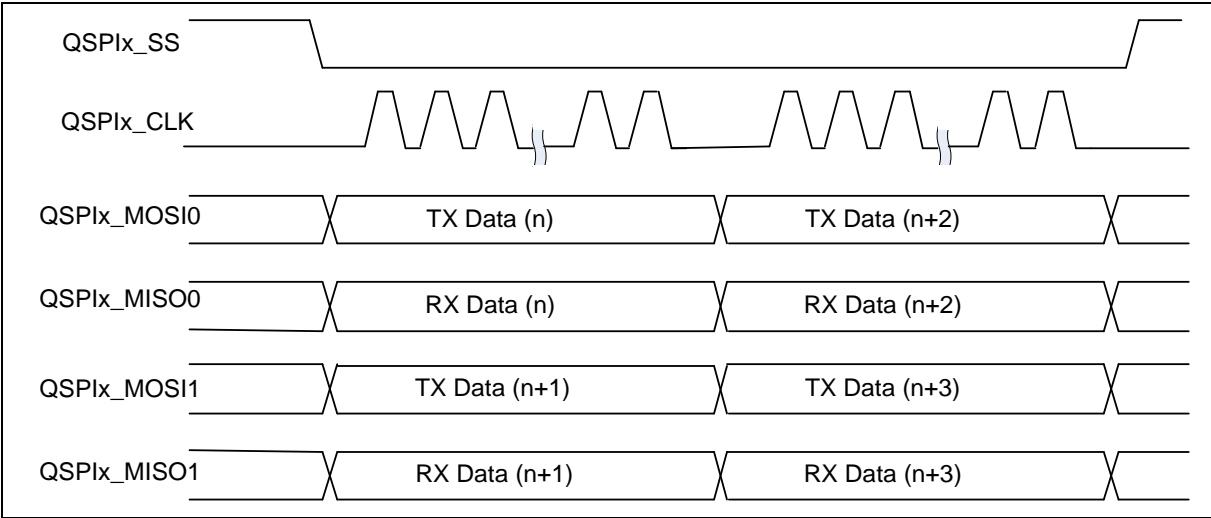

Figure 6.16-13 Two-bit Transfer Mode Timing (Master Mode)

6.16.5.9 Dual I/O Mode

The QSPI controller also supports Dual I/O transfer when setting the DUALIOEN ((QSPIx\_CTL[21]) to 1. Many general SPI Flashes support Dual I/O transfer. The DATDIR (QSPIx\_CTL[20]) is used to define the direction of the transfer data. When the DATDIR bit is set to 1, the controller will send the data to external device. When the DATDIR bit is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Dual I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled.

For Dual I/O mode, if both the DUALIOEN (QSPIx\_CTL[21]) and DATDIR (QSPIx\_CTL[20]) are set as

1, the QSPi<sub>x</sub>\_MOSI0 is the even bit data output and the QSPi<sub>x</sub>\_MISO0 will be set as the odd bit data output. If the DUALIOEN (QSPi<sub>x</sub>\_CTL[21]) is set as 1 and DATDIR (QSPi<sub>x</sub>\_CTL[20]) is set as 0, both the QSPi<sub>x</sub>\_MISO0 and QSPi<sub>x</sub>\_MOSI0 will be set as data input ports.

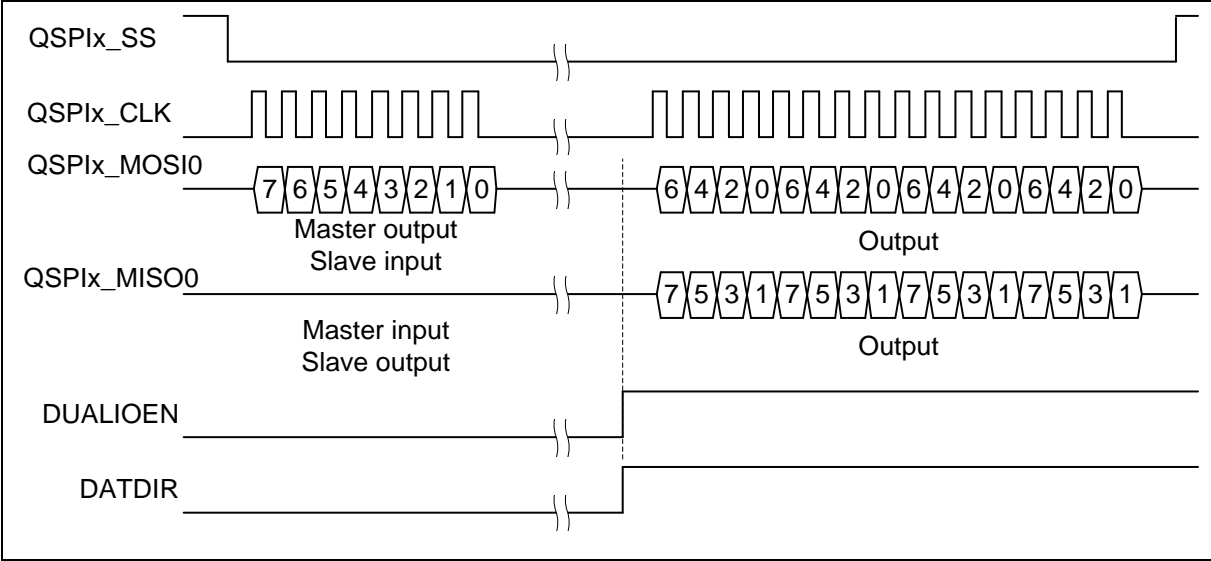

Figure 6.16-14 Bit Sequence of Dual Output Mode

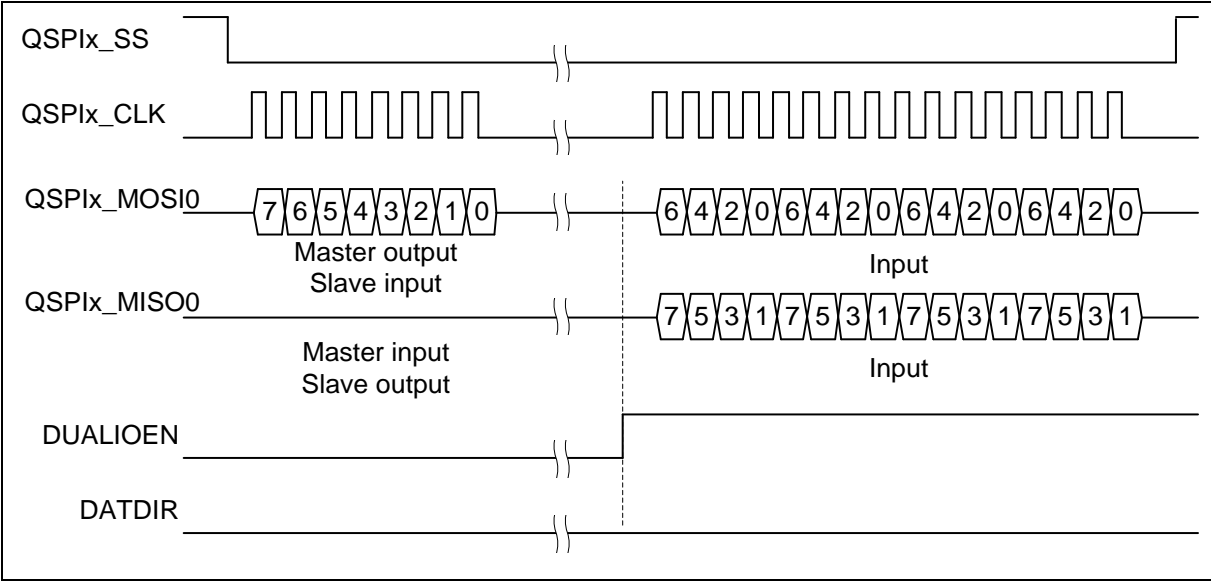

Figure 6.16-15 Bit Sequence of Dual Input Mode

6.16.5.10 Quad I/O Mode

The QSPI controller also supports Quad I/O transfer when setting the QUADIOEN (QSPi<sub>x</sub>\_CTL[22]) to 1. Many general SPI Flashs support Quad I/O transfer. The DATDIR bit (QSPi<sub>x</sub>\_CTL[20]) is used to define the direction of the transfer data. When the DATDIR (QSPi<sub>x</sub>\_CTL[20]) is set to 1, the controller will send the data to external device. When the DATDIR (QSPi<sub>x</sub>\_CTL[20]) is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Quad I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled. The DUALIOEN (QSPi<sub>x</sub>\_CTL[21]) and QUADIOEN (QSPi<sub>x</sub>\_CTL[22]) shall not be set to 1 simultaneously.

For Quad I/O mode, if both the QUADIOEN (QSPiX\_CTL[22]) and DATDIR (QSPiX\_CTL[20]) are set as 1, the QSPiX\_MOSI0 and QSPiX\_MOSI1 are the even bit data output and the QSPiX\_MISO0 and QSPiX\_MISO1 will be set as the odd bit data output. If the QUADIOEN (QSPiX\_CTL[22]) is set as 1 and DATDIR (QSPiX\_CTL[20]) is set as 0, all the QSPiX\_MISO0, QSPiX\_MISO1, QSPiX\_MOSI0 and QSPiX\_MOSI1 pins will be set as data input ports.

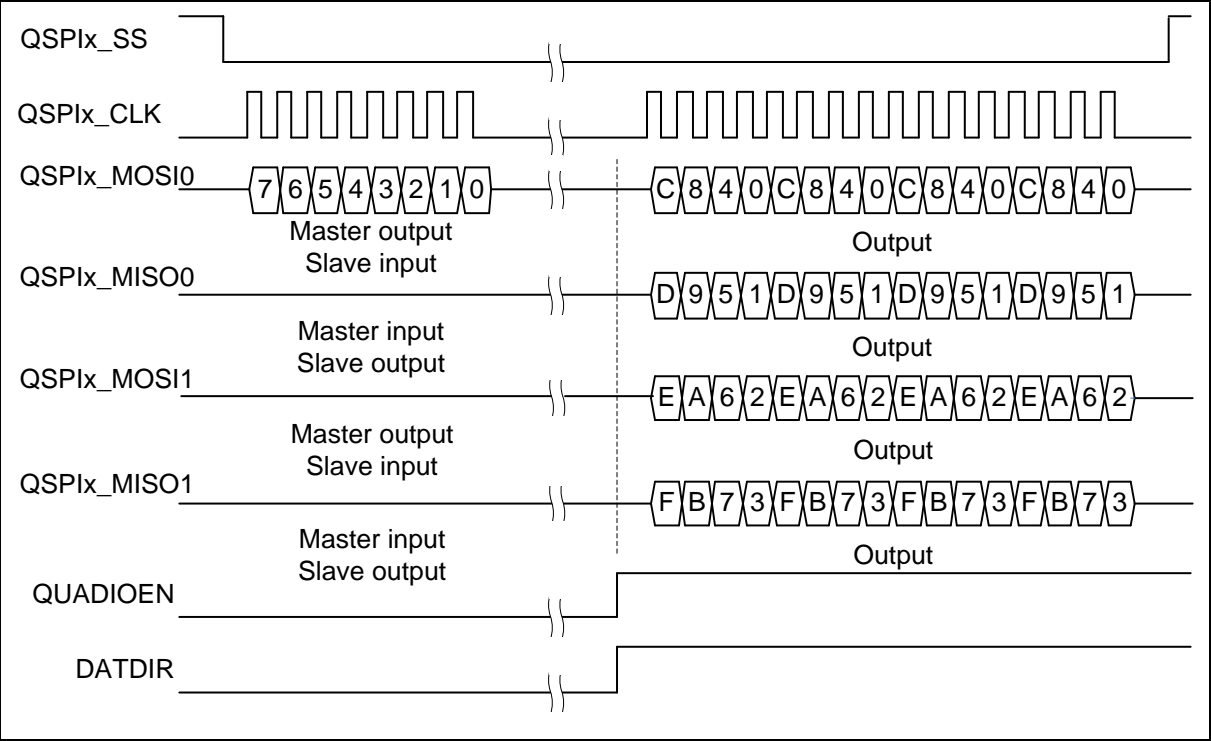

Figure 6.16-16 Bit Sequence of Quad Output Mode

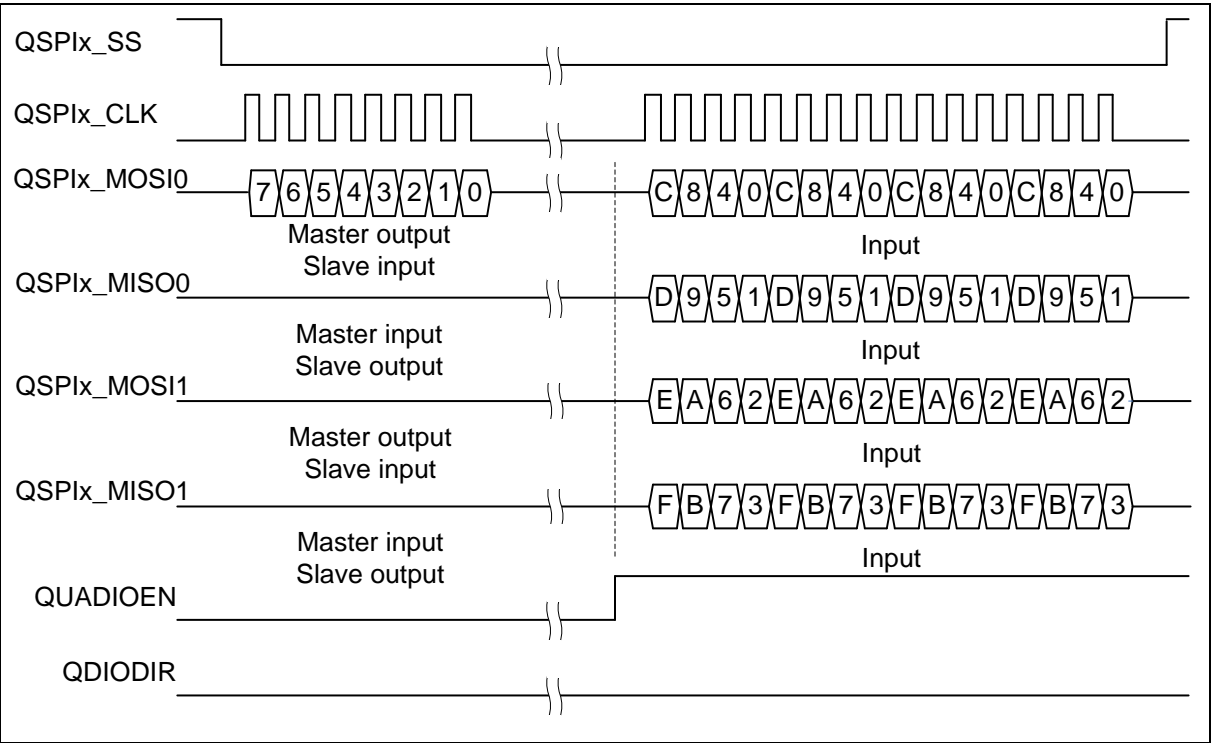

Figure 6.16-17 Bit Sequence of Quad Input Mode

#### 6.16.5.11 FIFO Buffer Operation

The QSPI controller is equipped with eight 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (QSPIx\_STATUS[17]) will be set to 1. When the QSPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (QSPIx\_STATUS[16]) will be set to 1. Note that the TXEMPTY (QSPIx\_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (QSPIx\_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the QSPI bus. (e.g. the slave selection signal is active and the QSPI controller is receiving data in Slave mode). It will be set to 0 when the transmit FIFO is empty and the current transaction is done. Thus, the status of BUSY (QSPIx\_STATUS[0]) should be checked by software to make sure whether the QSPI is in idle or not.

The receive control logic will store the QSPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (QSPIx\_STATUS[8]) and RXFULL (QSPIx\_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (QSPIx\_FIFCTL[30:28]) and RXTH (QSPIx\_FIFCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (QSPIx\_FIFCTL[30:28]) setting, TXTHIF (QSPIx\_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (QSPIx\_FIFCTL[26:24]) setting, RXTHIF (QSPIx\_STATUS[10]) will be set to 1.

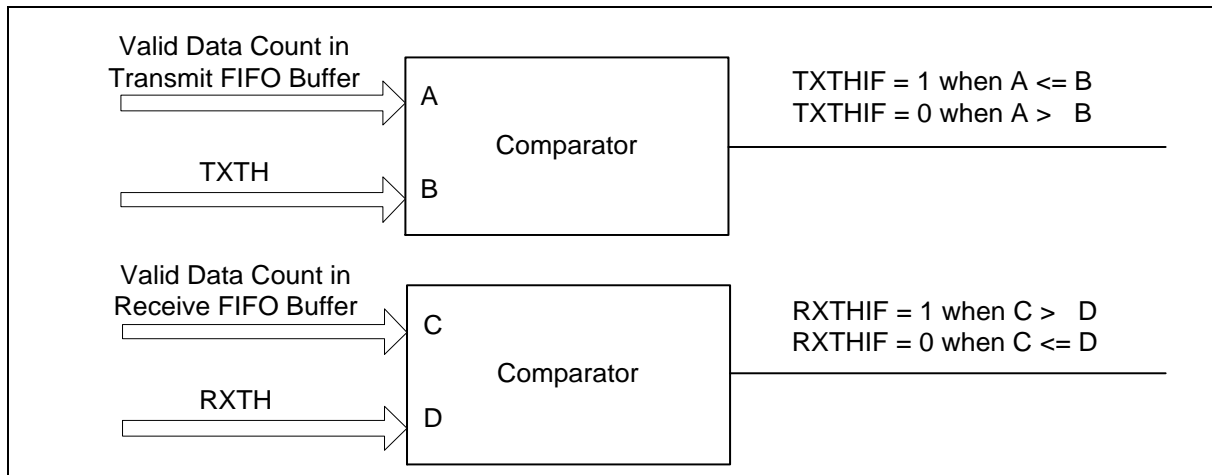

Figure 6.16-18 FIFO Threshold Comparator

In Master mode, when the first datum is written to the QSPIx\_TX register, the TXEMPTY flag (QSPIx\_STATUS[16]) will be cleared to 0. The transmission will start after 1 APB clock cycles and 6 peripheral clock cycles. User can write the next data into QSPIx\_TX register immediately. The QSPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (QSPIx\_CTL[7:4]). If the SUSPITV (QSPIx\_CTL[7:4]) equals 0, QSPI controller can perform continuous transfer. User can write data into QSPIx\_TX register as long as the TXFULL (QSPIx\_STATUS[17]) is 0.

In the example 1 of Figure 6.16-19, it indicates the updated condition of TXEMPTY (QSPIx\_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer. The TXEMPTY (QSPIx\_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (QSPIx\_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

In the Example 2 of Figure 6.16-19, it indicates the updated condition of TXFULL (QSPiX\_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the TXFULL = 1.

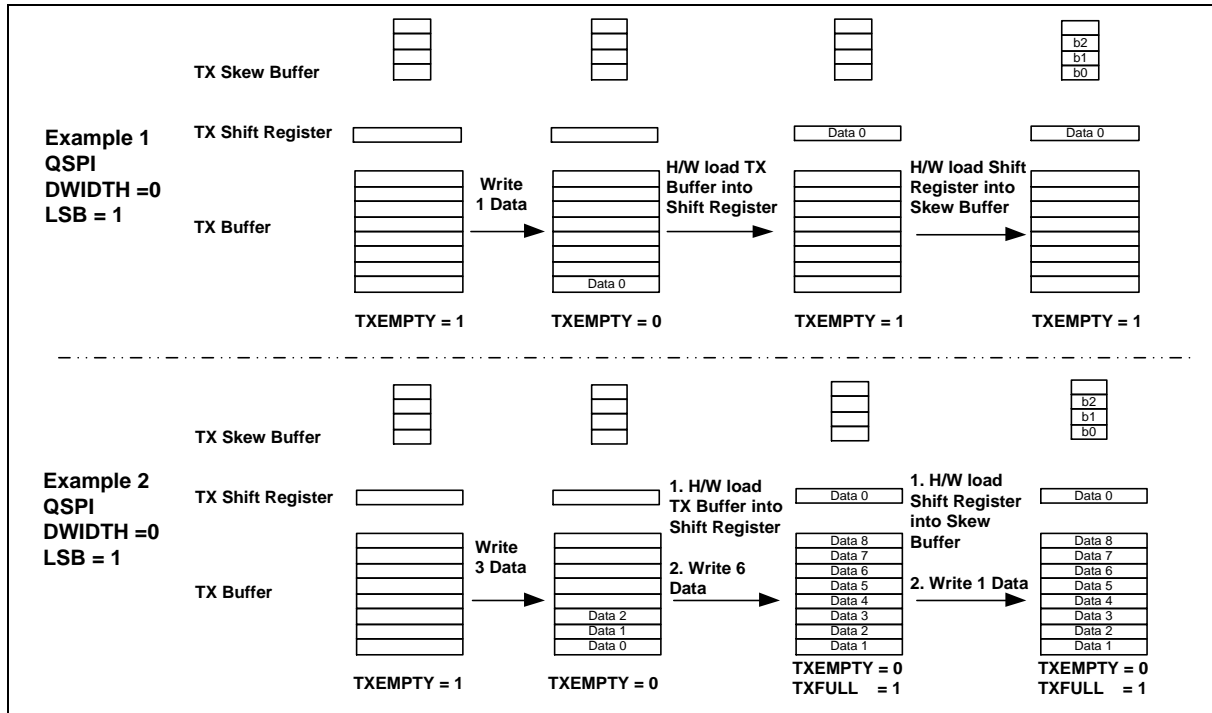

Figure 6.16-19 Transmit FIFO Buffer Example

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the QSPiX\_TX register does not be updated after all data transfer are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from QSPiX\_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (QSPiX\_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reach the value of DWIDTH (QSPiX\_CTL[12:8]). The RXEMPTY (QSPiX\_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer in Figure 6.16-20). The received data can be read by software from QSPiX\_RX register as long as the RXEMPTY (QSPiX\_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPiX\_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer in Figure 6.16-20).

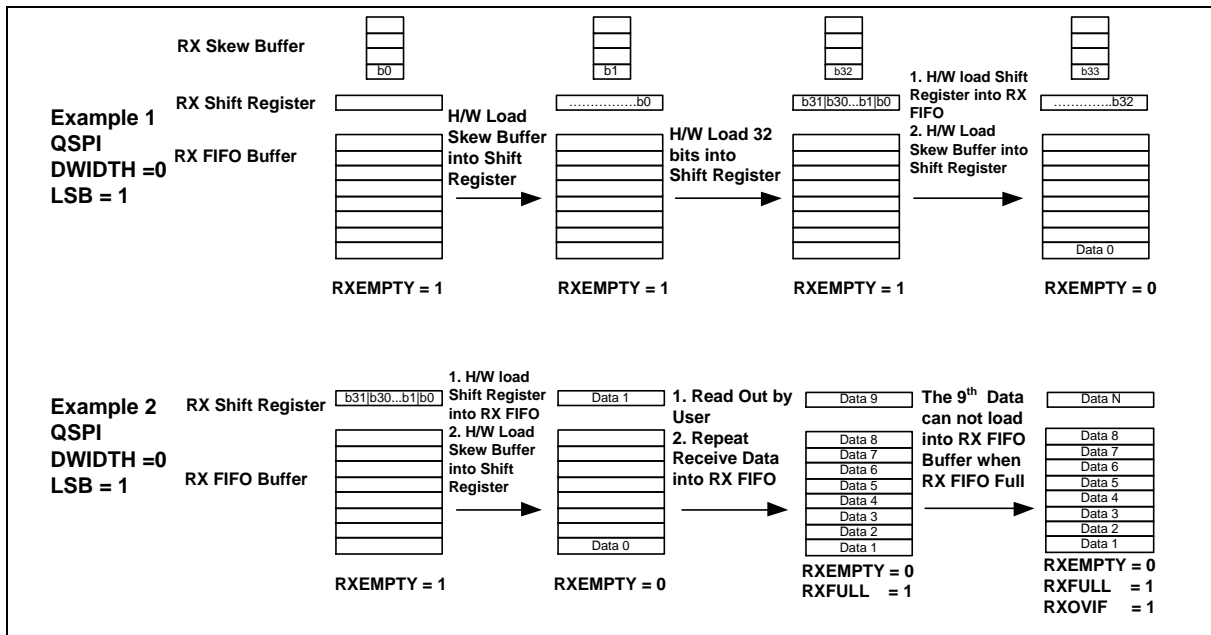

Figure 6.16-20 Receive FIFO Buffer Example

In Slave mode, during transmission operation, when data is written to the QSPIx\_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (QSPIx\_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to QSPIx\_TX register as long as the TXFULL (QSPIx\_STATUS[17]) is 0. After all data have been drawn out by the QSPI transmission logic unit and the QSPIx\_TX register is not updated by software, the TXEMPTY (QSPIx\_STATUS[16]) will be set to 1.

If there is no any data written to the QSPIx\_TX register, the transmit underflow interrupt flag, TXUFIF (QSPIx\_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (QSPIx\_FIFCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (QSPIx\_STATUS[7]), will be set to 1 as QSPIx\_SS goes to inactive state.

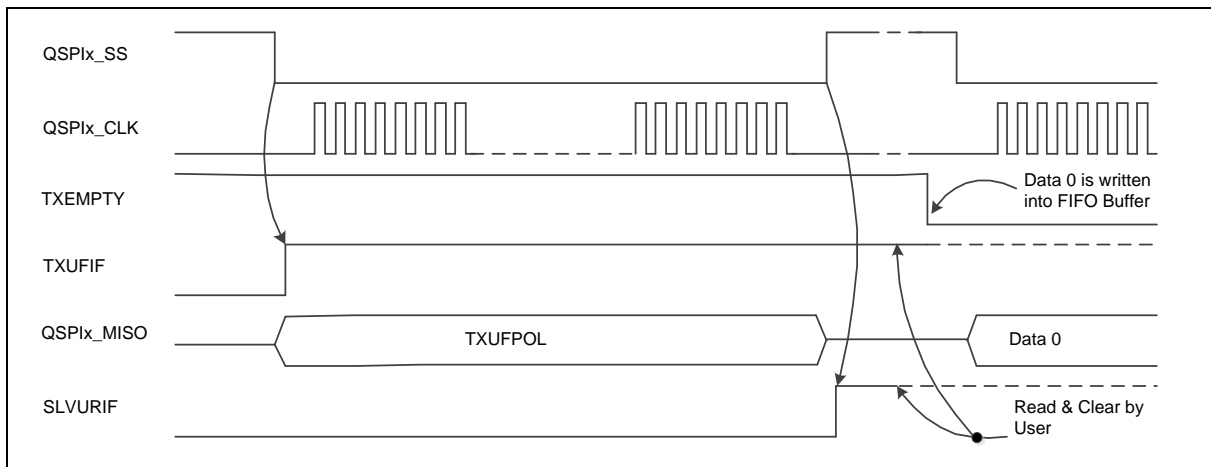

Figure 6.16-21 TX Underflow Event and Slave Under Run Event

In 2-bit Transfer mode, the transmit data is loaded into shift register after 2 datum have been written into the TX FIFO buffer. It uses two shift registers and two 4-level skew buffers concurrently. The detail timing of 2-bit Transfer mode, please refer to the section of Two-bit Transfer mode.

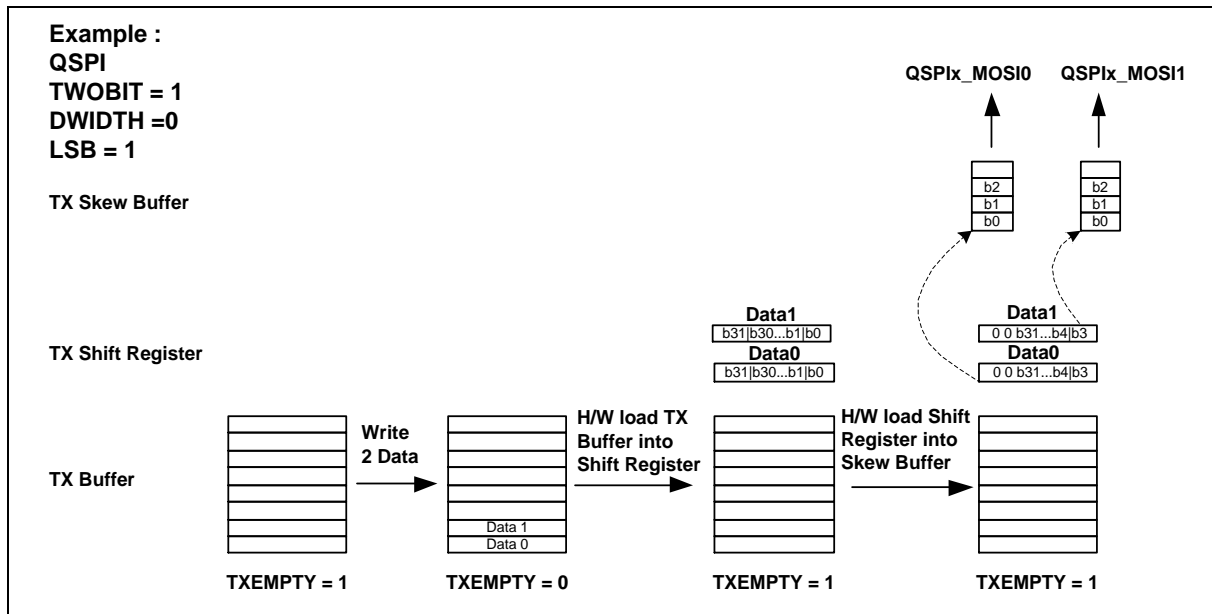

Figure 6.16-22 Two-bit Transfer Mode FIFO Buffer Example

In QSPI Slave 3-Wire mode, the first 2-bit data is un-predicted (keep on the level of last bit in previously transfer) if the data is written into TX FIFO among 3 peripheral clock cycles before the QSPI bus clock is presented. The other bits are held by TXUFPOL (QSPIx\_FIFCTL[6]) because there is TX underflow event. The written data will be transmitted in the next transfer.

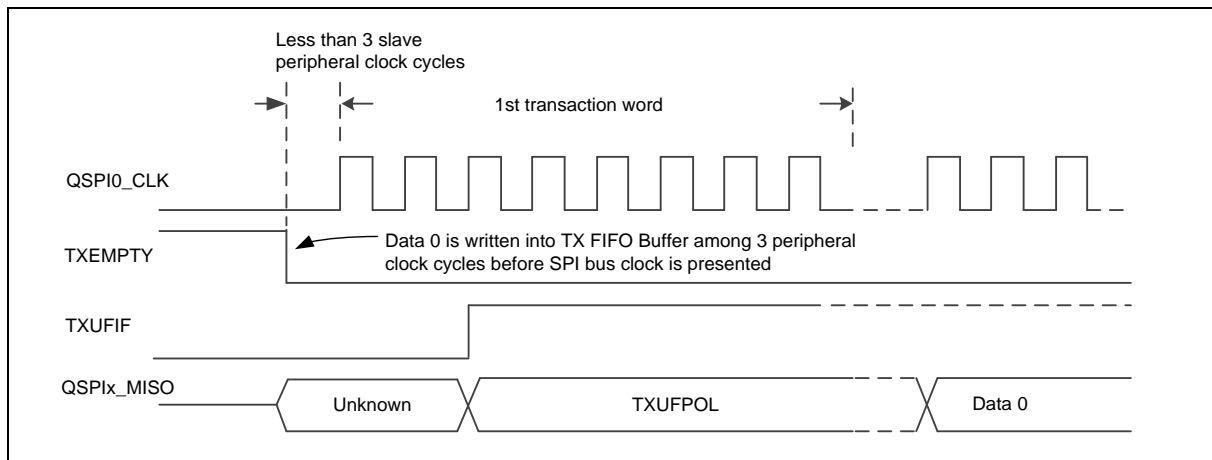

Figure 6.16-23 TX Underflow Event (QSPI0 Slave 3-Wire Mode Enabled)

In Slave mode, during receiving operation, the serial data is received from QSPIx\_MOSI pin and stored to QSPIx\_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx\_STATUS[9]) will be set to 1 and the RXOVIF (QSPIx\_STATUS[11]) will be set to 1 if there is more serial data received from QSPIx\_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Examples in Figure 6.16-20). If the receive bit count is mismatched with the DWIDTH (QSPIx\_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPIx\_STATUS[6]) will be set to 1.

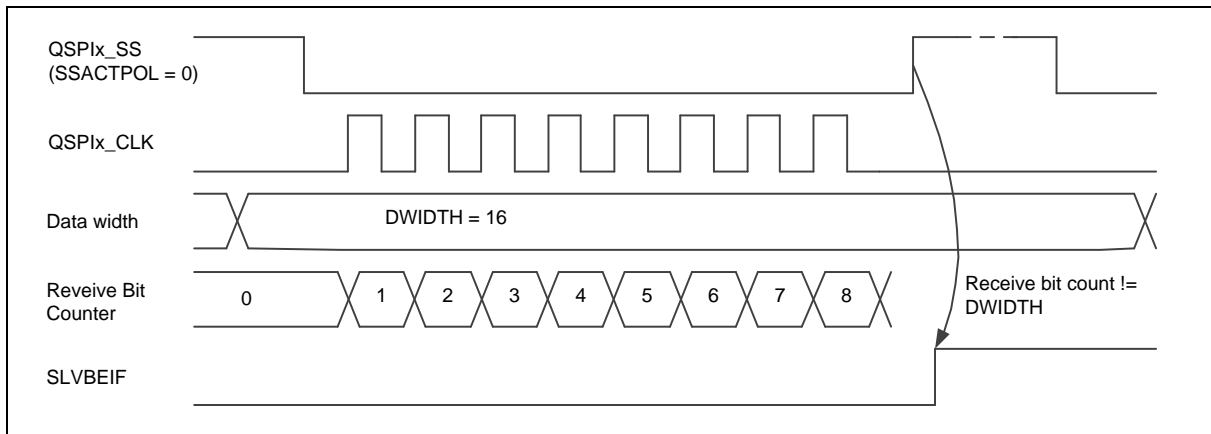

Figure 6.16-24 Slave Mode Bit Count Error

When the Slave select signal is active and the value of SLVTOCNT (QSPi\_SSCTL[31:16]) is not 0, the Slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT is set to 0. If the value of the time-out counter is equal to the value of SLVTOCNT before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPi\_STATUS[5]) will be set to 1.

Figure 6.16-25 Slave Time-out Event

The QSPI controller has the receive time-out function. When the receive FIFO is not empty and no read operation in receive FIFO over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTOIF (QSPi\_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

#### 6.16.5.12 Interrupt

- QSPI unit transfer interrupt

As the QSPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (QSPi\_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (QSPi\_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- QSPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (QSPiX\_STATUS[2]) and SSINAIF (QSPiX\_STATUS[3]), will be set to 1 when the SPIEN (QSPiX\_CTL[0]) and SLAVE (QSPiX\_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The QSPI controller will issue an interrupt if the SSINAIF (QSPiX\_SSCTL[13]) or SSACTIEN (QSPiX\_SSCTL[12]), are set to 1.

- Slave time-out interrupt

In Slave mode, there is slave time-out function for user to know that there is serial clock input but one transaction is not finished over the period of SLVTOCNT (QSPiX\_SSCTL[31:16]) basing on Slave peripheral clock.

When the slave selection signal is active and the value of SLVTOCNT (QSPiX\_SSCTL[31:16]) is not 0, the slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT (QSPiX\_SSCTL[31:16]) is set to 0. If the value of the time-out counter is greater than or equal to the value of SLVTOCNT (QSPiX\_SSCTL[31:16]) before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPiX\_STATUS[5]) will be set to 1. The QSPI controller will issue an interrupt if the SLVTOIEN (QSPiX\_SSCTL[5]) is set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count mismatch with the DWIDTH (QSPiX\_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPiX\_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The QSPI controller will issue an interrupt if the SLVBEIEN (QSPiX\_SSCTL[8]) is set to 1.

**Note:** If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (QSPiX\_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In QSPI Slave mode, if there is no any data is written to the QSPiX\_TX register, the TXUFIF (QSPiX\_STATUS[19]) will be set to 1 when the slave selection signal is active. The QSPI controller will issue a TX underflow interrupt if the TXUFIEN (QSPiX\_FIFCTL[7]) is set to 1.

**Note:** If underflow event occurs in QSPI Slave mode, there are two conditions which make QSPI Slave mode return to idle state and then go for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state while SLV3WIRE=0.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (QSPiX\_STATUS[7]) will be set to 1 when QSPiX\_SS goes to inactive state. The QSPI controller will issue a TX under run interrupt if the SLVURIEN (QSPiX\_SSCTL[9]) is set to 1.

**Note:** In Slave 3-Wire mode, the slave selection signal is considered active all the time so that user shall poll the TXUFIF (QSPiX\_STATUS[19]) to know if there is TX underflow event or not.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 8 unread data, the RXFULL (QSPiX\_STATUS[9]) will be set to 1 and the RXOVIF (QSPiX\_STATUS[11]) will be set to 1 if there is more serial data is received from QSPI bus and follow-up data will be dropped. The QSPI controller will issue an interrupt if the RXOVIEN (QSPiX\_FIFCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (QSPiX\_FIFCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (QSPiX\_FIFCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (QSPiX\_STATUS[18]) will be set to 1. The QSPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (QSPiX\_FIFCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (QSPiX\_FIFCTL[26:24]), the receive FIFO interrupt flag RXTHIF (QSPiX\_STATUS[10]) will be set to 1. The QSPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (QSPiX\_FIFCTL[2]), is set to 1.

### 6.16.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (QSPiX\_SSCTL[2]). The QSPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (QSPiX\_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (QSPiX\_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (QSPiX\_CTL[13]). User can also select which edge of QSPI clock to transmit/receive data in TXNEG/RXNEG (QSPiX\_CTL[2:1]). Four QSPI timing diagrams for master/slave operations and the related settings are shown below.

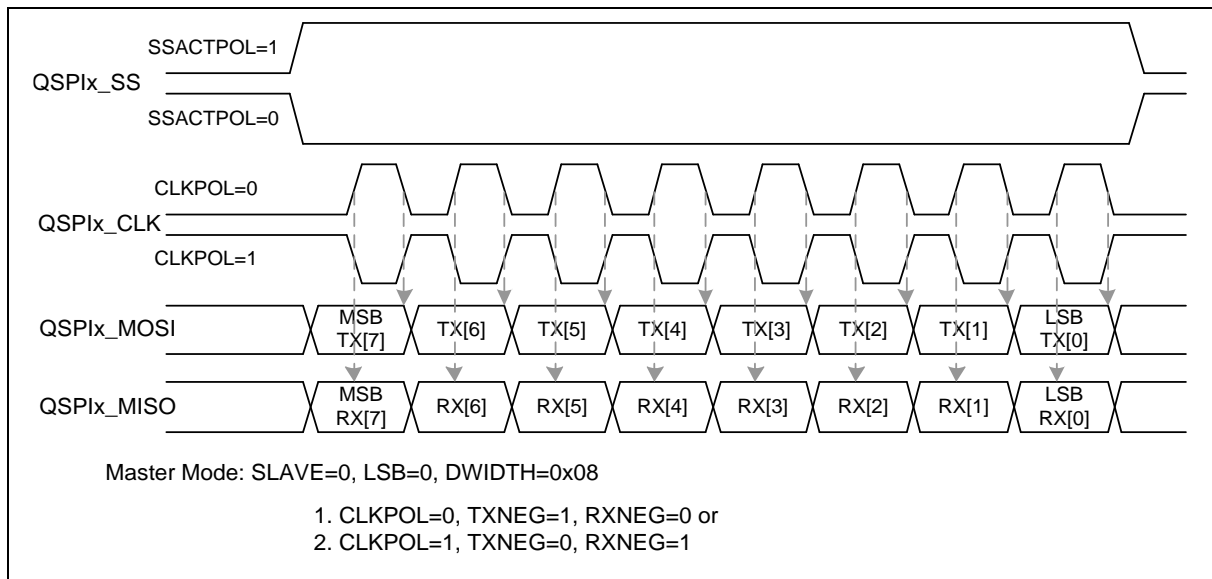

Figure 6.16-26 QSPI Timing in Master Mode

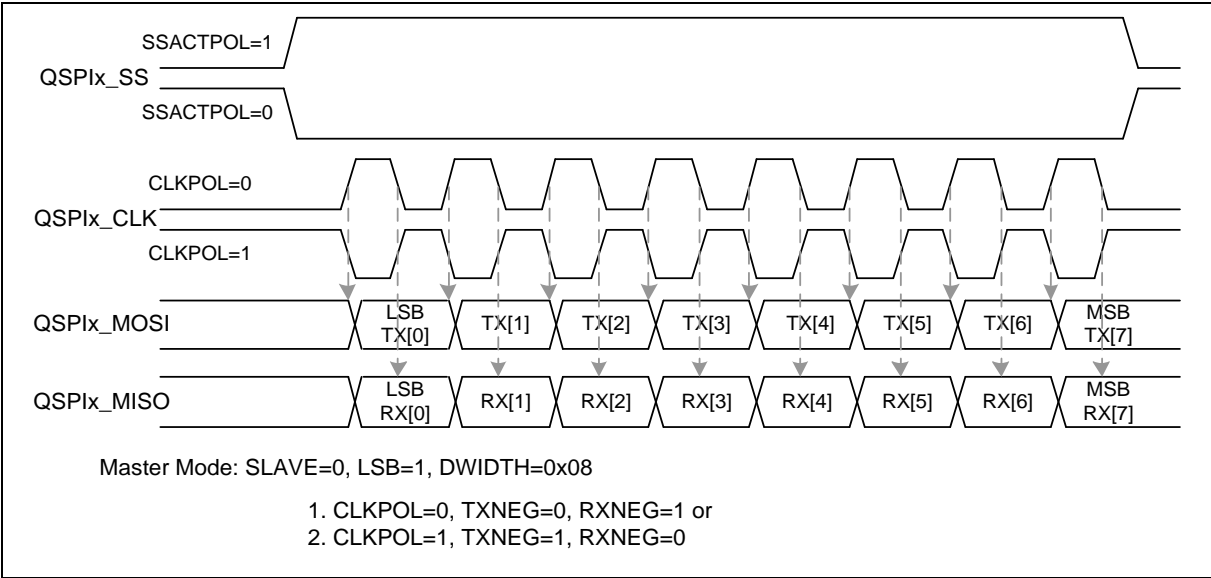

Figure 6.16-27 QSPI Timing in Master Mode (Alternate Phase of QSPIx\_CLK)

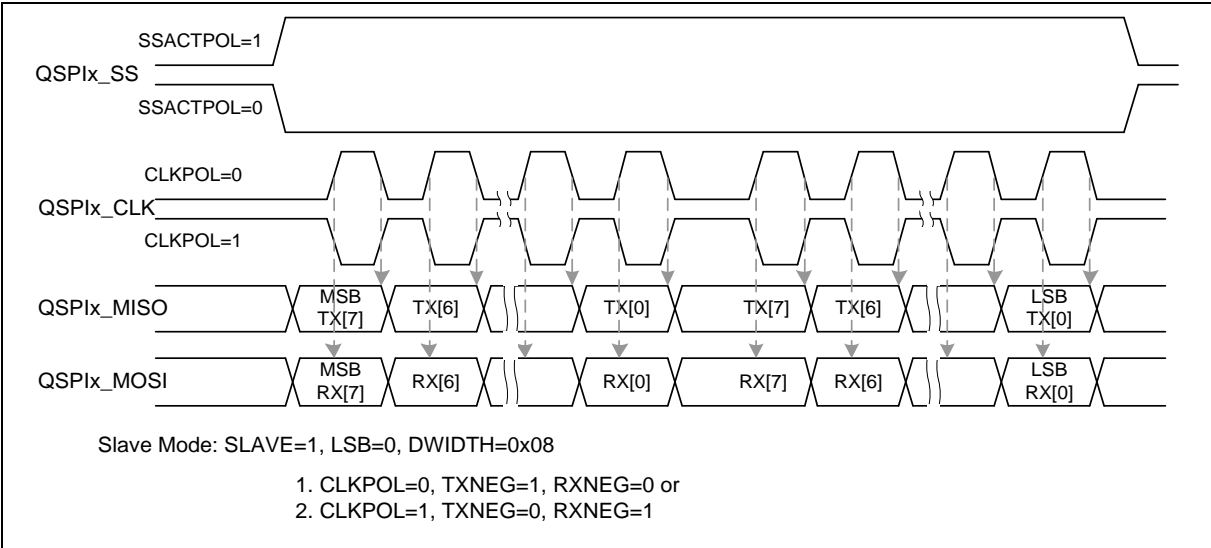

Figure 6.16-28 QSPI Timing in Slave Mode

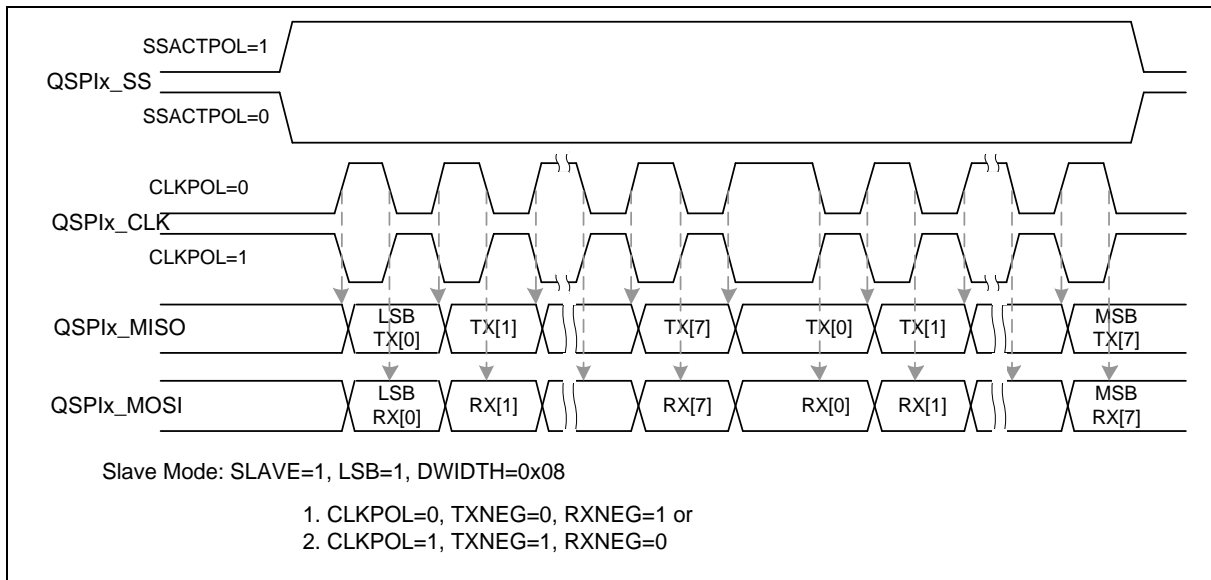

Figure 6.16-29 QSPI Timing in Slave Mode (Alternate Phase of QSPiX\_CLK)

### 6.16.7 Programming Examples

#### **Example 1:**

The QSPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from MSB first.
- QSPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Uses the first QSPI slave select pin to connect with an off-chip slave device. The slave selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (QSPiX\_CLKDIV [8:0]) to determine the output frequency of QSPI clock.
2. Write the QSPiX\_SSCTL register a proper value for the related settings of Master mode:
  - 1) Clear AUTOSS (QSPiX\_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
  - 2) Configure slave selection signal as active low by clearing SSACTPOL (QSPiX\_SSCTL[2]) to 0.
  - 3) Enable slave selection signal by setting SS (QSPiX\_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the QSPiX\_CTL register to control the QSPI master actions.
  - 1) Configure this QSPI controller as master device by setting SLAVE (QSPiX\_CTL[18]) to 0.
  - 2) Force the QSPI clock idle state at low by clearing CLKPOL (QSPiX\_CTL[3]) to 0.
  - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPiX\_CTL[2]) to 1.
  - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG

- (QSPiX\_CTL[1]) to 0.
- 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPiX\_CTL[12:8] = 0x08).
  - 6) Set MSB transfer first by clearing LSB (QSPiX\_CTL[13]) to 0.
  4. Set SPIEN (QSPiX\_CTL[0]) to 1 to enable the data transfer with the QSPI interface.
  5. If this QSPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the QSPiX\_TX register.
  6. Waiting for QSPI interrupt if the UNITIEN (QSPiX\_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (QSPiX\_STATUS[1]).
  7. Read out the received one byte data from QSPiX\_RX register.
  8. Go to 5) to continue another data transfer or set SS (QSPiX\_SSCTL[0]) to 0 to inactivate the off-chip slave device.

**Example 2:**

The QSPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip QSPI slave controller through the QSPI interface with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from LSB first.
- QSPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the QSPiX\_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (QSPiX\_SSCTL[2]) to 1.
3. Write the related settings into the QSPiX\_CTL register to control this QSPI slave actions
  - 1) Set the QSPI controller as slave device by setting SLAVE (QSPiX\_CTL[18]) to 1.
  - 2) Select the QSPI clock idle state at high by setting CLKPOL (QSPiX\_CTL[3]) to 1.
  - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPiX\_CTL[2]) to 1.
  - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG (QSPiX\_CTL[1]) to 0.
  - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPiX\_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (QSPiX\_CTL[13]) to 1.
5. Set the SPIEN (QSPiX\_CTL[0]) to 1. Wait for the slave select trigger input and QSPI clock input from the off-chip master device to start the data transfer.
6. If this QSPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the QSPiX\_TX register.
7. If this QSPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the QSPiX\_TX register does not need to be updated by software.

8. Waiting for QSPI interrupt if the UNITIEN (QSPiX\_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (QSPiX\_STATUS[1]).
9. Read out the received one byte data from QSPiX\_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

## 6.16.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>QSPI Base Address:</b> <b>QSPIx_BA = 0x4006_0000</b> <b>x=0</b>				
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register	0x0000_0034
QSPIx_CLKDIV	QSPIx_BA+0x04	R/W	QSPI Clock Divider Register	0x0000_0000
QSPIx_SSCTL	QSPIx_BA+0x08	R/W	QSPI Slave Select Control Register	0x0000_0000
QSPIx_PDMACTL	QSPIx_BA+0x0C	R/W	QSPI PDMA Control Register	0x0000_0000
QSPIx_FIFCTL	QSPIx_BA+0x10	R/W	QSPI FIFO Control Register	0x4400_0000
QSPIx_STATUS	QSPIx_BA+0x14	R/W	QSPI Status Register	0x0005_0110

QSPIx_RX	QSPIx_BA+0x30	R	QSPI Data Receive Register	0x0000_0000

### 6.16.9 Register Description

QSPI Control Register (QSPIx\_CTL)

Register	Offset	R/W	Description	Reset Value
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register	0x0000_0034

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved	QUADIOEN	DUALIOEN	DATDIR	REORDER	SLAVE	UNITIEN	TWOBIT
15	14	13	12	11	10	9	8
RXONLY	HALFDPX	LSB	DWIDTH				
7	6	5	4	3	2	1	0
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN

Bits	Description
[31:23]	Reserved
[22]	<b>QUADIOEN</b> <b>Quad I/O Mode Enable Bit</b> 0 = Quad I/O mode Disabled. 1 = Quad I/O mode Enabled.
[21]	<b>DUALIOEN</b> <b>Dual I/O Mode Enable Bit</b> 0 = Dual I/O mode Disabled. 1 = Dual I/O mode Enabled.
[20]	<b>DATDIR</b> <b>Data Port Direction Control</b> This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer 0 = QSPI data is input direction. 1 = QSPI data is output direction.
[19]	<b>REORDER</b> <b>Byte Reorder Function Enable Bit</b> 0 = Byte Reorder function Disabled. 1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV. <b>Note:</b> Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.
[18]	<b>SLAVE</b> <b>Slave Mode Control</b> 0 = Master mode. 1 = Slave mode.
[17]	<b>UNITIEN</b> <b>Unit Transfer Interrupt Enable Bit</b> 0 = QSPI unit transfer interrupt Disabled. 1 = QSPI unit transfer interrupt Enabled.

[16]	TWOBIT	<b>2-bit Transfer Mode Enable Bit</b> 0 = 2-bit Transfer mode Disabled. 1 = 2-bit Transfer mode Enabled. <b>Note:</b> When 2-bit Transfer mode is enabled, the first serial transmitted bit data is from the first FIFO buffer data, and the 2 <sup>nd</sup> serial transmitted bit data is from the second FIFO buffer data. As the same as transmitted function, the first received bit data is stored into the first FIFO buffer and the 2 <sup>nd</sup> received bit data is stored into the second FIFO buffer at the same time.
[15]	RXONLY	<b>Receive-only Mode Enable Bit (Master Only)</b> This bit field is only available in Master mode. In receive-only mode, QSPI Master will generate QSPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status. 0 = Receive-only mode Disabled. 1 = Receive-only mode Enabled.
[14]	HALFDPX	<b>QSPI Half-duplex Transfer Enable Bit</b> This bit is used to select full-duplex or half-duplex for QSPI transfer. The bit field DATDIR (QSPiX_CTL[20]) can be used to set the data direction in half-duplex transfer. 0 = QSPI operates in full-duplex transfer. 1 = QSPI operates in half-duplex transfer.
[13]	LSB	<b>Send LSB First</b> 0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first. 1 = The LSB, bit 0 of the QSPiX_TX register, is sent first to the QSPI data output pin, and the first bit received from the QSPI data input pin will be put in the LSB position of the RX register (bit 0 of QSPiX_RX).
[12:8]	DWIDTH	<b>Data Width</b> This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits. DWIDTH = 0x08 .... 8 bits. DWIDTH = 0x09 .... 9 bits. ..... DWIDTH = 0x1F .... 31 bits. DWIDTH = 0x00 .... 32 bits.
[7:4]	SUSPITV	<b>Suspend Interval (Master Only)</b> The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation. $(SUSPITV + 0.5) \times \text{period of QSPICLK clock cycle}$ Example: SUSPITV = 0x0 .... 0.5 QSPICLK clock cycle. SUSPITV = 0x1 .... 1.5 QSPICLK clock cycle. ..... SUSPITV = 0xE .... 14.5 QSPICLK clock cycle. SUSPITV = 0xF .... 15.5 QSPICLK clock cycle.
[3]	CLKPOL	<b>Clock Polarity</b> 0 = QSPI bus clock is idle low. 1 = QSPI bus clock is idle high.
[2]	TXNEG	<b>Transmit on Negative Edge</b> 0 = Transmitted data output signal is changed on the rising edge of QSPI bus clock.

		1 = Transmitted data output signal is changed on the falling edge of QSPI bus clock.
[1]	<b>RXNEG</b>	<b>Receive on Negative Edge</b> 0 = Received data input signal is latched on the rising edge of QSPI bus clock. 1 = Received data input signal is latched on the falling edge of QSPI bus clock.
[0]	<b>SPIEN</b>	<b>QSPI Transfer Control Enable Bit</b> In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1. 0 = Transfer control Disabled. 1 = Transfer control Enabled. <b>Note:</b> Before changing the configurations of QSPIx_CTL, QSPIx_CLKDIV, QSPIx_SSCTL and QSPIx_FIFCTL registers, user shall clear the SPIEN (QSPIx_CTL[0]) and confirm the SPIENSTS (QSPIx_STATUS[15]) is 0.

QSPI Clock Divider Register  
(QSPIx\_CLKDIV)

Bits	Description
[31:16]	<b>SLVTOCNT</b> <b>Slave Mode Time-out Period</b> In Slave mode, these bits indicate the time-out period when there is bus clock input during slave select active. The clock source of the time-out counter is Slave peripheral clock. If the value is 0, it indicates the slave mode time-out function is disabled.
[15:14]	<b>Reserved</b> Reserved.
[13]	<b>SSINAIEN</b> <b>Slave Select Inactive Interrupt Enable Bit</b> 0 = Slave select inactive interrupt Disabled. 1 = Slave select inactive interrupt Enabled.
[12]	<b>SSACTIEN</b> <b>Slave Select Active Interrupt Enable Bit</b> 0 = Slave select active interrupt Disabled. 1 = Slave select active interrupt Enabled.
[11:10]	<b>Reserved</b> Reserved.
[9]	<b>SLVURIEN</b> <b>Slave Mode TX Under Run Interrupt Enable Bit</b> 0 = Slave mode TX under run interrupt Disabled. 1 = Slave mode TX under run interrupt Enabled.
[8]	<b>SLVBEIEN</b> <b>Slave Mode Bit Count Error Interrupt Enable Bit</b> 0 = Slave mode bit count error interrupt Disabled. 1 = Slave mode bit count error interrupt Enabled.
[7]	<b>Reserved</b> Reserved.
[6]	<b>SLVTORST</b> <b>Slave Mode Time-out Reset Control</b> 0 = When Slave mode time-out event occurs, the TX and RX control circuit will not be reset. 1 = When Slave mode time-out event occurs, the TX and RX control circuit will be reset by hardware.
[5]	<b>SLVTOIEN</b> <b>Slave Mode Time-out Interrupt Enable Bit</b>

		0 = Slave mode time-out interrupt Disabled. 1 = Slave mode time-out interrupt Enabled.
[4]	SLV3WIRE	<b>Slave 3-wire Mode Enable Bit</b> In Slave 3-wire mode, the QSPI controller can work with 3-wire interface including QSPiX_CLK, QSPiX_MISO and QSPiX_MOSI pins. 0 = 4-wire bi-direction interface. 1 = 3-wire bi-direction interface.
[3]	AUTOSS	<b>Automatic Slave Selection Function Enable Bit (Master Only)</b> 0 = Automatic slave selection function Disabled. Slave selection signal will be asserted/de-asserted according to SS (QSPiX_SSCTL[0]). 1 = Automatic slave selection function Enabled.
[2]	SSACTPOL	<b>Slave Selection Active Polarity</b> This bit defines the active polarity of slave selection signal (QSPiX_SS). 0 = The slave selection signal QSPiX_SS is active low. 1 = The slave selection signal QSPiX_SS is active high.
[1]	Reserved	Reserved.
[0]	SS	<b>Slave Selection Control (Master Only)</b> If AUTOSS bit is cleared to 0, 0 = set the QSPiX_SS line to inactive state. 1 = set the QSPiX_SS line to active state. If the AUTOSS bit is set to 1, 0 = Keep the QSPiX_SS line at inactive state. 1 = QSPiX_SS line will be automatically driven to active state for the duration of data transfer, and will be driven to inactive state for the rest of the time. The active state of QSPiX_SS is specified in SSACTPOL (QSPiX_SSCTL[2]).

Bits	Description	
[31]	Reserved	Reserved.
[30:28]	TXTH	<b>Transmit FIFO Threshold</b> If the valid data count of the transmit FIFO buffer is less than or equal to the TXTH setting, the TXTHIF bit will be set to 1, else the TXTHIF bit will be cleared to 0.
[27]	Reserved	Reserved.
[26:24]	RXTH	<b>Receive FIFO Threshold</b> If the valid data count of the receive FIFO buffer is larger than the RXTH setting, the RXTHIF bit will be set to 1, else the RXTHIF bit will be cleared to 0.
[23:10]	Reserved	Reserved.
[9]	TXFBCLR	<b>Transmit FIFO Buffer Clear</b> 0 = No effect. 1 = Clear transmit FIFO pointer. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. <b>Note:</b> The TX shift register will not be cleared.
[8]	RXFBCLR	<b>Receive FIFO Buffer Clear</b> 0 = No effect. 1 = Clear receive FIFO pointer. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. <b>Note:</b> The RX shift register will not be cleared.
[7]	TXUFIE	<b>TX Underflow Interrupt Enable Bit</b> When TX underflow event occurs in Slave mode, TXUFIF (QSPIx_STATUS[19]) will be set to 1. This bit is used to enable the TX underflow interrupt. 0 = Slave TX underflow interrupt Disabled. 1 = Slave TX underflow interrupt Enabled.

[6]	TXUFPOL	<b>TX Underflow Data Polarity</b> 0 = The QSPI data out is keep 0 if there is TX underflow event in Slave mode. 1 = The QSPI data out is keep 1 if there is TX underflow event in Slave mode. <b>Note 1:</b> The TX underflow event occurs if there is no any data in TX FIFO when the slave selection signal is active. <b>Note 2:</b> When TX underflow event occurs, QSPiX_MISO pin state will be determined by this setting even though TX FIFO is not empty afterward. Data stored in TX FIFO will be sent through QSPiX_MISO pin in the next transfer frame.
[5]	RXOVLEN	<b>Receive FIFO Overrun Interrupt Enable Bit</b> 0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.
[4]	RXTOLN	<b>Slave Receive Time-out Interrupt Enable Bit</b> 0 = Receive time-out interrupt Disabled. 1 = Receive time-out interrupt Enabled.
[3]	TXTHLEN	<b>Transmit FIFO Threshold Interrupt Enable Bit</b> 0 = TX FIFO threshold interrupt Disabled. 1 = TX FIFO threshold interrupt Enabled.
[2]	RXTHLEN	<b>Receive FIFO Threshold Interrupt Enable Bit</b> 0 = RX FIFO threshold interrupt Disabled. 1 = RX FIFO threshold interrupt Enabled.
[1]	TXRST	<b>Transmit Reset</b> 0 = No effect. 1 = Reset transmit FIFO pointer and transmit circuit. The TxFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (QSPiX_STATUS[23]) to check if reset is accomplished or not. <b>Note:</b> If TX underflow event occurs in QSPI Slave mode, this bit can be used to make QSPI return to idle state.
[0]	RXRST	<b>Receive Reset</b> 0 = No effect. 1 = Reset receive FIFO pointer and receive circuit. The RxFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (QSPiX_STATUS[23]) to check if reset is accomplished or not.

## 6.17 I<sup>2</sup>C Serial Interface Controller (I<sup>2</sup>C)

### 6.17.1 Overview

I<sup>2</sup>C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I<sup>2</sup>C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

There are two sets of I<sup>2</sup>C controllers that support Power-down wake-up function.

### 6.17.2 Features

The I<sup>2</sup>C bus uses two wires (SDA and SCL) to transfer information between devices connected to the bus. The main features of the I<sup>2</sup>C bus include:

- Supports up to two I<sup>2</sup>C ports
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Supports Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allow devices with different bit rates to communicate via one serial bus
- Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
- Built-in 14-bit time-out counter requesting the I<sup>2</sup>C interrupt if the I<sup>2</sup>C bus hangs up and timer-out counter overflow
- Programmable clocks allow for versatile rate control
- Supports 7-bit addressing and 10-bit addressing mode
- Supports multiple address recognition ( four slave address with mask option)
- Supports Power-down wake-up function
- Supports PDMA with one buffer capability
- Supports setup/hold time programmable
- Supports Bus Management (SM/PM compatible) function

### 6.17.3 Block Diagram

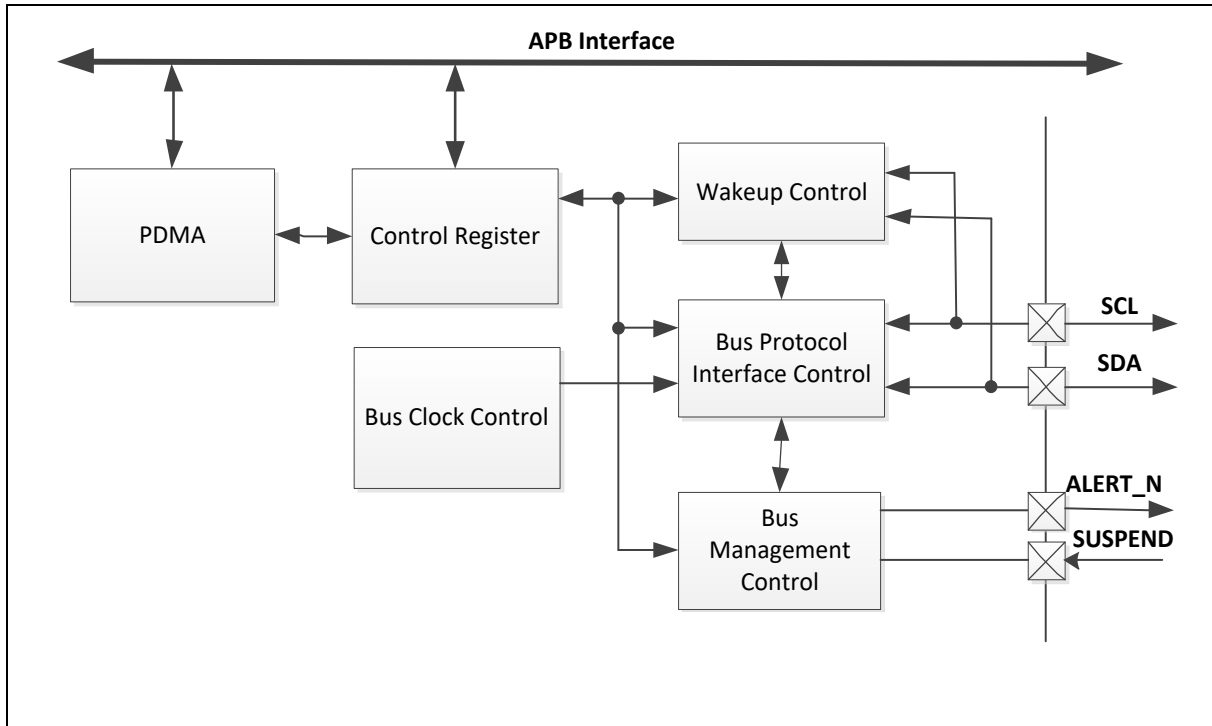

Figure 6.17-1 I²C Controller Block Diagram

### 6.17.4 Basic Configuration

#### 6.17.4.1 I2C0 basic configurations

- Clock source Configuration
  - Enable I2C0 peripheral clock in I2C0CKEN (CLK\_APBCLK0[8]).
- Reset Configuration
  - Reset I2C0 controller in I2C0RST (SYS\_IPRST1[8]).

#### 6.17.4.2 I2C1 Basic Configurations

- Clock Source Configuration
  - Enable I2C1 peripheral clock in I2C1CKEN (CLK\_APBCLK0[9]).
- Reset Configuration
  - Reset I2C1 controller in I2C1RST (SYS\_IPRST1[9]).

### 6.17.5 Functional Description

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit long. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.17-2 for more detailed I²C BUS Timing.

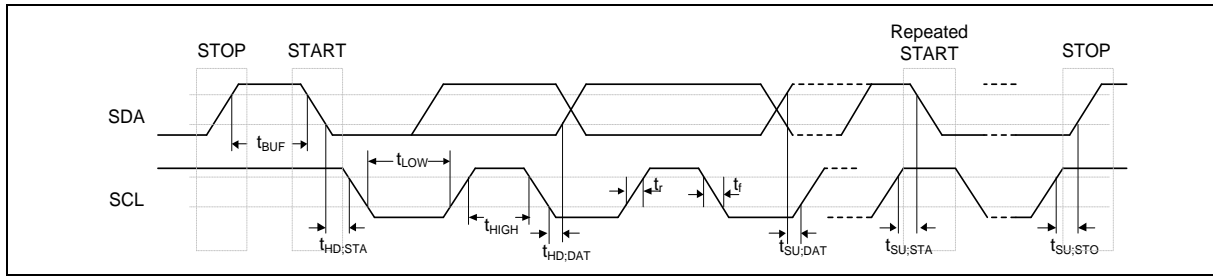

Figure 6.17-2 I²C Bus Timing

The on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. To enable this port, the bit I2CEN in I2C\_CTL0 should be set to '1'. The I²C hardware interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

**Note:** The external pull-up resistor is needed for I²C operation as the SDA and SCL are open-drain pins.

#### 6.17.5.1 I²C Protocol

Figure 6.17-3 shows the typical I²C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer
- Data transfer
- STOP signal generation

Figure 6.17-3 I²C Protocol

- START or Repeated START signal

When the bus is free/idle, which means no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the "S" bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

After having sent the address byte (address and read/write bit), the master may send any number of bytes followed by a stop condition. Instead of sending the stop condition it is also allowed to send another start condition again followed by an address (and of course including a read/write bit) and more data. The start condition is called as Repeat START (Sr). This is defined recursively allowing any number of start conditions to be sent. The purpose of this is to allow combined write/read operations to one or more devices without releasing the bus and thus with the guarantee that the operation is not interrupted. The controller uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

- STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the “P” bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH.

Figure 6.17-4 shows the waveform of START, Repeat START and STOP.

Figure 6.17-4 START and STOP Conditions

- Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave’s address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests.

- Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as a receiving device, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal. The Figure 6.17-5 and Figure 6.17-6 shows the waveform of bit transfer and acknowledge.

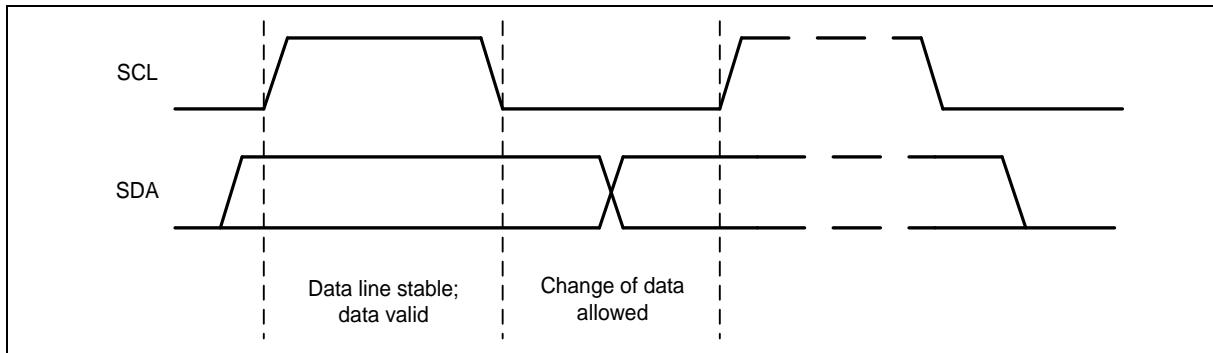

Figure 6.17-5 Bit Transfer on the I²C Bus

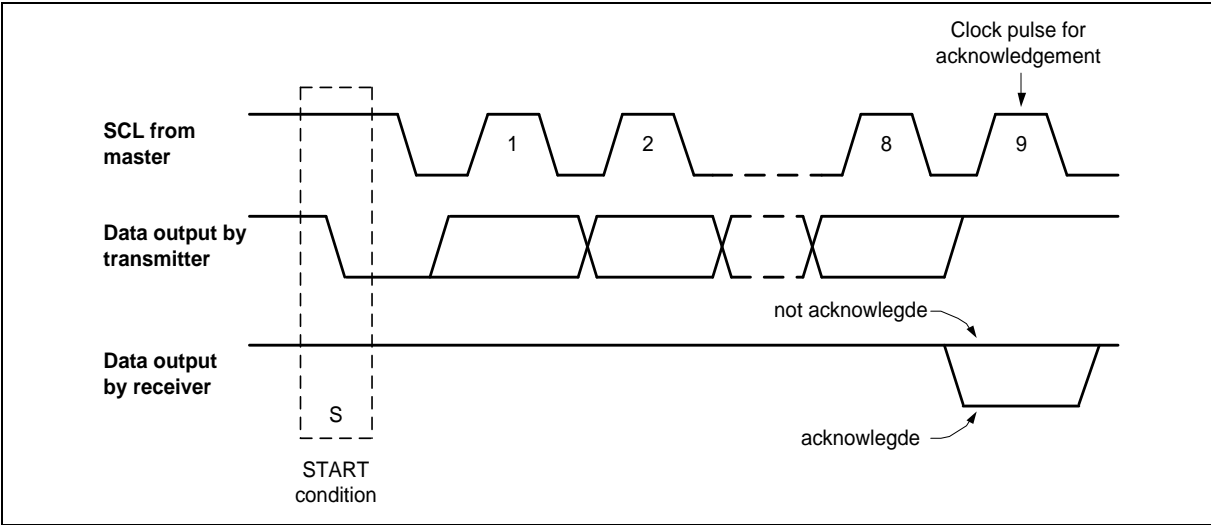

Figure 6.17-6 Acknowledge on the I<sup>2</sup>C Bus

● Data transfer on I<sup>2</sup>C bus

Figure 6.17-7 shows a master transmits data to slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

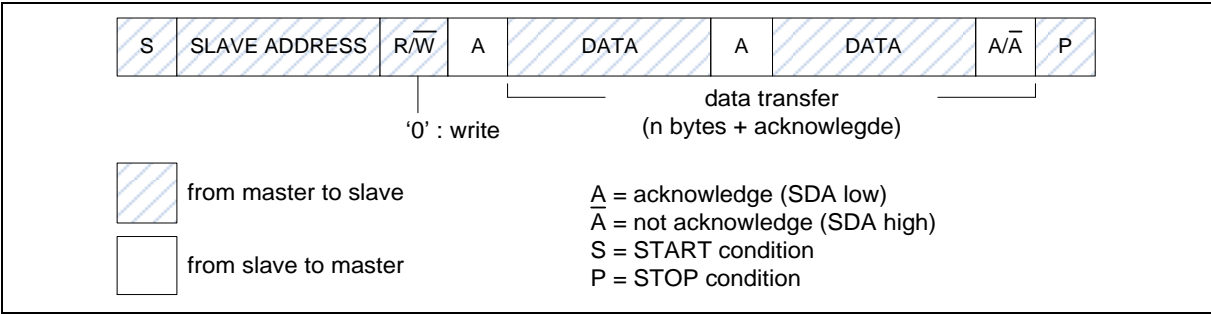

Figure 6.17-7 Master Transmits Data to Slave by 7-bit

Figure 6.17-8 shows a master read data from slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

Figure 6.17-8 Master Reads Data from Slave by 7-bit

Figure 6.17-9 shows a master transmits data to slave by 10-bit. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

The diagram illustrates the data transfer sequence between a microcontroller and an external memory device. It is divided into two main parts: address transfer and data transfer.

**Address Transfer Sequence:**

- S:** Slave Select signal.
- ADDRESS 1st byte:** The first byte of the address.
- R/W:** Read/Write control signal. '0' indicates write, '1' indicates read.
- A:** Acknowledge signal.
- ADDRESS 2nd byte:** The second byte of the address.
- A:** Acknowledge signal.
- ...** Ellipsis indicating further address bytes.

**Data Transfer Sequence:**

- Sr:** Slave Select signal.
- ADDRESS 1st byte:** The first byte of the address.
- R/W:** Read/Write control signal. '1' indicates read.
- A:** Acknowledge signal.
- DATA:** The data being transferred.
- A:** Acknowledge signal.
- DATA:** The data being transferred.
- A/A:** Address/Acknowledge signal.
- P:** Pulse signal.

The data transfer is labeled "data transfer (n bytes + acknowlegde)".

Figure 6.17-10 Master Reads Data from Slave by 10-bit

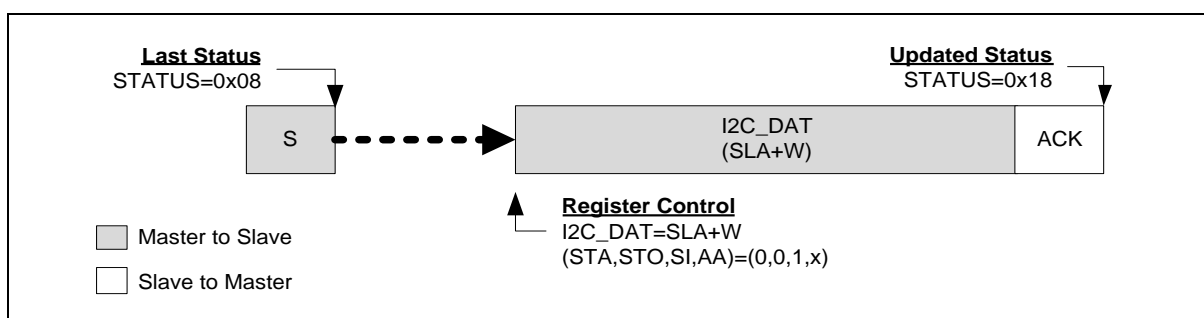

The on-chip I<sup>2</sup>C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I<sup>2</sup>C port may operate as a master or as a slave. In Slave mode, the I<sup>2</sup>C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master (by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If bus arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I<sup>2</sup>C bus transfer in each mode, user needs to set I2C\_CTL0, I2C\_DAT registers according to current status code of I2C\_STATUS0 register. In other words, for each I<sup>2</sup>C bus action, user needs to check current status by I2C\_STATUS0 register, and then set I2C\_CTL0, I2C\_DAT registers to take bus action. Finally, check the response status by I2C\_STATUS0.

The bits, STA, STO and AA in I2C\_CTL0 register are used to control the next state of the I<sup>2</sup>C hardware after SI flag of I2C\_CTL0 [3] register is cleared. Upon completion of the new action, a new status code will be updated in I2C\_STATUS0 register and the SI flag of I2C\_CTL0 register will be set. But the SI flag will not be set when I<sup>2</sup>C STOP. If the I<sup>2</sup>C interrupt control bit INTEN (I2C\_CTL0 [7]) is set, appropriate action or software branch of the new status code can be performed in the Interrupt service routine.

Figure 6.17-11 shows the current I<sup>2</sup>C status code is 0x08, and then set I2C\_DATA=SLA+W and (STA,STO,SI,AA) = (0,0,1,x) to send the address to I<sup>2</sup>C bus. If a slave on the bus matches the address and response ACK, the I2C STATUS0 will be updated by status code 0x18.

Figure 6.17-11 Control I<sup>2</sup>C Bus according to the Current I<sup>2</sup>C Status

## Master Mode

In Figure 6.17-12 and Figure 6.17-13, all possible protocols for I<sup>2</sup>C master are shown. User needs to follow proper path of the flow to implement required I<sup>2</sup>C protocol.

In other words, user can send a START signal to bus and I<sup>2</sup>C will be in Master Transmitter (MT) mode (Figure 6.17-12) or Master receiver (MR) mode (Figure 6.17-13) after START signal has been sent successfully and new status code would be 0x08. Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I<sup>2</sup>C protocol.

Figure 6.17-12 Master Transmitter Mode Control Flow

Figure 6.17-13 Master Receiver Mode Control Flow

If the I<sup>2</sup>C is in Master mode and gets arbitration lost, the status code will be 0x38. In status 0x38, user may set (STA, STO, SI, AA) = (1, 0, 1, X) to send START to re-start Master operation when bus become free. Otherwise, user may set (STA, STO, SI, AA) = (0, 0, 1, X) to release I<sup>2</sup>C bus and enter not addressed Slave mode.

### Slave Mode

When reset default, I<sup>2</sup>C is not addressed and will not recognize the address on I<sup>2</sup>C bus. User can set slave address by I2C\_ADDRn (n=0~3) and set (STA, STO, SI, AA) = (0, 0, 1, 1) to let I<sup>2</sup>C recognize the address sent by master. Figure 6.17-14 shows all the possible flow for I<sup>2</sup>C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.17-14) to implement their own I<sup>2</sup>C protocol.

If bus arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) after arbitration lost, the status code is 0x68. If the detected address is SLA+R (Master want to read data from Slave) after arbitration lost, the status code is 0xB0.

**Note:** During I<sup>2</sup>C communication, the SCL clock will be released when writing '1' to clear SI flag in Slave mode.

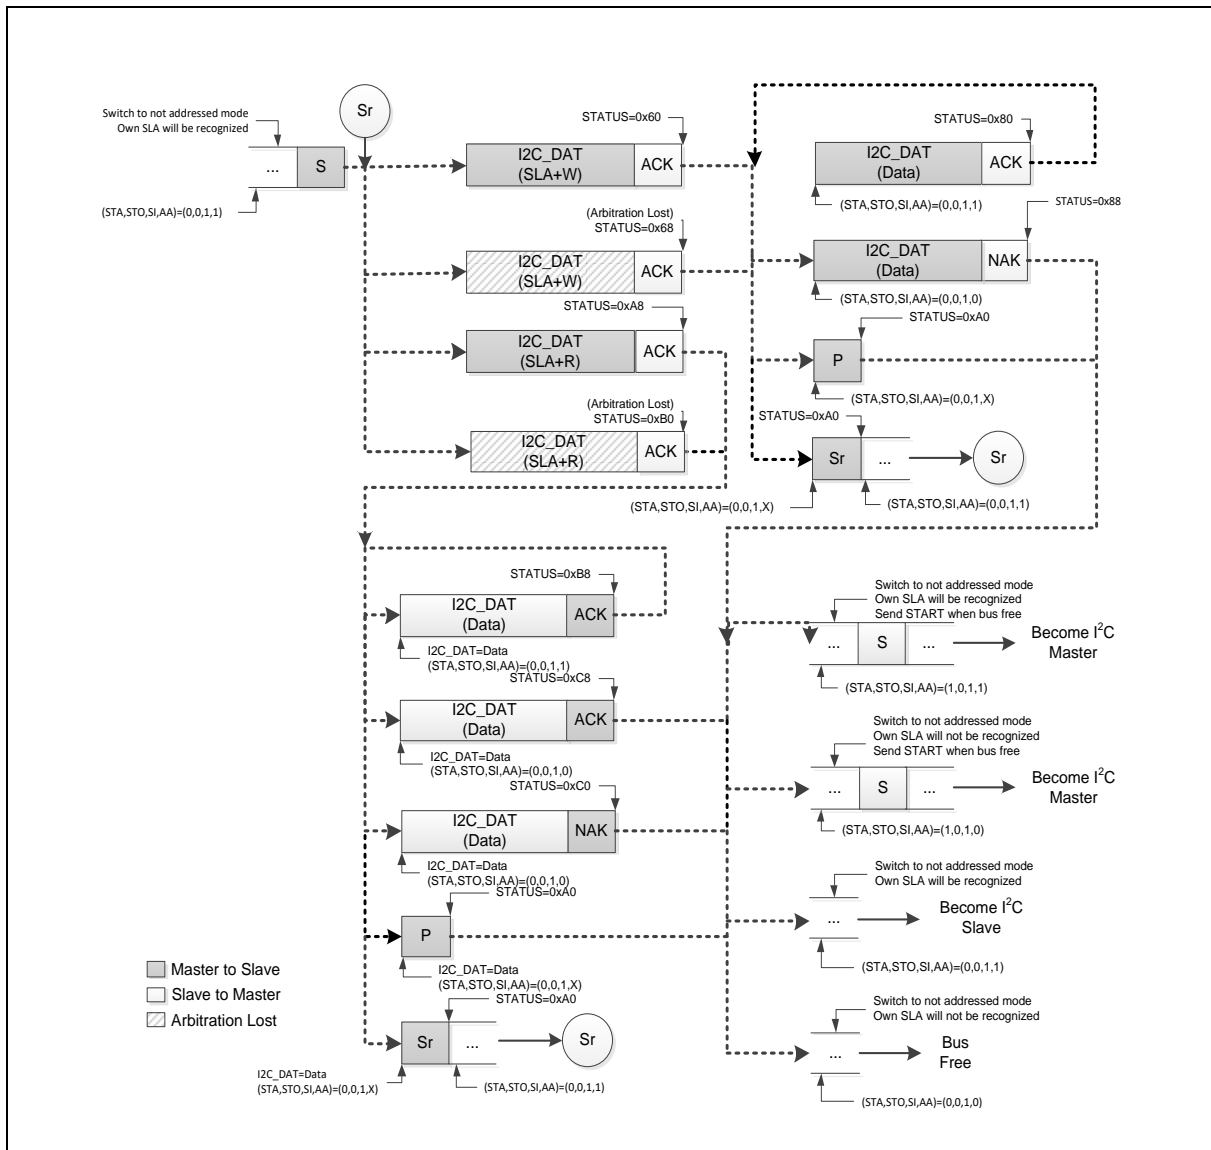

Figure 6.17-14 Slave Mode Control Flow

If I<sup>2</sup>C is still receiving data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x88 as shown in the above figure when getting 0xA0 status.

If I<sup>2</sup>C is still transmitting data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0xC8 as shown in the above figure when getting 0xA0 status.

**Note:** After slave gets status of 0x88, 0xC8, 0xC0 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I<sup>2</sup>C signal or address from master. At this status, I<sup>2</sup>C should enter idle mode.

### General Call (GC) Mode

If the GC bit (I2C\_ADDRn [0]) is set, the I<sup>2</sup>C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the I<sup>2</sup>C in Slave mode, it can receive the general call address by 0x00 after master sends general call address to I<sup>2</sup>C bus, then it will follow status of GC mode.

The GC mode can wake up when address matched. Note that the default address is 0x00, but user must set an address except for 0x00.

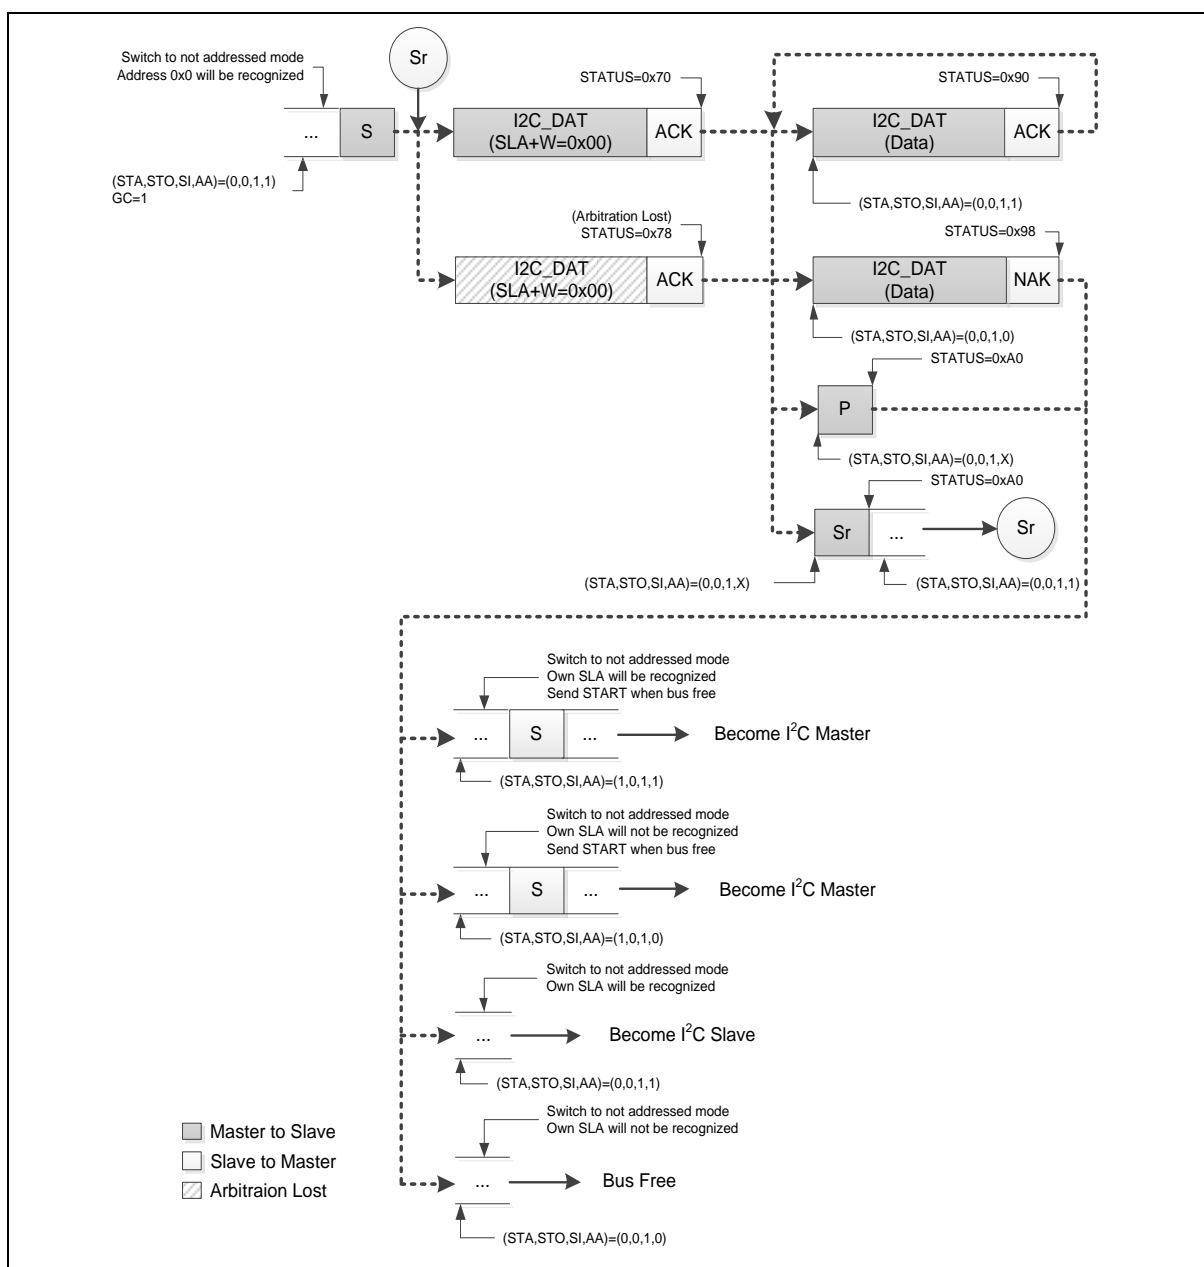

Figure 6.17-15 GC Mode

If I<sup>2</sup>C is still receiving data in GC mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x98 in above figure when getting 0xA0 status.

**Note:** After slave gets status of 0x98 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I<sup>2</sup>C signal or address from master. At this time, the I<sup>2</sup>C controller should enter idle mode.

### Multi-Master

In some applications, there are two or more masters on the same I<sup>2</sup>C bus to access slaves, and the masters may transmit data simultaneously. The I<sup>2</sup>C supports multi-master by including collision detection and arbitration to prevent data corruption.

If for some reason two masters initiate command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. The device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each master must monitor the bus for collisions and act accordingly.

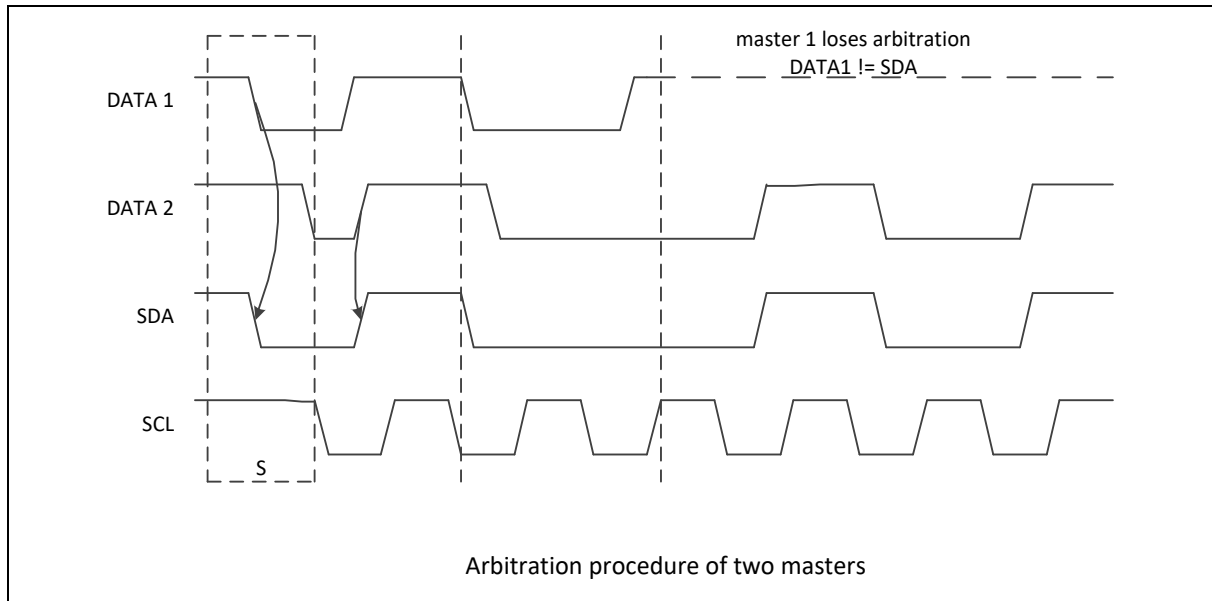

Figure 6.17-16 Arbitration Lost

- When I2C\_STATUS0 = 0x38, an “Arbitration Lost” is received. Arbitration lost event maybe occur during the send START bit, data bits or STOP bit. User could set (STA, STO, SI, AA) = (1, 0, 1, X) to send START again when bus free, or set (STA, STO, SI, AA) = (0, 0, 1, X) to not addressed Slave mode. User can detect bus free by ONBUSY (I2C\_STATUS1 [8]).
- When I2C\_STATUS0 = 0x00, a “Bus Error” is received. To recover I<sup>2</sup>C bus from a bus error, STO should be set and SI should be cleared, and then STO is cleared to release bus.
  - Set (STA, STO, SI, AA) = (0, 1, 1, X) to stop current transfer
  - Set (STA, STO, SI, AA) = (0, 0, 1, X) to release bus

#### **Bus Management (SMBus/PMBus Compatible)**

This section is relevant only when Bus Management feature is supported.

##### **Introduction**

The Bus Management is an I<sup>2</sup>C interface through which various devices can communicate with each other and with the rest of the system. It is based on I<sup>2</sup>C principles of operation. The Bus Management provides a control bus for system and power management related tasks.

This peripheral is compatible with the SMBUS specification rev 2.0 (<http://smbus.org/specs/>) and PMBUS specification rev 1.2 (<http://pmbus.org/>).

The System Management Bus Specification refers to three types of devices.

- A slave is a device that receives or responds to a command.

- A master is a device that issues commands, generates the clocks and terminates the transfer.
- A host is a specialized master that provides the main interface to the system's CPU. A host must be a master-slave and must support the SMBus host notify protocol. Only one host is allowed in a system.

This Bus Management peripheral is based on I<sup>2</sup>C specification Rev 2.1.

#### **Device Identification – Slave Address**

Any device that exists on the Bus Management as a slave has a unique address called the Slave Address. For reference, the following addresses are reserved and must not be used by or assign to any Bus Management device. (Refer to SMBus specification for detail information)

Slave Address Bits 7-1	R/W Bit Bit 0	Comment
0000 000	0	General Call Address
0000 000	1	START byte
0000 001	X	CBUS address
0000 010	X	Address reserved for different bus format
0000 011	X	Reserved for future use
0000 1XX	X	Reserved for future use
0101 000	X	Reserved for ACCESS bus host
0110 111	X	Reserved for ACCESS bus default address
1111 0XX	X	10-bit slave addressing
1111 1XX	X	Reserved for future use
0001 000	X	SMBus Host
0001 100	X	SMBus Alert Response Address
1100 001	X	SMBus Device Default Address

Table 6.17-1 Reserved SMBus Address

#### **Bus Protocols**

There are eleven possible command protocols for any given device. A device may use any or all of the eleven protocols to communicate. The protocols are Quick Command, Send Byte, Receive Byte, Write Byte, Write Word, Read Byte, Read Word, Process Call, Block Read, Block Write and Block Write-Block Read Process Call. These protocols should be implemented by the user software. (For more details of these protocols, refer to SMBus specification ver. 2.0)

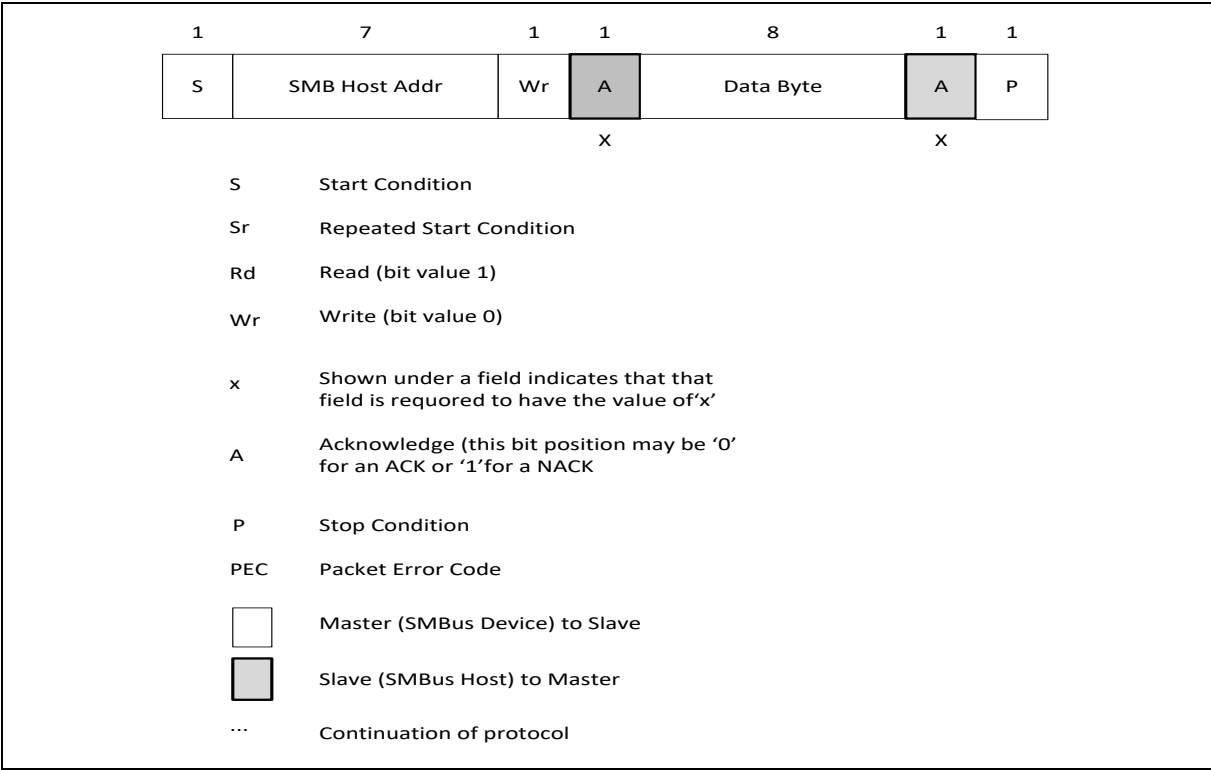

Figure 6.17-17 Bus Management Packet Protocol Diagram Element Key

**Address Resolution Protocol (ARP)**

Bus Management slave address conflicts can be resolved by dynamically assigning a new unique address to each slave device. In order to provide a mechanism to isolate each device for the purpose of address assignment each device must implement a unique device identifier (UDID). This 128-bit number is implemented by software.

This peripheral supports the Address Resolution Protocol (ARP). The Bus Management Device Default Address (0b1100 001) is enabled by setting BUSEN (I2C\_BUSCTL[7]), BMDEN (I2C\_BUSCTL[2]) and ALERTEN (I2C\_BUSCTL[4]) bits. The ARP commands should be implemented by the user software. Arbitration is also performed in slave mode for ARP support.

**Received Command and Data acknowledge control**

A Bus Management receiver must be able to NACK each received command or data. In order to allow the ACK control in slave mode, the Slave Byte Control mode must be enabled by setting ACKMEN bit (I2C\_BUSCTL[0]).

**Host Notify Protocol**

To prevent message coming to the Bus Management host controller from unknown devices in unknown formats only one method of communication is allowed, a modified form of the Write Word protocol. The standard Write Word protocol is modified by replacing the command code with the alerting device's address.

This peripheral supports the Host Notify protocol by setting the BUSEN (I2C\_BUSCTL[7]), BMHEN (I2C\_BUSCTL[3]) and ALERTEN (I2C\_BUSCTL[4]). In this case the host will acknowledge the Bus Management Host address (0b0001000). This protocol is used when the device acts as a master and the host as a slave.

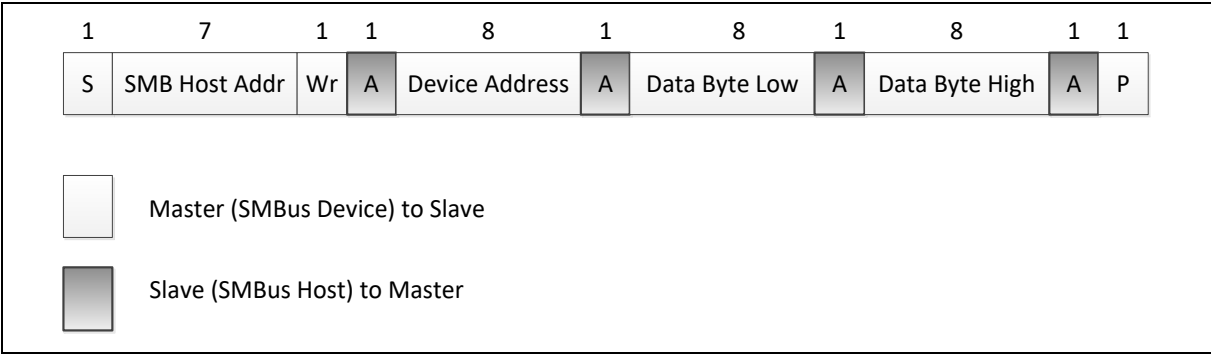

Figure 6.17-187-bit Addressable Device to Host Communication

**Bus Management Alert**

The Bus Management ALERT optional signal is supported. A slave-only device can signal the host through the Bus Management ALERT pin (GPA[14]/GPE[10]) that it wants to talk. The host processes the interrupt and simultaneously accesses all Bus Management ALERT pin's devices through the Alert Response Address (0b0001 100). Only the device(s) which pulled Bus Management ALERT pin low will acknowledge the Alert Response Address.

When configured as a slave device (BMHEN=0), the Bus Management ALERT pin is pulled low by setting the ALERTEN bit (I2C\_BUSCTL[4]). The Alert Response Address (ARA) is enabled at the same time.

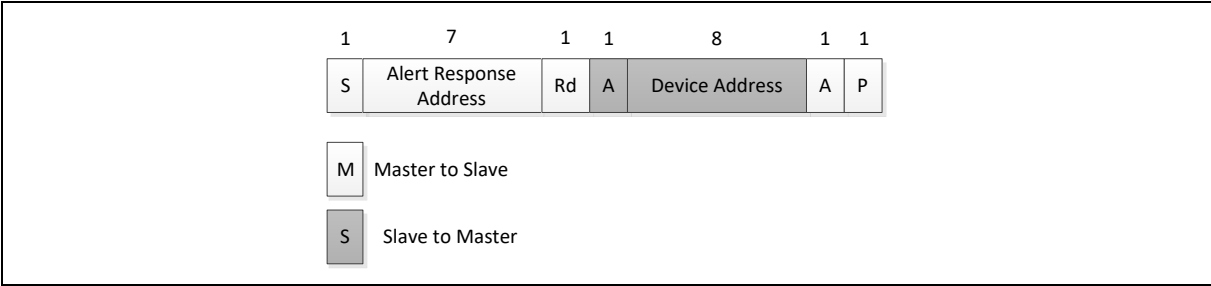

Figure 6.17-197-bit Addressable Device Responds to an ARA

When configured as a host (BMHEN=1), the ALERT flag (I2C\_BUSSTS[3]) is set when a falling edge is detected on the Bus Management ALERT pin and ALERTEN=1. When ALERTEN=0, the ALERT line is considered high even if the external Bus Management ALERT pin is low. If the Bus Management ALERT pin is not needed, the Bus Management ALERT pin can be used as a standard GPIO if ALERTEN = 0;

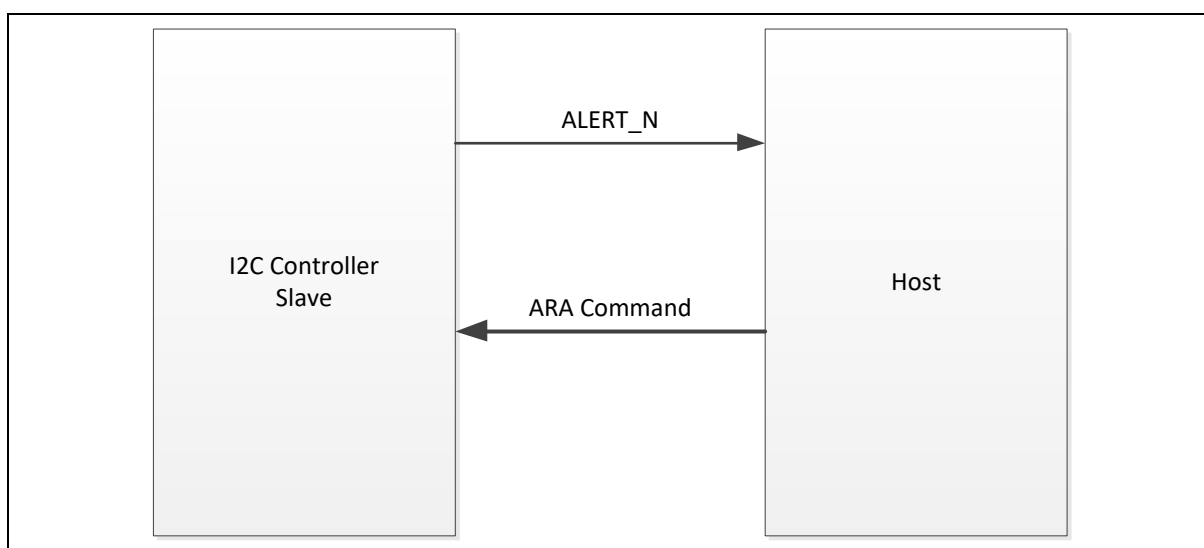

Figure 6.17-20 Bus Management ALERT function

### **Packet Error Checking**

A packet error checking mechanism has been introduced in the SMBus specification to improve reliability and communication robustness. Packet Error Checking is implemented by appending a Packet Error Code (PEC) at the end of each message transfer. The PEC is calculated by using the  $C(x) = x^8 + x^2 + x + 1$  CRC-8 polynomial on all the message bytes (including addresses and read/write bits).

The peripheral embeds a hardware PEC calculator when the PECEN bit (I2C\_BUSCTL[1]) is set and allows to send a Not Acknowledge automatically when the received byte does not match with the hardware calculated PEC. The calculated value of PEC also can be read back on I2C\_PKT\_CRC.

### **Time-out**

This peripheral embeds hardware timers in order to be compliant with the 3 time-outs defined in SMBus specification ver. 2.0.

### **Bus Management Time-out:**

The SCLK low time-out condition when bus no IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C\_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 0).}$$

$$= (\text{BUSTO}(\text{I2C\_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 1)}$$

The bus idle condition (both SCLK and SDA high) when bus IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C\_BUSTOUT}[7:0]) + 1) \times 4 \times T_{\text{PCLK}}.$$

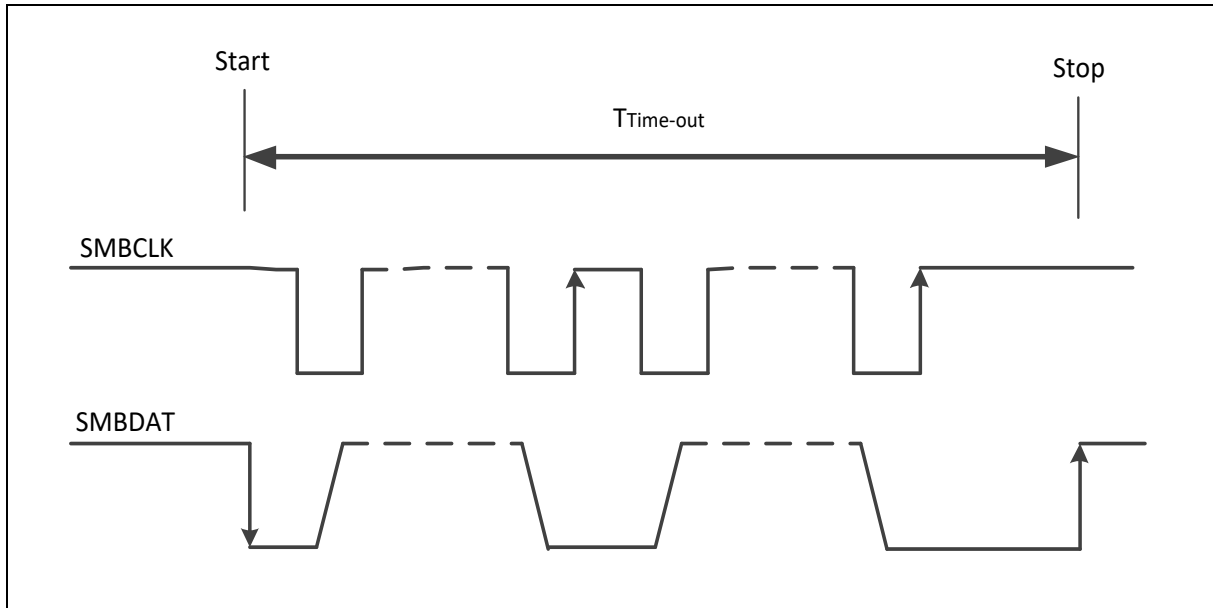

Figure 6.17-21 Bus Management Time Out Timing

**Bus Clock Low Time-out:**

In Master mode, the Master cumulative clock low extend time ( $T_{LOW:MEXT}$ ) is detected

In Slave mode, the slave cumulative clock low extend time ( $T_{LOW:SEXT}$ ) is detected

$T_{TLOW:EXT} = (CLKTO(I2C\_CLKTOUT[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times T_{PCLK} \text{ (if } TOCDIV4 = 0 \text{)}$

$= (CLKTO(I2C\_CLKTOUT[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{PCLK} \text{ (if } TOCDIV4 = 1 \text{)}$

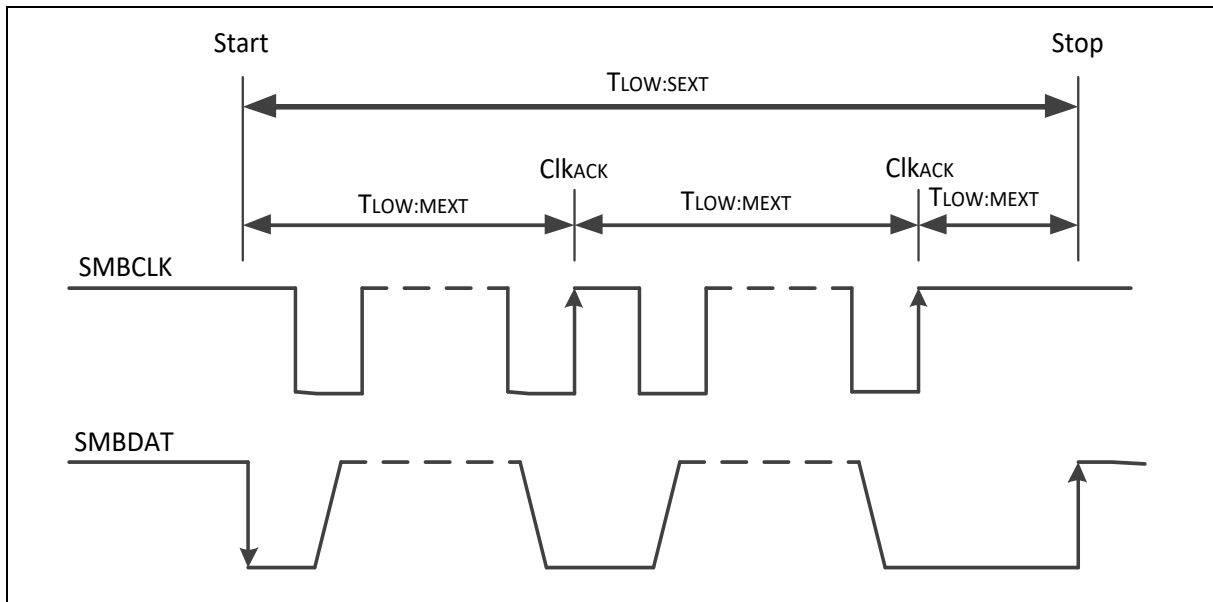

Figure 6.17-22 Bus Clock Low Time Out Timing

**Bus Idle Detection**

A master can assume that the bus is free if it detects that the clock and data signals have been high for  $T_{IDLE}$  greater than  $T_{HIGH,MAX}$ .

This timing parameter covers the condition where a master has been dynamically added to the bus and

may not have detected a state transition on the SMBCLK or SMBDAT lines. In this case, the master must wait long enough to ensure that a transfer is not currently in progress. The peripheral supports a hardware bus idle detection.

#### 6.17.5.3 PDMA Transfer Function

The I<sup>2</sup>C controller supports PDMA transfer function. When TXPDMAEN (I2C\_CTL1 [0]) is set to 1, the I<sup>2</sup>C controller will issue request to PDMA controller to start the DMA transmission process automatically.

When RXPDMAEN (I2C\_CTL1 [1]) is set to 1, the I<sup>2</sup>C controller will start the receive PDMA process. The I<sup>2</sup>C controller will issue the request to PDMA controller automatically when there is data written into the received BUFFER.

When I<sup>2</sup>C enters PDMA mode, the mostly status interrupt will be masked. Let the interrupt not occur besides the bus error or NACK or STOP interrupt (0x20, 0x30, 0x38, 0x48, 0x58, 0x00, 0xA0, 0xC0, 0x88 and 0x98).

Set the PDMASTR (I2C\_CTL1 [8]) only the I<sup>2</sup>C controller in master TX mode. If PDMASTR is cleared to 0, I<sup>2</sup>C will send STOP automatically after PDMA transfer done and buffer empty. If PDMASTR is set to 1, SI will be set to 1 and I<sup>2</sup>C bus will be stretched by hardware after PDMA transfer done and buffer empty.

#### 6.17.5.4 Programmable Setup and Hold Times

To guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (I2C\_TMCTL[24:16]) to configure hold time and STCTL (I2C\_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not be affected by stretched.

User should focus on the limitation of setup and hold time configuration. The timing setting must follow I<sup>2</sup>C protocol. Once the setup time configuration is greater than design limitation, it means if setup time setting make SCL output less than three PCLKs, the I<sup>2</sup>C controller cannot work normally since SCL must sample three times. Once the hold time configuration is greater than I<sup>2</sup>C clock limitation, I<sup>2</sup>C will occur bus error. It is suggested that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.17-2 shows the relationship between I<sup>2</sup>C baud rate and PCLK, and the number of table represent one clock duty contain how many PCLKs. The setup and hold time configuration can even program some extreme values in the design, but user should follow I<sup>2</sup>C protocol standard.

I <sup>2</sup> C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20
48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.17-2 Relationship between I<sup>2</sup>C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains 5 PCLKs and set STCTL (I2C\_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time maximum setting value:  $ST_{limit} = (I2C\_CLKDIV[7:0]+1) \times 2 - 6$ .

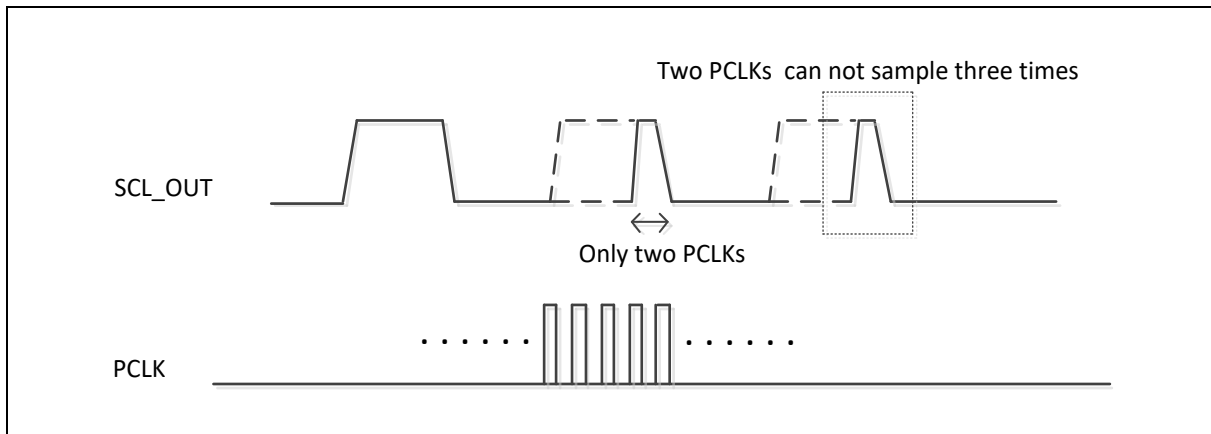

Figure 6.17-23 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I<sup>2</sup>C Baud Rate = 1200k and PCLK = 72 MHz, the SCL high/low duty = 60 PCLK. When HTCTL (I2C\_TMCTL[24:16]) is set to 61 and STCTL (I2C\_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time maximum setting value:  $HT_{limit} = (I2C\_CLKDIV[7:0]+1) \times 2 - 9$ .

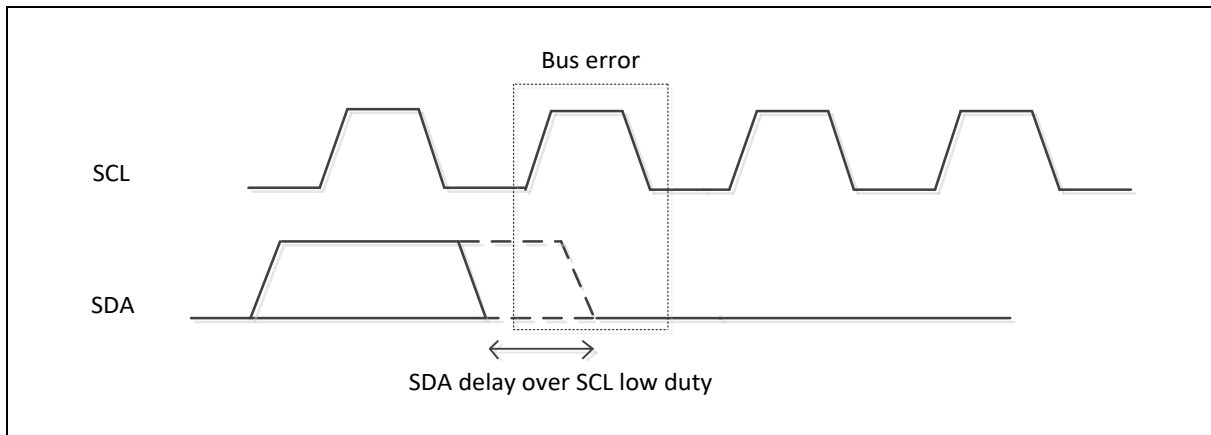

Figure 6.17-24 Hold Time Wrong Adjustment

#### 6.17.5.5 I<sup>2</sup>C Protocol Registers

To control I<sup>2</sup>C port through the following fifteen special function registers: I2C\_CTL0 (control register), I2C\_STATUS0 (status register), I2C\_DAT (data register), I2C\_ADDRn (address registers, n=0~3), I2C\_ADDRMSKn (address mask registers, n=0~3), I2C\_CLKDIV (clock rate register), I2C\_TOCTL (Time-out control register), I2C\_WKCTL(wake up control register) and I2C\_WKSTS(wake up status register).

#### Address Registers (I2C\_ADDR)

The I<sup>2</sup>C port is equipped with four slave address registers, I2C\_ADDRn (n=0~3). The contents of the register are irrelevant when I<sup>2</sup>C is in Master mode. In Slave mode, the bit field ADDR(I2C\_ADDRn[7:1]) must be loaded with the chip's own slave address. The I<sup>2</sup>C hardware will react if the contents of I2C\_ADDRn are matched with the received slave address.

The I<sup>2</sup>C ports support the "General Call" function. If the GC bit (I2C\_ADDRn [0]) is set the I<sup>2</sup>C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.

When the GC bit is set and the I<sup>2</sup>C is in Slave mode, it can receive the general call address by 00H after Master sends general call address to I<sup>2</sup>C bus, then it will follow status of GC mode.

### Slave Address Mask Registers (I2C\_ADDRMSK)

The I<sup>2</sup>C bus controller supports multiple address recognition with four address mask registers I2C\_ADDRMSKn (n=0~3). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

### Data Register (I2C\_DAT)

This register contains a byte of serial data to be transmitted or a byte which just has been received. The CPU can be read from or written to the 8-bit (I2C\_DAT [7:0]) directly while it is not in the process of shifting a byte. When I<sup>2</sup>C is in a defined state and the serial interrupt flag (SI) is set, data in I2C\_DAT [7:0] remains stable. While data is being shifted out, data on the bus is simultaneously being shifted in; I2C\_DAT [7:0] always contains the last data byte presented on the bus.

The acknowledge bit is controlled by the I<sup>2</sup>C hardware and cannot be accessed by the CPU. Serial data is shifted into I2C\_DAT [7:0] on the rising edges of serial clock pulses on the SCL line. When a byte has been shifted into I2C\_DAT [7:0], the serial data is available in I2C\_DAT [7:0], and the acknowledge bit (ACK or NACK) is returned by the control logic during the ninth clock pulse. In order to monitor bus status while sending data, the bus data will be shifted to I2C\_DAT[7:0] when sending I2C\_DAT[7:0] to bus. In the case of sending data, serial data bits are shifted out from I2C\_DAT [7:0] on the falling edge of SCL clocks, and is shifted to I2C\_DAT [7:0] on the rising edge of SCL clocks. Figure 6.17-25 shows I<sup>2</sup>C Data Shifting Direction.

Figure 6.17-25 I<sup>2</sup>C Data Shifting Direction

### Control Register (I2C\_CTL0)

The CPU can be read from and written to I2C\_CTL0 [7:0] directly. When the I<sup>2</sup>C port is enabled by setting I2CEN (I2C\_CTL0 [6]) to high, the internal states will be controlled by I2C\_CTL0 and I<sup>2</sup>C logic hardware.

There are two bits are affected by hardware: the SI bit is set when the I<sup>2</sup>C hardware requests a serial interrupt, and the STO bit is cleared when a STOP condition is present on the bus. The STO bit is also cleared when I2CEN = 0.

Once a new status code is generated and stored in I2C\_STATUS0, the I<sup>2</sup>C Interrupt Flag bit SI (I2C\_CTL0 [3]) will be set automatically. If the Enable Interrupt bit INTEN (I2C\_CTL0 [7]) is set at this time, the I<sup>2</sup>C interrupt will be generated. The bit field I2C\_STATUS0[7:0] stores the internal state code, the content keeps stable until SI is cleared by software.

### Status Register (I2C\_STATUS0)

I2C\_STATUS0 [7:0] is an 8-bit read-only register. The bit field I2C\_STATUS0 [7:0] contains the status code and there are 26 possible status codes. All states are listed in Table 6.17-3. When I2C\_STATUS0 [7:0] is F8H, no serial interrupt is requested. All other I2C\_STATUS0 [7:0] values correspond to the defined I<sup>2</sup>C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C\_STATUS0[7:0] one cycle PCLK after SI set by hardware and is still present one cycle PCLK after SI reset by software.

In addition, the state 00H stands for a Bus Error, which occurs when a START or STOP condition is present at an incorrect position in the I<sup>2</sup>C format frame. A Bus Error may occur during the serial transfer of an address byte, a data byte or an acknowledge bit. To recover I<sup>2</sup>C from bus error, STO should be set and SI should be cleared to enter Not Addressed Slave mode. Then STO is cleared to release bus and to wait for a new communication. The I<sup>2</sup>C bus cannot recognize stop condition during this action

when a bus error occurs.

Master Mode		Slave Mode	
STATUS	Description	STATUS	Description
0x08 <sup>[1]</sup>	Start	0xA0	Slave Transmit Repeat Start or Stop
0x10 <sup>[1]</sup>	Master Repeat Start	0xA8 <sup>[1]</sup>	Slave Transmit Address ACK
0x18 <sup>[1]</sup>	Master Transmit Address ACK	0xB8 <sup>[1]</sup>	Slave Transmit Data ACK
0x20	Master Transmit Address NACK	0xC0	Slave Transmit Data NACK
0x28 <sup>[1]</sup>	Master Transmit Data ACK	0xC8 <sup>[1]</sup>	Slave Transmit Last Data ACK
0x30	Master Transmit Data NACK	0x60 <sup>[1]</sup>	Slave Receive Address ACK
0x38	Master Arbitration Lost	0x68 <sup>[1]</sup>	Slave Receive Arbitration Lost
0x40 <sup>[1]</sup>	Master Receive Address ACK	0x80 <sup>[1]</sup>	Slave Receive Data ACK
0x48	Master Receive Address NACK	0x88	Slave Receive Data NACK
0x50 <sup>[1]</sup>	Master Receive Data ACK	0x70 <sup>[1]</sup>	GC mode Address ACK
0x58	Master Receive Data NACK	0x78 <sup>[1]</sup>	GC mode Arbitration Lost
0x00	Bus error	0x90 <sup>[1]</sup>	GC mode Data ACK
		0x98	GC mode Data NACK
		0xB0 <sup>[1]</sup>	Address Transmit Arbitration Lost
0xF0	If the BMDEN =1 and the ACKMEN bit is enabled, the information of I2C_STATUS0 will be fixed as 0xF0 in slave receive condition.		
0xF8	Bus Released <b>Note:</b> Status “0xF8” exists in both master/slave modes, and it won’t raise interrupt.		
Note [1]: No interrupt in PDMA mode			

Table 6.17-3 I<sup>2</sup>C Status Code Description

#### **Clock Baud Rate Bits (I2C\_CLKDIV)**

The data baud rate of I<sup>2</sup>C is determined by DIVIDER(I2C\_CLKDIV [7:0]) register when I<sup>2</sup>C is in Master mode, and it is not necessary in a Slave mode. In the Slave mode, I<sup>2</sup>C will automatically synchronize it with any clock frequency from master I<sup>2</sup>C device. In the slave mode, system clock frequency should be greater than I<sup>2</sup>C bus maximum clock 20 times.

The data baud rate of I<sup>2</sup>C setting is Data Baud Rate of I<sup>2</sup>C = (system clock) / (4x (I2C\_CLKDIV [7:0] +1)). If system clock = 16 MHz, the I2C\_CLKDIV [7:0] = 40 (28H), the data baud rate of I<sup>2</sup>C = 16 MHz/ (4x (40 +1)) = 97.5 Kbits/sec.

#### **Time-out Control Register (I2C\_TOCTL)**

There is a 14-bit time-out counter which can be used to deal with the I<sup>2</sup>C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it overflows (TOIF=1) and generates I<sup>2</sup>C interrupt to CPU or stops counting by clearing TOCEN to 0. When time-out counter is enabled, writing 1 to the SI flag will reset counter and re-start up counting after SI is cleared. If I<sup>2</sup>C bus hangs up, it causes the I2C\_STATUS0 and flag SI are not updated for a period, the 14-bit time-out counter may overflow and acknowledge CPU the I<sup>2</sup>C interrupt. Refer to Figure 6.17-26 for the 14-bit time-out counter. User may write 1 to clear TOIF to 0.

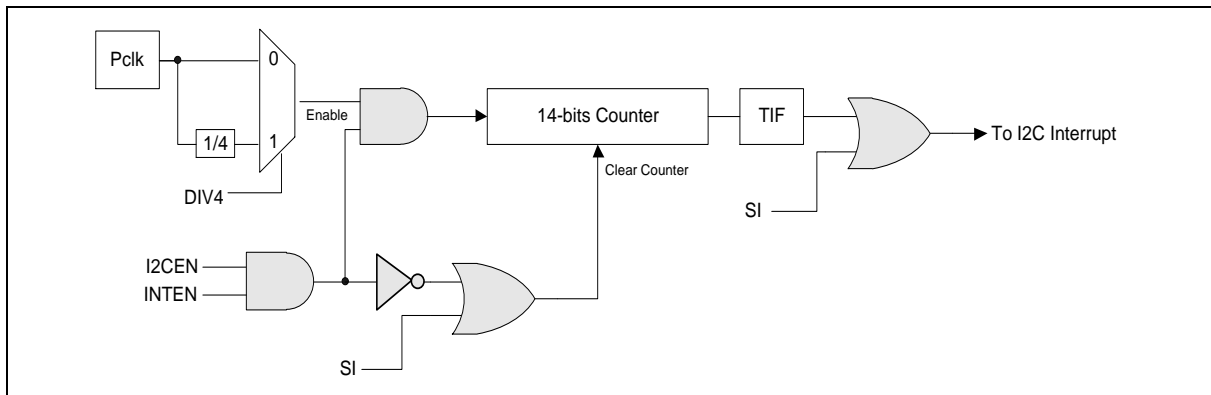

Figure 6.17-26 I²C Time-out Count Block Diagram

#### **Wake-up Control Register (I2C\_WKCTL)**

When chip enters Power-down mode and sets WKEN (I2C\_WKCTL [0]) to 1, other I²C master can wake up the chip by addressing the I²C device, user must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's address and the ACK cycle done, then the I²C controller will go ahead. If NHDBUSEN (I2C\_WKCTL [7]) is set, the controller will don't stretch the SCL to low. Note that when the controller doesn't stretch the SCL to low, transmit or receive data will perform immediately. If data transmitted or received when SI event is not clear, user must reset the I²C controller and execute the original operation again.

#### **Wake-up Status Register (I2C\_WKSTS)**

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs write "1" to clear this bit.

When the chip is woken-up by address match with one of the device address register (I2C\_ADDRn), the user shall check the WKAKDONE (I2C\_WKSTS [1]) bit is set to 1 to confirm the address byte has done. The WKAKDONE bit indicates that the ACK bit cycle of address byte is done in power-down. The controller will stretch the SCL to low when the address is matched the device's slave address and the ACK cycle done. The SCL is stretched until WKAKDONE is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check WKAKDONE to confirm this frame has transaction done and then to do the wakeup procedure. Note that user can't release WKIF through clearing the WKAKDONE bit to 0.

The WRSTSWK (I2C\_WKSTS [2]) bit records the Read/Write command before the I²C controller sends address. The user can read this bit's status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is woken up by the address match frame. Note that the WRSTSWK (I2C\_WKSTS [2]) bit is cleared when writing one to the WKAKDONE (I2C\_WKSTS [1]) bit.

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs to write "1" to clear this bit.

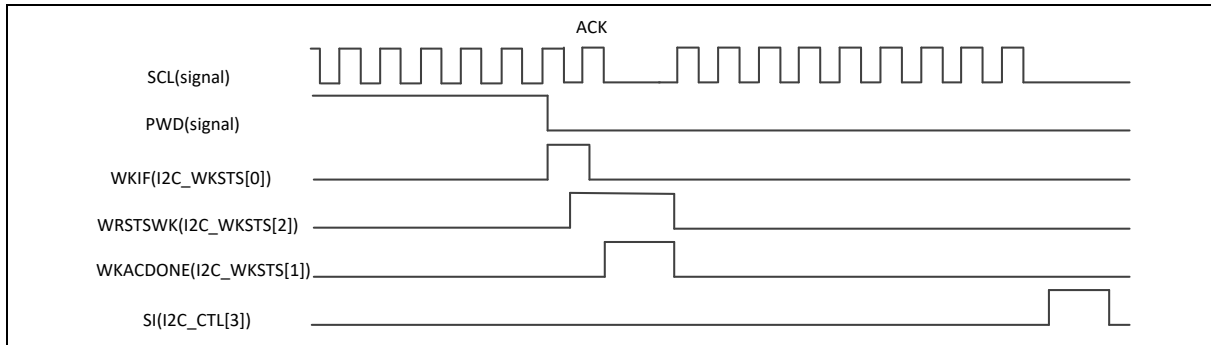

Figure 6.17-27 I<sup>2</sup>C Wake-Up Related Signals Waveform

### **I<sup>2</sup>C Control Register 1 (I2C\_CTL1)**

If enable 10-bit addressing mode ADDR10EN (I2C\_CTL1 [9]) is set, the I<sup>2</sup>C will run in 10-bit mode.

For PDMA function, set TXPDMAEN (I2C\_CTL1 [0]) and RXPDMAEN (I2C\_CTL1 [1]) can be set to operate. And set PDMARST (I2C\_CTL1 [2]) to reset the PDMA control logic.

### **I<sup>2</sup>C Status Register 1 (I2C\_STATUS1)**

The I<sup>2</sup>C controller supports four slave address flag registers, ADMAT0, ADMAT1, ADMAT2 and ADMAT3 (I2C\_STATUS1[3:0]). Every control register represent which address is used and set 1 to inform software.

### **I<sup>2</sup>C Timing Configure Control Register (I2C\_TMCTL)**

In order to configure setup/hold time, the HTCTL (I2C\_TMCTL[24:16]) and STCTL (I2C\_TMCTL[8:0]) are set based on actual demand.

### **Bus Management Control Register (I2C\_BUSCTL)**

The SM bus management control events are defined in this register. It includes the Acknowledge Control by Manual (ACKMEN (I2C\_BUSCTL[0])), Packet Error Checking Enable (PECEN (I2C\_BUSCTL[1])), device (BMDEN(I2C\_BUSCTL[2])) or host (BMHEN (I2C\_BUSCTL[3])) enable in this peripheral device. Both the alert and the suspend function can be set in ALERTEN (I2C\_BUSCTL[4]), SCTLOSTS (I2C\_BUSCTL[5]) and SCTLOEN (I2C\_BUSCTL[6]).

The system bus management enable control by BUSEN(I2CBUSCTL[7]) bit. The BUSTOUT(I2CBUSCTL[9]) is used to calculate the time-out of clock low in bus active and the idle period in bus Idle.

The calculated PEC (when the PECEN is set) value is transmitted or received can be controlled by PECTXEN bit (I2C\_BUSCTL[8]).

There is a special bit of ACKM9SI (I2C\_BUSCTL[11]). When the ACKMEN is set, there is SI interrupt in the 8th clock input and the user can read the data and status register. If the 8th clock bus is released when the SI interrupt is cleared, there is another SI interrupt event in the 9th clock cycle when this bit is set to 1 to know the bus status in this transaction frame done.

Set the PECDIEN (I2C\_BUSCTL[13]), BCDIEN (I2C\_BUSCTL[12]) or PECCLR (I2C\_BUSCTL[10]) for PEC control flow.

### **I<sup>2</sup>C Bus Management Timer Control Register (I2C\_BUSTCTL)**

Set TORSTEN (I2C\_BUSTCTL[4]), CLKTOIEN (I2C\_BUSTCTL[3]), BUSTOIEN (I2C\_BUSTCTL[2]), CLKTOEN (I2C\_BUSTCTL[1]) and BUSTOEN (I2C\_BUSTCTL[0]) for bus time-out or clock low time-out control flow.

### ***I<sup>2</sup>C Bus Management Status Register (I2C BUSSTS)***

Monitor the PECDONE (I2C\_BUSSTS[7]), BCDONE (I2C\_BUSSTS[1]) or PECERR (I2C\_BUSSTS[2]) for PEC control flow.

Monitor the SCTLDIN (I2C BUSSTS[4]) for SUSCON input status.

### ***I<sup>2</sup>C Byte Number Register (I2C PKTSIZE)***

When the PECEN bit (I2C\_BUSCTL[1]) is set. The I<sup>2</sup>C controller will calculate the PEC value of the data on the bus. The PLDSIZE (I2C\_PKTSIZE[8:0]) is used to define the data number in the bus. When the counter reach the value of PLDSIZE, the final PEC value will be transmitted or received automatically when the PECTXEN bit (I2C\_BUSCTL[8]) is set.

### PC PEC VALUR Register (I2C PKTCRC)

The register indicates the calculated PECCRC (I2C\_PKTCRC[7:0]) value of data on the I<sup>2</sup>C bus. The detail of information is defined the PEC section of SM Bus.

***I<sup>2</sup>C Bus Management Timer and I<sup>2</sup>C Clock Low Timer Register (I2C\_BUSTOUT/ I2C\_CLKTOUT)***

Both of the definitions of these registers are described in the time-out section of SM Bus.

#### 6.17.5.6 Example for Random Read on EEPROM

The following steps are used to configure the I2C0 related registers when using I<sup>2</sup>C to read data from EEPROM.

1. Set I2C0 the multi-function pin as SCL and SDA pins. The multi-function configuration reference Basic Configuration..
2. Enable I2C0 APB clock. The clock configuration reference Basic Configuration.
3. Set I2C0RST=1 to reset I2C0 controller then set I2C0 controller to normal operation. The reset controller configuration reference Basic Configuration.
4. Set I2CEN=1 to enable I2C0 controller in the “I2C\_CTL0” register.
5. Give I2C0 clock a divided register value for I<sup>2</sup>C clock rate in the “I2C\_CLKDIV”.
6. Enable system I2C0 IRQ in system “NVIC” control register.
7. Set INTEN=1 to enable I2C0 Interrupt in the “I2C\_CTL0” register.
8. Set I2C0 address registers “I2C\_ADDR0 ~ I2C\_ADDR3”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.17-28 shows the EEPROM random read operation.

Figure 6.17-28 EEPROM Random Read

Figure 6.17-29 shows how to use the I<sup>2</sup>C controller to implement the protocol of EEPROM random read.

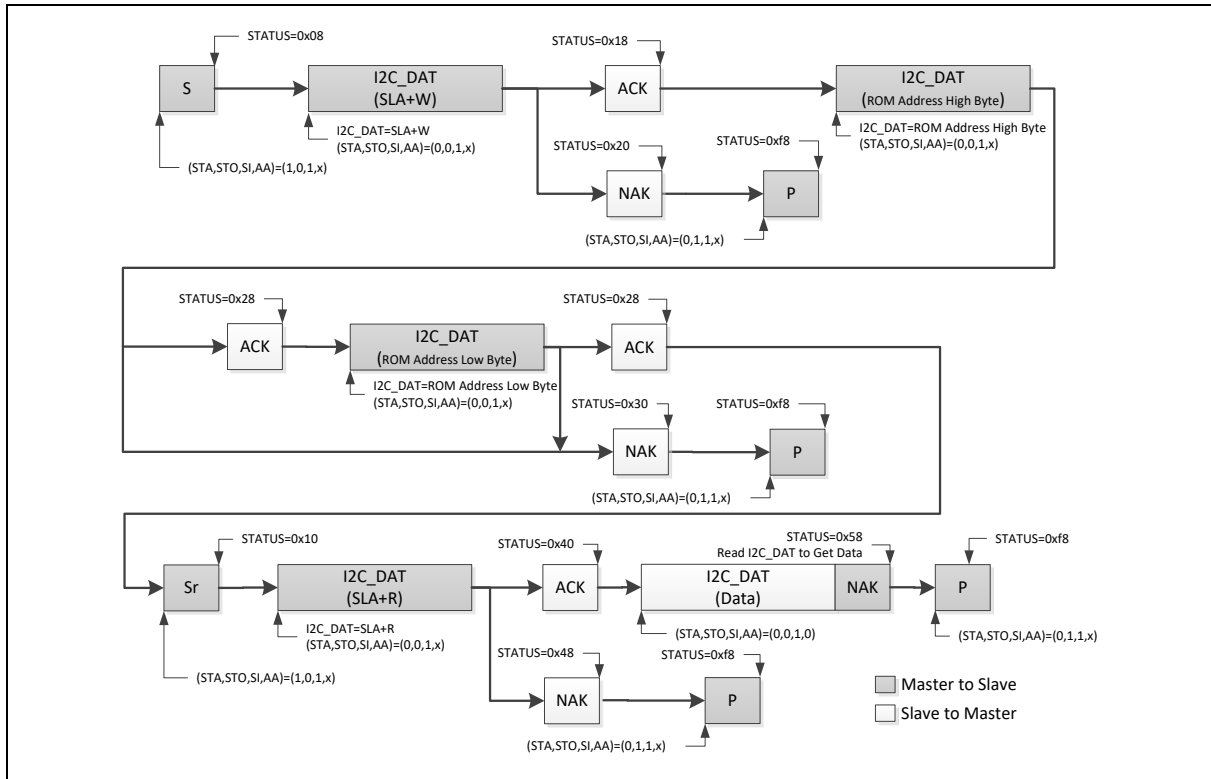

Figure 6.17-29 Protocol of EEPROM Random Read

The I<sup>2</sup>C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

## 6.17.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>I<sup>2</sup>C Base Address:</b> <b>I2Cn_BA = 0x4008_0000 + (0x1000 *n)</b> <b>n= 0,1</b>

## 6.17.7 Register Description

I<sup>2</sup>C Control Register  
(I2C\_CTL0)

Register	Offset	R/W	Description	Reset Value
I2C_CTL0	I2Cn_BA+0x00	R/W	I <sup>2</sup> C Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
INTEN	I2CEN	STA	STO	SI	AA	Reserved	

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	INTEN	<b>Enable Interrupt</b> 0 = I <sup>2</sup> C interrupt Disabled. 1 = I <sup>2</sup> C interrupt Enabled.
[6]	I2CEN	<b>I<sup>2</sup>C Controller Enable Bit</b> Set to enable I <sup>2</sup> C serial function controller. When I2CEN=1 the I <sup>2</sup> C serial function enable. The multi-function pin function must set to SDA, and SCL of I <sup>2</sup> C function first. 0 = I <sup>2</sup> C controller Disabled. 1 = I <sup>2</sup> C controller Enabled.
[5]	STA	<b>I<sup>2</sup>C START Control</b> Setting STA to logic 1 to enter Master mode, the I <sup>2</sup> C hardware sends a START or Repeat START condition to bus when the bus is free.
[4]	STO	<b>I<sup>2</sup>C STOP Control</b> In Master mode, setting STO to transmit a STOP condition to bus then I <sup>2</sup> C controller will check the bus condition if a STOP condition is detected. This bit will be cleared by hardware automatically.
[3]	SI	<b>I<sup>2</sup>C Interrupt Flag</b> When a new I <sup>2</sup> C state is present in the I2C_STATUS0 register, the SI flag is set by hardware. If bit INTEN (I2C_CTL0 [7]) is set, the I <sup>2</sup> C interrupt is requested. SI must be cleared by software. Clear SI by writing 1 to this bit. For ACKMEN is set in slave read mode, the SI flag is set in 8th clock period for user to confirm the acknowledge bit and 9th clock period for user to read the data in the data buffer.
[2]	AA	<b>Assert Acknowledge Control</b> When AA =1 prior to address or data is received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.

7	6	5	4	3	2	1	0
STATUS							

Bits	Description
[31:8]	<b>Reserved</b> Reserved.
[7:0]	<b>STATUS</b> <b>I<sup>2</sup>C Status</b> The three least significant bits are always 0. The five most significant bits contain the status code. There are 28 possible status codes. When the content of I2C_STATUS0 is F8H, no serial interrupt is requested. Others I2C_STATUS0 values correspond to defined I <sup>2</sup> C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C_STATUS0 one cycle after SI is set by hardware and is still present one cycle after SI has been reset by software. In addition, states 00H stands for a Bus Error. A Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit.

I<sup>2</sup>C Clock Divided Register  
(I2C\_CLKDIV)

## 6.18 USCI - Universal Serial Control Interface Controller (USCI)

### 6.18.1 Overview

The Universal Serial Control Interface (USCI) is a flexible interface module covering several serial communication protocols. The user can configure this controller as UART, SPI, or I<sup>2</sup>C functional protocol.

### 6.18.2 Features

The controller can be individually configured to match the application needs. The following protocols are supported:

- UART
- SPI
- I<sup>2</sup>C

### 6.18.3 Block Diagram

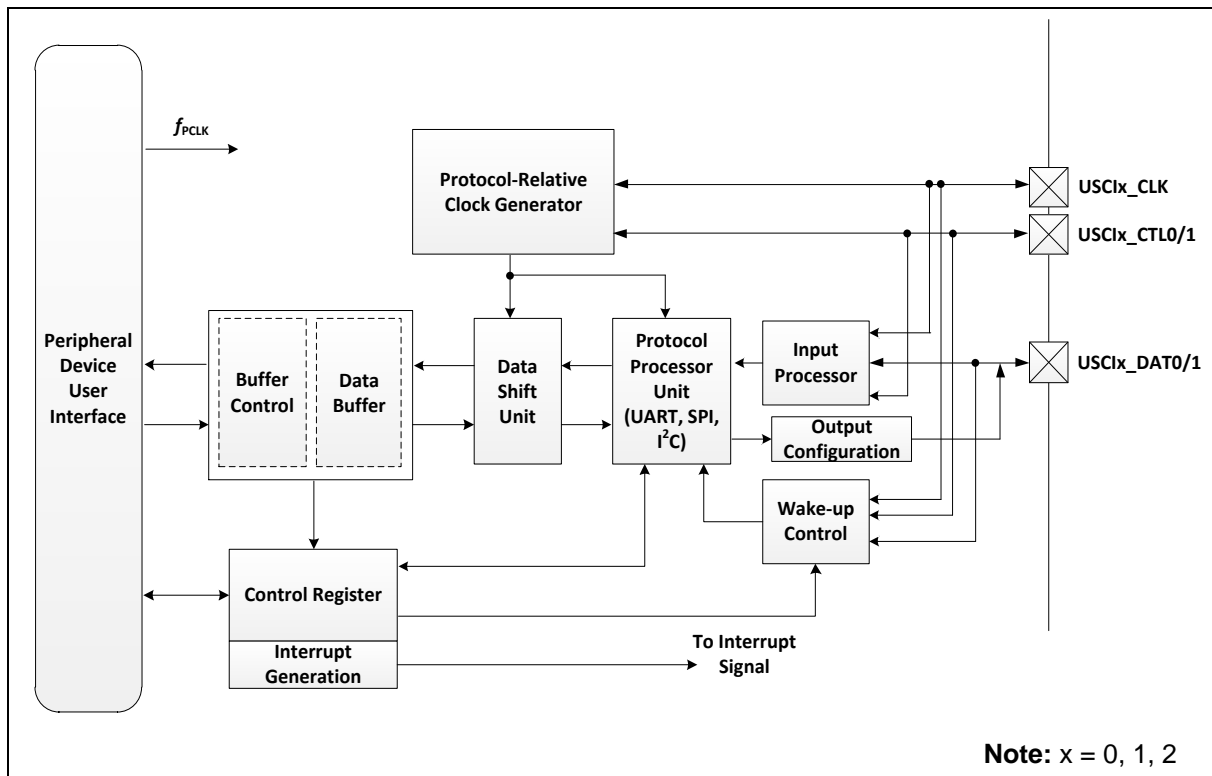

Figure 6.18-1 USCI Block Diagram

### 6.18.4 Functional Description

The structure of the Universal Serial Control Interface (USCI) controller is shown in Figure 6.18-1 USCI Block Diagram. The input signal is implemented in input processor. The data buffers and the data shift unit support the data transfers. Each protocol-specific function is handled by the protocol processor unit. The timing and time event control signals of the specific protocol are handled by the protocol-relative clock generator. All the protocol-specific events are processed in the interrupt generation unit. The wake-up function of the specific protocol is implemented in the wake-up control unit.

The USCI is equipped with three protocols including UART, SPI, and I<sup>2</sup>C. They can be selected by FUNMODE (USCI\_CTL [2:0]). Note that the FUNMODE must be set to 0 before changing protocol.

#### 6.18.4.1 I/O Processor

##### Input Signal

All input stages offer the similar feature set. They are used for all protocols.

Table 6.18-1 lists the relative input signals for each selected protocol. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter.

Selected Protocol		UART	SPI	I <sup>2</sup> C
Serial Bus Clock Input	USCIX_CLK	-	SPI_CLK	SCL
Control Input	USCIX_CTL0	nCTS	SPI_SS	-
	USCIX_CTL1	-	-	-
Data Input	USCIX_DAT0	RX	SPI_MOSI_0	SDA
	USCIX_DAT1	-	SPI_MISO_0	-

Table 6.18-1 Input Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

##### General Input Structure

The input structures of data and control signals include inverter, digital filter and edge detection (data signal only).

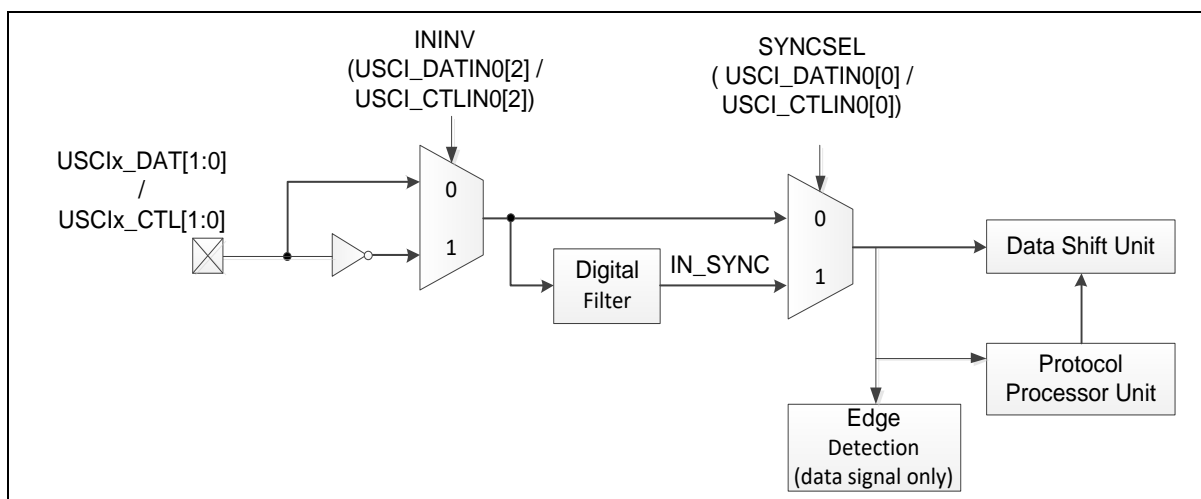

Figure 6.18-2 Input Conditioning for USCIX\_DAT[1:0] and USCIX\_CTL[1:0]

The input structure of USCIX\_CLK is similar to USCIX\_CTL[1:0] input structure, except it does not support inverse function.

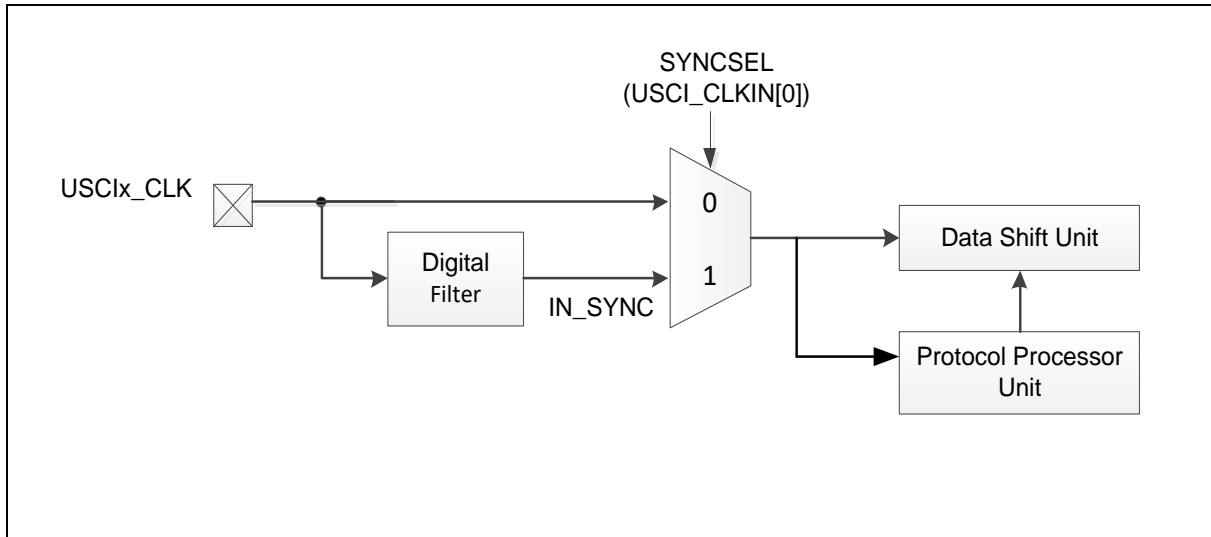

Figure 6.18-3 Input Conditioning for USCIx\_CLK

All configurations of control, clock and data input structures are in USCI\_CTLIN0, USCI\_CLKIN and USCI\_DATIN0 registers respectively. EDGEDET (USCI\_DATIN0[4:3]) is used to select the edge detection condition. Note that the EDGEDET for USCI\_DATIN0 must be set 2'b10 in UART mode. The programmable edge detection indicates that the desired event has occurred by activating the trigger signal.

ININV (USCI\_DATIN0[2] / USCI\_CTLIN0[2]) allows a polarity inversion of the selected input signal to adapt the input signal polarity to the internal polarity of the data shift unit and the protocol state machine.

If the SYNCSEL (USCI\_DATIN0[0] / USCI\_CTLIN0[0] / USCI\_CLKIN[0]) is set to 0, the paths of input signals do not contain any delay due to synchronization or filtering. If there is noise on the input signals, the noise can be filtered from the input signal (signal IN\_SYNC is synchronized to  $f_{CLK}$ ) when SYNCSEL is set to 1. The synchronization leads to a delay in the signal path of 2-3 times the period of  $f_{CLK}$ .

### Output Signals

Table 6.18-2 shows the relative output signals for each protocol. The number of actually used outputs depends on the selected protocol and they can be classified according to their meaning for the protocols.

Selected Protocol		UART	SPI	I <sup>2</sup> C
Serial Bus Clock Output	USCIx_CLK	-	SPI_CLK	SCL
	USCIx_CTL0	-	SPI_SS	-
Control Output	USCIx_CTL1	nRTS	-	-
	USCIx_DAT0	-	SPI_MOSI_0	SDA
Data Output	USCIx_DAT1	TX	SPI_MISO_0	-

Table 6.18-2 Output Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

#### 6.18.4.2 Data Buffering

The data handling of the USCI controller is based on a Data Shift Unit (DSU) and a buffer structure.

Both of the data shift and buffer registers are 16-bit wide. The inputs of Data Shift Unit include the shift data, the serial bus clock, and the shift control. The output pin of transmission can be USC1x\_DAT0 pin or USC1x\_DAT1 pin depends on what protocol is selected.

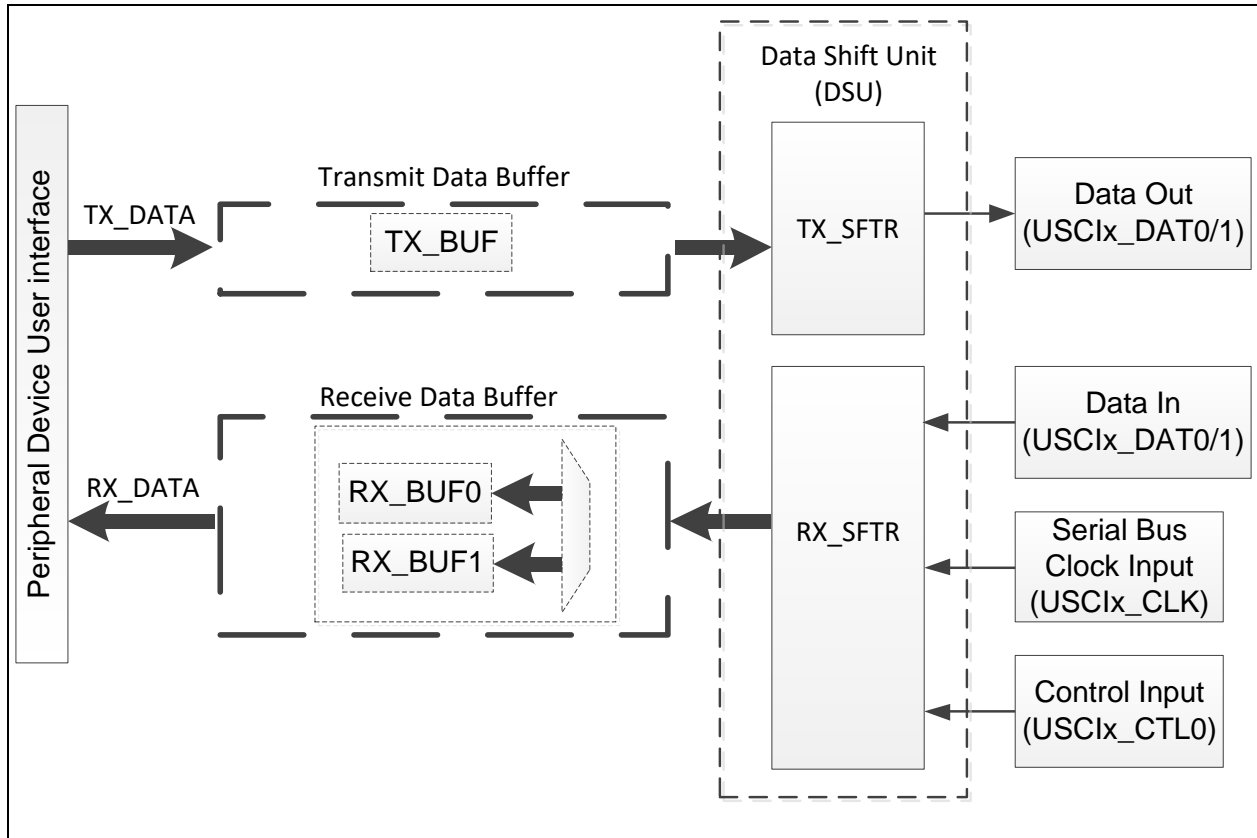

Figure 6.18-4 Block Diagram of Data Buffering

The operation of data handling includes:

- The peripheral device clock (PCLK) is used to handle data, status and control information.
- A transmitter includes transmit shift register (TX\_SFTR) and a transmit data buffer (TX\_BUF). The TXFULL / TXEMPTY (USCI\_BUFSTS[9:8]) and TXENDIF (USCI\_PROTSTS[2]) can indicate the status of transmitter.
- A receiver includes receive shift register (RX\_SFTR) and a double receive buffer structure (RX\_BUF0, RX\_BUF1). In double buffer structure, user need not care about the reception sequence and two received data can be hold if user does not read the data of USC1\_RXDAT register in time.

#### Data Access Structure

The Data Access Structure includes read access to received data and write access of data to be transmitted. The received data is stored in the receiver buffers including RX\_BUF0 and RX\_BUF1. User need not care about the reception sequence. The receive buffer can be accessed by reading USC1\_RXDAT register. The first received data is read out first and the next received data becomes visible in USC1\_RXDAT and can be read out next.

Transmit data can be loaded to TX\_BUF by writing to the transmit register USC1\_TXDAT.

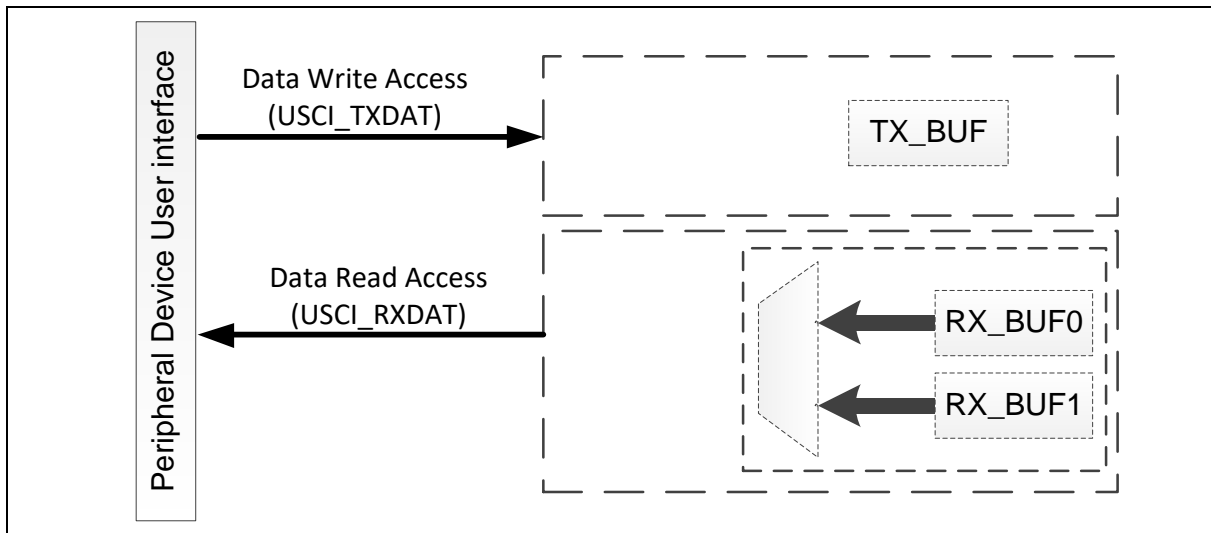

Figure 6.18-5 Data Access Structure

### Transmit Data Path

The transmit data path is based on 16-bit wide transmit shift register (TX\_SFTR) and transmit buffer TX\_BUF. The data transfer parameters like data word length is controlled commonly for transmission and reception by the line control register USCI\_LINECTL.

### Transmit Buffering

The transmit shift register cannot be directly accessed by user. It is updated automatically with the value stored in the transmit buffer (TX\_BUF) if a currently transmitted data is finished and new data is valid for transmission.

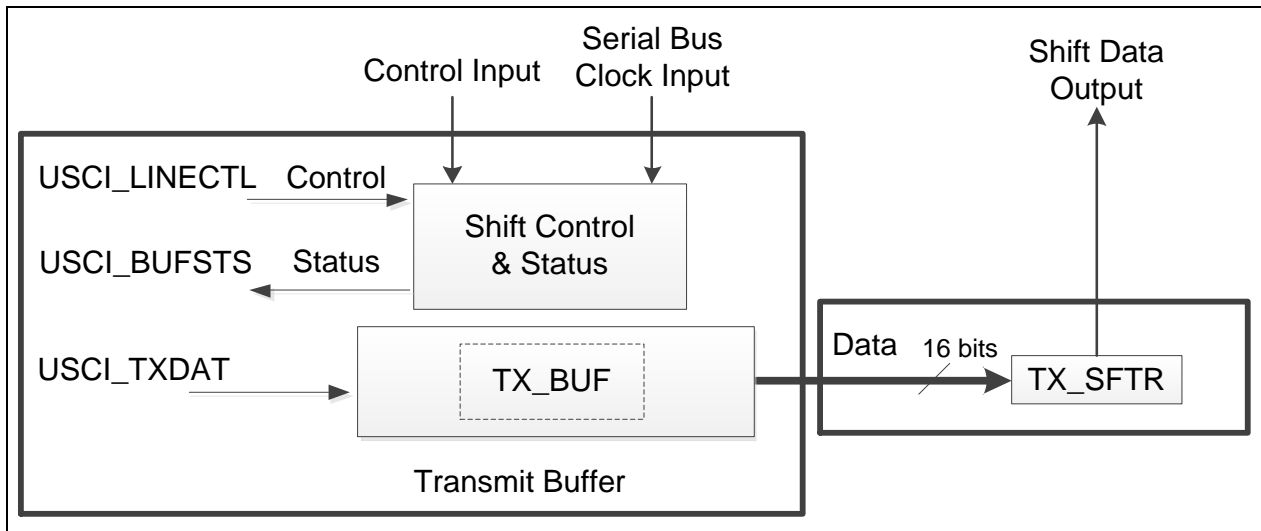

Figure 6.18-6 Transmit Data Path

### Transmit Data Validation

The status of TXEMPTY (USCI\_BUFSTS[8]) indicates the transmission data is valid or not in the transmit buffer (TX\_BUF) and the TXSTIF (USCI\_PROTSTS[1]) labels the start conditions for each data.

- If the USCI controller is a Master, the data transfer can only be started with valid data in the transmit buffer (TX\_BUF). In this case, the transmit shift register is loaded with the content of transmit buffer.

**Note:** Master defines the start of data transfer.

- If the USCI controller is a Slave, a data transfer requested by Master and it has to be started independently of the status in transmit buffer (TX\_BUF). If a data transfer is requested and started by the Master, the transmit shift register is loaded from specific protocol control signal if it is valid for transmission.

**Note:** Slave can not define the start itself, but has to react.

- The timing of loading data from transmit buffer to data shift unit depends on protocol configurations.
- **UART:** A transmission of the data word in transmit buffer can be started if TXEMPTY = 0 in normal operation. In auto flow control, A transmission of the data word in transmit buffer can be started while TXEMPTY = 0 and USCIx\_CTL0 in active stage.
- **SPI:** In Master mode, data transmission will be started when TXEMPTY is 0. In Slave mode, the data transmission can be started only when slave selection signal is at active state and clock is presented on USCIx\_CLK pin.
- **I<sup>2</sup>C:** A transmission of the data byte in transmit buffer can be started if TXEMPTY = 0.
- A transmission data which is located in transmit buffer can be started if the TXEMPTY (USCI\_BUFSTS [8]) = 0. The content of the transmit buffer (in TX\_BUF condition) should not be overwritten with new data while it is valid for transmission and a new transmission can start. If the content of TX\_BUF has to be changed, user can set TXRST (USCI\_BUFCTL [16]) to 1 to clear the content of TX\_BUF before updating the data. Moreover, TXEMPTY (USCI\_BUFSTS [8]) will be cleared automatically when transmit buffer (TX\_BUF) is updated with new data. While a transmission is in progress, TX\_BUF can be loaded with new data. User has to update the TX\_BUF before a new transmission.

#### **Receive Data Path**

The receive data path is based on 16-bit wide receive shift register RX\_SFTR and receive buffers RX\_BUF0 and RX\_BUF1. The data transfer parameters like data word length, or the shift direction are controlled commonly for transmission and reception by the line control register USCI\_LINECTL. Register USCI\_BUFSTS monitors the data validation of USCI\_RXDAT.

#### **Receive Buffering**

The receive shift register cannot be directly accessed by user, but its content is automatically loaded into the receive buffer if a complete data word has been received or the frame is finished. The received data words in Receive Buffer can be read out automatically from register USCI\_RXDAT.

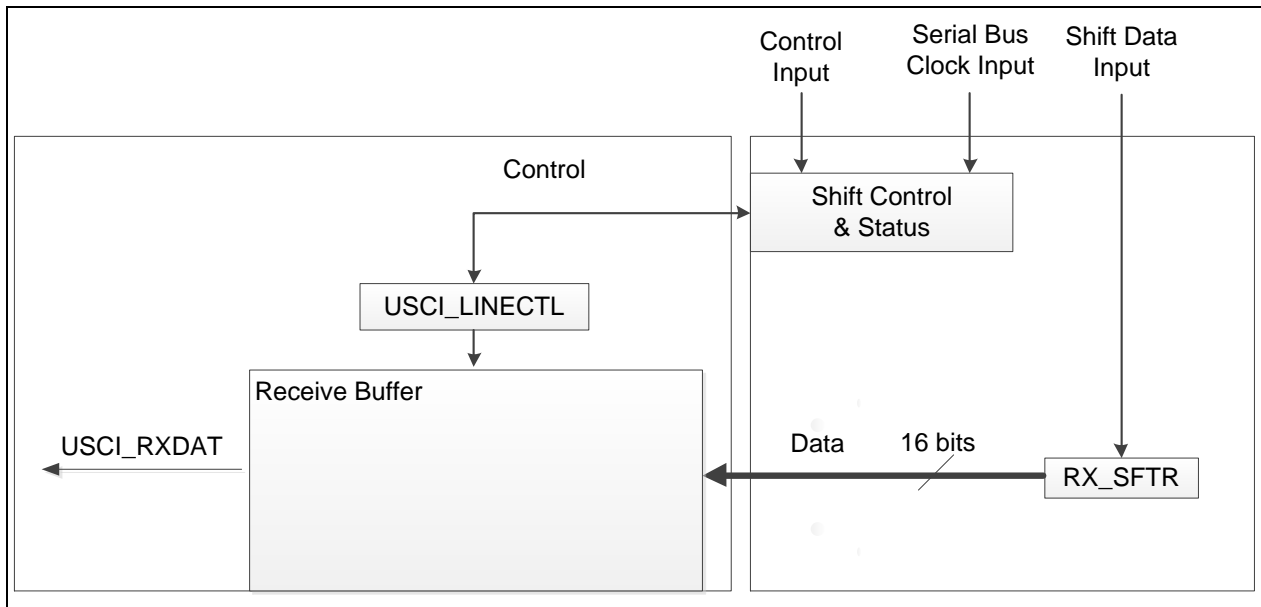

Figure 6.18-7 Receive Data Path

#### 6.18.4.3 Port Direction Control

In SPI protocol with half-duplex configurations, the data port is bidirectional. Port direction control is intended to control the pin direction through a dedicated hardware interface.

The direction of selected pin is controlled by PORTDIR (USCI\_TXDAT[16]). When user writes USCI\_TXDAT register, the transmit data and its port direction are settled simultaneously.

#### 6.18.4.4 Protocol Control and Status

The protocol-related control and status information are located in the protocol control register USCI\_PROTCTL and in the protocol status register USCI\_PROTSTS. These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols. Refer to each protocol's relative register for detail information.

#### 6.18.4.5 Protocol-Relative Clock Generator

The USCI controller contains a protocol-relative clock generator and it is controlled by register USCI\_BRGEN. It is reset when the USCI\_BRGEN register is written. The structured of protocol-relative clock generator is shown in Figure 6.18-8.

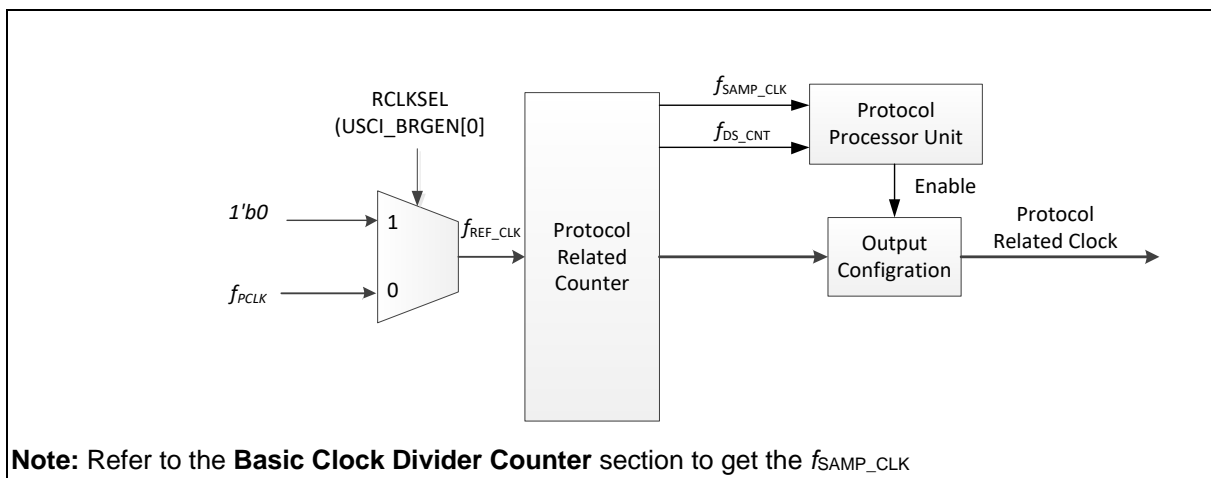

Figure 6.18-8 Protocol-Relative Clock Generator

The protocol related counter contains basic clock divider counter and timing measurement counter. It is based on a divider stages, providing the frequencies needed for the different protocols. It contains:

- The basic clock divider counter provides the protocol-relative clock signal and other protocol-related signals ( $f_{SAMP\_CLK}$  and  $f_{DS\_CLK}$ ).
- The timing measurement counter for time interval measurement, e.g. baud rate detection on UART protocol.
- The output signals of protocol-relative clock generator can be made available on pins (e.g. USC1x\_CLK for SPI).

### **Basic Clock Divider Counter**

The basic clock divider counter is used for an integer division delivering  $f_{REF\_CLK2}$ ,  $f_{REF\_CLK}$ ,  $f_{DIV\_CLK}$ ,  $f_{SCLK}$ , and  $f_{SAMP\_CLK}$ . The frequencies of this divider are controlled by PTCLKSEL (USCI\_BRGEN [1]), CLKDIV (USCI\_BRGEN [25:16]), SPCLKSEL (USCI\_BRGEN [3:2]).

The basic clock divider counter is used to generate the relative protocol timing signals.

$$f_{DIV\_CLK} = f_{REF\_CLK} \times \frac{1}{CLKDIV + 1} \text{ if PTCLKSEL} = 0$$

$$f_{DIV\_CLK} = f_{REF\_CLK} \times \frac{1}{(CLKDIV + 1) \times 2} \text{ if PTCLKSEL} = 1$$

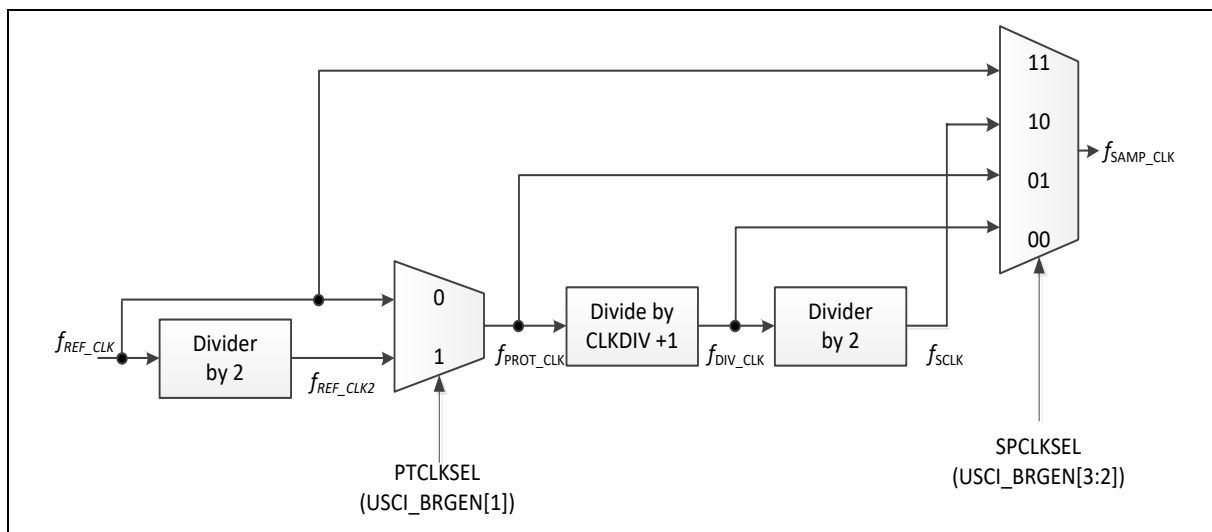

Figure 6.18-9 Basic Clock Divider Counter

### **Timing Measurement Counter**

The timing measurement counter is used for time interval measurement and is enabled by TMCNTEN (USCI\_BRGEN [4]) = 1. When TMCNTSRC (USCI\_BRGEN [5]) is set to 1, the timer works on  $f_{DIV\_CLK}$ , otherwise, the timer works independently from  $f_{PROT\_CLK}$ . Therefore, any serial data reception or transmission can continue while the timer is performing timing measurements. The timer counts the length of protocol-related signals with  $f_{PROT\_CLK}$  or  $f_{DIV\_CLK}$ . It stops counting when it reaches the user-specified value.

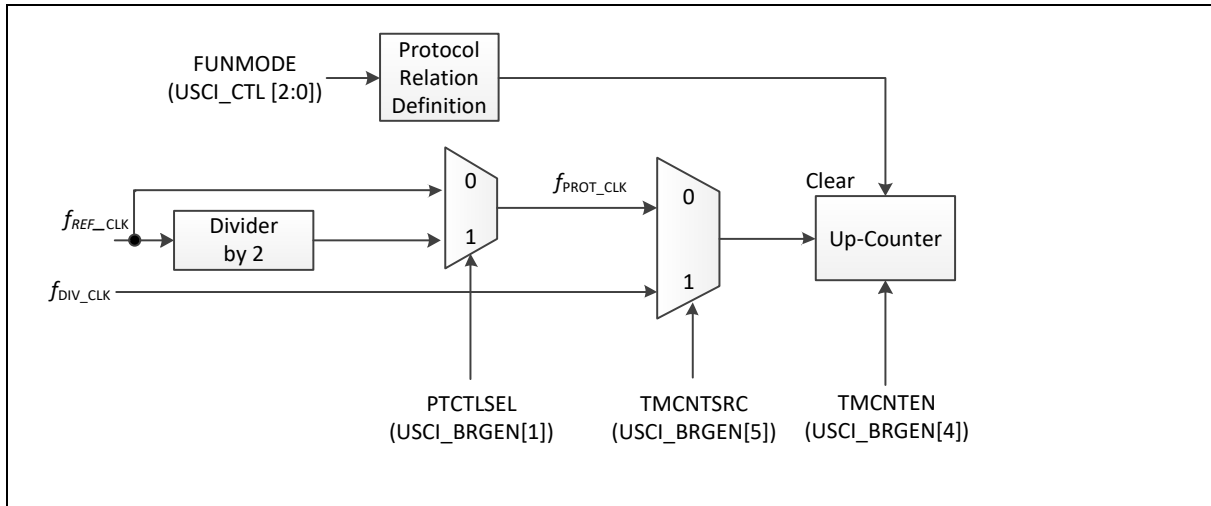

Figure 6.18-10 Block of Timing Measurement Counter

The timing measurement counter is used to perform time-out function or auto-baud rate mechanism. Its functionality depends on the selected protocol as shown below.

- UART: The timing measurement counter is used in auto baud rate detection.
- SPI: The timing measurement counter is used for counting the slave time-out period.
- I<sup>2</sup>C: The timing measurement counter indicates time-out clock cycle.

#### **Sample Time Counter**

A sample time counter associated to the protocol related counter defining protocol-specific timings, such shift control signals or bit timings, based on the input frequency  $f_{SAMP\_CLK}$ . The sample time counter allows generating time intervals for protocol-specific purposes. The period of a sample frequency  $f_{PDS\_CNT}$  is given by the selected input frequency  $f_{SAMP\_CLK}$  and the programmed pre-divider value (PDSCNT (USCI\_BRGEN [9:8])). The meaning of the sample time depends on the selected protocol. Please refer to the corresponding chapters for more protocol-specific information.

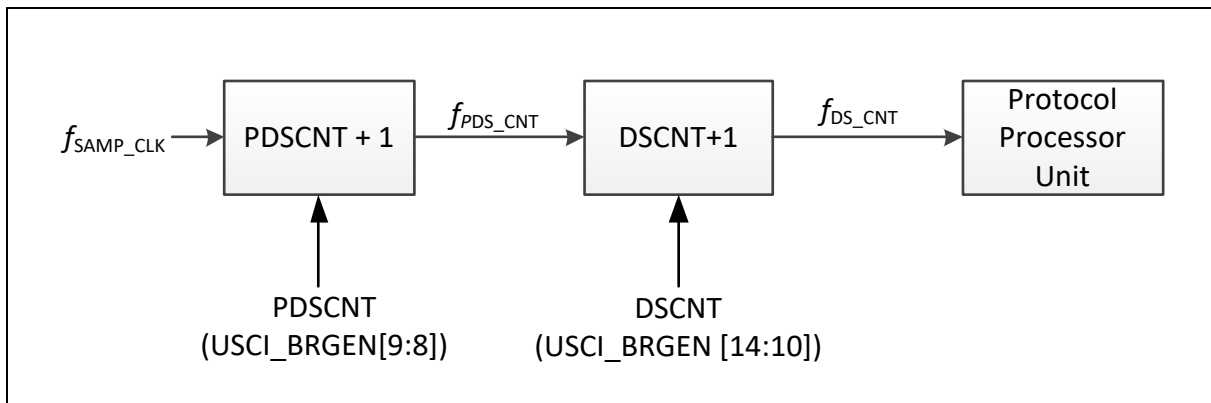

Figure 6.18-11 Sample Time Counter

#### **6.18.4.6 Data Transfer Events and Interrupts**

The data transfer events are based on the transmission or reception of a data word. The related indication flags are located in register USCI\_PROTSTS. All events can be individually enabled for interrupt generation. If the FUNMODE (USCI\_CTL [2:0]) is set to 0, the USCI is disabled. When FUNMODE (USCI\_CTL [2:0]) is setting for a protocol port, the internal states will be controlled by logic hardware of the selected protocol.

- Transmit start interrupt event to indicate that a data word has been started:  
A transmit start interrupt event occurs when the data is loaded into transmitted shift register. It is indicated by flag TXSTIF (USCI\_PROTSTS [1]) and, if TXSTIEN (USCI\_INTEN [1]) is enabled, it leads to transmit start interrupt.
- Transmit end interrupt event to indicate that a data word transmission has been done:  
A transmit end interrupt event occurs when the current transmit data in shift register had been finished. It is indicated by flag TXENDIF (USCI\_PROTSTS [2]) and, if TXENDIEN (USCI\_INTEN [2]) is enabled, it leads to transmit end interrupt. This event also indicates when the shift control settings (word length, shift direction, etc.) are internally “frozen” for the current data word transmission. In UART and I<sup>2</sup>C mode, the transmit data is valid according to TXEMPTY (USCI\_BUFSTS [8]) and protocol-relative internal signal with the transmit end interrupt event.
- Receiver start event to indicate that a data word reception has started:  
When the receive clock edge that shifts in the first bit of a new data word is detected and reception is enabled, a receiver start event occurs. It is indicated by flag RXSTIF (USCI\_PROTSTS [3]) and, if RXSTIEN (USCI\_INTEN [3]) is enabled, it leads to receiver start interrupt.
- Receive event to indicate that a data word has been received:  
If a new received word becomes available in the receive buffer, a receive event occurs. It is indicated by flag RXENDIF (USCI\_PROTSTS [4]) and, if RXENDIEN (USCI\_INTEN [4]) is enabled, it leads to receive interrupt.
- Data lost event to indicate a loss of the newest received data word:  
If the data word available in register USCI\_RXDAT (oldest data word from RX\_BUF0 or RX\_BUF1) has not been read out and the receive buffer is FULL, the new incoming data will lose and this event occurs. It is indicated by flag RXOVIF (USCI\_BUFSTS[3]) and, if RXOVIEN (USCI\_BUFCTL[14]) is enabled, it leads to a protocol interrupt.

The general event and interrupt structure is shown in Figure 6.18-12.

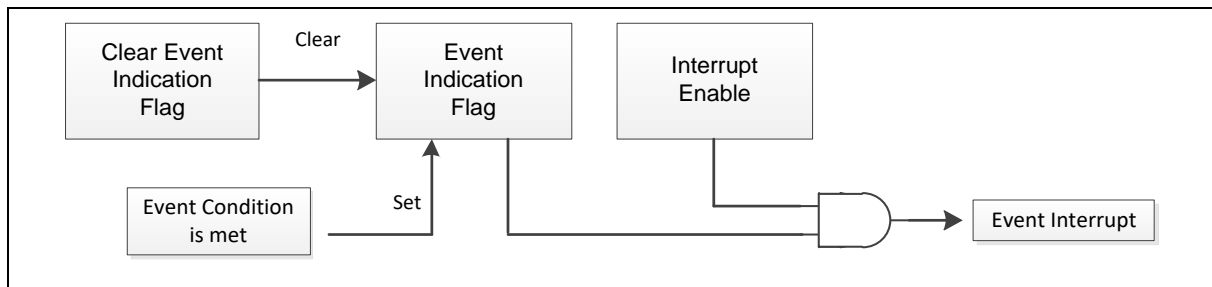

Figure 6.18-12 Event and Interrupt Structure

Each general interrupt enable can be set by RXENDIEN, RXSTIEN, TXENDIEN, and TXSTIEN of USCI\_INTEN [4:1]. The events include receive end interrupt event, receive start interrupt event, transmit end interrupt event, and transmit start interrupt event. For protocol-specific interrupt, it is specified in each protocol interrupt enable register.

If a defined condition is met, an event is detected and an event indication flag becomes automatically set. The flag stays set until it is cleared by software. If enabled, an interrupt can be generated if an event is detected.

The registers, bits and bit fields indicate the data transfer events and control the general interrupts of a USCI are shown in Table 6.18-3.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Transmit start interrupt event	TXSTIF (USCI_PROTSTS [1])	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	TXSTIEN (USCI_INTEN [1])
Transmit end interrupt event	TXENDIF (USCI_PROTSTS [2])		TXENDIEN (USCI_INTEN [2])
Receive start interrupt event	RXSTIF (USCI_PROTSTS [3])		RXSTIEN (USCI_INTEN [3])
Receive end interrupt event	RXENDIF (USCI_PROTSTS [4])		RXENDIEN (USCI_INTEN [4])

Table 6.18-3 Data Transfer Events and Interrupt Handling

#### 6.18.4.7 Protocol-specific Events and Interrupts

These events are related to protocol-specific actions that are described in the corresponding protocol chapters. The related indication flags are located in register USCI\_PROTSTS. All events can be individually enabled for the generation of the common protocol interrupt.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Protocol-specific events in UART mode	USCI_PROTSTS [17:16] and USCI_PROTSTS [11:5]	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	USCI_PROTIEN[2:1]
Protocol-specific events in SPI mode	USCI_PROTSTS [9:8], USCI_PROTSTS [6:5]		USCI_PROTIEN [3:0]
Protocol-specific events in I <sup>2</sup> C mode	USCI_PROTSTS [13:8], USCI_PROTSTS [5]		USCI_PROTIEN [6:0]

Table 6.18-4 Protocol-specific Events and Interrupt Handling

#### 6.18.4.8 Wake-up

The protocol-related wake-up functional information is located in the Wake-up Control Register (USCI\_WKCTL) and in the Wake-up Status Register (USCI\_WKSTS). These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols.

#### 6.18.4.9 PDMA

The USCI supports PDMA transfer function. When PDMAEN (USCI\_PDMACTL [3]) is set to 1, the PDMA function is enabled.

When TXPDMAEN (USCI\_PDMACTL [1]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (USCI\_PDMACTL [2]) is set to 1, the controller will start the PDMA reception process. USCI will issue request to PDMA controller automatically when there is data in the receive FIFO buffer.

In UART function, the requirement of RXPDMAEN will be cleared and hold if there is any error condition events including frame error, parity error or break detection. The user shall read out the current data and then the requirement of RXPDMAEN will send to the PDMA module in the next data.

## 6.19 USCI – UART Mode

### 6.19.1 Overview

The asynchronous serial channel UART covers the reception and the transmission of asynchronous data frames. It performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the controller. The receiver and transmitter being independent, frames can start at different points in time for transmission and reception.

The UART controller also provides auto flow control. There are two conditions to wake-up the system.

### 6.19.2 Features

- Supports one transmit buffer and two receive buffer for data payload
- Supports hardware auto flow control function
- Supports programmable baud-rate generator
- Supports 9-bit Data Transfer (supports 9-bit RS-485)
- Baud rate detection possible by built-in capture event of baud rate generator
- Supports PDMA capability
- Supports Wake-up function (Data and nCTS Wakeup Only)

### 6.19.3 Block Diagram

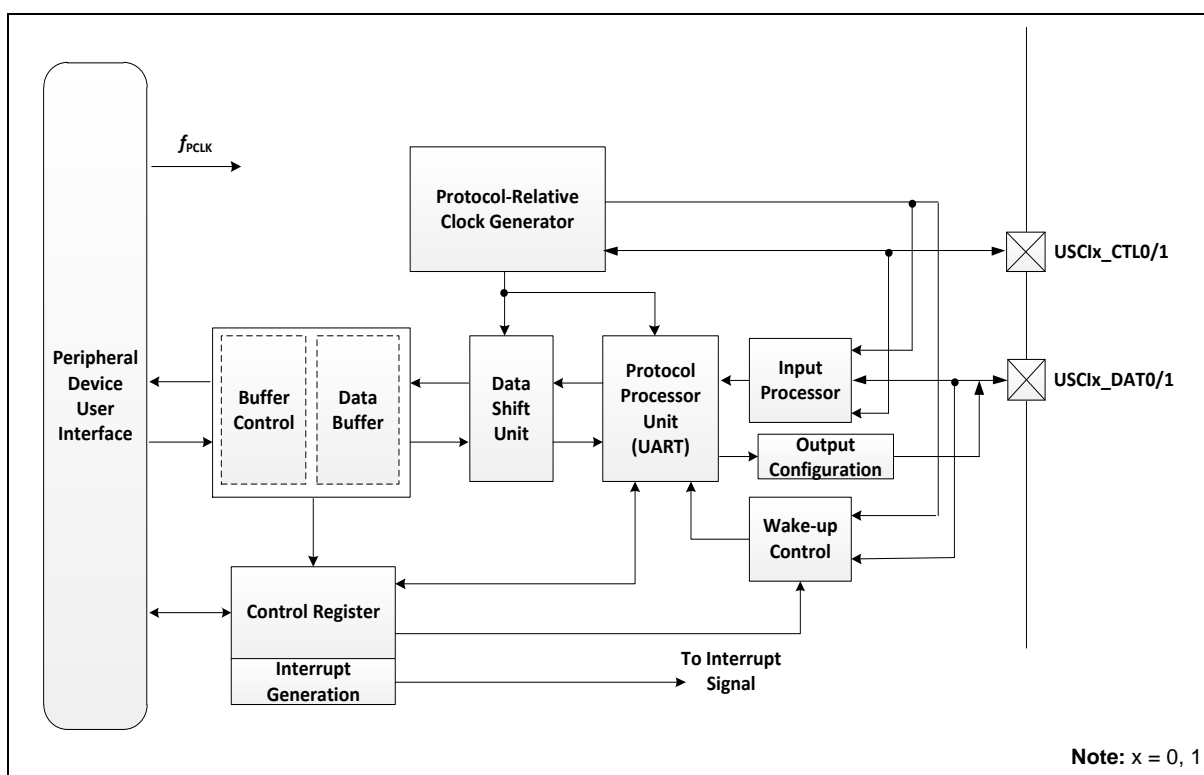

Figure 6.19-1 USCI-UART Mode Block Diagram

#### 6.19.4 Basic Configuration

The basic configurations of USCIO\_UART are as follows:

- Clock Source Configuration
  - Enable USCIO peripheral clock in USCIOCKEN (CLK\_APBCLK1[8]).
  - Enable USCIO\_UART function in FUNMODE (UUART\_CTL[2:0]=0x2).
- Reset Configuration
  - Reset USCIO controller in USCIO\_RST (SYS\_IPRST2[8]).

The basic configurations of USC1\_UART are as follows:

- Clock source Configuration
  - Enable USC1 peripheral clock in USC1CKEN (CLK\_APBCLK1[9]).
  - Enable USC1\_UART function in FUNMODE (UUART\_CTL[2:0]=0x2).
- Reset Configuration
  - Reset USC1 controller in USC1\_RST (SYS\_IPRST2[9]).

The basic configurations of USC2\_UART are as follows:

- Clock source Configuration
  - Enable USC2 peripheral clock in USC2CKEN (CLK\_APBCLK1[10]).
  - Enable USC2\_UART function in FUNMODE (UUART\_CTL[2:0]=0x2).
- Reset Configuration
  - Reset USC2 controller in USC2\_RST (SYS\_IPRST2[10]).

#### 6.19.5 Functional Description

##### 6.19.5.1 USCI Common Functional Description

Please refer to section USCI for detailed information.

##### 6.19.5.2 Signal Description

An UART connection is characterized by the use of a single connection line between a transmitter and a receiver. The receiver input signal (RXD) is handled by the input stage USC1x\_DAT0 and the transmit output (TXD) signal is handled by the output stage of USC1x\_DAT1.

For full-duplex communication, an independent communication line is needed for each transfer direction. Figure 6.19-2 shows an example with a point-to-point full-duplex connection between two communication partners UART module A and UART module B.

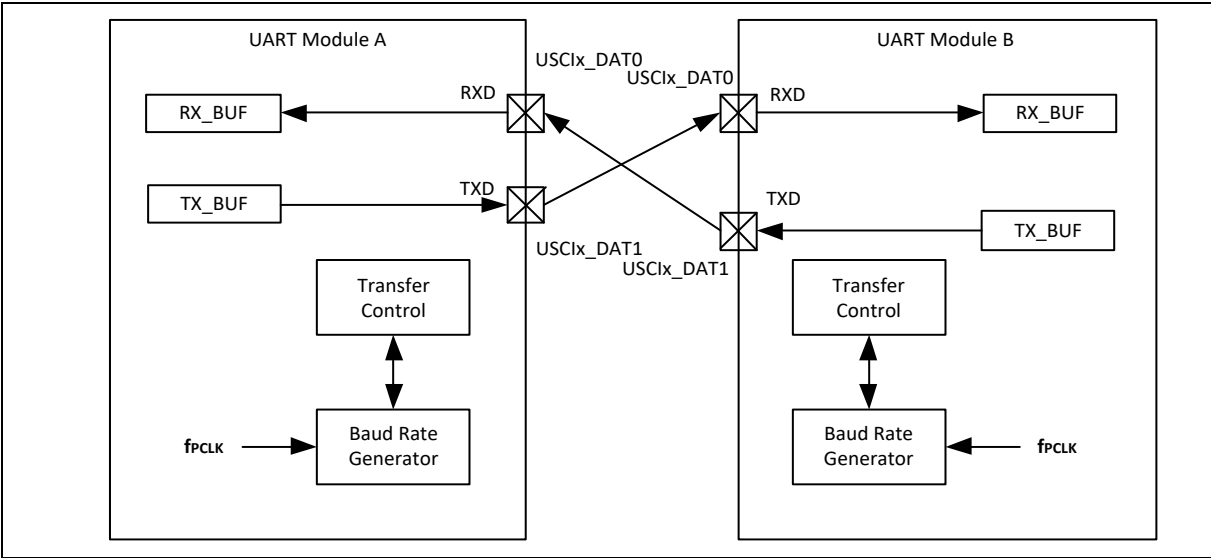

Figure 6.19-2 UART Signal Connection for Full-Duplex Communication

**Input Signal**

For UART protocol, the number of input signals is shown in Table 6.19-2. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter. They can be classified according to their meaning for the protocols (see Table 6.19-2).

Selected Protocol		UART
Control Input	USC1x_CTL0	nCTS
	USC1x_CTL1	X
Data Input	USC1x_DAT0	RX
	USC1x_DAT1	X

Table 6.19-2 Input Signals for UART Protocol

**Output Signals**

For UART protocol, up to each protocol-related output signals are available. The number of actually used outputs depends on the selected protocol. They can be classified according to their meaning for the protocols.

Selected Protocol		UART
Control Output	USC1x_CTL0	X
	USC1x_CTL1	nRTS
Data Output	USC1x_DAT0	X
	USC1x_DAT1	TX

Table 6.19-3 Output Signals for UART Protocol

**6.19.5.3 Frame Format**

A standard UART frame is shown in Figure 6.19-3. It consists of:

- An idle time with the signal level 1.

- One start of frame bit (SOF) with the signal level 0.
- 6~13 bit data
- A parity bit (P), programmable for either even or odd parity. It is optionally possible to handle frames without parity bit.
- One or two stop bits with the signal level 1.

Figure 6.19-3 UART Standard Frame Format

The protocol specific bits (SOF, P, STOP) are automatically handled by the UART protocol state machine and do not appear in the data flow via the receive and transmit buffers.

#### **Start Bit**

The receiver input signal USC1x\_DAT0 is checked for a falling edge. An SOF bit is detected when a falling edge occurs while the receiver is idle or after the sampling point of the last stop bit. To increase noise immunity, the SOF bit timing starts with the first falling edge that is detected. If the sampled bit value of the SOF is 1, the previous falling edge is considered to be due to noise and the receiver is considered to be idle again.

#### **Data Field**

The length of the data field (number of data bits) can be programmed by the bit field of DWIDTH (UART\_LINECTL[11:8]). It can vary between 6 to 13 data bits.

**Note:** In UART protocol, the data transmission order is LSB first by setting LSB (UART\_LINECTL[0]) to 1.

#### **Parity Bit**

The UART allows parity generation for transmission and parity check for reception on frame base. The type of parity can be selected by bit field PARITYEN (UART\_PROTCTL[1]) and EVENPARITY (UART\_PROTCTL[2]), common for transmission and reception (no parity, even or odd parity). If the parity handling is disabled, the UART frame does not contain any parity bit. For consistency reasons, all communication partners have to be programmed to the same parity mode.

After the last data bit of the data field, the transmitter automatically sends out its calculated parity bit if parity generation has been enabled. The receiver interprets this bit as received parity and compares it to its internally calculated one. The result of the parity check and frame check (STOP bit) are monitored in the protocol status registers (UART\_PROTSTS). The register contains bits to monitor a protocol-related status and protocol-related error indication (FRMERR, PARITYERR).

#### **Stop Bit**

Each UART frame is completed by 1 or 2 of stop bits with the signal level 1 (same level as the idle level). The number of stop bits is programmable by bit STOPB (UART\_PROTCTL[0]). A new start bit can be transferred directly after the last stop bit.

#### **Transfer Status Indication**

RXBUSY (UART\_PROTSTS[10]) indicates the receiver status.

The receiver status can be monitored by RXBUSY bit. In this case, bit RXBUSY is set during a complete frame reception from the beginning of the start of frame bit to the end of the last stop bit.

#### 6.19.5.4 Operating Mode

To operate the UART protocol, the following issues have to be considered:

##### Select UART Mode

The UART protocol can be selected by setting FUNMODEOE (UUART\_CTL[2:0]) to 0x2 and the UART protocol can be enabled by setting PROTEN (UUART\_PROTCTL [31]) to 1. Note that the FUNMODE must be set 0 before protocol changing and it is recommended to configure all parameters of the UART before UART protocol is enabled.

##### Pin Connections

The USC1x\_DAT0 pin is used for UART receive data input signal (RX) in UART protocol. The property of input data signal can be configured in UUART\_DATIN0. It is suggested to set EDGEDET (UUART\_DATIN0[4:3]) as 10B for start bit detection.

The USC1x\_DAT1 pin is used for UART transmit data output signal (TX) in UART protocol. The property of output data signal can be configured in UUART\_LINECTL.

The USC1x\_CTL0 pin is used for UART clear to send signal (nCTS) in UART protocol. The property of input control signal can be configured in UUART\_CTLIN0.

The USC1x\_CTL1 pin is used for UART request to send signal (nRTS) in UART protocol. The property of output control signal can be configured in UUART\_LINECTL.

##### Bit Timing Configuration

The desired baud rate setting has to be selected, comprising the baud rate generator and the bit timing.

##### Frame Format Configuration

The word length, the stop bit number, and the parity mode has to be set up according to the application requirements by programming UUART\_LINECTL and the UUART\_PROTCTL register. If required by the application, the data input and output signals can be inverted. The data transmission order is LSB first by setting LSB (UUART\_LINECTL[0]) to 1.

#### 6.19.5.5 Bit Timing

In UART mode, each frame bit is divided into data sample time in order to provide granularity in the sub-bit range to adjust the sample point to the application requirements. The number of data sample time per bit is defined by bit fields DSCNT (UUART\_BRGEN[14:10]) and the length of a data sample time is given by PDSCNT (UUART\_BRGEN[9:8]).

In the example given in Figure 6.19-4, one bit time is composed of 16 data sample time DSCNT(UUART\_BRGEN[14:10]) = 15. It is not recommended to program less and equal than 4 data sample time per bit time.

The position of the sampling point for the bit value is fixed in 1/2 samples time. It is possible to sample the bit value to take the average of samples.

The bit timing setup (number of data sample time) is common for the transmitter and the receiver because they use the same hardware circuit.

Figure 6.19-4 UART Bit Timing (Data Sample Time)

#### 6.19.5.6 Baud Rate Generation

The baud rate  $f_{UART}$  in UART mode depends on the number of data sample time per bit time and their timing. The baud rate setting should only be changed while the transmitter and the receiver are idle. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

##### RCLKSEL (UUART\_BRGEN[0])

to define the input frequency  $f_{REF\_CLK}$

##### SPCLKSEL (UUART\_BRGEN[3:2])

to define the multiple source of the sample clock  $f_{SAMP\_CLK}$

##### PDSCNT (UUART\_BRGEN[9:8])

to define the length of a data sample time (division of  $f_{REF\_CLK}$  by 1, 2, 3, or 4)

##### DSCNT (UUART\_BRGEN[14:10])

to define the number of data sample time per bit time

The standard setting is given by RCLKSEL = 0 ( $f_{REF\_CLK} = f_{PCLK}$ ), PTCLKSEL = 0 ( $f_{PROT\_CLK} = f_{REF\_CLK}$ ) and SPCLKSEL = 0 ( $f_{SAMP\_CLK} = f_{DIV\_CLK}$ ). Under these conditions, the baud rate is given by:

$$f_{UART} = f_{REF\_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ( $f_{PROT\_CLK} = f_{REF\_CLK2}$ ), leading to:

$$f_{UART} = \frac{f_{REF\_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2 ( $f_{SAMP\_CLK} = f_{SCLK}$ ), and RCLKSEL = 0 ( $f_{REF\_CLK} = f_{PCLK}$ ), PTCLKSEL = 0 ( $f_{PROT\_CLK} = f_{REF\_CLK}$ ). The baud rate is given by:

$$f_{UART} = f_{REF\_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

There is error tolerance for the UART baud rate after setting the baud rate parameter. Table 6.19-4 lists the baud rate setting examples and the relative error percentage for user to calculate his relative baud rate setting. The clock source is standard setting (SPCLKSEL=0, PTCLKSEL=0 and RCLKSEL=0).

HCLK Source	PCLK Source	Expect Baud Rate	CLKDIV (UUART_BRGEN[25:16])	DSCNT (UUART_BRGEN[14:10])	PDSCNT	Active Baud Rate	Error Percentage
12 MHz	HCLK	115200	0xC	0x7	0x0	115384	0.16%
12 MHz	HCLK	9600	0x7C	0x9	0x0	9600	0%
12 MHz	HCLK	2400	0x1F3	0x9	0x0	2400	0%

Table 6.19-4 Baud Rate Relationship

#### 6.19.5.7 Auto Baud Rate Detection

The UART controller supports auto baud rate detection function. It is used to identify the input baud rate from the receiver signal (USC1x\_DAT0) and then revised the baud rate clock divider CLKDIV (UUART\_BRGEN[25:16]) after the baud rate function done to meet the detected baud rate information. According the section of Timing Measurement Counter, the timing measurement counter is used for time interval measurement of the input signal (USC1x\_DAT0) and the actual timer value is captured into bit field BRDETITV (UUART\_PROTCTL [24:16]) in each falling edge of the detected signal.

When the ABREN (UART\_PROTCTL[6]) bit is enabled, the 0x55 data patterns is necessary for auto baud rate detection. The falling edge of input signal starts the baud rate counter and it loads the timing measurement counter value into the BRDETITV (UART\_PROTCTL [24:16]) in the next falling edge. It is suggested to use the fDIV\_CLK (TMCNTSRC (UART\_BRGENC[5]) =1) as the counter source.

The CLKDIV (UART\_BRGEN[25:16]) will be revised by BRDETITV (UART\_PROTCTL [25:16]) after the auto baud rate function done (the time of 4th falling edge of input signal). If the user want to receive the next successive frame correctly, it is better to set the value of CLKDIV (UART\_BRGEN[25:16]) and DSCNT (UART\_BRGEN[14:10]) as the same value (the value shall be among the rang of 0xF and 0x5 because the DSCNT is used to define the sample counter of each bit and the PDSCNT (UART\_BRGEN[9:8]) is 0x0.

During the auto baud rate detection, the ABRDETIF (UART\_PROTSTS[9]) and the BRDETITV (UART\_PROTCTL [24:16]) will be updated after each falling edge of input signal and the auto baud rate pattern, 0x55, won't be received into the receiver buffer after the frame done. The bit of ABREN will be cleared by hardware after the 4th falling edge of input signal is detected thus the user can read the status of ABREN to know the auto baud rate function is done or not.

If the CLKDIV and DSCNT are not set as the same value in calculation the auto baud rate function, the user shall calculate the proper average baud rate by the value of BRDETITV and CLKDIV after the auto baud rate function done.

If the baud rate of input signal is very slower and the bit time of timing measurement counter can't calculate the correct period of the input bit time, there is a ABERRSTS bit (UART\_PROTSTS[11]) to indicate the error information of the auto baud rate detection. At this time, the user shall revise the value of CLKDIV and require the Host device to send the 0x55 pattern again.

According the limitation of timing measurement counter, the maximum auto baud rate detection is 0x1FE for BRDETITV. The UART Auto Baud Rate Control is shown in Figure 6.19-5.

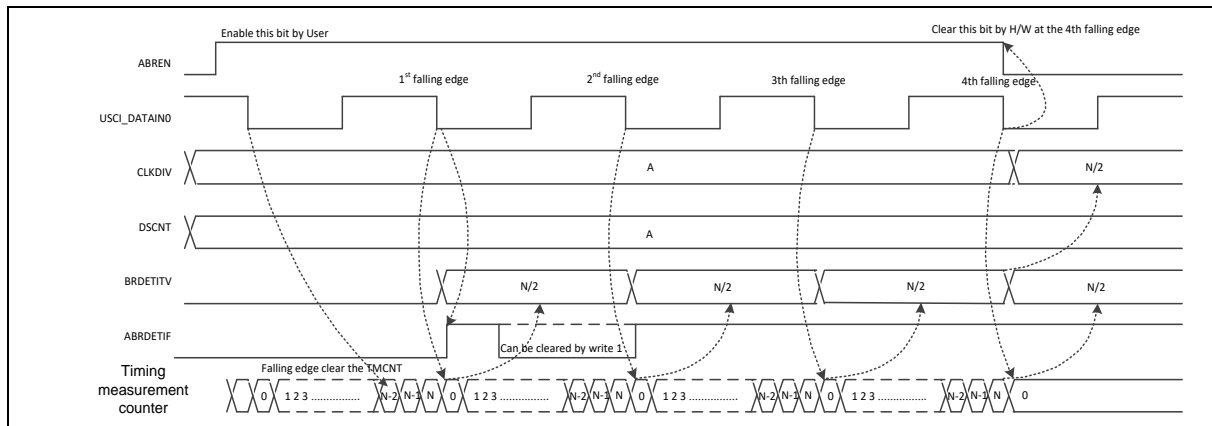

Figure 6.19-5 UART Auto Baud Rate Control

#### 6.19.5.8 Auto Flow Control

The UART supports hardware auto-flow control that provides nRTS flow control by indicator RXFULL (UART\_BUFSTS[1]) on receiver buffer. When the buffer is full (RXFULL = 1), the nRTS is de-asserted.

The UART also provides nCTS flow control on transmitter. The nCTS is used to control the transmitted data is sent out when the nCTS is asserted.

#### 6.19.5.9 RS-485 Support

The UART controller can play the role of the RS-485 master transmitter will identify an address character by setting the parity (9-th bit) to 1. For data characters, the parity is set to 0. Software can use the bit15 of each data to control the parity bit (PARITYEN (UART\_PROTCTL[1]) be set) when the STICKEN (UART\_PROTCTL[26]) is set. For example, if the STICKEN is set to 1 and data sequence are 0x8015, 0x8033, 0x0055, 0x0033 and 0x80AA the transmitted parity of data 0x15, 0x33, 0x55, 0x33 and 0xAA

will be 1, 1, 0, 0 and 1.

The UART controller can also play as an RS-485 addressable slave, the protocol-related error of PARITYERR (UART\_PROTSTS[5]) can be acted as the address bit detection when the PARITYEN (UART\_PROTCTL[1]), EVENPARITY (UART\_PROTCTL[2]) and STICKEN (UART\_PROTCTL[26]) were set. If the PARITYERR was set, it means that the address bit in the received bus is detected otherwise, the data is received into Buffer.

#### 6.19.5.10 Wake-up Function

The USCI Controller in UART mode supports wake-up system function. The wake-up source includes incoming data and nCTS pin. Each wake-up source description is as follows:

- (a) Incoming data wake-up

When system is in power-down and both of the WKEN (UART\_WKCTL [0]) and DATWKEN (UART\_PROTCTL[9]) are set, the toggle of incoming data pin can wake-up the system. In order to receive the incoming data after the system wake-up, the WAKECNT (UART\_PROTCTL[14:11]) shall be set. These bits field of WAKECNT (UART\_PROTCTL[14:11]) indicate how many clock cycle selected by fPDS\_CNT do the controller can get the 1<sup>st</sup> bit (start bit) when the device is wakeup from Power-down mode. The incoming data wake-up is shown in Figure 6.19-6.

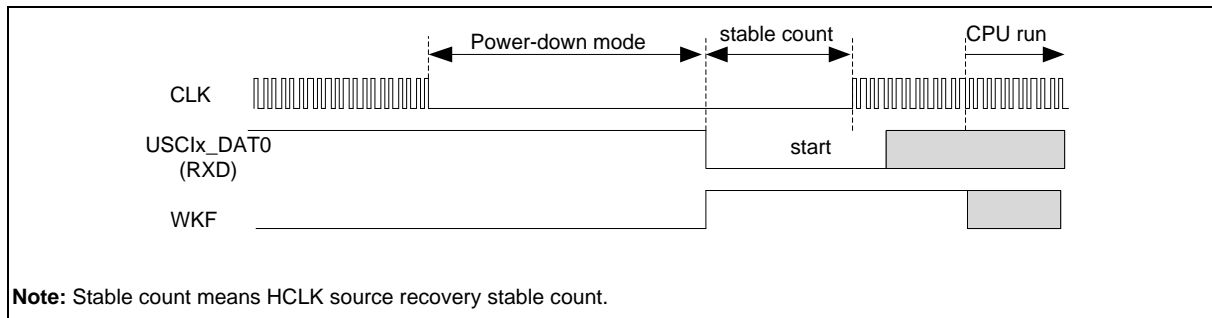

Figure 6.19-6 Incoming Data Wake-Up

- (b) nCTS pin wake-up

When system is in power-down and both of the WKEN (UART\_WKCTL [0]) and CTSWKEN (UART\_PROTCTL[10]) are set, the toggle of nCTS pin can wake-up the system. The nCTS wake-up is shown in Figure 6.19-7 and Figure 6.19-8.

#### Case 1(nCTS transition from low to high):

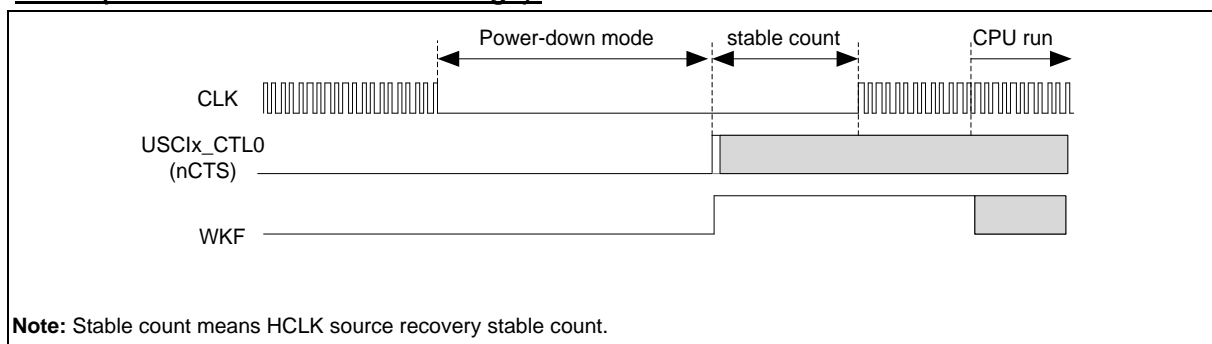

Figure 6.19-7 nCTS Wake-Up Case 1

#### Case 2 (nCTS transition from high to low):

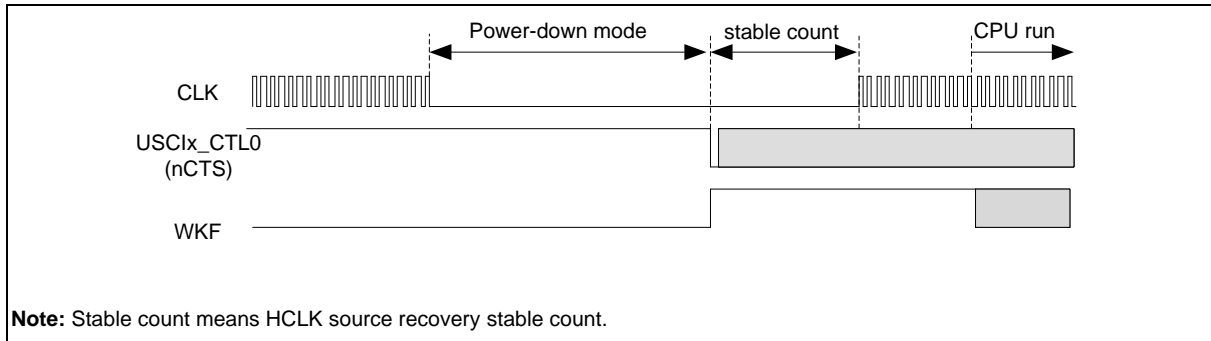

Figure 6.19-8 nCTS Wake-Up Case 2

#### 6.19.5.11 Interrupt Events

The UART provided interrupt for protocol event and data transfer event. The description show below:

##### Protocol Interrupt Events

The following protocol-related events are generated in UART mode and can lead to a protocol interrupt.

Please note that the bits in register UART\_PROTSTS are not automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

##### Receiver Line Status

The protocol-related error FRMERR (UART\_PROTSTS[6]) or PARITYERR (UART\_PROTSTS[5]) are two flags that are assigned to each received data word in the corresponding receiver buffer status registers.

In UART mode, the result of the parity check by the protocol-related error indication PARITYERR (0 = received parity bit equal to calculated parity value), and the result of frame check by the protocol-related error indication FRMERR (0 = received stop bit equal to the format value '1'). This information is elaborated for each data frame.

The break error flag BREAK (UART\_PROTSTS[7]) is assigned when the receive data is 0, the received parity and the stop bit are also 0.

The interrupt indicates that there are parity error, frame error or the break data detection in the BREAK, FRMERR, PARITYERR (UART\_PROTSTS[7:5]) bits.

##### Auto Baud Rate Detection

The auto baud rate interrupt, ABRDETIF (UART\_PROTSTS [9]), indicates that the timing measurement counter has getting 2-bit duration for auto baud rate capture function.

The auto baud rate detection function will be enabled in the first falling edge of receiver signal. The auto baud rate detection function is measurement after the next following falling is detected and it is finished when the frame transfer done. After the transfer done, the timing measurement counter value divided by twice is equal to the number of sample time per bit. The user can read the value of BRDETITV (UART\_PROTCTL[24:16]) and write into the baud rate generator register CLKDIV (UART\_BRGEN[25:16]).

##### Data Transfer Interrupt Handling

The data transfer interrupts indicate events related to UART frame handling.

##### Transmit Start Interrupt

Bit TXSTIF (UART\_PROTSTS [1]) is set after the start bit of a data word. In buffer mode, this is the earliest point in time when a new data word can be written to UART\_TXDAT.

#### **Transmitter Finished**

This interrupt indicates that the transmitter has completely finished all data in the buffer. Bit TXENDIF (UART\_PROTSTS [2]) becomes set at the end of the last stop bit.

#### **Receiver Starts Interrupt**

Bit RXSTIF (UART\_PROTSTS [3]) is set after the sample point of the start bit.

#### **Receiver Frame Finished**

This interrupt indicates that the receiver has completely finished a frame. Bit RXENDIF (UART\_PROTSTS [4]) becomes set at the end of the last receive bit.

#### **6.19.5.12 Programming Example**

The following steps are used to configure the UART protocol setting and the data transmission.

1. Set FUNMODE (UART\_CTL[2:0]) to 0x2 to select UART protocol.
2. Write baud rate generator register UART\_BRGEN to select desired baud rate.
  - Set SPCLKSEL (UART\_BRGEN[3:2]), PTCLKSEL (UART\_BRGEN[1]) and RCLKSEL (UART\_BRGEN[0]) to select the clock source.
  - Configure CLKDIV (UART\_BRGEN[25:16]), DSCNT (UART\_BRGEN[14:10]) and PSSCNT (UART\_BRGEN[9:8]) to determine the baud rate divider.
3. Write line control register UART\_LINECTL and protocol control register UART\_PROTCTL to configure the transmission data format and UART protocol setting.
  - Program data field length in DWIDTH (UART\_LINECTL[11:8]).
  - Enable parity bit and determine the parity bit type by setting EVENPARITY (UART\_PROTCTL[2]) and PARITYEN (UART\_PROTCTL[1]).
  - Configure stop bit length by setting STOPB (UART\_PROTCTL[0]).
  - Enable LSB (UART\_LINECTL[0]) to select LSB first transmission for UART protocol.
  - Set EDGEDET (UART\_DATIN0[4:3]) to 0x2 to select the detected edge as falling edge for receiver start bit detection.
4. Set PROTEN (UART\_PROTCTL[31]) to 1 to enable UART protocol.
5. Transmit and receive data.
  - Write transmit data register UART\_TXDAT to transmit data.
  - Wait until TXSTIF(UART\_PROTSTS[1]) is set and then user can write the next data in UART\_TXDAT.
  - When TXENDIF(UART\_PROTSTS[2]) is set, the transmit buffer is empty and the stop bit of the last data has been transmitted.
  - If RXENDIF(UART\_PROTSTS[4]) is set, the receiver has finished a data frame completely. User can get the data by reading receive data register UART\_RXDAT.

## 6.19.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>USCI_UART Base Address:</b> $UUARTn\_BA = 0x400D\_0000 + (0x1000 * n)$ $n = 0, 1, 2$

### 6.19.7 Register Description

USCI Control Register (UART\_CTL)

Register	Offset	R/W	Description	Reset Value
UART_CTL	UARTn_BA+0x00	R/W	USCI Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					FUNMODE		

Bits	Description
[31:3]	<b>Reserved</b> Reserved.
[2:0]	<b>Function Mode</b> This bit field selects the protocol for this USCI controller. Selecting a protocol that is not available or a reserved combination disables the USCI. When switching between two protocols, the USCI has to be disabled before selecting a new protocol. Simultaneously, the USCI will be reset when user write 000 to FUNMODE. <b>FUNMODE</b> 000 = The USCI is disabled. All protocol related state machines are set to idle state. 001 = The SPI protocol is selected. 010 = The UART protocol is selected. 100 = The I <sup>2</sup> C protocol is selected. Others = Reserved.

USCI                      Baud                      Rate                      Generator                      Register  
(UART BRGEN)

Register	Offset	R/W	Description	Reset Value
UART_BRGEN	UARTn_BA+0x08	R/W	USCI Baud Rate Generator Register	0x0000_3C00

31	30	29	28	27	26	25	24
Reserved						CLKDIV	
23	22	21	20	19	18	17	16
CLKDIV							
15	14	13	12	11	10	9	8
Reserved	DSCNT					PDS_CNT	
7	6	5	4	3	2	1	0
Reserved		TMCNTSRC	TMCNTEN	SPCLKSEL		PTCLKSEL	RCLKSEL

Bits	Description
[31:26]	<b>Reserved</b> Reserved.
[25:16]	<b>CLKDIV</b> <b>Clock Divider</b> This bit field defines the ratio between the protocol clock frequency $f_{\text{PROT\_CLK}}$ and the clock divider frequency $f_{\text{DIV\_CLK}}$ ( $f_{\text{DIV\_CLK}} = f_{\text{PROT\_CLK}} / (\text{CLKDIV} + 1)$ ). <b>Note:</b> In UART function, it can be updated by hardware in the 4 <sup>th</sup> falling edge of the input data 0x55 when the auto baud rate function (ABREN(UART_PROTCTL[6])) is enabled. The revised value is the average bit time between bit 5 and bit 6. The user can use revised CLKDIV and new BRDETIV (UART_PROTCTL[24:16]) to calculate the precise baud rate.
[15]	<b>Reserved</b> Reserved.
[14:10]	<b>DSCNT</b> <b>Denominator for Sample Counter</b> This bit field defines the divide ratio of the sample clock $f_{\text{SAMP\_CLK}}$ . The divided frequency $f_{\text{DS\_CNT}} = f_{\text{PDS\_CNT}} / (\text{DSCNT} + 1)$ . <b>Note:</b> The maximum value of DSCNT is 0xF on UART mode and suggest to set over 4 to confirm the receiver data is sampled in right value.
[9:8]	<b>PDS_CNT</b> <b>Pre-divider for Sample Counter</b> This bit field defines the divide ratio of the clock division from sample clock $f_{\text{SAMP\_CLK}}$ . The divided frequency $f_{\text{PDS\_CNT}} = f_{\text{SAMP\_CLK}} / (\text{PDS_CNT} + 1)$ .
[7:6]	<b>Reserved</b> Reserved.
[5]	<b>TMCNTSRC</b> <b>Timing Measurement Counter Clock Source Selection</b> 0 = Timing measurement counter with $f_{\text{PROT\_CLK}}$ . 1 = Timing measurement counter with $f_{\text{DIV\_CLK}}$ .
[4]	<b>TMCNTEN</b> <b>Timing Measurement Counter Enable Bit</b> This bit enables the 10-bit timing measurement counter. 0 = Timing measurement counter is Disabled. 1 = Timing measurement counter is Enabled.
[3:2]	<b>SPCLKSEL</b> <b>Sample Clock Source Selection</b>

		<p>This bit field used for the clock source selection of a sample clock (<math>f_{\text{SAMP\_CLK}}</math>) for the protocol processor.</p> <p>00 = <math>f_{\text{SAMP\_CLK}}</math> is selected to <math>f_{\text{DIV\_CLK}}</math>.</p> <p>01 = <math>f_{\text{SAMP\_CLK}}</math> is selected to <math>f_{\text{PROT\_CLK}}</math>.</p> <p>10 = <math>f_{\text{SAMP\_CLK}}</math> is selected to <math>f_{\text{SCLK}}</math>.</p> <p>11 = <math>f_{\text{SAMP\_CLK}}</math> is selected to <math>f_{\text{REF\_CLK}}</math>.</p>
[1]	PTCLKSEL	<p><b>Protocol Clock Source Selection</b></p> <p>This bit selects the source signal of protocol clock (<math>f_{\text{PROT\_CLK}}</math>).</p> <p>0 = Reference clock <math>f_{\text{REF\_CLK}}</math>.</p> <p>1 = <math>f_{\text{REF\_CLK2}}</math> (its frequency is half of <math>f_{\text{REF\_CLK}}</math>).</p>
[0]	RCLKSEL	<p><b>Reference Clock Source Selection</b></p> <p>This bit selects the source signal of reference clock (<math>f_{\text{REF\_CLK}}</math>).</p> <p>0 = Peripheral device clock <math>f_{\text{PCLK}}</math>.</p> <p>1 = Reserved.</p>

## USCI Input Data Signal Configuration Register 0 (UART DATIN0)

Register	Offset	R/W	Description	Reset Value
UUART_DATIN0	UUARTn_BA+0x10	R/W	USCI Input Data Signal Configuration Register 0	0x0000_0000

31	30	29	28	27	26	25	24

7	6	5	4	3	2	1	0
Reserved			EDGEDET		ININV	Reserved	SYNCSEL

Bits	Description
[31:5]	<b>Reserved</b> Reserved.
[4:3]	<b>EDGEDET</b> <p><b>Input Signal Edge Detection Mode</b>  This bit field selects which edge activates the trigger event of input data signal.  00 = The trigger event activation is disabled.  01 = A rising edge activates the trigger event of input data signal.  10 = A falling edge activates the trigger event of input data signal.  11 = Both edges activate the trigger event of input data signal.  <b>Note:</b> In UART function mode, it is suggested to set this bit field as 0x2.</p>
[2]	<b>ININV</b> <p><b>Input Signal Inverse Selection</b>  This bit defines the inverter enable of the input asynchronous signal.  0 = The un-synchronized input signal will not be inverted.  1 = The un-synchronized input signal will be inverted.</p>
[1]	<b>Reserved</b> Reserved.
[0]	<b>SYNCSEL</b> <p><b>Input Signal Synchronization Selection</b>  This bit selects if the un-synchronized input signal (with optionally inverted) or the synchronized (and optionally filtered) signal can be used as input for the data shift unit.  0 = The un-synchronized signal can be taken as input for the data shift unit.  1 = The synchronized signal can be taken as input for the data shift unit.</p>

USCI                      Input                      Control                      Signal                      Configuration  
(UART\_CTLIN0)

Register	Offset	R/W	Description	Reset Value
UART_CTLIN0	UARTn_BA+0x20	R/W	USCI Input Control Signal Configuration Register 0	0x0000_0000

7	6	5	4	3	2	1	0
Reserved							SYNCSEL

Bits	Description	
[31:1]	<b>Reserved</b>	Reserved.
[0]	<b>SYNCSEL</b>	<b>Input Synchronization Signal Selection</b> This bit selects if the un-synchronized input signal or the synchronized (and optionally filtered) signal can be used as input for the data shift unit. 0 = The un-synchronized signal can be taken as input for the data shift unit. 1 = The synchronized signal can be taken as input for the data shift unit.

USCI Line Control Register

Register	Offset	R/W	Description	Reset Value
UUART_LINECTL	UUARTn_BA+0x2C	R/W	USCI Line Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				DWIDTH			
7	6	5	4	3	2	1	0
CTLOINV	Reserved	DATOINV	Reserved				LSB

Bits	Description
[31:12]	<b>Reserved</b> Reserved.
[11:8]	<b>DWIDTH</b> <p><b>Word Length of Transmission</b></p> <p>This bit field defines the data word length (amount of bits) for reception and transmission. The data word is always right-aligned in the data buffer. USCI support word length from 4 to 16 bits.</p> <p>0000 = The data word contains 16 bits located at bit positions [15:0].</p> <p>0001 = Reserved.</p> <p>0010 = Reserved.</p> <p>0011 = Reserved.</p> <p>0100 = The data word contains 4 bits located at bit positions [3:0].</p> <p>0101 = The data word contains 5 bits located at bit positions [4:0].</p> <p>0110 = The data word contains 6 bits located at bit positions [5:0].</p> <p>0111 = The data word contains 7 bits located at bit positions [6:0].</p> <p>1000 = The data word contains 8 bits located at bit positions [7:0].</p> <p>1001 = The data word contains 9 bits located at bit positions [8:0].</p> <p>1010 = The data word contains 10 bits located at bit positions [9:0].</p> <p>1011 = The data word contains 11 bits located at bit positions [10:0].</p> <p>1100 = The data word contains 12 bits located at bit positions [11:0].</p> <p>1101 = The data word contains 13 bits located at bit positions [12:0].</p> <p>1110 = The data word contains 14 bits located at bit positions [13:0].</p> <p>1111 = The data word contains 15 bits located at bit positions [14:0].</p> <p><b>Note:</b> In UART protocol, the length can be configured as 6~13 bits.</p>
[7]	<b>CTLOINV</b> <p><b>Control Signal Output Inverse Selection</b></p> <p>This bit defines the relation between the internal control signal and the output control signal.</p> <p>0 = No effect.</p> <p>1 = The control signal will be inverted before its output.</p> <p><b>Note:</b> In UART protocol, the control signal means nRTS signal.</p>

[6]	<b>Reserved</b>	Reserved.
[5]	<b>DATOINV</b>	<b>Data Output Inverse Selection</b> This bit defines the relation between the internal shift data value and the output data signal of USC1x_DAT1 pin. 0 = The value of USC1x_DAT1 is equal to the data shift register. 1 = The value of USC1x_DAT1 is the inversion of data shift register.
[4:1]	<b>Reserved</b>	Reserved.
[0]	<b>LSB</b>	<b>LSB First Transmission Selection</b> 0 = The MSB, which bit of transmit/receive data buffer depends on the setting of DWIDTH, is transmitted/received first. 1 = The LSB, the bit 0 of data buffer, will be transmitted/received first.

**USCI** **Transmit** **Data** **Register**  
**(UART\_TXDAT)**

Register	Offset	R/W	Description	Reset Value
UART_TXDAT	UARTn_BA+0x30	W	USCI Transmit Data Register	0x0000_0000

RXDAT							

Bits	Description	
[31:16]	<b>Reserved</b>	Reserved.
[15:0]	<b>RXDAT</b>	<p><b>Received Data</b></p> <p>This bit field monitors the received data which stored in receive data buffer.</p> <p><b>Note:</b> RXDAT[15:13] indicate the same frame status of BREAK, FRMERR and PARITYERR (UART_PROTSTS[7:5]).</p>

USCI Transmitter/Receive Buffer Control Register  
(UART BUFCTL)

Register	Offset	R/W	Description	Reset Value
UART_BUFCTL	UARTn_BA+0x38	R/W	USCI Transmit/Receive Buffer Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved						RXRST	TXRST
15	14	13	12	11	10	9	8
RXCLR	RXOVEN	Reserved					
7	6	5	4	3	2	1	0
TXCLR	Reserved						

Bits	Description
[31:18]	<b>Reserved</b> Reserved.
[17]	<b>RXRST</b> <b>Receive Reset</b> 0 = No effect. 1 = Reset the receive-related counters, state machine, and the content of receive shift register and data buffer. <b>Note 1:</b> It is cleared automatically after one PCLK cycle. <b>Note 2:</b> It is suggested to check the RXBUSY (UART_PROTSTS[10]) before this bit will be set to 1.
[16]	<b>TXRST</b> <b>Transmit Reset</b> 0 = No effect. 1 = Reset the transmit-related counters, state machine, and the content of transmit shift register and data buffer. <b>Note:</b> It is cleared automatically after one PCLK cycle.
[15]	<b>RXCLR</b> <b>Clear Receive Buffer</b> 0 = No effect. 1 = The receive buffer is cleared (filling level is cleared and output pointer is set to input pointer value). Should only be used while the buffer is not taking part in data traffic. <b>Note:</b> It is cleared automatically after one PCLK cycle.
[14]	<b>RXOVEN</b> <b>Receive Buffer Overrun Error Interrupt Enable Bit</b> 0 = Receive overrun interrupt Disabled. 1 = Receive overrun interrupt Enabled.
[13:8]	<b>Reserved</b> Reserved.
[7]	<b>TXCLR</b> <b>Clear Transmit Buffer</b> 0 = No effect. 1 = The transmit buffer is cleared (filling level is cleared and output pointer is set to input pointer value). Should only be used while the buffer is not taking part in data traffic. <b>Note:</b> It is cleared automatically after one PCLK cycle.

[6:0]	Reserved	Reserved.
-------	----------	-----------

**USCI                      Transmit/Receive                      Buffer                      Status                      Register**  
**(UART BUFSTS)**

Register	Offset	R/W	Description	Reset Value
UART_BUFSTS	UARTn_BA+0x3C	R/W	USCI Transmit/Receive Buffer Status Register	0x0000_0101

7	6	5	4	3	2	1	0
Reserved	ABREN	RTSAUDIREN	CTSAUTOEN	RTSAUTOEN	EVENPARITY	PARITYEN	STOPB

Bits	Description
[31]	<b>PROTEN</b> <b>UART Protocol Enable Bit</b> 0 = UART Protocol Disabled. 1 = UART Protocol Enabled.
[30]	<b>DGE</b> <b>Deglitch Enable Bit</b> 0 = Deglitch Disabled. 1 = Deglitch Enabled. <b>Note 1:</b> When this bit is set to logic 1, any pulse width less than about 150 ns will be considered a glitch and will be removed in the serial data input (RX). This bit acts only on RX line and has no effect on the transmitter logic. <b>Note 2:</b> It is recommended to set this bit only when operating at baud rate under 2.5 Mbps.
[29]	<b>BCEN</b> <b>Transmit Break Control Enable Bit</b> 0 = Transmit Break Control Disabled. 1 = Transmit Break Control Enabled. <b>Note:</b> When this bit is set to logic 1, the serial data output (TX) is forced to the Spacing State (logic 0). This bit acts only on TX line and has no effect on the receiver logic.
[28:27]	Reserved.
[26]	<b>STICKEN</b> <b>Stick Parity Enable Bit</b> 0 = Stick parity Disabled. 1 = Stick parity Enabled. <b>Note:</b> Refer to RS-485 Support section for detailed information.
[25]	Reserved.
[24:16]	<b>BRDETITV</b> <b>Baud Rate Detection Interval</b> This bit fields indicate how many clock cycle selected by TMCNTSRC (UUART_BRGEN [5]) does the slave calculates the baud rate in one bits. The order of the bus shall be 1 and 0 step by step (e.g. the input data pattern shall be 0x55). The user can read the value to know the current input baud rate of the bus whenever the ABRDETIF (UUART_PROTCTL[9]) is set. <b>Note:</b> This bit can be cleared to 0 by software writing '0' to the <b>BRDETITV</b> .

[15]	<b>Reserved</b>	Reserved.
[14:11]	<b>WAKECNT</b>	<b>Wake-up Counter</b> These bits field indicate how many clock cycle selected by $f_{PDS\_CNT}$ do the slave can get the 1 <sup>st</sup> bit (start bit) when the device is woken up from Power-down mode.
[10]	<b>CTSWKEN</b>	<b>nCTS Wake-up Mode Enable Bit</b> 0 = nCTS wake-up mode Disabled. 1 = nCTS wake-up mode Enabled.
[9]	<b>DATWKEN</b>	<b>Data Wake-up Mode Enable Bit</b> 0 = Data wake-up mode Disabled. 1 = Data wake-up mode Enabled.
[8:7]	<b>Reserved</b>	Reserved.
[6]	<b>ABREN</b>	<b>Auto-baud Rate Detect Enable Bit</b> 0 = Auto-baud rate detect function Disabled. 1 = Auto-baud rate detect function Enabled. <b>Note:</b> When the auto - baud rate detect operation finishes, hardware will clear this bit. The associated interrupt ABRDETIF (UART_PROTSTS[9]) will be generated (If ARBIEN (UART_PROTIEN [1]) is enabled).
[5]	<b>RTSAUDIREN</b>	<b>nRTS Auto Direction Enable Bit</b> When nRTS auto direction is enabled, if the transmitted bytes in the TX buffer is empty, the nRTS signal is inactive automatically. 0 = nRTS auto direction control Disabled. 1 = nRTS auto direction control Enabled. <b>Note 1:</b> This bit is used for nRTS auto direction control for RS485. <b>Note 2:</b> This bit has effect only when the RTSAUTOEN is not set.
[4]	<b>CTSAUTOEN</b>	<b>nCTS Auto-flow Control Enable Bit</b> When nCTS auto-flow is enabled, the UART will send data to external device when nCTS input assert (UART will not send data to device if nCTS input is dis-asserted). 0 = nCTS auto-flow control Disabled. 1 = nCTS auto-flow control Enabled.
[3]	<b>RTSAUTOEN</b>	<b>nRTS Auto-flow Control Enable Bit</b> When nRTS auto-flow is enabled, if the receiver buffer is full (RXFULL (UART_BUFSTS[1] =1), the UART will de-assert nRTS signal. 0 = nRTS auto-flow control Disabled. 1 = nRTS auto-flow control Enabled. <b>Note:</b> This bit has effect only when the RTSAUDIREN is not set.
[2]	<b>EVENPARITY</b>	<b>Even Parity Enable Bit</b> 0 = Odd number of logic 1's is transmitted and checked in each word. 1 = Even number of logic 1's is transmitted and checked in each word. <b>Note:</b> This bit has effect only when PARITYEN is set.
[1]	<b>PARITYEN</b>	<b>Parity Enable Bit</b> This bit defines the parity bit is enabled in an UART frame. 0 = The parity bit Disabled. 1 = The parity bit Enabled.
[0]	<b>STOPB</b>	<b>Stop Bits</b> This bit defines the number of stop bits in an UART frame. 0 = The number of stop bits is 1.

		1 = The number of stop bits is 2.
--	--	-----------------------------------

## 6.20 USCI - SPI Mode

### 6.20.1 Overview

The SPI protocol of USCI controller applies to synchronous serial data communication and allows full duplex transfer. It supports both master and Slave operation mode with the 4-wire bi-direction interface. SPI mode of USCI controller performs a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. The SPI mode is selected by FUNMODE (USPI\_CTL[2:0]) = 0x1

This SPI protocol can operate as master or Slave mode by setting the SLAVE (USPI\_PROTCTL[0]) to communicate with the off-chip SPI Slave or master device. The application block diagrams in master and Slave mode are shown below.

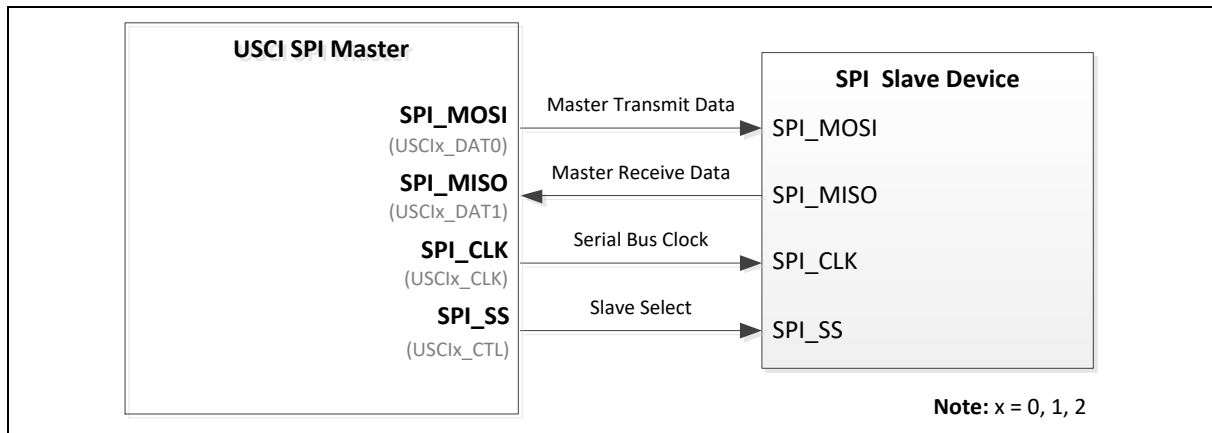

Figure 6.20-1 SPI Master Mode Application Block Diagram

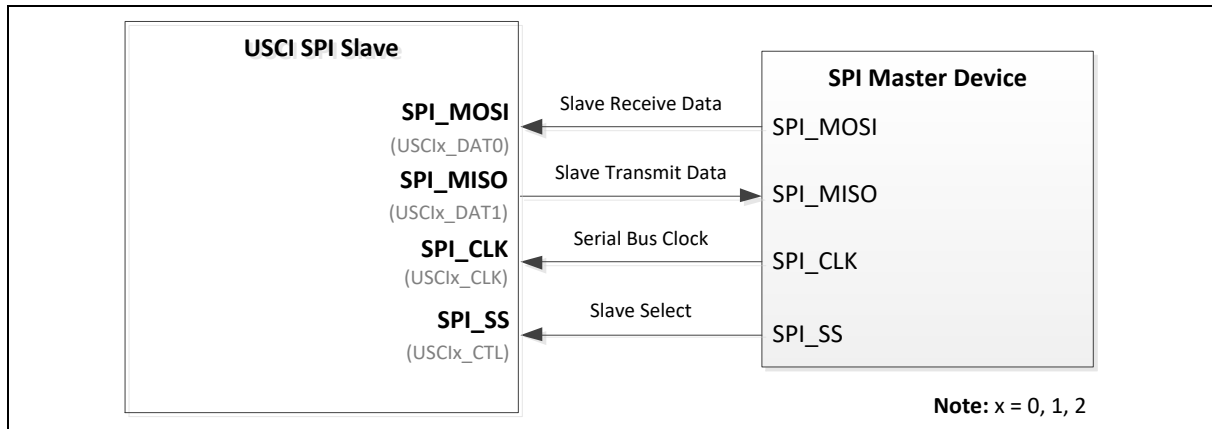

Figure 6.20-2 SPI Slave Mode Application Block Diagram

### 6.20.2 Features

- Supports Master or Slave mode operation (the maximum frequency -- Master <  $f_{PCLK} / 2$ , Slave <  $f_{PCLK} / 5$ )
- Configurable bit length of a transfer word from 4 to 16-bit
- Supports one transmit buffer and two receive buffers for data payload
- Supports MSB first or LSB first transfer sequence

- Supports Word Suspend function
- Supports PDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface
- Supports wake-up function by slave select signal in Slave mode
- Supports one data channel half-duplex transfer

### 6.20.3 Block Diagram

#### 6.20.4 Basic Configuration

#### 6.20.4.1 USCI0 SPI Basic Configurations

- Clock Source Configuration
  - Enable USCI0 peripheral clock in USCI0CKEN (CLK\_APBCLK1[8]).
  - Enable USCI0\_SPI function USPI\_CTL[2:0] register, USPI\_CTL[2:0]=0x1.
- Reset Configuration
  - Reset USCI0 controller in USCI0RST (SYS\_IPRST2[8]).

#### 6.20.4.2 USCI1 SPI Basic Configurations

- Clock source Configuration
  - Enable USCI1 peripheral clock in USCI1CKEN (CLK\_APBCLK1[9]).
  - Enable USCI1\_SPI function USPI\_CTL[2:0] register, USPI\_CTL[2:0]=0x1.
- Reset Configuration
  - Reset USCI1 controller in USCI1RST (SYS\_IPRST2[9]).

#### 6.20.4.3 USCI2 SPI Basic Configurations

- Clock source Configuration
  - Enable USCI2 peripheral clock in USCI2CKEN (CLK\_APBCLK1[10]).
  - Enable USCI2\_SPI function USPI\_CTL[2:0] register, USPI\_CTL[2:0]=0x1
- Reset Configuration
  - Reset USCI2 controller in USCI2RST (SYS\_IPRST2[10]).

### 6.20.5 Functional Description

#### 6.20.5.1 USPI Common Functional Description

Please refer to section USCI for detailed information.

#### 6.20.5.2 Signal Description

A device operating in Master mode controls the start and end of a data transfer, as well as the generation of the SPI bus clock and slave select signal. The slave select signal indicates the start and the end of a data transfer, and the master device can use it to enable the transmitting or receiving operations of Slave device. Slave device receives the SPI bus clock and optionally a slave select signal for data transaction. The signals for SPI communication are shown in Table 6.20-1.

SPI Mode	Receive Data	Transmit Data	Serial Bus Clock	Slave Select
Full-duplex SPI Master	SPI_MISO (USCIx_DAT1)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Full-duplex SPI Slave	SPI_MOSI (USCIx_DAT0)	SPI_MISO (USCIx_DAT1)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Half-duplex SPI Master/Slave	SPI_MOSI (USCIx_DAT0)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)

Table 6.20-1 Signals for SPI communication

#### ● SPI Communication Signals

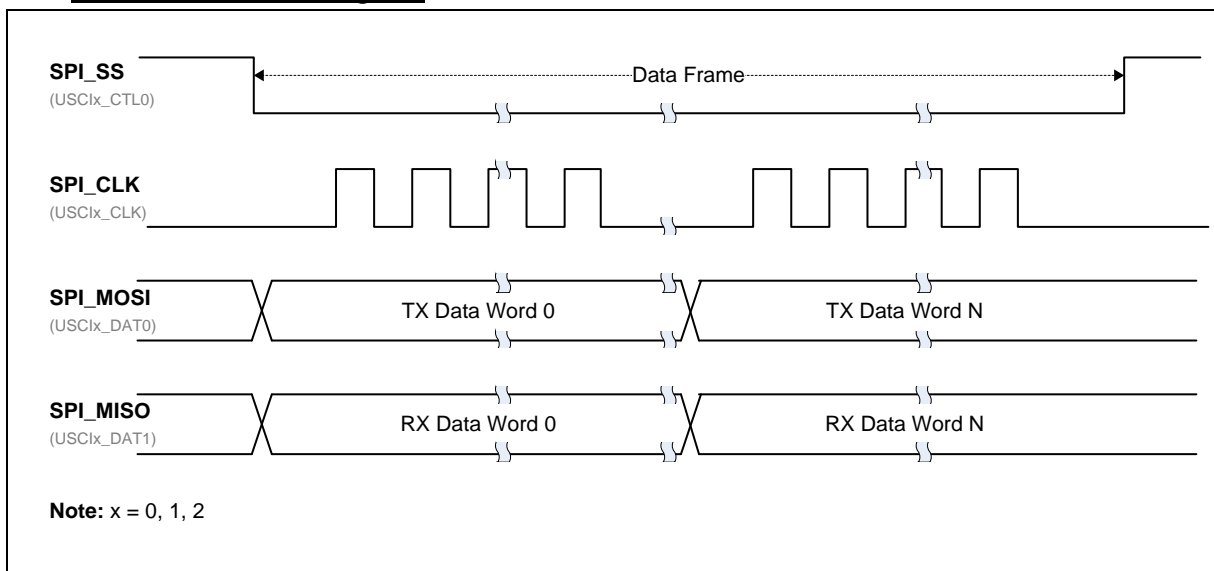

Figure 6.20-44-Wire Full-Duplex SPI Communication Signals (Master Mode)

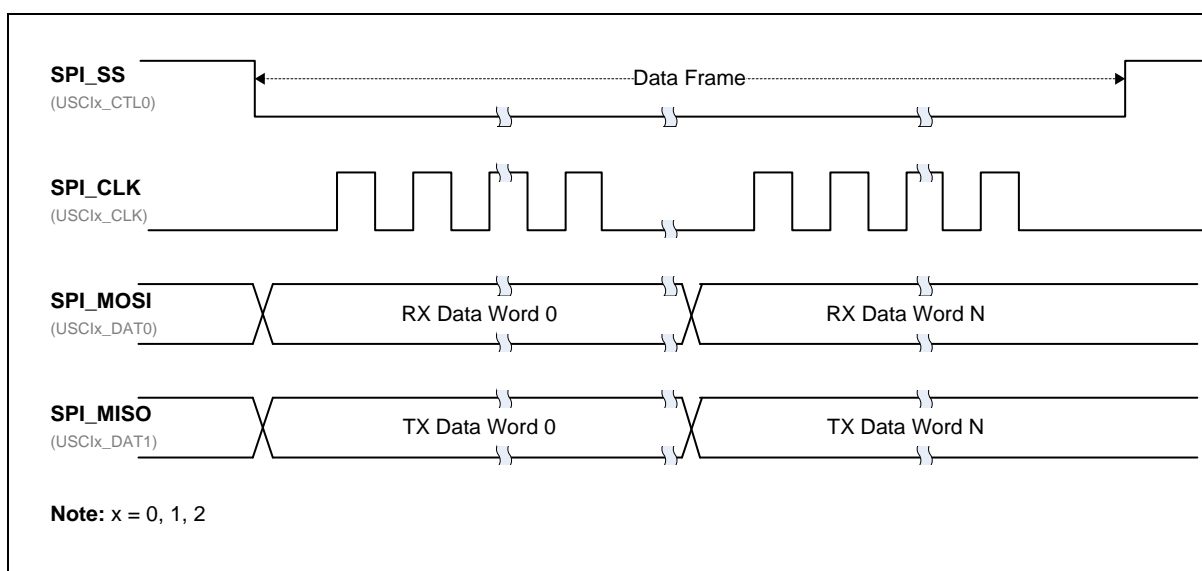

Figure 6.20-54-Wire Full-Duplex SPI Communication Signals (Slave Mode)

### 6.20.5.3 Serial Bus Clock Configuration

The USPI controller needs the peripheral clock to drive the USPI logic unit to perform the data transfer. The peripheral clock of USPI controller is from PCLK.

In Master mode, the frequency of the SPI bus clock is determined by protocol-relative clock generator. In general, the SPI bus clock is denoted as SPI clock. The frequency of SPI clock is half of  $f_{SAMP\_CLK}$ , which can be selected by SPCLKSEL (USPI\_BRGEN[3:2]).

In Slave mode, the SPI bus clock is provided by an off-chip Master device. The peripheral clock frequency,  $f_{PCLK}$ , of SPI Slave device must be 5-times faster than the serial bus clock rate of the SPI Master device connected together (i.e. the clock rate of serial bus clock < 1/5 peripheral clock  $f_{PCLK}$  in Slave mode).

In SPI protocol, SCLKMODE (USPI\_PROTCTL[7:6]) defines not only the idle state of serial bus clock but also the serial clock edge used for transmit and receive data. Both Master and Slave devices on the same communication bus should have the same SCLKMODE configuration. The four kinds of serial bus clock configuration are shown below.

SCLKMODE [1:0]	SPI Clock Idle State	Transmit Timing	Receive Timing
0x0	Low	Falling edge	Rising edge
0x1	Low	Rising edge	Falling edge
0x2	High	Rising edge	Falling edge
0x3	High	Falling edge	Rising edge

Table 6.20-2 Serial Bus Clock Configuration

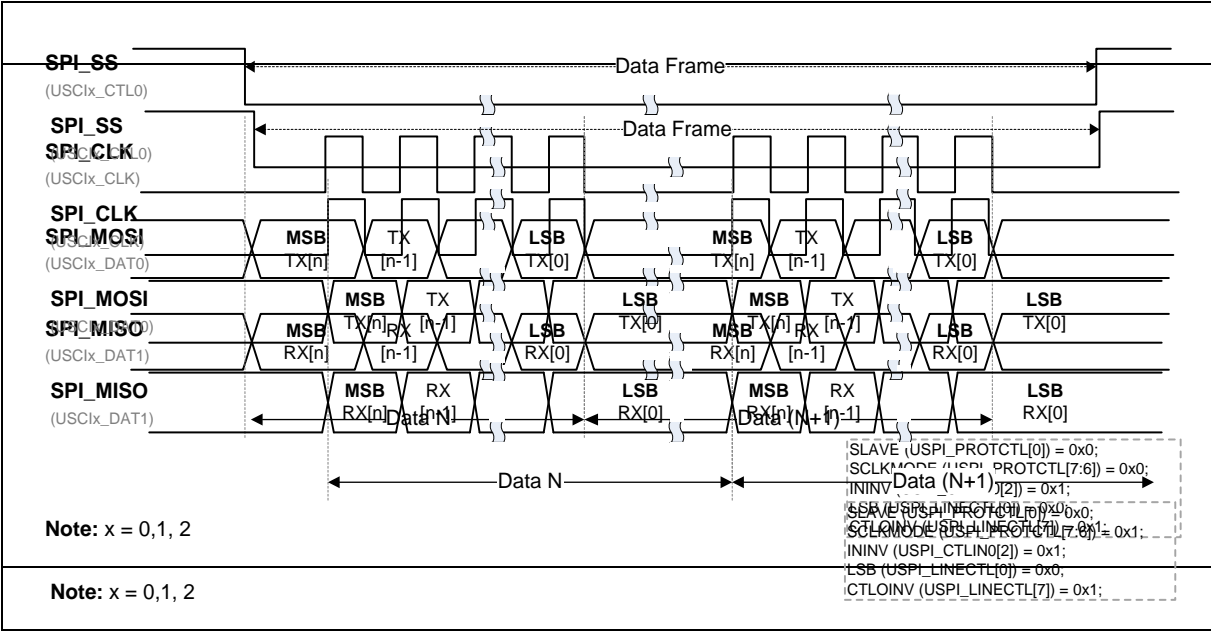

Figure 6.20-7 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x1)

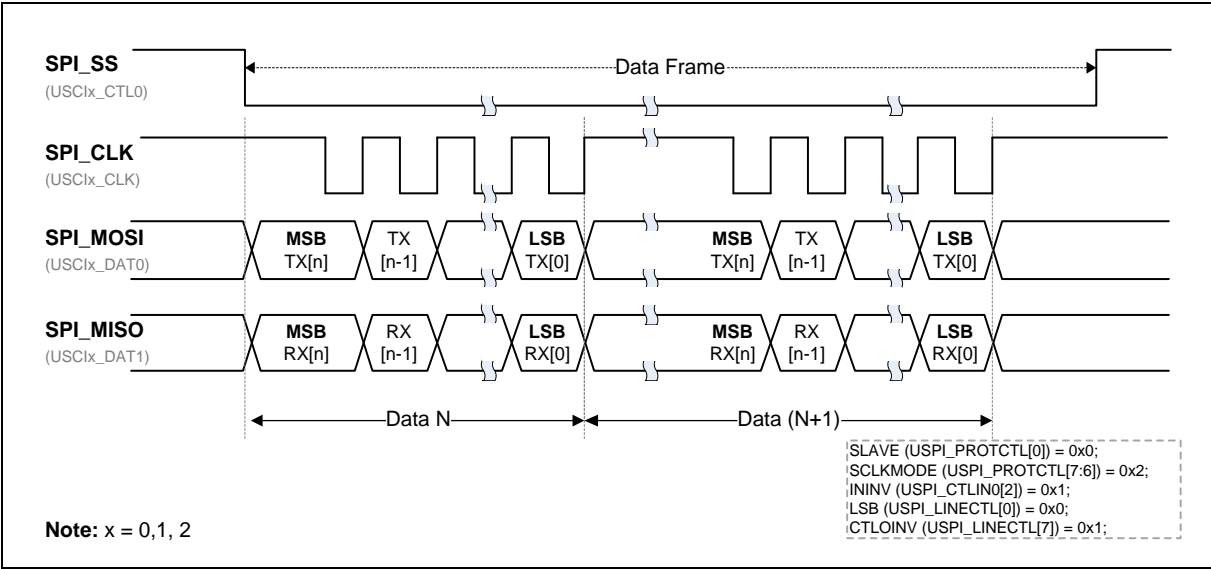

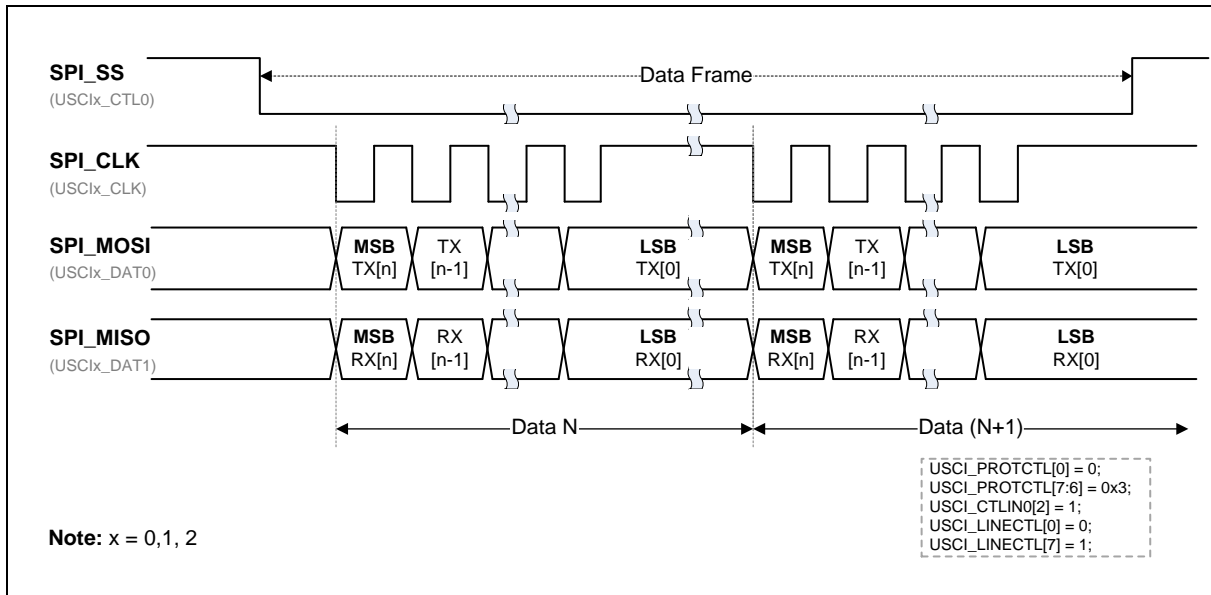

Figure 6.20-8 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x2)

Figure 6.20-9 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x3)

#### 6.20.5.4 Slave Select Signal

The slave selection signal of SPI protocol is active high by default. In SPI Master mode, the USPI controller can drive the control signal to off-chip SPI Slave device through slave select pin SPI\_SS (USCIx\_CTL0). In SPI Slave mode, the received slave select signal can be inverted by ININV (USPI\_CTLIN0[2]).

If the slave select signal of external SPI Master device is low active, the ININV (USPI\_CTLIN0[2]) setting of slave device should be set to 1 for the inversion of input control signal. If USPI operates as SPI Master mode, the output slave select inversion CTLOINV (USPI\_LINECTL[7]) is also needed to set as 1 for the external SPI Slave device whose slave select signal is active low.

The duration between the slave select active edge and the first SPI clock input edge shall over 2 SPI bus clock cycles.

The input slave select signal of SPI Slave has to be kept inactive for at least 2 SPI bus clock cycles between two consecutive frames in order to correctly detect the end of a frame.

#### 6.20.5.5 Transmit and Receive Data

The bit length of a transmit/receive data word in SPI protocol of USPI controller is defined in DWIDTH (USPI\_LINECTL[11:8]), and it can be configured up to 16-bit length for transmitting and receiving data in SPI communication.

The LSB bit (USPI\_LINECTL[0]) defines the order of transfer data bit. If the LSB bit is set to 1, the transmission data sequence is LSB first. If the LSB bit is cleared to 0, the transmission data sequence is MSB first.

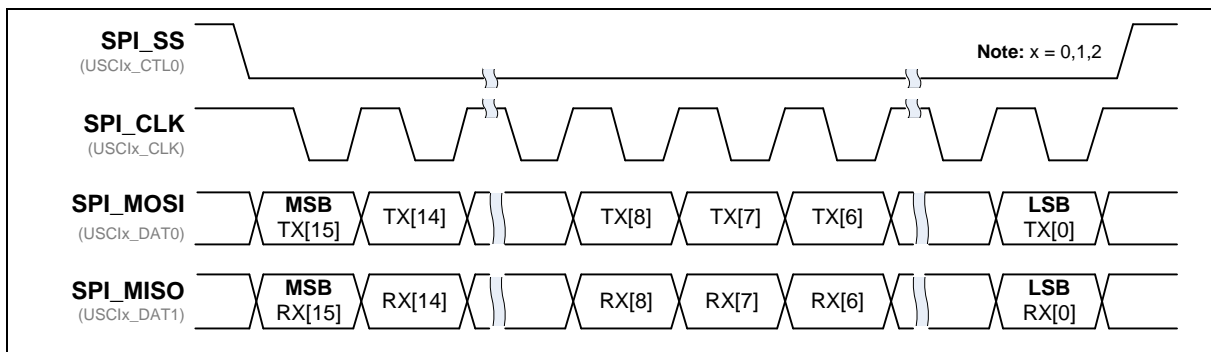

Figure 6.20-1016-bit Data Length in One Word Transaction with MSB First Format

#### 6.20.5.6 Word Suspend

SUSPITV (USPI\_PROTCTL[11:8]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV (USPI\_PROTCTL[11:8]) is 0x3 (3.5 SPI clock cycles).

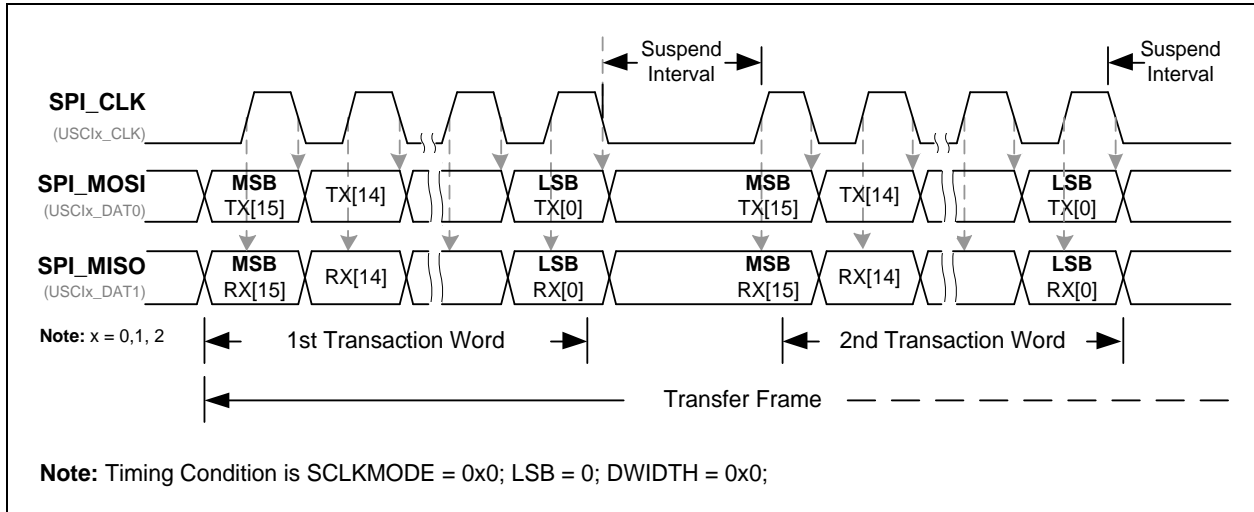

Figure 6.20-11 Word Suspend Interval between Two Transaction Words

#### 6.20.5.7 Automatic Slave Select Function

AUTOSS (USPI\_PROTCTL[3]) is used for SPI Master mode to enable the automatic slave select function. If the bit AUTOSS (USPI\_PROTCTL[3]) is set, the slave select signal will be generated automatically and the setting value of SS (USPI\_PROTCTL[2]) will not affect the output slave select (through USCIX\_CTL0 line). This means that the slave select signal will be asserted by the USPI controller when the SPI data transfer is started by writing to the transmit buffer. And, it will be de-asserted after either all transaction is finished or one word transaction done if the value of SUSPITV (USPI\_PROTCTL[11:8]) is equal to or greater than 3.

If the AUTOSS bit (USPI\_PROTCTL[3]) is cleared, the slave select on USCIX\_CTL0 pin will be asserted/de-asserted by setting/clearing the SS (USPI\_PROTCTL[2]). The internal slave select signal is active high and the CTLOINV (USPI\_LINECTL[7]) can be used for the inversion of the slave select signal.

In SPI Master mode, if the value of SUSPITV (USPI\_PROTCTL[11:8]) is less than 3 and the AUTOSS (USPI\_PROTCTL[3]) is set as 1, the slave select signal will be kept at active state between two successive word transactions.

In SPI Slave mode, to recognize the inactive state of the slave select signal, the inactive period of the received slave select signal must be larger than 2 peripheral clock cycles between two successive transactions.

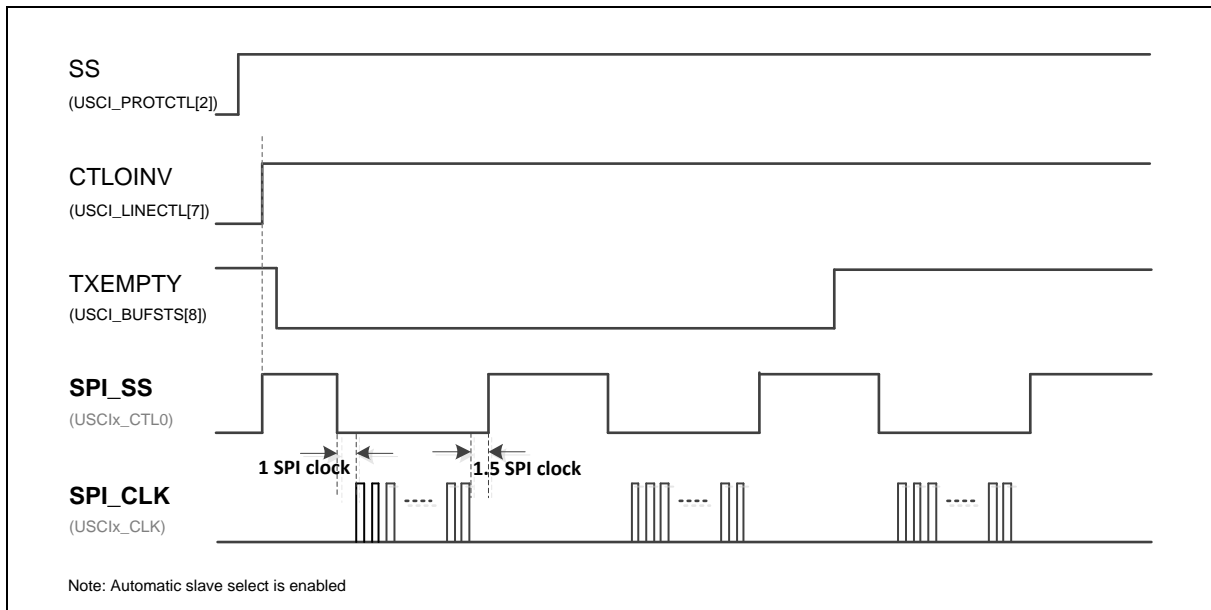

Figure 6.20-12 Auto Slave Select ( $SUSPITV \geq 0x3$ )

Figure 6.20-13 Auto Slave Select ( $SUSPITV < 0x3$ )

#### 6.20.5.8 Slave 3-wire Mode

When the SLV3WIRE (USPI\_PROTCTL[1]) is set by software to enable the Slave 3-wire mode, the USCI SPI communication can work with no slave select signal in Slave mode. The SLV3WIRE (USPI\_PROTCTL[1]) only takes effect in SPI Slave mode. Only three pins, SPI\_CLK (through USCIX\_CLK line), SPI\_MOSI (through USCIX\_DAT0 line), and SPI\_MISO (through USCIX\_DAT1 line), are required to communicate with a SPI Master. When the SLV3WIRE (USPI\_PROTCTL[1]) is set to 1, the SPI Slave will be ready to transmit/receive data after the SPI protocol is enabled by setting FUNMODE(USPI\_CTL [2:0]) to 0x1.

#### 6.20.5.9 Data Transfer Mode

The USPI controller supports full-duplex SPI transfer and one data channel half-duplex SPI transfer.

- Full-duplex SPI transfer

In full-duplex SPI transfer, there are two data pins. One is used for transmitting data and the other is used for receiving data. Thus, data transmission and data reception can be performed simultaneously.

SCLKMODE (USPI\_PROTCTL[7:6]) defines the transition timing of the data shift output signal on USCIX\_DAT0 pin. The transition may happen at the corresponding edge of SPI bus clock or active edge of slave select signal. The level of the last data bit of a data word is held on USCIX\_DAT0 pin until the next data word begins with the next corresponding edge of the serial bus clock.

- One data channel half-duplex SPI transfer

In one data channel half-duplex SPI transfer, there is only one data pin for data transfer. Thus, the data transmission and data reception are at different time interval. The data shift direction is determined by PORTDIR (USPI\_TXDAT[16]). Refer to the register description for more detail information.

The function of one data channel half-duplex SPI transfer is similar to the full-duplex SPI protocol. All the transfer data timing is the same as the full-duplex SPI transfer.

Figure 6.20-14 shows the one output data channel and one input data channel half-duplex transfer diagrams with the external device.

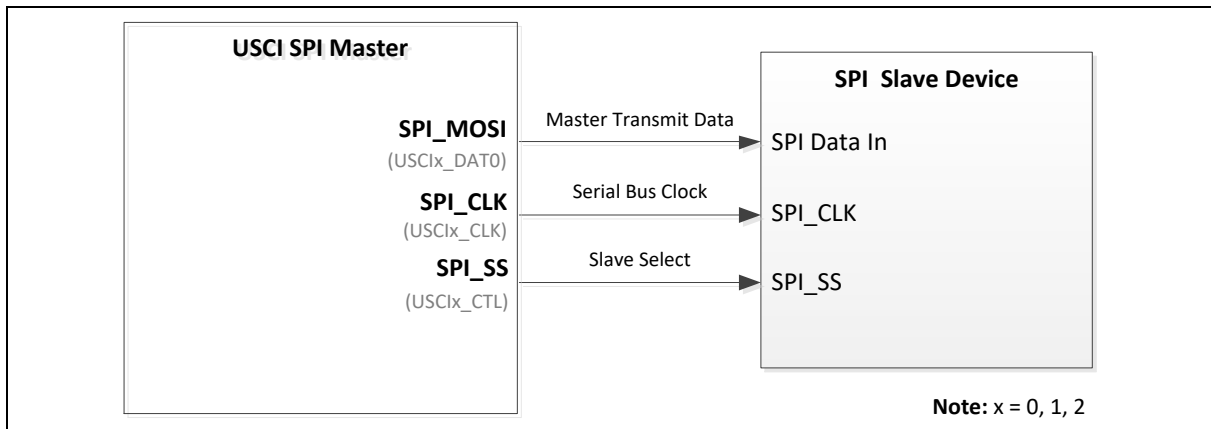

Figure 6.20-14 One Output Data Channel Half-duplex (SPI Master Mode)

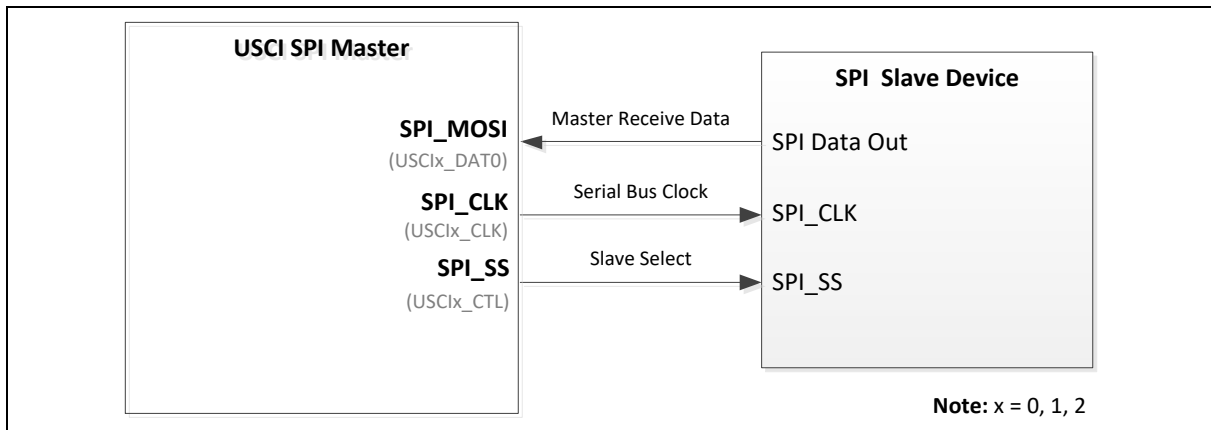

Figure 6.20-15 One Input Data Channel Half-duplex (SPI Master Mode)

The one data channel half-duplex transfer mode can be configured by TSMSEL[2:0] (USPI\_PROTCTL[14:12]) and PORTDIR (USPI\_TXDAT[16]) settings. When TSMSEL (USPI\_PROTCTL[14:12]) is set to 0x4, one data channel half-duplex transfer mode is selected. The

PORTDIR (USPI\_TXDAT[16]) is used to define the direction of the corresponding transmit data. When the PORTDIR bit is set to 0, the USPI controller will send the corresponding data to external SPI device. When the PORTDIR bit is set to 1, the controller will read the corresponding data from the external SPI device.

For example, in one data channel half-duplex transfer mode with PORTDIR=0, USCI SPI transmits data through USCIX\_DAT0 pin; if PORTDIR=1, USCI SPI receives data through USCIX\_DAT0 pin.

#### 6.20.5.10 Interrupt

##### **Data Transfer Interrupts**

- Transmit start interrupt  
The interrupt event TXSTIF (USPI\_PROTSTS[1]) is set after the start of the first data bit of a transmit data word. It can be cleared only by writing 1 to it.
- Transmit end interrupt  
The interrupt event TXENDIF (USPI\_PROTSTS[2]) is set after the start of the last data bit of the last transmit data which has been stored in transmit buffer. It can be cleared only by writing 1 to it.
- Receive start interrupt  
The interrupt event RXSTIF (USPI\_PROTSTS[3]) is set after the start of the first data bit of a receive data word. It can be cleared only by writing 1 to it.
- Receive end interrupt  
The interrupt event RXENDIF (USPI\_PROTSTS[4]) is set after the start of the last data bit of a receive data word. It can be cleared only by writing 1 to it.

##### **Protocol-Related Interrupts**

- SPI slave select interrupt  
In SPI Slave mode, there are slave select active and in-active interrupt flags, SSACTIF (USPI\_PROTSTS[9]) and SSINAIF (USPI\_PROTSTS[8]), will be set to 1 when SLAVE (USPI\_PROTCTL[0]) is set to 1 and Slave senses the slave select signal active or inactive. The SPI controller will issue an interrupt if SSINAIF (USPI\_PROTSTS[8]) or SSACTIF (USPI\_PROTSTS[9]), are set to 1. Because the internal slave select signal in SPI function is active high, the ININV (USPI\_CTLIN0[2]) can be used for inverting the slave select signal comes from an active low device.
- Slave time-out interrupt  
In SPI Slave mode, there is Slave time-out function for user to know that there is no serial clock input during the period of one word transaction. The Slave time-out function uses the timing measurement counter for the calculation of Slave time-out period which is defined by SLVTOCNT (USPI\_PROTCTL[25:16]). TMCNTSRC (USPI\_BRGEN[5]) can be used for clock frequency selection of timing measurement counter to calculate the Slave time-out period.  
  
When the timing measurement counter is enabled by TMCNTEN (USPI\_BRGEN[4]) and the setting value of SLVTOCNT (USPI\_PROTCTL[25:16]) is not 0 in SPI Slave mode, the timing measurement counter will start counting after the first input serial clock of each received word data. This counter will be reset while receiving the following input serial clock and then keep counting. Finally, the timing measurement counter will be cleared and stopped after the finish of the current word transaction. If the value of the time-out counter is equal to or greater than the value of SLVTOCNT (USPI\_PROTCTL[25:16]) before one word transaction is done, the Slave time-out interrupt event occurs and the SLVTOIF (USPI\_PROTSTS[5]) will be set to 1.

##### **Buffer-Related Interrupts**

The buffer-related interrupts are available if there is transmit/receive buffer in USPI controller.

- Receive buffer overrun interrupt  
If there is receive buffer overrun event, RXOVIF (USPI\_BUFSTS[3]) will be set as 1. It can be cleared by write 1 into it.
- Transmit buffer under-run interrupt  
If there is transmit buffer under-run event, TXUDRIF (USPI\_BUFSTS[11]) will be set as 1. It can be cleared by write 1 into it.

#### 6.20.5.11 Timing Diagram

The slave select signal of USCI SPI protocol is active high by default, and it can be inverted by CTLOINV (USPI\_LINECTL[7]) setting.

The idle state of serial bus clock and the serial bus clock edge used for transmit/receive data can be configured by setting SCLKMODE (USPI\_PROTCTL[7:6]). The bit length of a transaction word data is determined by DWIDTH (USPI\_LINECTL[11:8]), and data bit transfer sequence is determined by LSB (USPI\_LINECTL[0]). Four SPI timing diagrams for Master/Slave operations and the related settings are shown below.

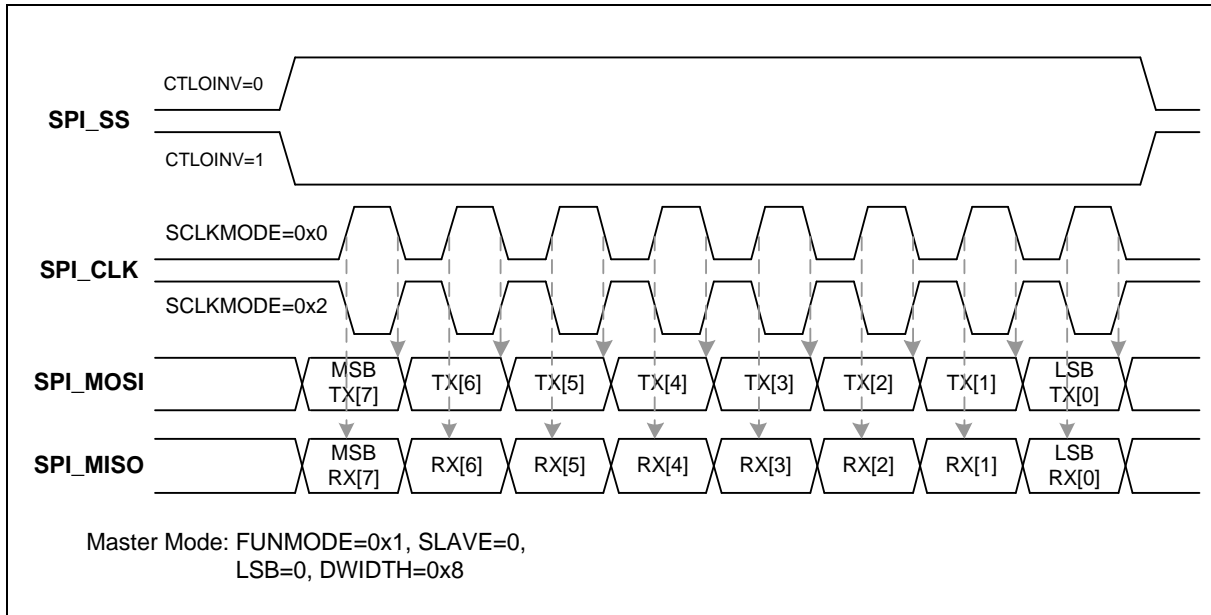

Figure 6.20-16 SPI Timing in Master Mode

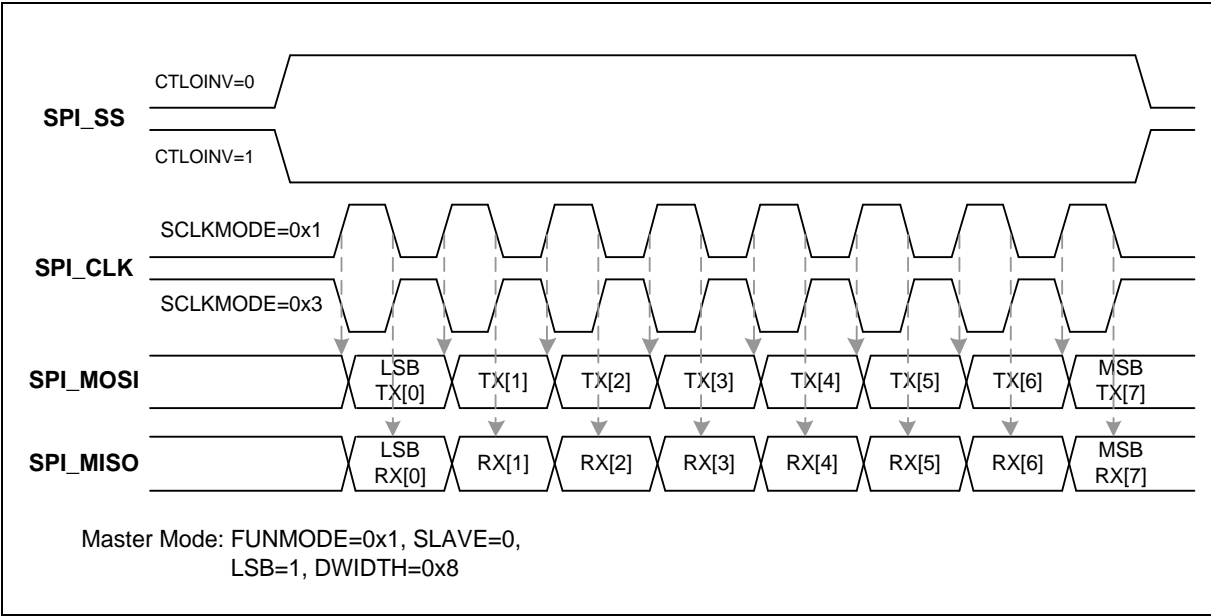

Figure 6.20-17 SPI Timing in Master Mode (Alternate Phase of Serial Bus Clock)

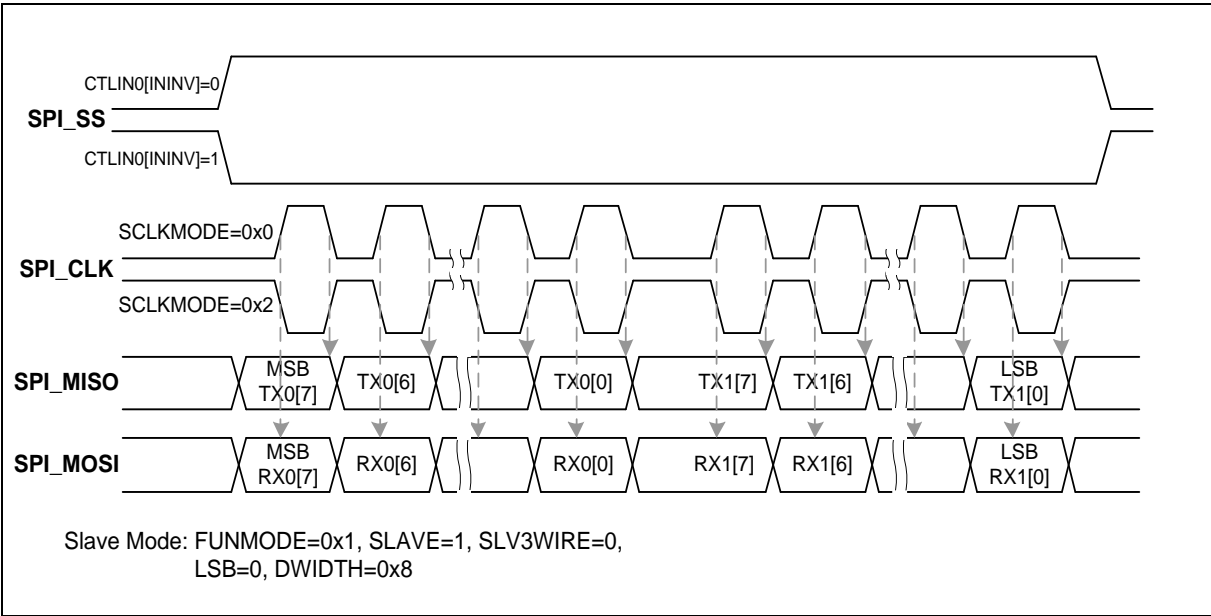

Figure 6.20-18 SPI Timing in Slave Mode

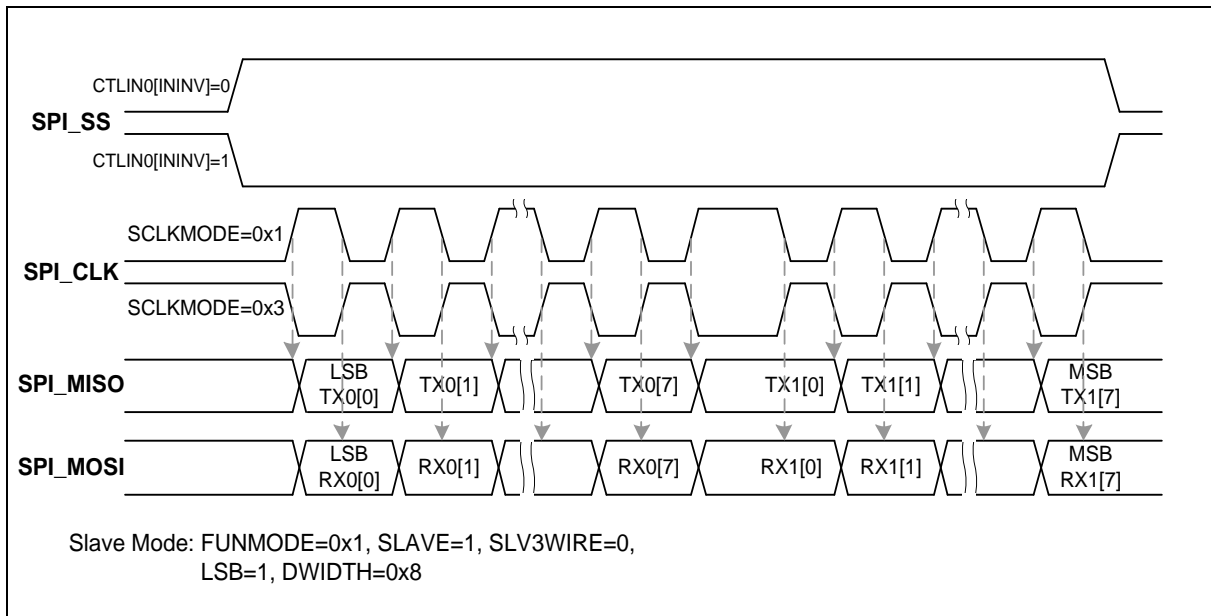

Figure 6.20-19 SPI Timing in Slave Mode (Alternate Phase of Serial Bus Clock)

#### 6.20.5.12 Programming Flow

This section describes the programming flow for USCI SPI data transfer.

##### **For Master mode:**

1. Enable USPI peripheral clock by setting CLK\_APBCLK1 register.
2. Configure user-specified pins as USPI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USPI\_CTL[2:0]) to 1 to select SPI mode.
4. Set USPI\_BRGEN register to determine the SPI bus clock frequency.
5. According to the requirements of user's application, configure the settings as follows.
  - CTLOINV (USPI\_LINECTL[7]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
  - DWIDTH (USPI\_LINECTL[11:8]): Data width setting.
  - LSB (USPI\_LINECTL[0]): LSB first or MSB first.
  - TSMSEL (USPI\_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
  - SCLKMODE (USPI\_PROTCTL[7:6]): Determine the clock timing.
  - AUTOSS (USPI\_PROTCTL[3]): Enable automatic slave select function or not.
  - SLAVE (USPI\_PROTCTL[0]): Set to 0 for Master mode.
  - Set PROTEN (USPI\_PROTCTL[31]) to 1 to enable SPI protocol.
6. If automatic slave select function is disabled (AUTOSS=0), set SS (USPI\_PROTCTL[2]) to 1 before data transfer; set SS to 0 to inactivate the slave selection signal by user's application.
7. Write USPI\_TXDAT register to trigger SPI transfer. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USPI\_TXDAT[16]) setting.
8. User can get the received data by reading USPI\_RXDAT register as long as RXEMPTY (USPI\_BUFSTS[0]) is 0. The SPI data transfer can be triggered by writing USPI\_TXDAT

register as long as TXFULL (USPI\_BUFSTS[9]) is 0.

**For Slave mode:**

1. Enable USPI peripheral clock by setting CLK\_APBCLK1 register.
2. Configure user-specified pins as USPI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USPI\_CTL[2:0]) to 1 to select SPI mode.
4. According to the requirements of user's application, configure the settings as follows.
  - ININV (USPI\_CTLIN0[2]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
  - DWIDTH (USPI\_LINECTL[11:8]): Data width setting.
  - LSB (USPI\_LINECTL[0]): LSB first or MSB first.
  - TSMSEL (USPI\_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
  - SCLKMODE (USPI\_PROTCTL[7:6]): Determine the clock timing.
  - SLAVE (USPI\_PROTCTL[0]): Set to 1 for Slave mode.
5. Set PROTEN (USPI\_PROTCTL[31]) to 1 to enable SPI protocol.
6. Write USPI\_TXDAT register for transmission. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USPI\_TXDAT[16]) setting.
7. User can get the received data by reading USPI\_RXDAT register as long as RXEMPTY (USPI\_BUFSTS[0]) is 0. The next datum for transmission can be written to USPI\_TXDAT register as long as TXFULL (USPI\_BUFSTS[9]) is 0.

**6.20.5.13 Wake-up Function**

The USCI Controller in SPI mode supports wake-up system function. The wake-up source in SPI protocol is the transition of input slave select signal.

## 6.20.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Bits	Description
[31:3]	Reserved.
[2:0]	<b>Function Mode</b> This bit field selects the protocol for this USCI controller. Selecting a protocol that is not available or a reserved combination disables the USCI. When switching between two protocols, the USCI has to be disabled before selecting a new protocol. Simultaneously, the USCI will be reset when user write 000 to FUNMODE. 000 = The USCI is disabled. All protocol related state machines are set to idle state. 001 = The SPI protocol is selected. 010 = The UART protocol is selected. 100 = The I <sup>2</sup> C protocol is selected. <b>Note:</b> Other bit combinations are reserved.

## USCI Interrupt Enable Register (USPI\_INTEN)

Register	Offset	R/W	Description	Reset Value
USPI_INTEN	USPIn_BA+0x04	R/W	USCI Interrupt Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved

Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved			RXENDIEN	RXSTIEN	TXENDIEN	TXSTIEN	Reserved

Bits	Description
[31:5]	<b>Reserved</b> Reserved.
[4]	<b>RXENDIEN</b> <b>Receive End Interrupt Enable Bit</b> This bit enables the interrupt generation in case of a receive finish event. 0 = The receive end interrupt Disabled. 1 = The receive end interrupt Enabled. <b>Note:</b> The receive finish event happens when hardware receives the last bit of RX data into shift data unit.
[3]	<b>RXSTIEN</b> <b>Receive Start Interrupt Enable Bit</b> This bit enables the interrupt generation in case of a receive start event. 0 = The receive start interrupt Disabled. 1 = The receive start interrupt Enabled. <b>Note:</b> For SPI master mode, the receive start event happens when SPI master sends slave select active and spi clock to the external SPI slave. For SPI slave mode, the receive start event happens when slave select of SPI slave is active and spi clock of SPI slave is inputted from the external SPI master.
[2]	<b>TXENDIEN</b> <b>Transmit End Interrupt Enable Bit</b> This bit enables the interrupt generation in case of a transmit finish event. 0 = The transmit finish interrupt Disabled. 1 = The transmit finish interrupt Enabled. <b>Note:</b> The transmit finish event happens when hardware sends the last bit of TX data from shift data unit.
[1]	<b>TXSTIEN</b> <b>Transmit Start Interrupt Enable Bit</b> This bit enables the interrupt generation in case of a transmit start event. 0 = The transmit start interrupt Disabled. 1 = The transmit start interrupt Enabled. <b>Note:</b> The transmit start event happens when hardware starts to move TX data from data buffer to shift data unit.

## USCI (SPI) Protocol Control Register – USPI\_PROTCTL

Register	Offset	R/W	Description	Reset Value
USPI_PROTCTL	USPIn_BA+0x5C	R/W	USCI Protocol Control Register	0x0000_0300

31	30	29	28	27	26	25	24
PROTEN	Reserved		TXUDRPOL	Reserved		SLVTOCNT	
23	22	21	20	19	18	17	16
SLVTOCNT							
15	14	13	12	11	10	9	8
Reserved	TSMSEL			SUSPITV			
7	6	5	4	3	2	1	0
SCLKMODE		Reserved		AUTOSS	SS	SLV3WIRE	SLAVE

Bits	Description
[31]	<b>PROTEN</b> <b>SPI Protocol Enable Bit</b> 0 = SPI Protocol Disabled. 1 = SPI Protocol Enabled.
[30:29]	<b>Reserved</b> Reserved.
[28]	<b>TXUDRPOL</b> <b>Transmit Under-run Data Polarity (for Slave)</b> This bit defines the transmitting data level of USCIX_DAT1 when no data is available for transferring. 0 = The output data level is 0 if TX under run event occurs. 1 = The output data level is 1 if TX under run event occurs.
[27:26]	<b>Reserved</b> Reserved.
[25:16]	<b>SLVTOCNT</b> <b>Slave Mode Time-out Period (Slave Only)</b> In Slave mode, this bit field is used for Slave time-out period. This bit field indicates how many clock periods (selected by TMCNTSRC, USPI_BRGEN[5]) between the two edges of input SCLK will assert the Slave time-out event. Writing 0x0 into this bit field will disable the Slave time-out function. Example: Assume SLVTOCNT is 0x0A and TMCNTSRC (USPI_BRGEN[5]) is 1, it means the time-out event will occur if the state of SPI bus clock pin is not changed more than (10+1) periods of $f_{DIV\_CLK}$ .
[15]	<b>Reserved</b> Reserved.
[14:12]	<b>TSMSEL</b> <b>Transmit Data Mode Selection</b> This bit field describes how receive and transmit data is shifted in and out. 000 = TSMSEL: Full-duplex SPI. 100 = TSMSEL: Half-duplex SPI. Others = Reserved. <b>Note:</b> Changing the value of this bit field will produce the TXRST and RXRST to clear the TX/RX data buffer automatically.
[11:8]	<b>SUSPITV</b> <b>Suspend Interval (Master Only)</b>

		<p>This bit field provides the configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation.</p> $(SUSPITV + 0.5) * \text{period of SPI\_CLK clock cycle}$ <p>Example:</p> <p>SUSPITV = 0x0 ... 0.5 SPI_CLK clock cycle.</p> <p>SUSPITV = 0x1 ... 1.5 SPI_CLK clock cycle.</p> <p>.....</p> <p>SUSPITV = 0xE ... 14.5 SPI_CLK clock cycle.</p> <p>SUSPITV = 0xF ... 15.5 SPI_CLK clock cycle.</p>
[7:6]	<b>SCLKMODE</b>	<p><b>Serial Bus Clock Mode</b></p> <p>This bit field defines the SCLK idle status, data transmit, and data receive edge.</p> <p>00 = MODE0. The idle state of SPI clock is low level. Data is transmitted with falling edge and received with rising edge.</p> <p>01 = MODE1. The idle state of SPI clock is low level. Data is transmitted with rising edge and received with falling edge.</p> <p>10 = MODE2. The idle state of SPI clock is high level. Data is transmitted with rising edge and received with falling edge.</p> <p>11 = MODE3. The idle state of SPI clock is high level. Data is transmitted with falling edge and received with rising edge.</p>
[5:4]	<b>Reserved</b>	Reserved.
[3]	<b>AUTOSS</b>	<p><b>Automatic Slave Select Function Enable (Master Only)</b></p> <p>0 = Slave select signal will be controlled by the setting value of SS (USPI_PROTCTL[2]) bit.</p> <p>1 = Slave select signal will be generated automatically. The slave select signal will be asserted by the SPI controller when transmit/receive is started, and will be de-asserted after each transmit/receive is finished.</p>
[2]	<b>SS</b>	<p><b>Slave Select Control (Master Only)</b></p> <p>If AUTOSS bit is cleared, setting this bit to 1 will set the slave select signal to active state, and setting this bit to 0 will set the slave select signal back to inactive state.</p> <p>If the AUTOSS function is enabled (AUTOSS = 1), the setting value of this bit will not affect the current state of slave select signal.</p> <p><b>Note:</b> In SPI protocol, the internal slave select signal is active high.</p>
[1]	<b>SLV3WIRE</b>	<p><b>Slave 3-wire Mode Selection (Slave Only)</b></p> <p>The SPI protocol can work with 3-wire interface (without slave select signal) in Slave mode.</p> <p>0 = 4-wire bi-direction interface.</p> <p>1 = 3-wire bi-direction interface.</p>
[0]	<b>SLAVE</b>	<p><b>Slave Mode Selection</b></p> <p>0 = Master mode.</p> <p>1 = Slave mode.</p>

The transmit start event happens when hardware starts to move TX data from data buffer to shift data unit.</p>
[0]	Reserved	Reserved.

## 6.21 USCI - I<sup>2</sup>C Mode

### 6.21.1 Overview

On I<sup>2</sup>C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.21-1 for more detailed I<sup>2</sup>C BUS Timing.

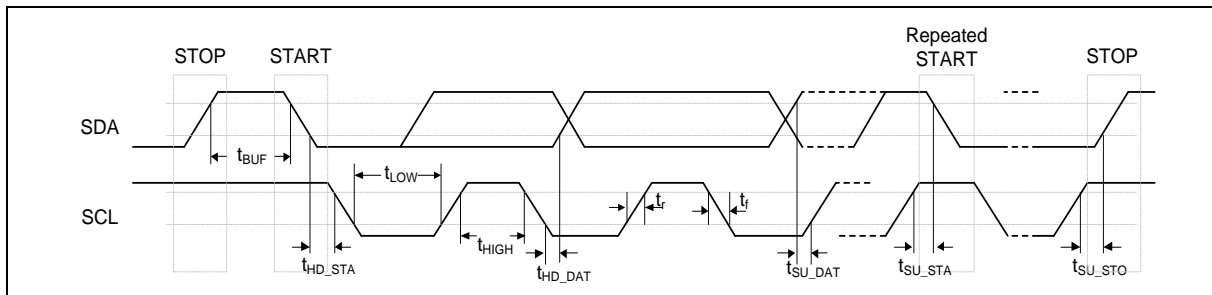

Figure 6.21-1 I<sup>2</sup>C Bus Timing

The device's on-chip I<sup>2</sup>C provides the serial interface that meets the I<sup>2</sup>C bus standard mode specification. The I<sup>2</sup>C port handles byte transfers autonomously. The I<sup>2</sup>C mode is selected by FUNMODE (UI2C\_CTL [2:0]) = 100B. When enable this port, the USCI interfaces to the I<sup>2</sup>C bus via two pins: SDA and SCL. When I/O pins are used as I<sup>2</sup>C ports, user must set the pins function to I<sup>2</sup>C in advance.

**Note:** The external pull-up resistor is needed for I<sup>2</sup>C operation because the SDA and SCL are set to open-drain pins when USCI is selected to I<sup>2</sup>C operation mode.

### 6.21.2 Features

- Full master and slave device capability
- Supports of 7-bit addressing, as well as 10-bit addressing
- Communication in standard mode (100 kbps) or in fast mode (up to 400 kbps)
- Supports multi-master bus
- Supports one transmit buffer and two receive buffer for data payload
- Supports 10-bit bus time-out capability
- Supports bus monitor mode.
- Supports Power down wake-up by data toggle or address match
- Supports setup/hold time programmable
- Supports multiple address recognition (two slave address with mask option)

### 6.21.3 Block Diagram

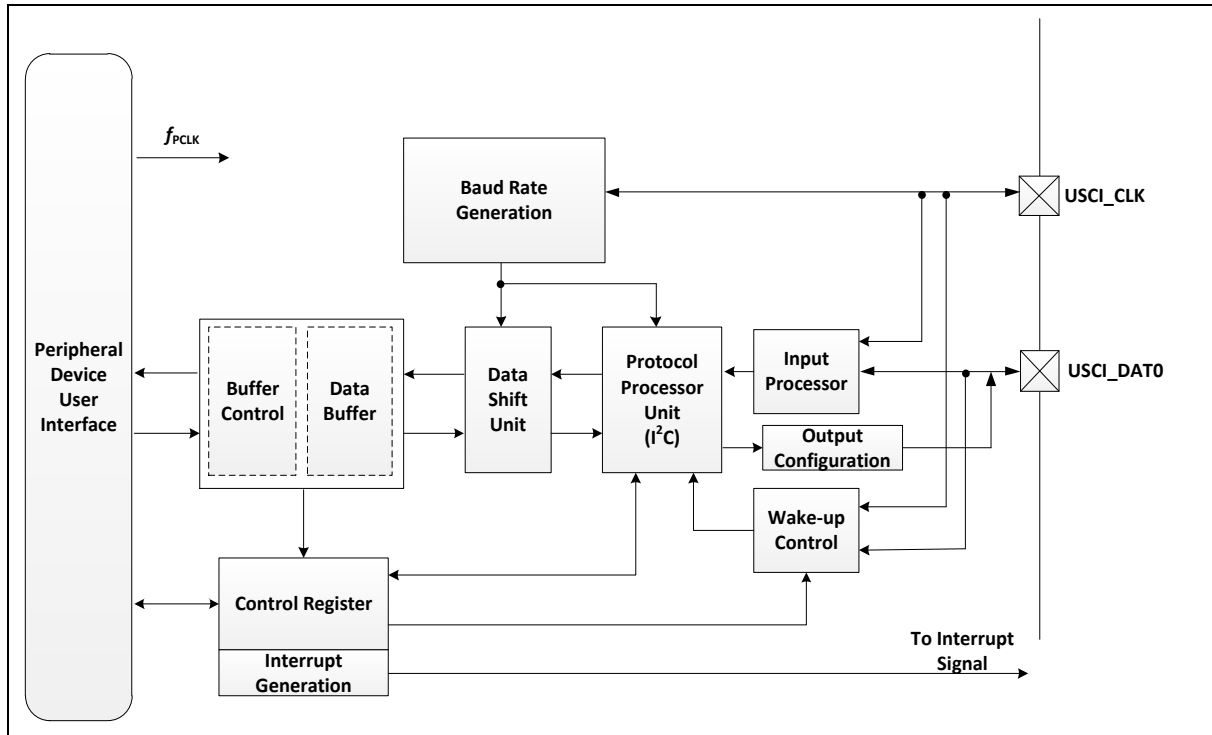

Figure 6.21-2 USCI I²C Mode Block Diagram

### 6.21.4 Basic Configuration

#### 6.21.4.1 USCI0 I²C Basic Configurations

The basic configurations of USCI0\_I2C are as follows:

- Clock Source Configuration
  - Enable USCI0 peripheral clock in USCI0CKEN (CLK\_APBCLK1[8]).
  - Enable USCI0\_I2C function UI2C\_CTL[2:0] register, UI2C\_CTL[2:0]=3'b100
- Reset Configuration
  - Reset USCI0 controller in USCI0RST (SYS\_IPRST2[8]).

The basic configurations of USCI1\_I2C are as follows:

Clock Source Configuration

- Enable USCI1 peripheral clock in USCI1CKEN (CLK\_APBCLK1[9]).
- Enable USCI1\_I2C function UI2C\_CTL[2:0] register, UI2C\_CTL[2:0]=3'b100
- Reset Configuration
  - Reset USCI1 controller in USCI1RST (SYS\_IPRST2[9]).

The basic configurations of USCI2\_I2C are as follows:

- Clock Source Configuration
  - Enable USCI2 peripheral clock in USCI2CKEN (CLK\_APBCLK1[10]).
  - Enable USCI2\_I2C function UI2C\_CTL[2:0] register, UI2C\_CTL[2:0]=3'b100
- Reset Configuration

- Reset USCI2 controller in USCI2RST (SYS\_IPRST2[10]).

## 6.21.5 Functional Description

### 6.21.5.1 START or Repeated START Signal

Figure 6.21-3 shows the typical I<sup>2</sup>C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer
- Data transfer
- STOP signal generation

Figure 6.21-3 I<sup>2</sup>C Protocol

When the bus is free/idle, meaning no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the “S” bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

A Repeated START is not a STOP signal between two START signals and usually referred to as the “Sr” bit. The master uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus idle flag.

### 6.21.5.2 STOP Signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the “P” bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH. The section between STOP and START is called bus free.

Figure 6.21-4 shows the waveform of START, Repeat START and STOP.

Figure 6.21-4 START and STOP Conditions

### 6.21.5.3 Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave's address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests. The address byte 00H indicates a general call address that can be acknowledged.

In order to allow selective acknowledges for the different values of the address byte(s), the following control mechanism is implemented:

- If the GCFUNC bit (UI2C\_PROTCTL [0]) is set the I<sup>2</sup>C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.
- The I<sup>2</sup>C port is equipped with one device address registers, UI2C\_DEVADDR<sub>n</sub> (n = 0~1). In 7-bit address mode, the first 7 bits of a received first address byte are compared to the programmed slave address (UI2C\_DEVADDR<sub>n</sub> [6:0]). If these bits match, the slave sends an acknowledge.
- For 10 bit addressing mode, if the slave address is programmed to 1111 0XXB, the XX bits are compared to the bits UI2C\_DEVADDR [9:8] to check for address match and also sends an acknowledge when ADDR10EN (UI2C\_PROTCTL [4]) is set. The slave waits for a second address byte compares it with UI2C\_DEVADDR [7:0] and sends an acknowledge accordingly to cover the 10 bit addressing mode. The user has to take care about reserved addresses (refer to I<sup>2</sup>C specification for more detailed description). Only the address 1111 0XXB is supported. Under each of these conditions, bit SLASEL (UI2C\_PROTSTS [14]) will be set when the addressing delivered a match. This SLASEL (UI2C\_PROTSTS [14]) bit is cleared automatically by a (Repeated) START or STOP condition.
- The I<sup>2</sup>C port is equipped with multiple address recognition with one address mask registers I2C\_ADDRMSK<sub>n</sub> (n = 0~1). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

#### 6.21.5.4 Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

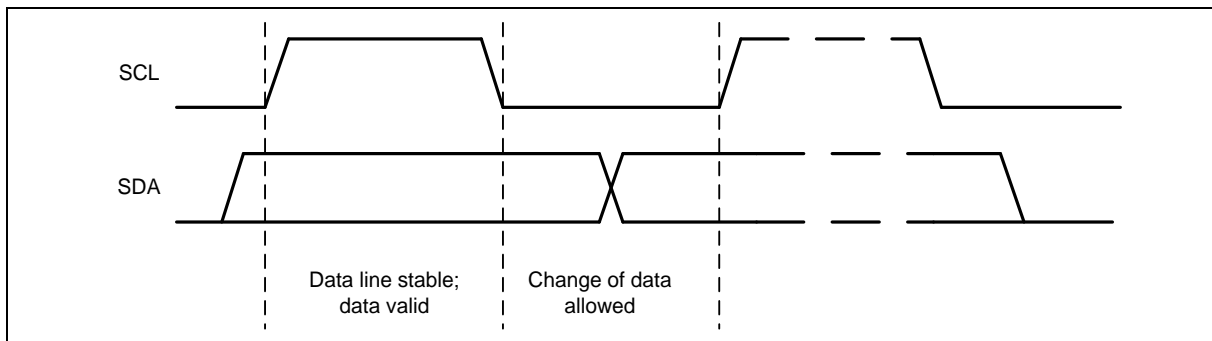

Figure 6.21-5 Bit Transfer on the I<sup>2</sup>C Bus

If the master receives data, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal.

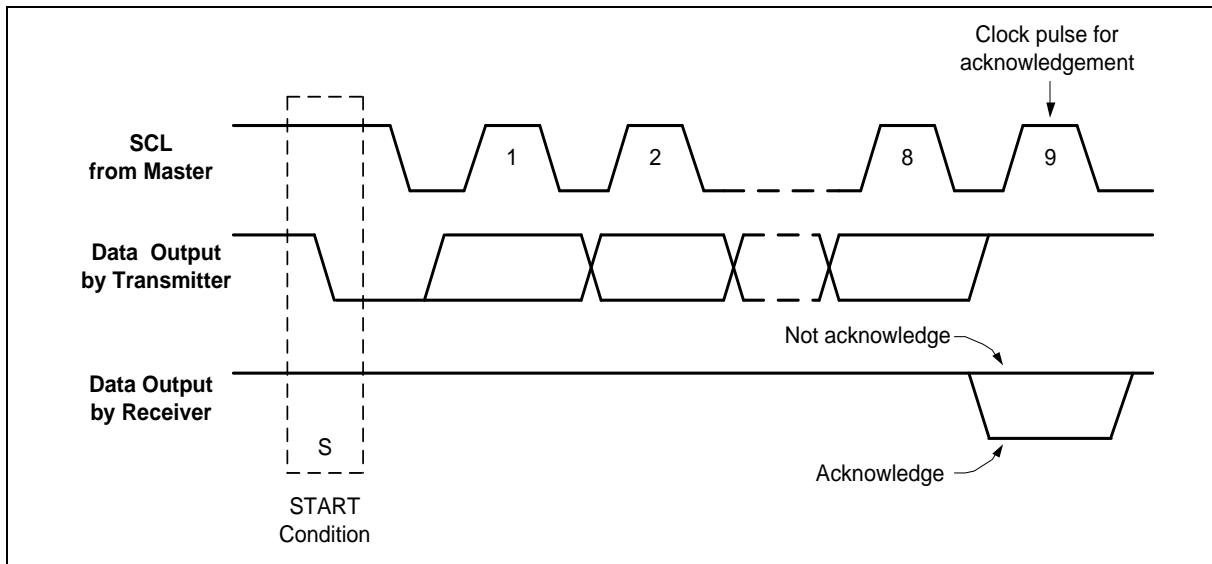

Figure 6.21-6 Acknowledge on the I<sup>2</sup>C Bus

#### 6.21.5.5 Clock Baud Rate Bits

The data baud rate of I<sup>2</sup>C is determined by UI2C\_BRGEN register when I<sup>2</sup>C is in Master Mode, and it is not necessary in a Slave mode. In the Slave mode, I<sup>2</sup>C will automatically synchronize it with any clock frequency from master I<sup>2</sup>C device. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

- RCLKSEL (UI2C\_BRGEN [0])  
to define the input frequency  $f_{REF\_CLK}$
- SPCLKSEL (UI2C\_BRGEN[3:2])  
to define the multiple source of the sample clock  $f_{SAMP\_CLK}$
- PDSCNT (UI2C\_BRGEN [9:8])  
to define the length of a data sample time (division of  $f_{REF\_CLK}$  by 1, 2, 3, or 4)
- DSCNT (UI2C\_BRGEN [14:10])  
to define the number of data sample time per bit time

The standard setting is given by RCLKSEL = 0 ( $f_{REF\_CLK} = f_{PCLK}$ ), PTCLKSEL = 0 ( $f_{PROT\_CLK} = f_{REF\_CLK}$ ) and SPCLKSEL = 2'b00 ( $f_{SAMP\_CLK} = f_{DIV\_CLK}$ ). Under these conditions, the baud rate is given by:

$$f_{I2C} = f_{REF\_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ( $f_{PROT\_CLK} = f_{REF\_CLK}/2$ ), leading to:

$$f_{I2C} = \frac{f_{REF\_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2'b10 ( $f_{SAMP\_CLK} = f_{SCLK}$ ), and RCLKSEL = 0 ( $f_{REF\_CLK} = f_{PCLK}$ ), PTCLKSEL = 0 ( $f_{PROT\_CLK} = f_{REF\_CLK}$ ). The baud rate is given by:

$$f_{I2C} = f_{REF\_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

#### 6.21.5.6 Byte Stretching

If a device is selected as master/slave transmit mode and should transmit a data byte but the transmit buffer TXDAT does not contain valid data to be transmitted, the device ties down SCL = 0 at the end of the previous acknowledge bit. The waiting period is finished if software writes 1 to PTRG (UI2C\_PROTCTL [5]).

#### 6.21.5.7 Multi-master Arbitration

In some applications, there are two or more masters on the same I<sup>2</sup>C bus to access slaves, and the masters may transmit data simultaneously. The I<sup>2</sup>C supports multi-master by including collision detection and arbitration to prevent data corruption.

If two masters sometimes initiate I<sup>2</sup>C command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. Master I<sup>2</sup>C device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each I<sup>2</sup>C master must monitor the I<sup>2</sup>C bus for collisions and act accordingly. Figure 6.21-7 describes master1 data and master2 data are compete arbitration.

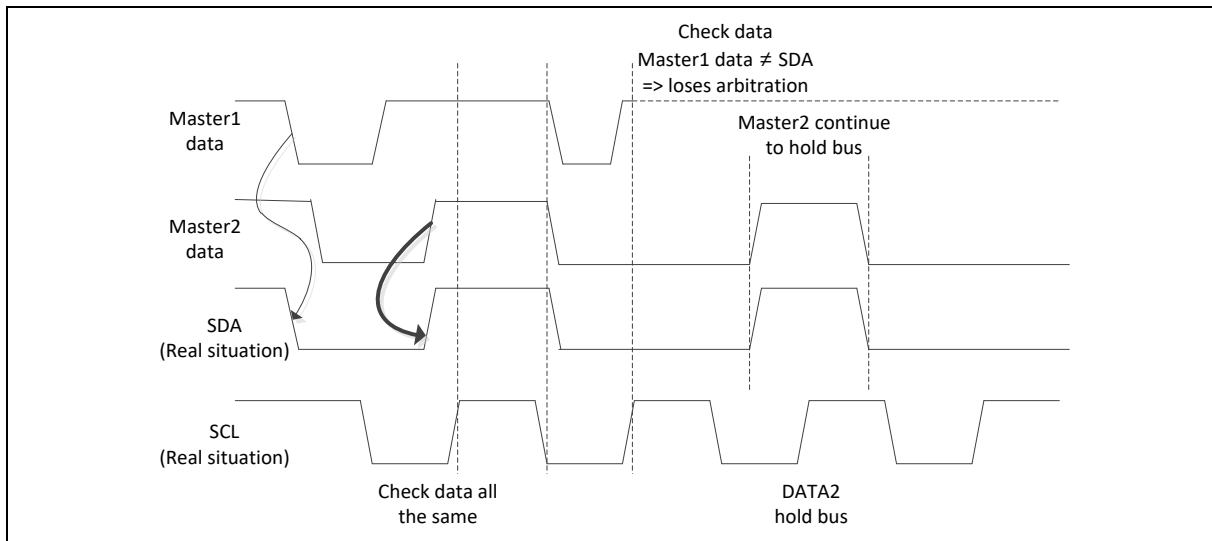

Figure 6.21-7 Arbitration Lost

In this case, during the address and data transmission, the master transmitter checks at the rising edge of SCL for each data bit if the value it is sending is equal to the value read on the SDA line. If yes, master can hold bus continuously. If this is not the case (transmitted value = 1, value read = 0), the master has lost the transmit arbitration. This is indicated by interrupt flag ARBLOIF (UI2C\_PROTSTS [11]) and can generate a protocol interrupt if enabled by ARBLOIEN (UI2C\_PROTIEN [4]).

When the transmit arbitration has been lost, the software has to initialize the complete frame again, starting with the first address byte together with the START condition for a new master transmit attempt. Arbitration also takes place for the ACK bit. If master arbitration lost and match the device address, then master will turn to slave.

#### 6.21.5.8 Transmission Chain

The I<sup>2</sup>C bus protocol requiring a kind of in-bit-response during the arbitration phase and while a slave is transmitting, the resulting loop delay of the transmission chain can limit the reachable maximal baud rate, strongly depending on the bus characteristics (bus load, module frequency, etc.).

The shift clock SCL is generated by the master device, output on the wire, then it passes through the

input stage and the input filter. Now, the edges can be detected and the SDA data signal can be generated accordingly. The SDA signal passes through the output stage and the wire to the master receiver part. There, it passes through the input stage and the input filter before it is sampled.

This complete loop has to be finished (including all settling times to obtain stable signal levels) before the SCL signal changes again. The delays in this path have to be taken into account for the calculation of the baud rate as a function of  $f_{\text{PCLK}}$  and  $f_{\text{PROT\_CLK}}$ . We suggest user adopt  $f_{\text{PCLK}}$ .

#### 6.21.5.9 Non-Acknowledge and Error Conditions

In case of a non-acknowledge (NACKIF (UI2C\_PROTSTS [10])) or an error (ERRIF (UI2C\_PROTSTS [12])), no further transmission will take place. User software doesn't invalidate the transmit buffer and disable transmissions, before configuring the transmission (by writing TXDAT) again with appropriate values to react on the previous event.

#### 6.21.5.10 I<sup>2</sup>C Protocol Interrupt Events

The following protocol-related events are generated in I<sup>2</sup>C mode and can lead to a protocol interrupt.

Please note that the bits in register UI2C\_PROTSTS are not all automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

- START condition received at a correct position in a frame (STARIF (UI2C\_PROTSTS [8]))
- STOP condition transferred at a correct position in a frame (STORIF (UI2C\_PROTSTS [9]))
- Master arbitration lost (ARBLOIF (UI2C\_PROTSTS [11]))
- Slave read requested (SLAREAD (UI2C\_PROTSTS [15]))
- Acknowledge received (ACKIF (UI2C\_PROTSTS [13]))
- Non-acknowledge received (NACKIF (UI2C\_PROTSTS [10]))
- START condition not at the expected position in a frame (ERRIF (UI2C\_PROTSTS [12]))
- STOP condition not at the expected position in a frame (ERRIF (UI2C\_PROTSTS [12]))

#### 6.21.5.11 Operating the I<sup>2</sup>C

To operate the I<sup>2</sup>C protocol, the following issues have to be considered:

##### Select I<sup>2</sup>C Mode

It is recommended to configure all parameters of the I<sup>2</sup>C that do not change during run time while FUNMODE (UI2C\_CTL [2:0]) = 000B. The I<sup>2</sup>C control flow has to be done while FUNMODE (UI2C\_CTL [2:0]) = 000B to avoid unintended edges of the input signals and the I<sup>2</sup>C mode can be enabled by FUNMODE (UI2C\_CTL [2:0]) = 100B afterwards.

Step 1. Set FUNMODE (UI2C\_CTL [2:0]) = 000B

Step 2. Set FUNMODE (UI2C\_CTL [2:0]) = 100B

##### Pin Connections

The pins used for SDA and SCL have to be set to open-drain mode by USCI controller to support the wired-AND structure of the I<sup>2</sup>C bus lines.

**Note:** The step to enable the alternate output port functions should only be done after the I<sup>2</sup>C mode is enabled, to avoid unintended spikes on the output.

##### Bit Timing Configuration

In standard mode (100 kBits/s) a minimum module frequency of 2 MHz is necessary, whereas in fast mode (400 kBits/s) a minimum of 10 MHz is required. Additionally, if the digital filter stage should be used to eliminate spikes up to 50 ns, a filter frequency of 20 MHz is necessary. There could be an

uncertainty in the SCL high phase timing of maximum  $1/f_{\text{PROT\_CLK}}$  if another I<sup>2</sup>C participant lengthens the SCL low phase on the bus. Note that the SCL maximum frequency is  $f_{\text{SAMP\_CLK}}/2$  and the SPCLKSEL (UI2C\_BRGEN [3:2]) must be set to 0 for selecting  $f_{\text{SAMP\_CLK}} = f_{\text{DIV\_CLK}}$ .

### **Data Format Configuration**

The data format has to be configured for 8 data bits (DWIDTH (UI2C\_LINECTL [11:8]) = 8), and MSB shifted first (LSB (UI2C\_LINECTL [0]) = 0). As a result, UI2C\_LINECTL has to be set to 0x800.

### **Control Flow**

The on-chip I<sup>2</sup>C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I<sup>2</sup>C port may operate as a master or as a slave. In Slave mode, the I<sup>2</sup>C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master (by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If address arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I<sup>2</sup>C bus transfer in each mode, user needs to set UI2C\_PROTCTL, UI2C\_PROTIEN, TXDAT registers according to current status of UI2C\_PROTSTS register. In other words, for each I<sup>2</sup>C bus action, user needs to check current status by UI2C\_PROTSTS register, and then set UI2C\_PROTCTL, UI2C\_PROTIEN, TXDAT registers to take bus action. Finally, check the response status by UI2C\_PROTSTS.

The bits, STA, STO and AA in UI2C\_PROTCTL register are used to control the next state of the I<sup>2</sup>C hardware after interrupt signal is cleared. Upon completion of the new action, a new status will be updated in UI2C\_PROTSTS register will be set. If the I<sup>2</sup>C interrupt control bit of UI2C\_PROTIEN is set, appropriate action or software branch of the new status can be performed in the Interrupt service routine.

Figure 6.21-8 shows the current I<sup>2</sup>C STARIF (UI2C\_PROTSTS [8]) is set to 1 by hardware, and then set TXDAT = SLA+W (Slave address + Write bit), (PTRG, STA, STO, AA) = (1, 0, 0, x) to send the address to I<sup>2</sup>C bus, and write 1 to STARIF (UI2C\_PROTSTS [8]) to clear flag. If a slave on the bus matches the address and response ACK, the UI2C\_PROTSTS will be updated by ACKIF (UI2C\_PROTSTS [13]) setting.

Figure 6.21-8 Control I<sup>2</sup>C Bus according to Current I<sup>2</sup>C Status

### **Data Transfer on the I<sup>2</sup>C Bus**

Figure 6.21-9 shows a master transmits data to slave. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

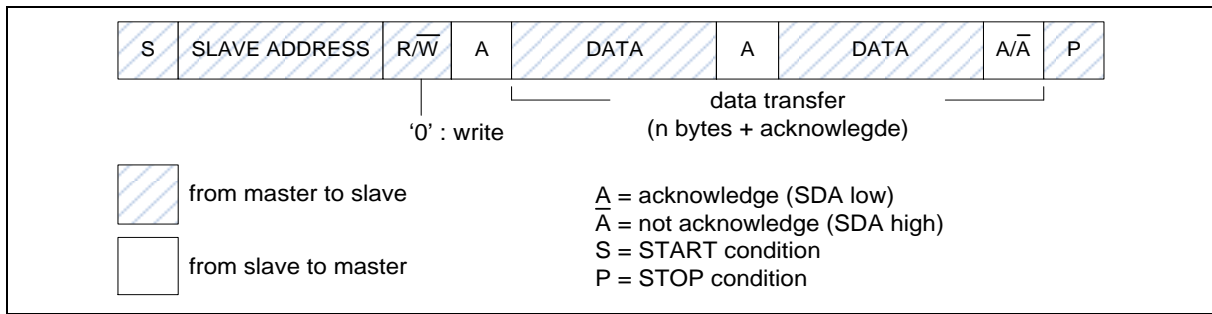

Figure 6.21-9 Master Transmits Data to Slave with a 7-bit Address

Figure 6.21-10 shows a master read data from slave. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

Figure 6.21-10 Master Reads Data from Slave with a 7-bit Address

Figure 6.21-11 shows a master transmits data to slave by 10-bit address. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

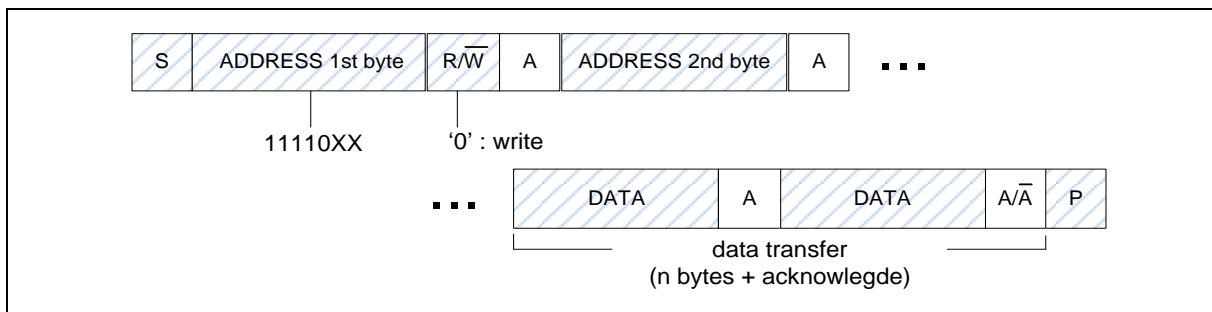

Figure 6.21-11 Master Transmits Data to Slave by 10-bit Address

Figure 6.21-12 shows a master read data from slave by 10-bit address. A master addresses a slave with a 10-bit address. First master transmits 10-bit address to slave, after that master transmits first byte with read index. The slave will start transmitting data after the first byte with read index.

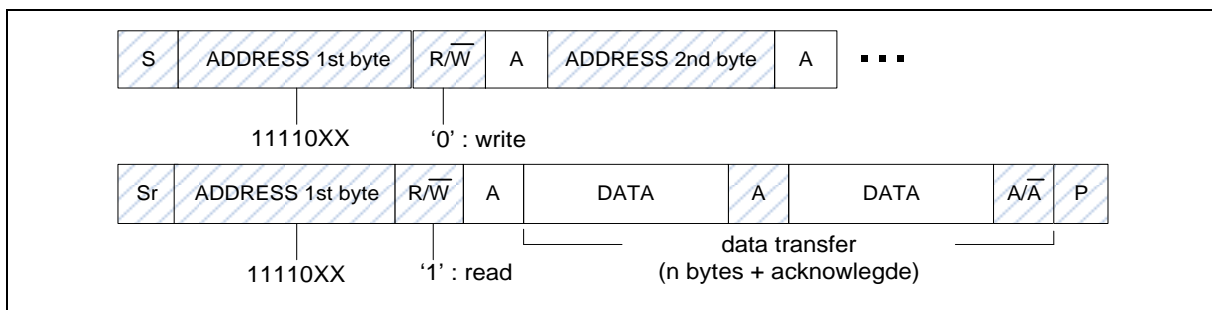

Figure 6.21-12 Master Reads Data from Slave by 10-bit Address

### Master Mode

In Figure 6.21-13 and Figure 6.21-14, all possible protocols for I<sup>2</sup>C master are shown. User needs to follow proper path of the flow to implement required I<sup>2</sup>C protocol.

In other words, user can send a START signal to bus and I<sup>2</sup>C will be in Master Transmitter mode (Figure 6.21-13) or Master receiver mode (Figure 6.21-14) after START signal has been sent successfully and new status register would be set STARIF (UI2C\_PROTSTS [8]). Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I<sup>2</sup>C protocol.

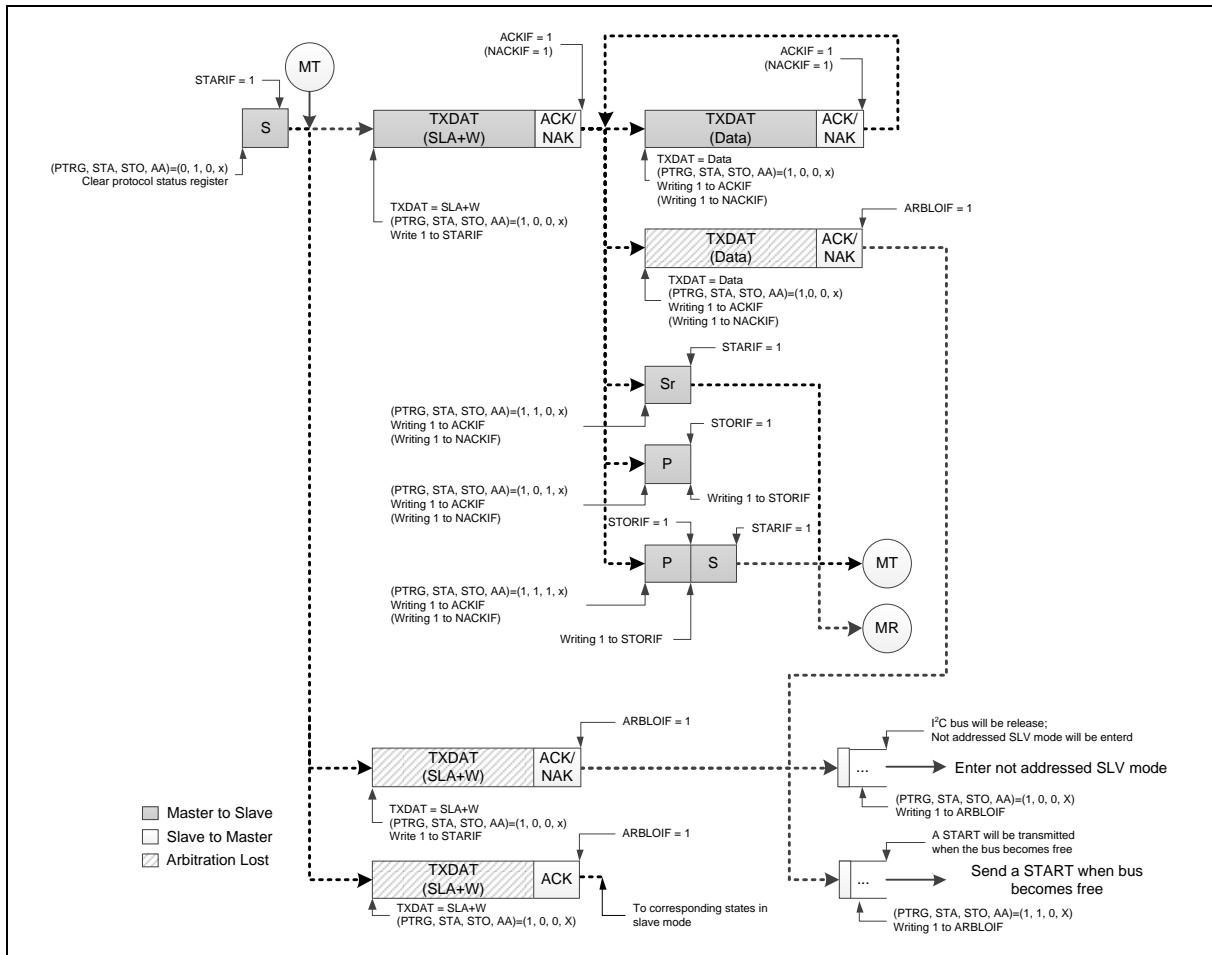

Figure 6.21-13 Master Transmitter Mode Control Flow with 7-bit Address

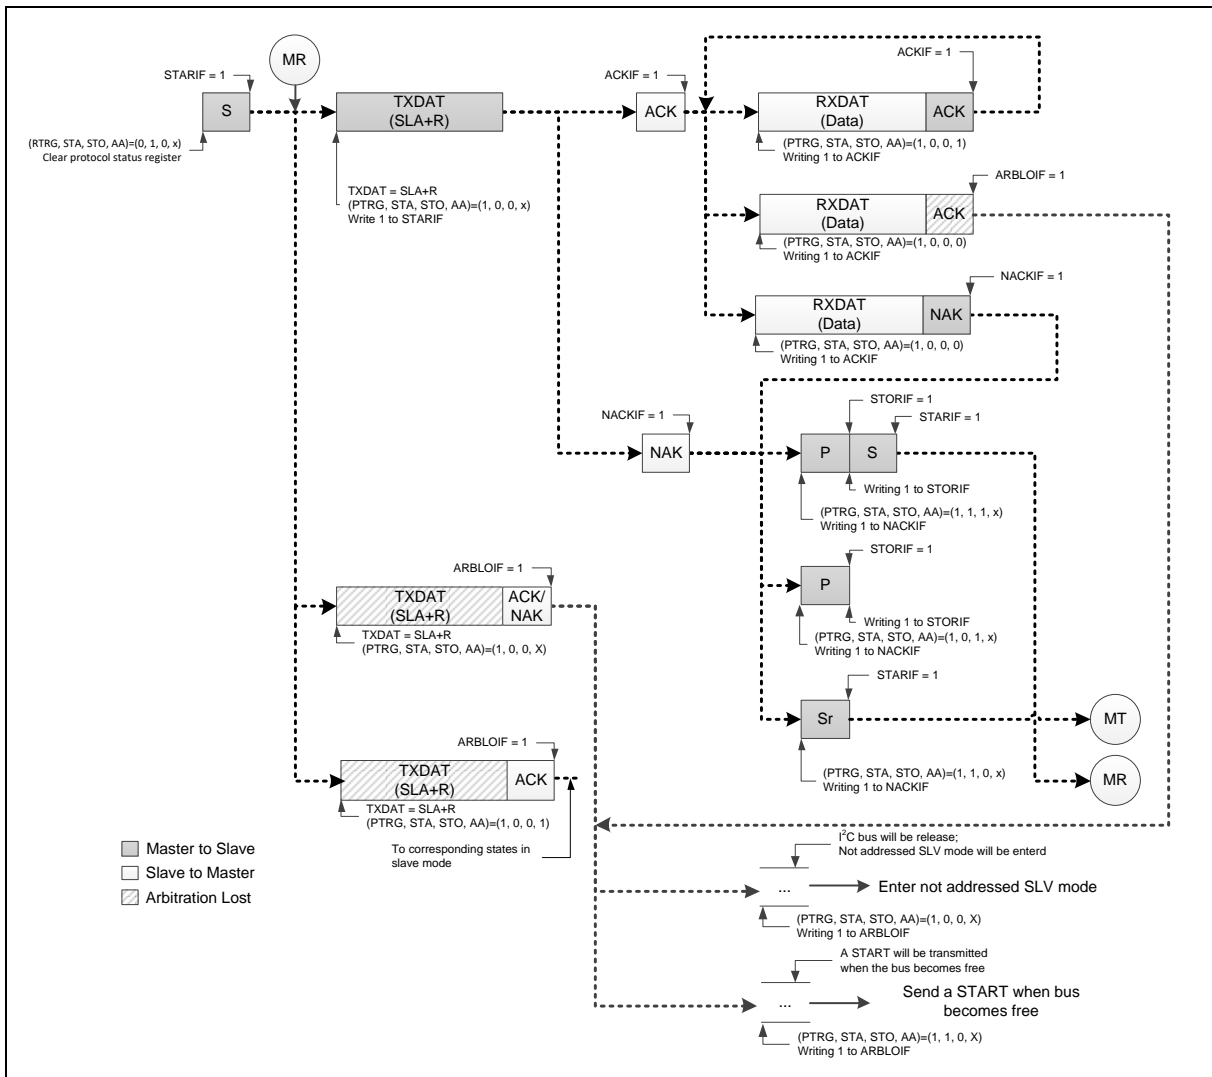

Figure 6.21-14 Master Receiver Mode Control Flow with 7-bit Address

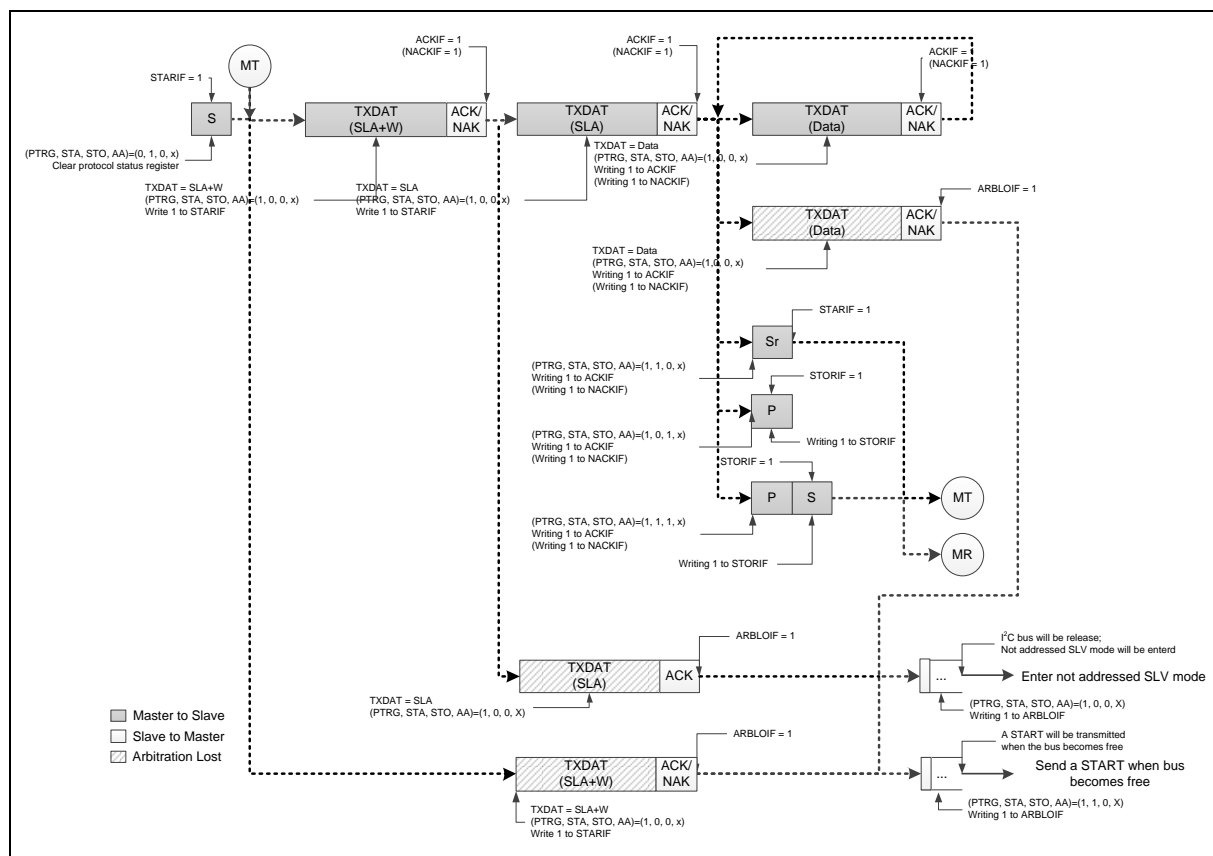

Figure 6.21-15 Master Transmitter Mode Control Flow with 10-bit Address

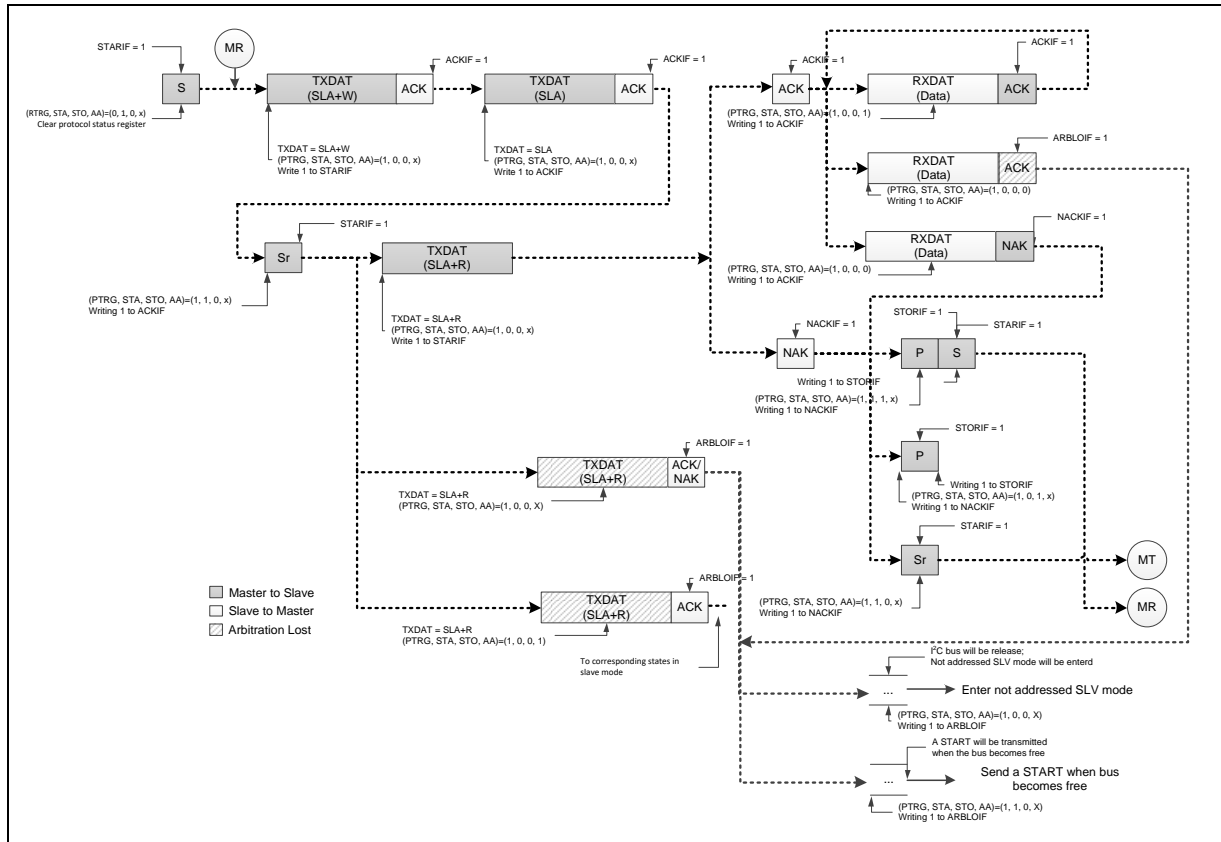

Figure 6.21-16 Master Receiver Mode Control Flow with 10-bit Address

If the I<sup>2</sup>C is in Master mode and gets arbitration lost, the bit of ARBLOIF (UI2C\_PROTSTS [11]) will be set. User may writing 1 to ARBLOIF (UI2C\_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 1, 0, X) to send START to re-start Master operation when bus becomes free. Otherwise, user may write 1 to ARBLOIF (UI2C\_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 0, 0, X) to release I<sup>2</sup>C bus and enter not addressed Slave mode.

### Slave Mode

When reset, I<sup>2</sup>C is not addressed and will not recognize the address on I<sup>2</sup>C bus. User can set device address by UI2C\_DEVADDRn and set (PTRG, STA, STO, AA) = (1, 0, 0, 1) to let I<sup>2</sup>C recognize the address sent by master. Figure 6.21-17 shows all the possible flow for I<sup>2</sup>C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.21-17 to implement their own I<sup>2</sup>C protocol.

If bus arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) or SLA+R (Master wants to read data from Slave) after arbitration lost, the ARBLOIF will be set to 1.

The I<sup>2</sup>C controller supports two slave address match flags, ADMAT0 and ADMAT1 on UI2C\_ADMAT[1:0] register. Every control register represents which address is used and set 1 to inform software.

**Note:** During I<sup>2</sup>C communication, the SCL clock will be released when writing '1' to PTRG (UI2C\_PROTCTL [5]) in Slave mode.

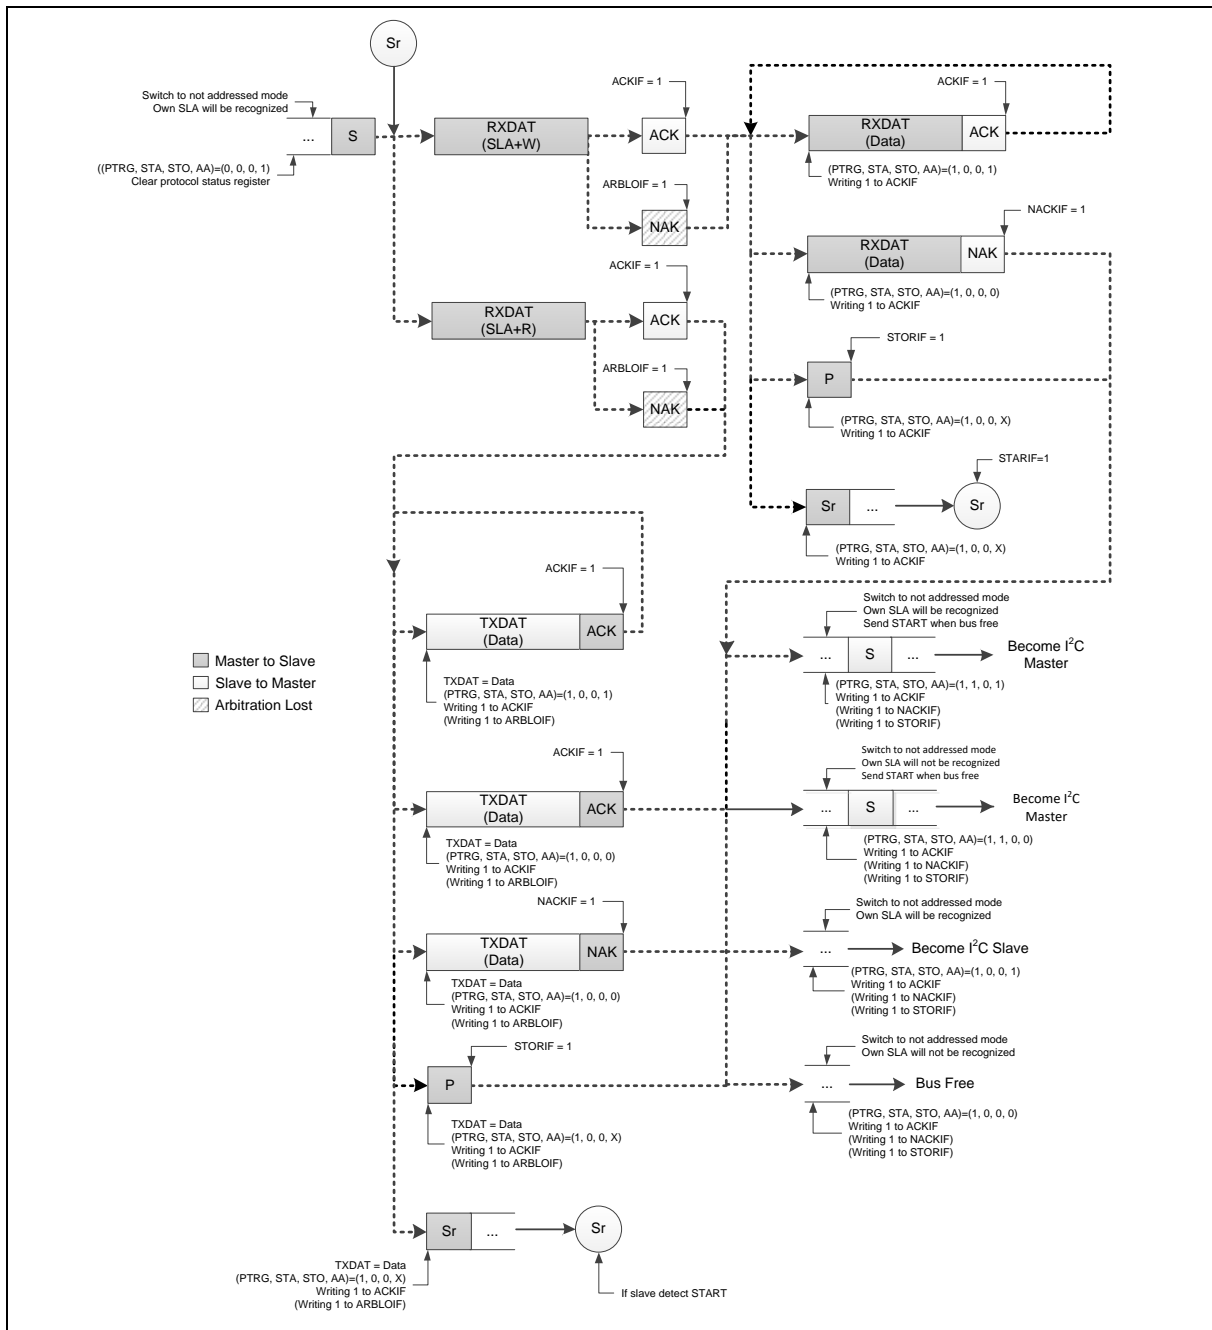

Figure 6.21-17 Save Mode Control Flow with 7-bit Address

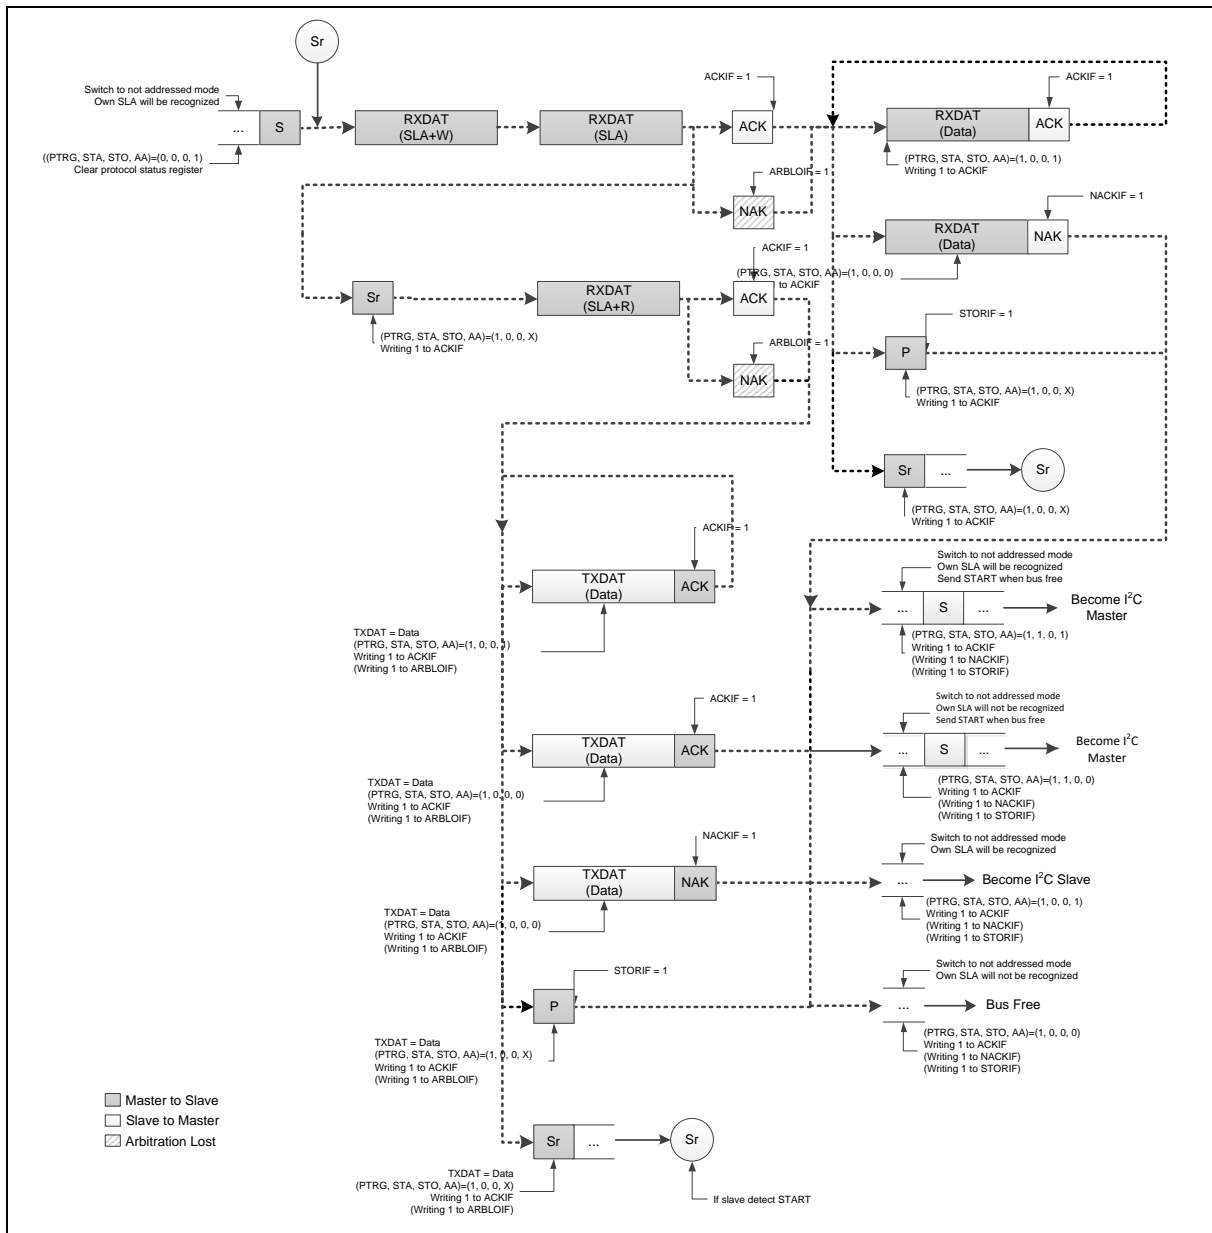

Figure 6.21-18 Save Mode Control Flow with 10-bit Address

If I<sup>2</sup>C is still transmitting and receiving data in addressed Slave mode but got a STOP or Repeat START, the register STORIF (UI2C\_PROTSTS [9]) or STARIF (UI2C\_PROTSTS [8]) will be set. User could follow the action for NACKIF (UI2C\_PROTSTS [10]) as shown in the above figure when got STARIF (UI2C\_PROTSTS [8]) is set.

**Note:** After slave gets interrupt flag of NACKIF (UI2C\_PROTSTS [10]) and start/stop symbol including STARIF (UI2C\_PROTSTS [8]) and STORIF (UI2C\_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I<sup>2</sup>C signal or address from master. At this status, I<sup>2</sup>C should be reset by setting FUNMODE (UI2C\_CTL [2:0]) = 000B to leave this status.

### General Call (GC) Mode

If the GCFUNC bit (UI2C\_PROTCTL [0]) is set, the I<sup>2</sup>C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the

I<sup>2</sup>C in slave mode, it can receive the general call address by 0x00 after master send general call address to I<sup>2</sup>C bus, and then it also will follow protocol status register.

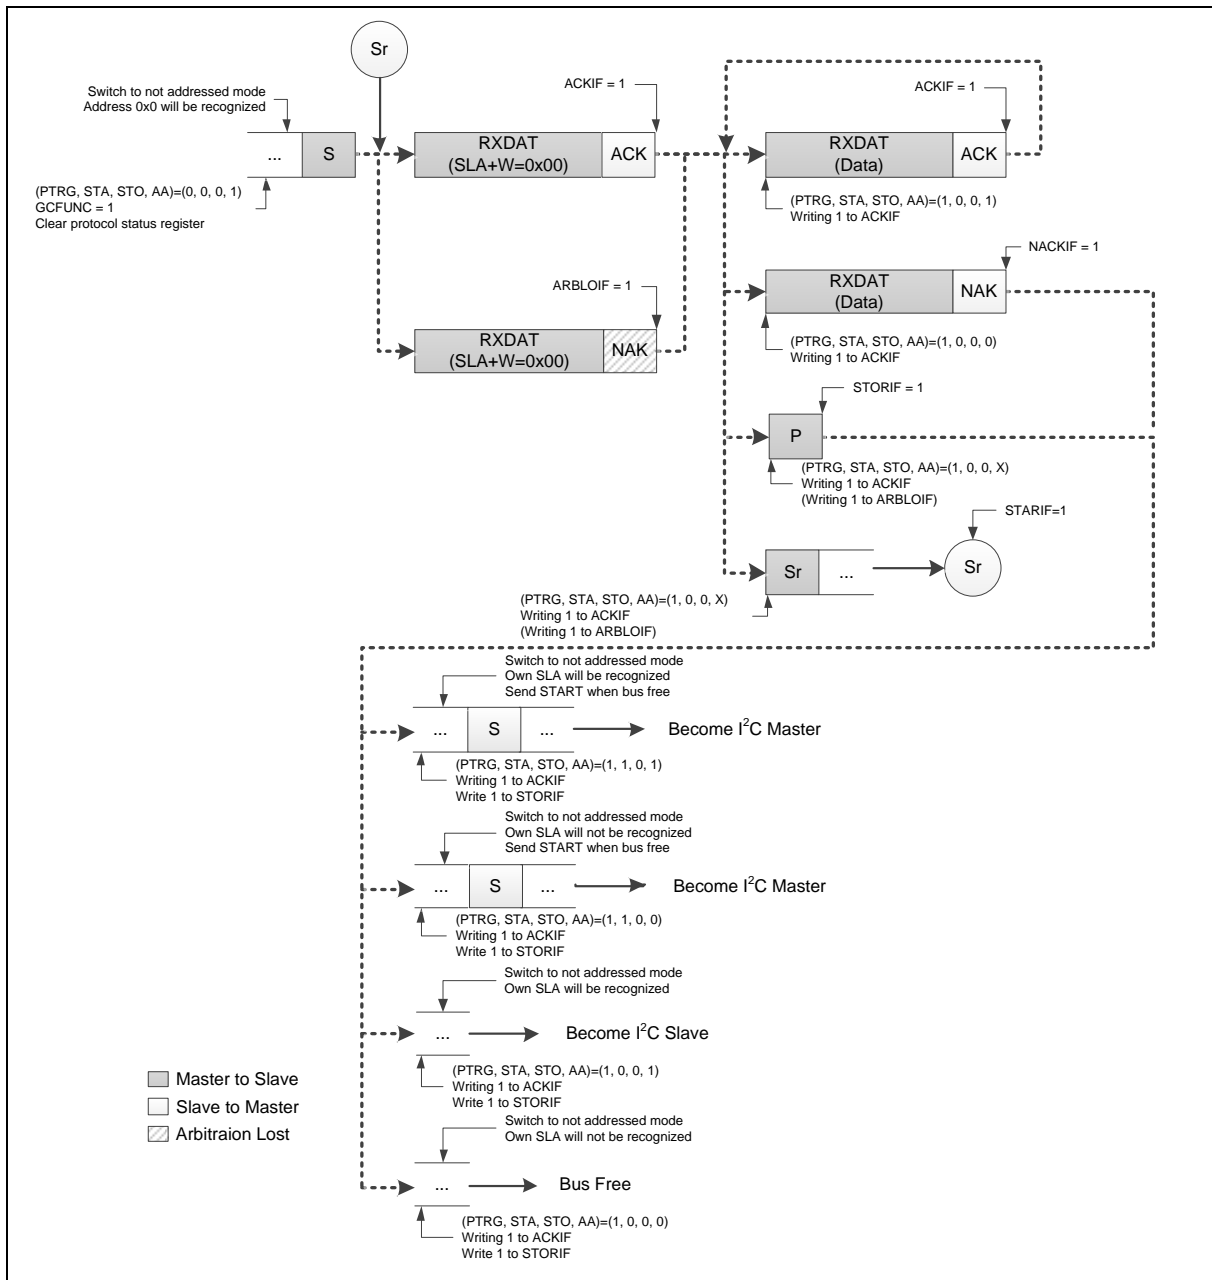

Figure 6.21-19 GC Mode with 7-bit Address

If I<sup>2</sup>C is still receiving data in GC mode but got a STOP or Repeat START, the STORIF (UI2C\_PROTSTS [9]) or STARIF (UI2C\_PROTSTS [8]) will be set. User could follow the action for NACKIF (UI2C\_PROTSTS [10]) in above figure when got STORIF (UI2C\_PROTSTS [9]) or STARIF (UI2C\_PROTSTS [8]) is set.

**Note:** After slave gets interrupt flag of NACKIF (UI2C\_PROTSTS [10]) and start/stop symbol including STARIF (UI2C\_PROTSTS [8]) and STORIF (UI2C\_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I<sup>2</sup>C signal or address from master. At this time, I<sup>2</sup>C controller should be reset by setting FUNMODE (UI2C\_CTL [2:0]) = 000B to leave this status.

## Protocol Functional Description

### Monitor Mode

When I<sup>2</sup>C enters monitor mode, this device always returns NACK to master after each frame reception even address matching. Moreover, this device will store any receive data including address, command code, and data.

### Interrupt in Monitor Mode

All interrupts will occur as normal process when the MONEN (UI2C\_PROTCTL [9]) is set. Note that the first interrupt will occur when initial START, it not the same as I<sup>2</sup>C slave, but the other interrupts are the same.

Subsequent to the address-match detection, interrupts will be generated after each data byte is received as slave mode control flow, or after each byte that the module believes it has transmitted for a slave-read transfer. In this second case, the data register will actually contain data transmitted by some other slave on the bus which was actually addressed by the master. If user wants to watch other device, user can set address mask and monitor.

If the monitor has not had time to respond to interrupt, the SCL signal will be pulled to low when SCLOUTEN (UI2C\_PROTCTL [8]) is set to 1. User must set PTRG (UI2C\_PROTCTL [5]) to release bus when SCLOUTEN (UI2C\_PROTCTL [8]) is set to 1. If SCLOUTEN (UI2C\_PROTCTL [8]) is not set to 1, user doesn't need to set PTRG (UI2C\_PROTCTL [5]) to 1.

When device address match, but the device response NACK, this address will be received into buffer and NACK interrupt will be generated.

Following all of these interrupts, the processor may read the data register to see what was actually transmitted on the bus.

### Loss of Arbitration in Monitor Mode

In monitor mode, the I<sup>2</sup>C module will not be able to respond to a request for information by the bus master or issue an ACK. Some other slave on the bus will respond instead. Software should be aware of the fact that the module is in monitor mode and should not respond to any loss of arbitration state that is detected.

### Programmable Setup and Hold Time

In order to guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (UI2C\_TMCTL[24:16]) to configure hold time and STCTL (UI2C\_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not affected by stretched.

User should focus the limitation of setup and hold time configuration, the timing setting must follow I<sup>2</sup>C protocol. Once setup time configuration greater than design limitation, that means if setup time setting make SCL output less than three PCLKs, I<sup>2</sup>C controller can't work normally due to SCL must sample three times. And once hold time configuration greater than I<sup>2</sup>C clock limitation, I<sup>2</sup>C will occur bus error. Suggest that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.21-1 shows the relationship between I<sup>2</sup>C baud rate and PCLK, the number of table represent one clock duty contain how many PCLKs. Setup and hold time configuration even can program some extreme values in the design, but user should follow I<sup>2</sup>C protocol standard.

I <sup>2</sup> C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20

48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.21-1 Relationship between I<sup>2</sup>C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains ten PCLKs and set STCTL (UI2C\_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time setting limitation:  $ST_{limit} = (UI2C_BRGEN[25:16]+1) - 6$ .

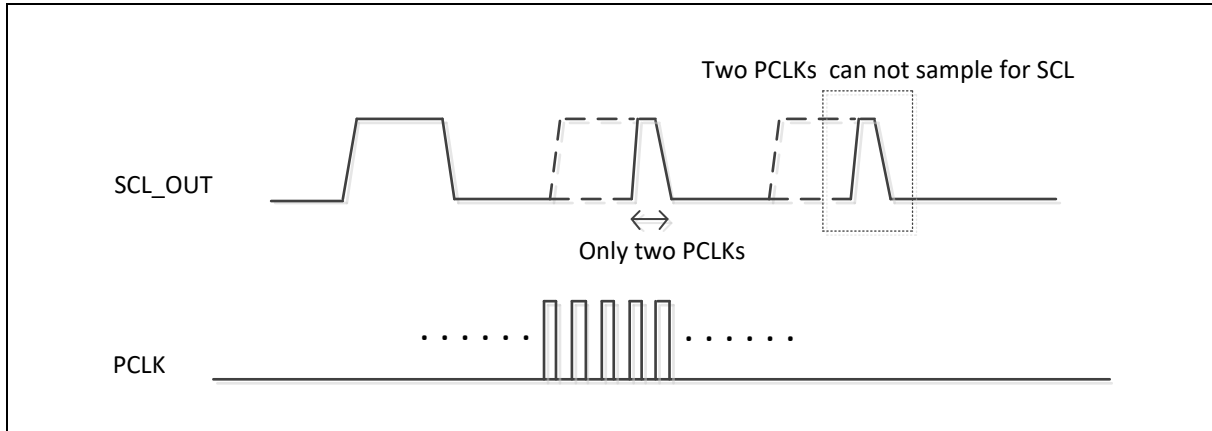

Figure 6.21-20 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I<sup>2</sup>C Baud Rate = 1200k and PCLK = 72 MHz, the SCL high/low duty = 60 PCLK. When HTCTL (UI2C\_TMCTL[24:16]) is set to 63 and STCTL (UI2C\_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time setting limitation:  $HT_{limit} = (UI2C_BRGEN[25:16]+1) - 9$ .

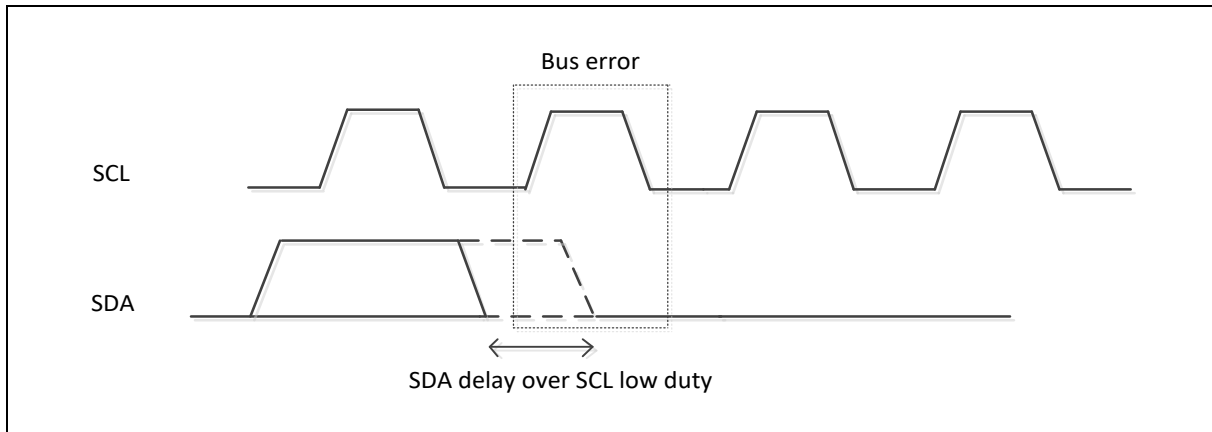

Figure 6.21-21 Hold Time Wrong Adjustment

### **I<sup>2</sup>C Time-out Function**

There is a 10 bits time-out counter TOCNT (UI2C\_PROTCTL [25:16]) which can be used to deal with the I<sup>2</sup>C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it equals TOCNT (UI2C\_PROTCTL [25:16]) and generates I<sup>2</sup>C interrupt to CPU or stops counting by clearing TOIEN (UI2C\_PROTIEN [0]) to 0 or setting all I<sup>2</sup>C interrupt signal (ACKIF, ERRIF, ARBLOIF, NACKIF, STORIF, STARIF). User may write 1 to clear TOIF (UI2C\_PROTSTS[5]) to 0. When time-out counter is enabled, writing 1 to the TOIF will reset counter and re-start up counting after TOIF is cleared. Refer to Figure 6.21-22 for the time-out counter TOCNT (UI2C\_PROTCTL [25:16]).  $T_{TOCNT} = (TOCNT (UI2C_PROTCTL [25:16]) + 1) \times 32 (5\text{-bit}) \times T_{PCLK}$ . Note that the time counter clock source TMCNTSRC

(UI2C\_ BRGEN [5]) must be set as 0.

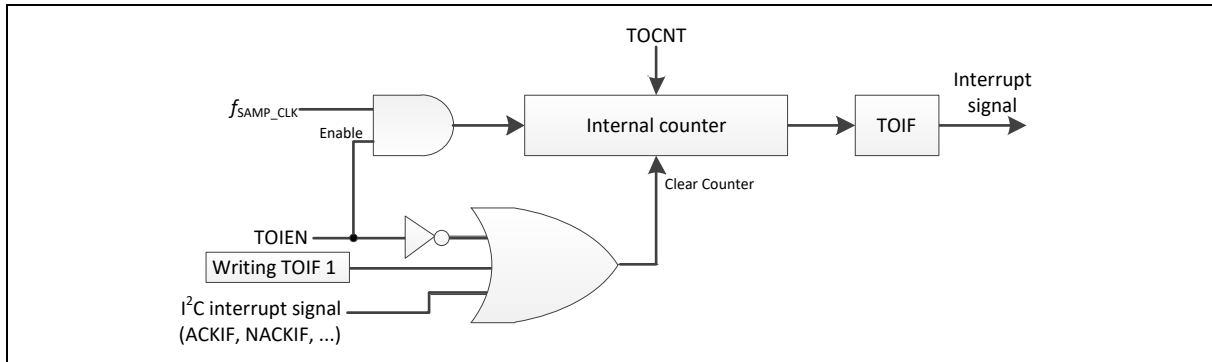

Figure 6.21-22 I²C Time-out Count Block Diagram

### **Wake-up Function**

When chip enters Power-down mode and sets WKEN (WKCTL[0]) to 1, other I²C master can wake up the chip by addressing the I²C device. User must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's address and the ACK cycle done. The SCL is stretched until the bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Therefore, when the chip is woken up by address match with one of the device address register (UI2C\_DEVADDRn), the user shall check the WKAKDONE (UI2C\_PROTSTS [16]) bit is set to 1 to confirm if the address wakeup frame has been done. The WKAKDONE bit indicates that the ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's slave address and the ACK cycle done. The SCL is stretched until the WKAKDONE bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Note that user must clear WKUPIF after clearing the WKAKDONE bit to 0.

The WRSTSWK (UI2C\_PROTSTS [17]) bit records the Read/Write command on the address match wake-up frame. The user can use read this bit's status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is woken up by the address match frame.

When system is woken up by other I²C master device, WKF (UI2C\_WKSTS [0]) is set to indicate this event. User needs write "1" to clear this bit.

### **Example for Random Read on EEPROM**

The following steps are used to configure the USCIO\_I2C related registers when using I²C protocol to read data from EEPROM.

1. Set USCIO\_I2C the multi-function pin as SCL and SDA pins. The multi-function configuration reference Basic Configuration.
2. Enable USCIO APB clock. The multi-function configuration reference Basic Configuration.
3. Set USCIO\_RST=1 to reset USCI controller then set USCIO\_RST=0 let USCI controller to normal operation. The reset controller configuration reference Basic Configuration.
4. Set FUNMODE =100 to enable USCIO\_I2C controller in the "UI2C\_CTL" register.
5. Give USCIO\_I2C clock a divided register value for USCIO\_I2C clock rate in the "UI2C\_BRGEN".
6. Enable system I2C0 IRQ in system "NVIC" control register.
7. Set ACKIEN, ERRIEN, ARBLOIEN, NACKIEN, STORIEN, STARIEN, and TOIEN to enable

I<sup>2</sup>C Interrupt in the “UI2C\_PROTIEN” register.

8. Set USCI address registers “UI2C\_ADDR0 ~ UI2C\_ADDR1”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.21-23 shows the EEPROM random read operation.

Figure 6.21-23 EEPROM Random Read

Figure 6.21-24 shows how to use I<sup>2</sup>C controller to implement the protocol of EEPROM random read.

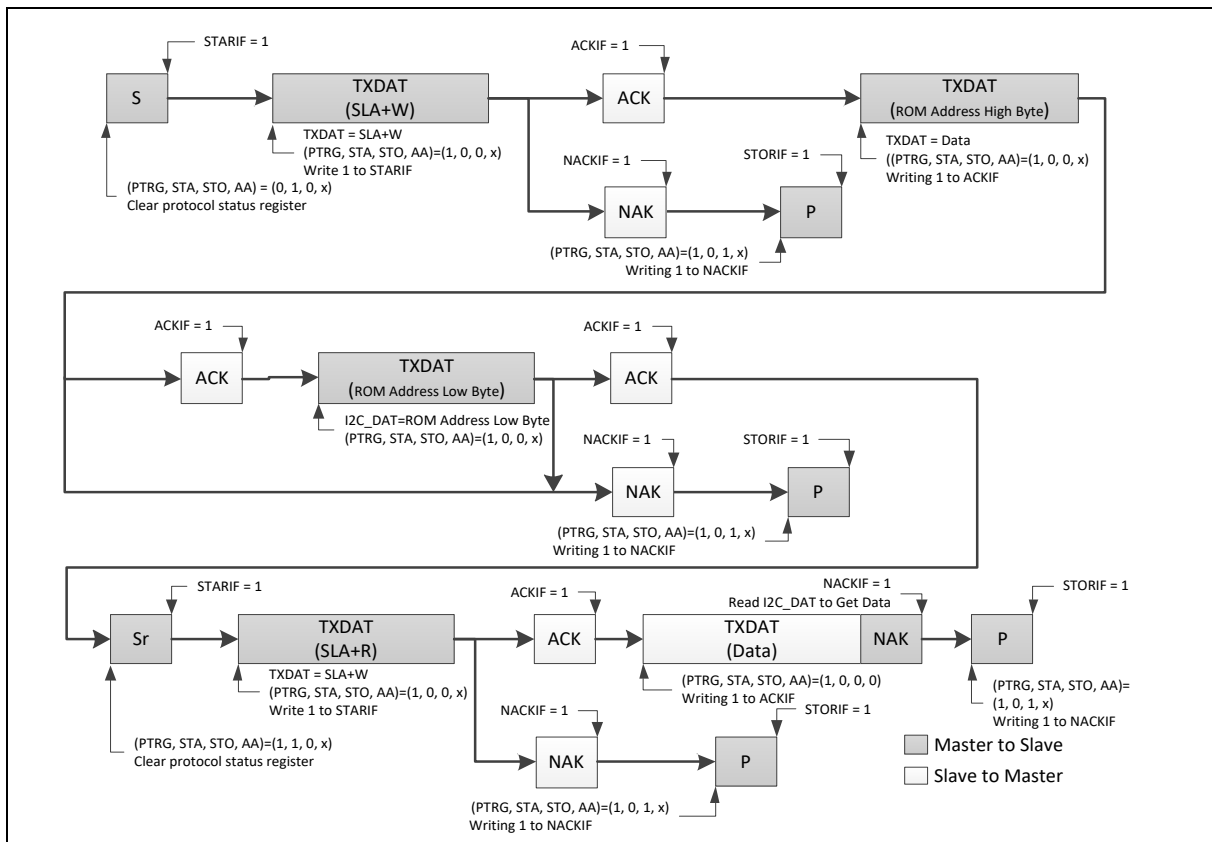

Figure 6.21-24 Protocol of EEPROM Random Read

The I<sup>2</sup>C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

## 6.21.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Reserved						MONEN	SCLOUTEN
7	6	5	4	3	2	1	0
Reserved		PTRG	ADDR10EN	STA	STO	AA	GCFUNC

Bits	Description	
[31]	PROTEN	<b>I<sup>2</sup>C Protocol Enable Bit</b> 0 = I <sup>2</sup> C Protocol Disabled. 1 = I <sup>2</sup> C Protocol Enabled.
[30:26]	Reserved	Reserved.
[25:16]	TOCNT	<b>Time-out Clock Cycle</b> This bit field indicates how many clock cycle selected by TMCNTSRC (UI2C_BRGEN [5]) when each interrupt flags are clear. The time-out is enable when TOCNT bigger than 0. <b>Note:</b> The TMCNTSRC (UI2C_BRGEN [5]) must be set zero on I <sup>2</sup> C mode.
[15:10]	Reserved	Reserved.
[9]	MONEN	<b>Monitor Mode Enable Bit</b> This bit enables monitor mode. In monitor mode the SDA output will be put in high impedance mode. This prevents the I <sup>2</sup> C module from outputting data of any kind (including ACK) onto the I <sup>2</sup> C data bus. 0 = The monitor mode Disabled. 1 = The monitor mode Enabled. <b>Note:</b> Depending on the state of the SCLOUTEN bit, the SCL output may be also forced high, preventing the module from having control over the I <sup>2</sup> C clock line.
[8]	SCLOUTEN	<b>SCL Output Enable Bit</b> This bit enables monitor pulling SCL to low. This monitor will pull SCL to low until it has had time to respond to an I <sup>2</sup> C interrupt. 0 = SCL output will be forced high due to open drain mechanism. 1 = I <sup>2</sup> C module may act as a slave peripheral just like in normal operation, the I <sup>2</sup> C holds the clock line low until it has had time to clear I <sup>2</sup> C interrupt.
[7:6]	Reserved	Reserved.

[5]	<b>PTRG</b>	<b>I<sup>2</sup>C Protocol Trigger (Write Only)</b> When a new state is present in the UI2C_PROTSTS register, if the related interrupt enable bits are set, the I <sup>2</sup> C interrupt is requested. It must write one by software to this bit after the related interrupt flags are set to 1 and the I <sup>2</sup> C protocol function will go ahead until the STOP is active or the PROTEN is disabled. 0 = I2C's stretch disabled and the I <sup>2</sup> C protocol function will go ahead. 1 = I2C's stretch active.
[4]	<b>ADDR10EN</b>	<b>Address 10-bit Function Enable Bit</b> 0 = Address match 10 bit function Disabled. 1 = Address match 10 bit function Enabled.
[3]	<b>STA</b>	<b>I<sup>2</sup>C START Control</b> Setting STA to logic 1 to enter Master mode, the I <sup>2</sup> C hardware sends a START or repeat START condition to bus when the bus is free.
[2]	<b>STO</b>	<b>I<sup>2</sup>C STOP Control</b> In Master mode, setting STO to transmit a STOP condition to bus then I <sup>2</sup> C hardware will check the bus condition if a STOP condition is detected this bit will be cleared by hardware automatically. In a slave mode, setting STO resets I <sup>2</sup> C hardware to the defined "not addressed" slave mode when bus error (UI2C_PROTSTS.ERRIF = 1).
[1]	<b>AA</b>	<b>Assert Acknowledge Control</b> When AA =1 prior to address or data received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.
[0]	<b>GCFUNC</b>	<b>General Call Function</b> 0 = General Call Function Disabled. 1 = General Call Function Enabled.

Bits	Description
[31:20]	<b>Reserved</b> Reserved.
[19]	<b>ERRARBLO</b> <b>Error Arbitration Lost</b> This bit indicates bus arbitration lost due to bigger noise which is can't be filtered by input processor. The I <sup>2</sup> C can send start condition when ERRARBLO is set. Thus this bit doesn't be cared on slave mode. 0 = The bus is normal status for transmission. 1 = The bus is error arbitration lost status for transmission. <b>Note:</b> This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.
[18]	<b>BUSHANG</b> <b>Bus Hang-up</b> This bit indicates bus hang-up status. There is 4-bit counter count when SCL hold high and refer f <sub>SAMP_CLK</sub> . The hang-up counter will count to overflow and set this bit when SDA is low. The counter will be reset by falling edge of SCL signal. 0 = The bus is normal status for transmission. 1 = The bus is hang-up status for transmission. <b>Note:</b> This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.
[17]	<b>WRSTSWK</b> <b>Read/Write Status Bit in Address Wake-up Frame</b> 0 = Write command is recorded on the address match wake-up frame. 1 = Read command is recorded on the address match wake-up frame.
[16]	<b>WKAKDONE</b> <b>Wake-up Address Frame Acknowledge Bit Done</b> 0 = The ACK bit cycle of address match frame isn't done. 1 = The ACK bit cycle of address match frame is done in power-down. <b>Note:</b> This bit can't release when WKUPIF is set.
[15]	<b>SLAREAD</b> <b>Slave Read Request Status</b> This bit indicates that a slave read request has been detected. 0 = A slave R/W bit is 1 has not been detected.

		<p>1 = A slave R/W bit is 1 has been detected.</p> <p><b>Note:</b> This bit has no interrupt signal, and it will be cleared automatically by hardware.</p>
[14]	<b>SLASEL</b>	<p><b>Slave Select Status</b></p> <p>This bit indicates that this device has been selected as slave.</p> <p>0 = The device is not selected as slave.</p> <p>1 = The device is selected as slave.</p> <p><b>Note:</b> This bit has no interrupt signal, and it will be cleared automatically by hardware.</p>
[13]	<b>ACKIF</b>	<p><b>Acknowledge Received Interrupt Flag</b></p> <p>This bit indicates that an acknowledge has been received in master mode. A protocol interrupt can be generated if UI2C_PROTCTL.ACKIEN = 1.</p> <p>0 = An acknowledge has not been received.</p> <p>1 = An acknowledge has been received.</p> <p><b>Note:</b> It is cleared by software writing 1 into this bit.</p>
[12]	<b>ERRIF</b>	<p><b>Error Interrupt Flag</b></p> <p>This bit indicates that a Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit. A protocol interrupt can be generated if UI2C_PROTCTL.ERRIEN = 1.</p> <p>0 = An I<sup>2</sup>C error has not been detected.</p> <p>1 = An I<sup>2</sup>C error has been detected.</p> <p><b>Note 1:</b> It is cleared by software writing 1 into this bit</p> <p><b>Note 2:</b> This bit is set for slave mode, and user must write 1 into STO register to the defined "not addressed" slave mode.</p>
[11]	<b>ARBLOIF</b>	<p><b>Arbitration Lost Interrupt Flag</b></p> <p>This bit indicates that an arbitration has been lost. A protocol interrupt can be generated if UI2C_PROTCTL.ARBLOIEN = 1.</p> <p>0 = An arbitration has not been lost.</p> <p>1 = An arbitration has been lost.</p> <p><b>Note:</b> It is cleared by software writing 1 into this bit.</p>
[10]	<b>NACKIF</b>	<p><b>Non - Acknowledge Received Interrupt Flag</b></p> <p>This bit indicates that a non - acknowledge has been received in master mode. A protocol interrupt can be generated if UI2C_PROTCTL.NACKIEN = 1.</p> <p>0 = A non - acknowledge has not been received.</p> <p>1 = A non - acknowledge has been received.</p> <p><b>Note:</b> It is cleared by software writing 1 into this bit.</p>
[9]	<b>STORIF</b>	<p><b>Stop Condition Received Interrupt Flag</b></p> <p>This bit indicates that a stop condition has been detected on the I<sup>2</sup>C bus lines. A protocol interrupt can be generated if UI2C_PROTCTL.STORIEN = 1.</p> <p>0 = A stop condition has not yet been detected.</p> <p>1 = A stop condition has been detected.</p> <p><b>Note 1:</b> It is cleared by software writing 1 into this bit.</p>
[8]	<b>STARIF</b>	<p><b>Start Condition Received Interrupt Flag</b></p> <p>This bit indicates that a start condition or repeated start condition has been detected on master mode. However, this bit also indicates that a repeated start condition has been detected on slave mode.</p> <p>A protocol interrupt can be generated if UI2C_PROTCTL.STARIEN = 1.</p> <p>0 = A start condition has not yet been detected.</p> <p>1 = A start condition has been detected.</p> <p><b>Note:</b> It is cleared by software writing 1 into this bit.</p>
[7]	<b>Reserved</b>	Reserved.

[6]	<b>ONBUSY</b>	<b>On Bus Busy</b> Indicates that a communication is in progress on the bus. It is set by hardware when a START condition is detected. It is cleared by hardware when a STOP condition is detected 0 = The bus is IDLE (both SCLK and SDA High). 1 = The bus is busy.
[5]	<b>TOIF</b>	<b>Time-out Interrupt Flag</b> 0 = A time-out interrupt status has not occurred. 1 = A time-out interrupt status has occurred. <b>Note:</b> It is cleared by software writing 1 into this bit
[4:0]	<b>Reserved</b>	Reserved.

## 6.22 Programmable Serial IO (PSIO)

### 6.22.1 Overview

Programmable Serial I/O (PSIO) provides a simple way to implement simple serial signal processing, e.g. UART and IR. The PSIO can control when the pin will output high or low and how long the pin need to output high or low. It also provides the easy way to sample the pin state.

### 6.22.2 Features

- Supports up to 8 PSIO pins, from PSIO pin0 to PSIO pin7
- Supports 6 clock sources, they are HXT, LXT, HIRC, LIRC, PLL, PCLK1
- Supports one clock divider, which can be divided from 1 to 255
- Supports slot controller for timing sequence control
  - Supports 4 slot controllers, 8 slots in each slot controller
  - Supports counting from 1 PSIO clock to 15 PSIO clocks in each slot
  - Supports 3 slot repeat modes:
    - ◆ Normal repeat mode
    - ◆ Normal repeat mode with infinity loops
    - ◆ Whole repeat mode
  - Supports 4 slot trigger conditions:
    - ◆ Triggered by software
    - ◆ Triggered by falling edge
    - ◆ Triggered by rising edge
    - ◆ Triggered by rising edge or falling edge
- Supports PSIO PIN for pin state control
  - Supports 8 check points to connect with slots in each pin
  - Supports 8 check point actions in each check point.
  - Supports 7 kinds of check point action to setting
    - ◆ Output high
    - ◆ Output low
    - ◆ Output data
    - ◆ Output toggle
    - ◆ Input data
    - ◆ Input status
    - ◆ Input status update
  - Supports 4 I/O modes, input, output, open-drain, and quasi
  - Supports switch I/O mode in different check points
- Supports 4 kinds of Interrupt trigger conditions
  - Two sets of configurable slot interrupt controllers
  - Mismatch interrupt when PSIO is enabled with PDMA

- Transfer Error interrupt
- Slot controller counting done interrupt
- Supports PDMA function

### 6.22.3 Block Diagram

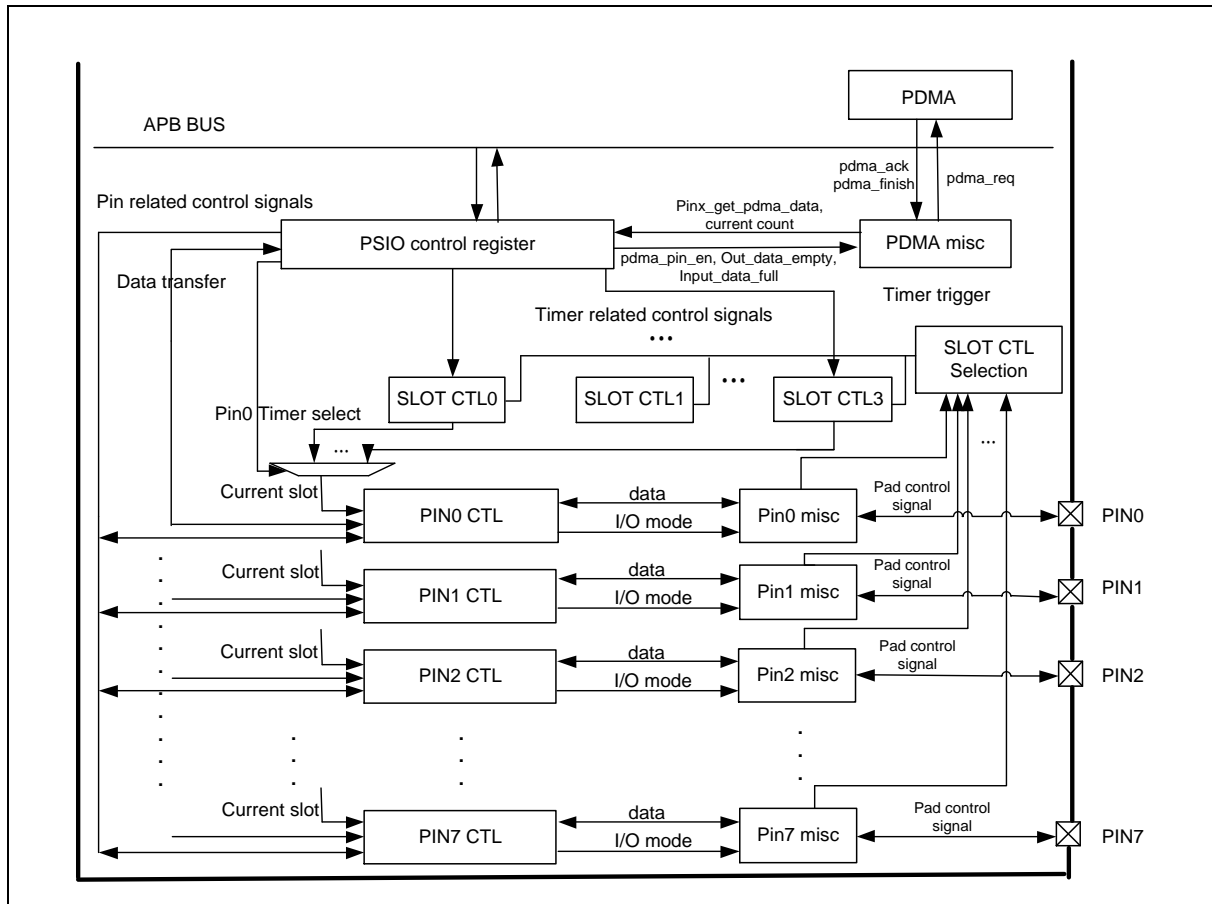

Figure 6.22-1 PSIO Block Diagram

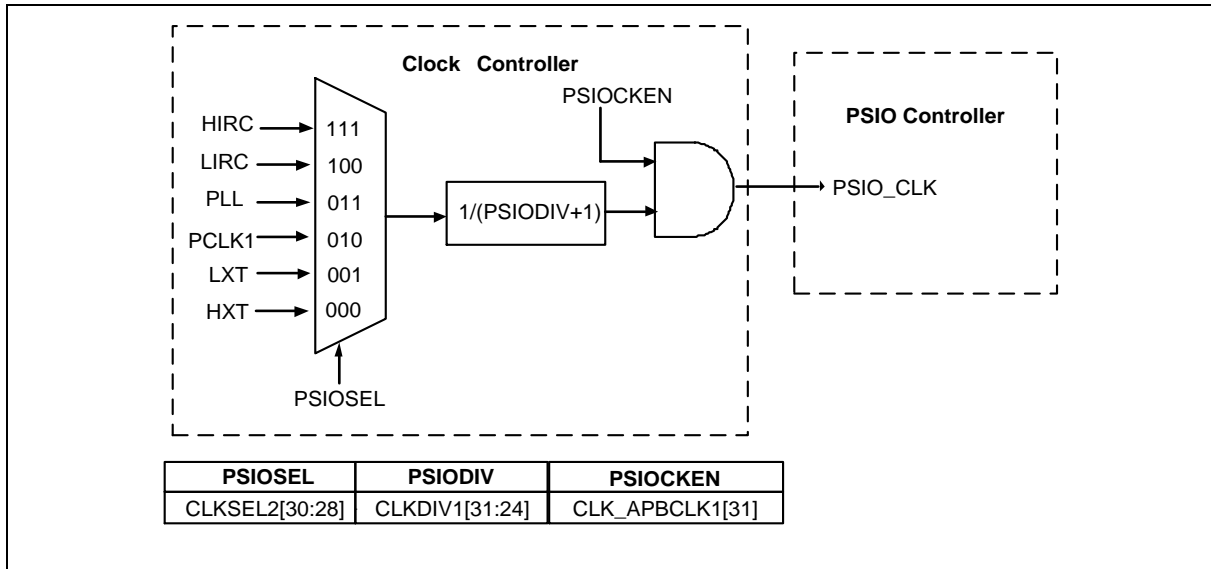

Figure 6.22-2 PSIO Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller)

#### 6.22.4 Basic Configuration

- Clock Source Configuration
  - Select the source of PSIO peripheral clock on PSIO SEL (CLK\_CLKSEL2[30:28]).
  - Select the clock divider number of PSIO peripheral clock on PSIODIV (CLK\_CLKDIV1[31:24]).
  - Enable PSIO peripheral clock in PSIOCKEN (CLK\_APBCLK1[31]).
- Reset Configuration
  - Reset PSIO controller in PSIORST (SYS\_IPRST2[31]).

#### 6.22.5 Data Rate Limitation

Due to only one PDMA channel for Tx and Rx independently, there is a data rate limitation for Tx and Rx in PDMA mode. The data rate is inversely proportional to the number of pins with PDMA enable. Table shows the fastest internal clock frequency and the maximum data rate with PDMA in the busy bus cases.

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest Slot controller CLK Frequency	40.42 MHz	20.21 MHz	13.47 MHz	10.10 MHz	8.08 MHz	6.73 MHz	5.77 MHz	5.05 MHz
Data rate (bit/s)	40.42 Mbps	20.21 Mbps	13.47 Mbps	10.10 Mbps	8.08 Mbps	6.73 Mbps	5.77 Mbps	5.04 Mbps
Data rate (byte/s)	5.05 Mbps	2.52 Mbps	1.68 Mbps	1.26 Mbps	1.01 Mbps	0.84 Mbps	0.72 Mbps	0.63 Mbps

Table 6.22-1 PSIO Output Data Rate when Bus Traffic is Heavy

**Note:** Assuming it takes 18 cycles to read a data from SRAM and write it to peripheral or read it from peripheral and write it to SRAM, (Consider PDMA takes 2 cycles to access SRAM, 13 cycles for PDMA transfer data, and 3 cycles for PDMA access PSIO) and 2 cycles for PSIO sync flag. Assuming that

when PSIO sends a request to the PDMA, the PDMA is just starting to execute another request. So it would take  $18 \times 2 + 2 = 38$  cycles per data. The CPU clock frequency is 48 MHz, and 1 cycle period is 20.48 ns. And the buffer data size is 32 bit.

$$\text{Data Rates} = \frac{\text{PSIO Buffer Data size (bits)}}{\text{PSIO pin numbers} \times \text{PDMA channels} \times \text{CPU Cycles of transfer data(ns)}}$$

When pin numbers = 1, and the data size is 32 bit,

$$\text{Data Rates} = \frac{32(\text{bits})}{1 \times 1 \times 38 \text{ Cycles(ns)}} = \frac{32(\text{bits})}{38 \times 20.83(\text{ns})} = 40.42 \left( \frac{\text{Mbits}}{\text{sec}} \right) = 5.05 \left( \frac{\text{Mbytes}}{\text{sec}} \right)$$

the fastest slot controller clock frequency is 40.42 MHz

When pin numbers = 2, and the data size is 32 bit,

$$\text{Data Rates} = \frac{32(\text{bits})}{2 \times 1 \times 38 \text{ Cycles(ns)}} = \frac{32(\text{bits})}{2 \times 38 \times 20.83(\text{ns})} = 20.21 \left( \frac{\text{Mbits}}{\text{sec}} \right) = 2.52 \left( \frac{\text{Mbytes}}{\text{sec}} \right)$$

the fastest slot controller clock frequency is 20.21 MHz

Assuming it takes 16 cycles to read a data from SRAM and write it to peripheral or read it from peripheral and write it to SRAM. (Consider PDMA takes 1 cycles to access SRAM, 13 cycles for PDMA transfer data, and 2 cycles for PDMA access PSIO) and 2 cycles for PSIO sync flag. Assuming that when PSIO sends a request to the PDMA, the PDMA is free. So it would take  $16 + 2 = 18$  cycles per data. Table shows the fastest internal clock frequency and the maximum data rate with PDMA in the best bus cases. Transfer data size is 32-bit and the CPU clock frequency is 48 MHz.

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest slot controller CLK frequency	48 Mhz	42.66 MHz	28.44 MHz	21.33 MHz	17.06 MHz	14.22 MHz	12.19 MHz	10.66 MHz
Data rate (bit/s)	48 Mbps	42.66 Mbps	28.44 Mbps	21.33 Mbps	17.06 Mbps	14.22 Mbps	12.19 Mbps	10.66 Mbps
Data rate (byte/s)	6 Mbps	5.33 Mbps	3.55 Mbps	2.66 Mbps	2.13 Mbps	1.77 Mbps	1.52 Mbps	1.33 Mbps

Table 6.22-2 PSIO Output Data Rate With Bus Is Free

When pin numbers = 2, and the data size is 32 bit,

$$\text{Data Rates} = \frac{32(\text{bits})}{2 \times 1 \times 18 \text{ Cycles(ns)}} = \frac{32(\text{bits})}{18 \times 20.83(\text{ns})} = 42.66 \left( \frac{\text{Mbits}}{\text{sec}} \right) = 5.33 \left( \frac{\text{Mbytes}}{\text{sec}} \right)$$

the fastest slot controller clock frequency is 42.66 MHz

When pin numbers = 8, and the data size is 32 bit,

$$\text{Data Rates} = \frac{32(\text{bits})}{8 \times 1 \times 18 \text{ Cycles(ns)}} = \frac{32(\text{bits})}{8 \times 18 \times 20.83(\text{ns})} = 10.66 \left( \frac{\text{Mbits}}{\text{sec}} \right) = 1.33 \left( \frac{\text{Mbytes}}{\text{sec}} \right)$$

the fastest slot controller clock frequency is 10.66 MHz

For the fastest input data rate, consider the PDMA will read the PSIO then update it to SRAM. The last pin that PDMA read will only takes 8 cycles to finish the whole data transfer. So when we calculated the fastest input data frequency, the total cycles that PDMA need to read data from PSIO can subtract 8 cycles. Note that the fastest input data rate does not represent the sample rate that the PSIO can sample in input pin.

Table 6.22-3 PSIO Input Data Rate With Bus Is Free

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest slot controller CLK frequency	48 Mhz	48 MHz	33.39 MHz	24 MHz	18.73 MHz	15.36 MHz	13.01 MHz	11.29 MHz
Data rate (bit/s)	48 Mbps	48 Mbps	33.39 Mbps	24 Mbps	18.73 Mbps	15.36 Mbps	13.01 Mbps	11.29 Mbps
Data rate (byte/s)	6 Mbps	6 Mbps	4.17 Mbps	3 Mbps	2.34 Mbps	1.92 Mbps	1.62 Mbps	1.41 Mbps

When pin numbers = 3, and the data size is 32 bit,  

$$\text{Data Rates} = \frac{32(\text{bits})}{(3 \times 18 - 8) \text{ Cycles}(ns)} = \frac{32(\text{bits})}{(46) \times 20.83(ns)} = 33.39 \left( \frac{Mbits}{sec} \right) = 4.17 \left( \frac{Mbytes}{sec} \right)$$

the fastest slot controller clock frequency is 42.66 MHz

When pin numbers = 8, and the data size is 32 bit,  

$$\text{Data Rates} = \frac{32(\text{bits})}{(8 \times 18 - 8) \text{ Cycles}(ns)} = \frac{32(\text{bits})}{(136) \times 20.83(ns)} = 11.29 \left( \frac{Mbits}{sec} \right) = 1.41 \left( \frac{Mbytes}{sec} \right)$$

the fastest slot controller clock frequency is 11.29 MHz

#### 6.22.6 Functional Description

There are a total of 4 slot controllers and 8 pins in PSIO. Each pin can choose one of the 4 slot controllers as the counting source. The slot controller has 8 slots. Each Slot can set counting cycles from 0 to 15. There have slot period repeat mode, which can choose some slot repeat counting. There also have I/O mode switch point, which can change I/O mode type at the selected check point.

The PSIO provides data transfer with PDMA, it can support up to 8 pins transfer data.

##### 6.22.6.1 Basic Operation

Each slot can set counting cycles in PSIO\_SCnSLOT. After filling the slot controller slot in PSIO\_SCnSLOT, trigger source of slot controller is set from TRIGSRC(PSIO\_SCnCTL[15:14]). There are four kind of trigger source, software trigger, START(PSIO\_SCnCTL[16]), falling edge trigger from related input PIN, rising edge trigger from related input PIN, and rising edge or falling edge trigger from related input PIN.

Each PSIO pin can be linked to one of the slot controllers by SCSEL(PSIOOn\_GENCTL[25:24]). The pin can link the check point to the slot of related slot controller by setting CKPT0(PSIOOn\_CPCTL0[3:0]) to CKPT7 (PSIOOn\_CPCTL0[31:28]). After the slot controller start counting, pin will do the corresponding check point action filled in PSIOOn\_CPCTL1 when the slot of the slot controller is the same as the pin's check point.

When the slot controller finishes all setting slots, BUSY(PSIO\_SCnCTL[24]) will be cleared to 0, and the BUSY flag will be cleared to 0 ,too.

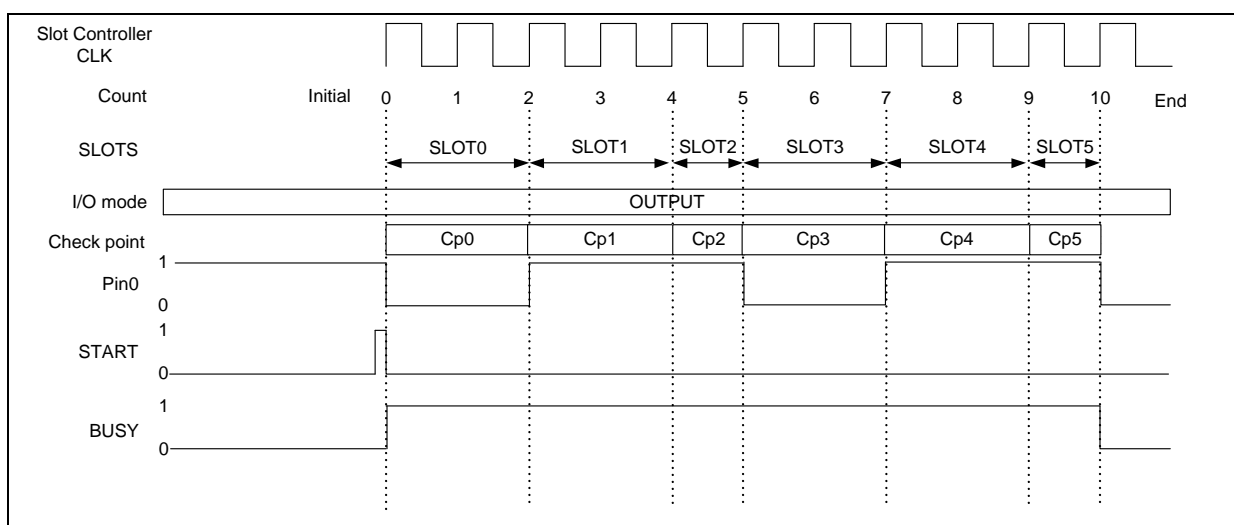

Figure 6.22-3 Basic Operation

#### 6.22.6.2 Slot Controller Trigger Condition

There are two ways to trigger Slot Controller. First way to trigger slot controller is by programming 1 to START (PSIO\_SCnCTL[16]), then the slot controller will be trigger immediately. If the slot controller also enable the PDMA function to transfer data from memory space to the PSIO pin which is intend to output data, then the slot controller will not start counting until the output data is ready.

The second way to trigger slot controller is by external pin edge detection. PSIO provides three kinds of edge trigger, they are falling edge trigger, rising edge trigger and both edge trigger. When the pin rises or fall, it must keep it pin state at least 2 PSIO\_CLK or the edge variation will not be detect.

If the slot controller is triggered and the related pin action is output data, but there is no output data in output data buffer, then the output data underflow flag will be set.

#### 6.22.6.3 Slot Controller Repeat Mode

There are three kinds of repeat mode for slot controller in PSIO. The first kind is partial repeat mode with finite loops. Initial repeat slot (INISLOT, PSIO\_SCnCTL[3:0]) and end repeat slot (ENDSLOT, PSIO\_SCnCTL[7:4]) decide which slots to repeat. Slot period loop count (SPLCNT, PSIO\_SCnCTL[13:8]) decides how many times slots should repeated.

The third kind of setting repeat mode with infinite loops is whole slots repeat mode. Configuring 1 to Repeat bit (PSIO\_SCnCTL[17]) enables the whole repeat endless mode. In this mode, the enabled slot controller counts the slots enabled in PSIO\_SCnSLOT in infinite loop. Only when the output data buffer is underflow or input data buffer is overflow or configuring 0 to START(PSIO\_SCnCTL[16]), then the slot controller will stop at the last enable slot when it receives stop signal.

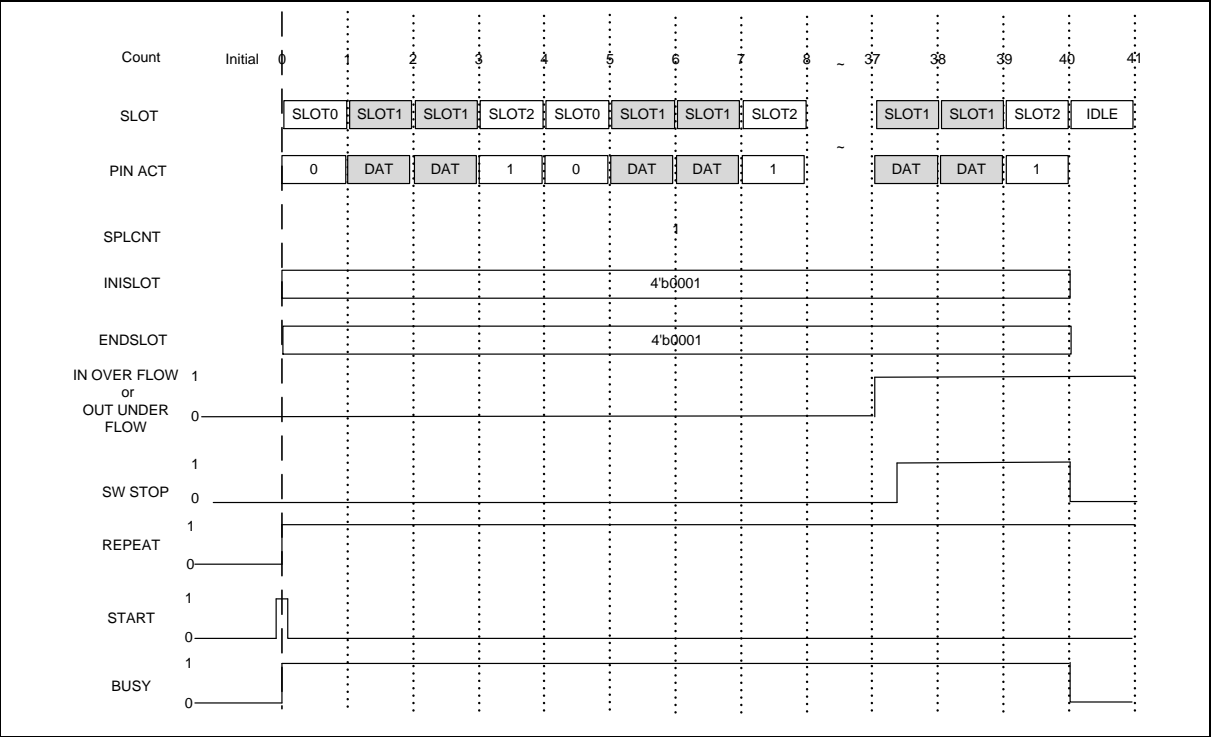

Figure 6.22-6 Slot Controller Repeat Mode with Whole Repeat Mode

If the pin enables input data and output data in the same loop with switch point function, the slot controller is set in repeat mode with finite loops, the conditions of stop counting is the output data underflow or input data overflow occurs.

6.22.6.4 Pin Initial State, Interval State and IDLE Flag

There are two control bits that determine the pin state is Initial or interval. The pin uses initial or interval as default setting depending on the IDLE(PSIO\_SCNCTL[25]) and the slot controller has started or not. Before the slot controller starts counting, the pin state is determined by the initial bit. After the slot controller finishes counting and the IDLE(PSIO\_SCNCTL[25]) is 0, the pin state is determined by the interval bit. As long as the slot controller starts counting, the IDLE(PSIO\_SCNCTL[25]) will be cleared to 0 automatically. Only when software writes 1 to set IDLE(PSIO\_SCNCTL[25]) to 1, the IDLE(PSIO\_SCNCTL[25]) will be set to 1 or it will always keep 0.

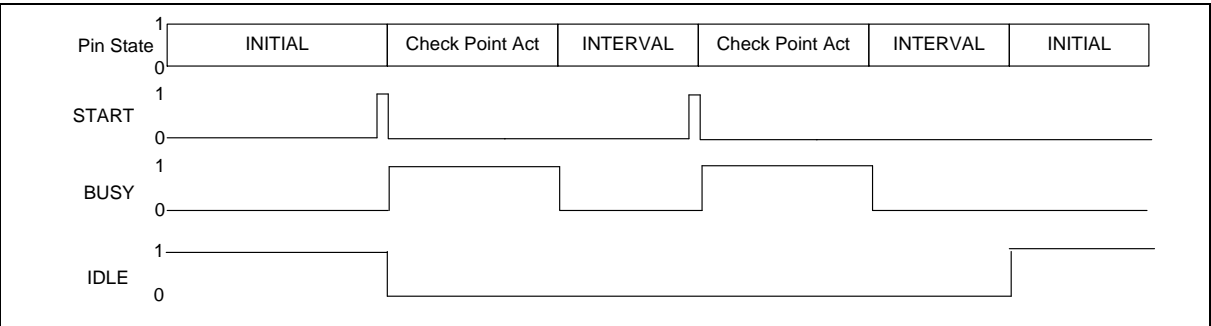

Figure 6.22-7 Initial State, Interval State And IDLE Flag

#### 6.22.6.5 Pin Switch I/O State during Counting

In Slot action, user can use switch point function to change the I/O state at different slot. PSIO supports at most switching I/O operation mode twice in a loop. User can configure MODESW1, MODESW0, SW0CP, and SW1CP in PSION\_GENCTL.

There is a hardware limitation for mode switch from output to input. We need to consider the pad delay and the device response time to choose the slot length of input check point which can affect the time PSIO sample the device responds. The input delay from input pin to input data buffer is 4 PSIO\_CLK. The PADOUT delay represents the delay from PSIO to chip pin. The device response time represents the time that device responds the PSIO. The PADIN delay represents the delay from chip pin to PSIO. For PSIO switch the I/O mode at check point 2, and the device respond is transfer before count 4. PSIO input data buffer will sample it at count 8. Due to the input data sample delay and PADOUT DELAY, PADIN DELAY, device response time, the shortest slot length of check point 2 is 8 for the switch I/O mode in input mode to sample the device responds.

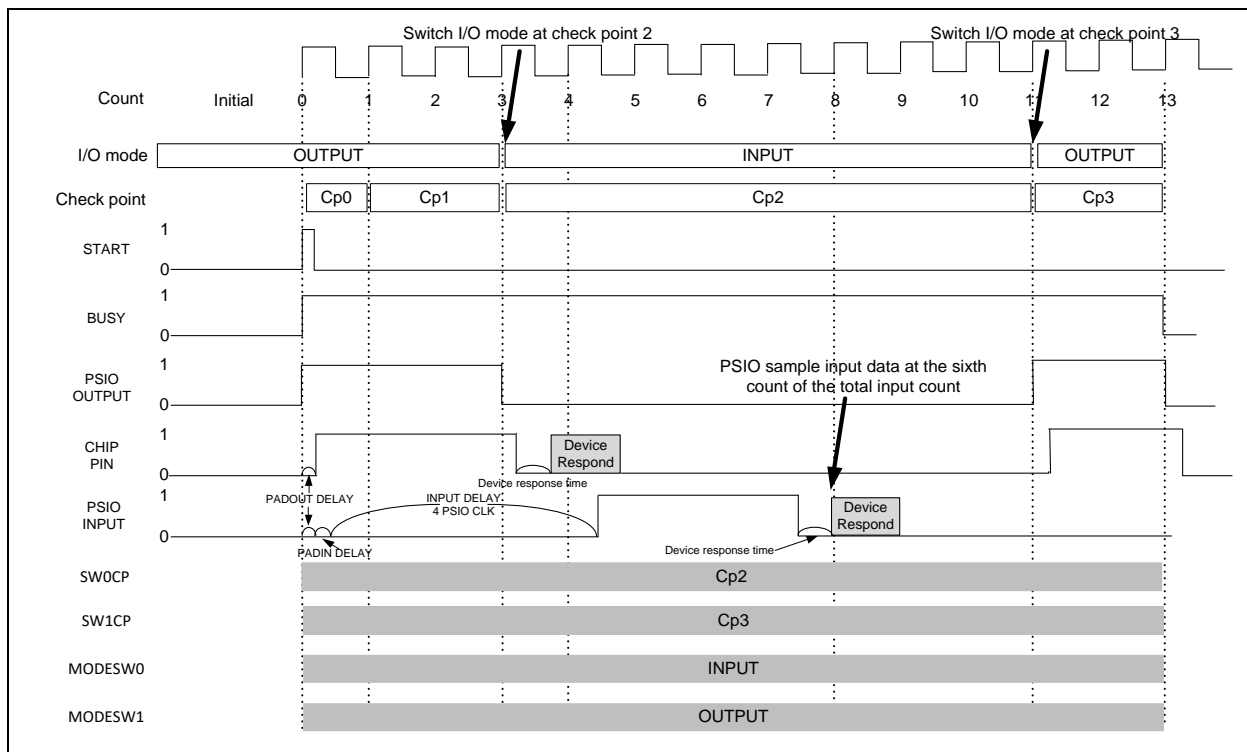

Figure 6.22-8 Switch I/O Mode

The relationship between PSIO, PADOUT DELAY, PADIN DELAY, Device response time and Device is shown in Figure 6.22-9.

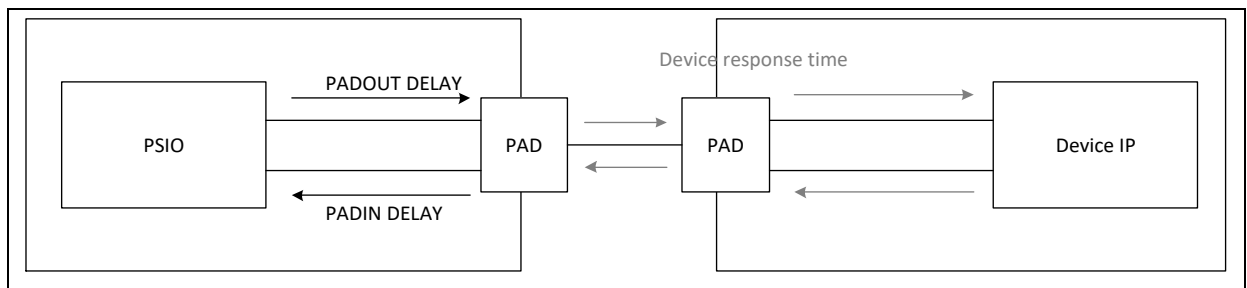

Figure 6.22-9 PAD Delay Time and Device Response Time

The PADOUT DELAY and PADIN DELAY may vary from different chip model for the routing. The

PADOUT DELAY and PADIN DELAY value is shown in Table 6.22-4.

	PADOUT DELAY	PADIN DELAY
M251/M252	20 nS	10 nS

Table 6.22-4 PADOUT DELAY and PADIN DELAY

6.22.6.6 Input/Output Data Buffer

Each PSIO\_PIN has its own 32-bit input data buffer and output data buffer to let the buffer operation be more efficient. The 32-bit data buffer can be sliced into shorter buffer when data width is shorter than 16-bit by setting OUTDEPTH(PSION\_DATCTL[25:24]) and INDEPTH(PSION\_DATCTL[29:28]).

When the OUTDATWD (PSION\_DATCTL[4:0]) and INDATWD (PSION\_DATCTL[12:9]) are larger than 16-bit, the setting of OUTDEPTH(PSION\_DATCTL[25:24]) and INDEPTH(PSION\_DATCTL[29:28]) will be ignored. The PSIO\_PIN will have one 32-bit data buffer.

Figure 6.22-10 Data Width Larger Than 16-bit

When the OUTDATWD (PSION\_DATCTL[4:0]) and INDATWD (PSION\_DATCTL[12:9]) is between 8-bit to 16-bit, the 32-bit data buffer can be sliced into two 16-bit buffer by setting OUTDEPTH[0](PSION\_DATCTL[24]) and INDEPTH[0](PSION\_DATCTL[28]).

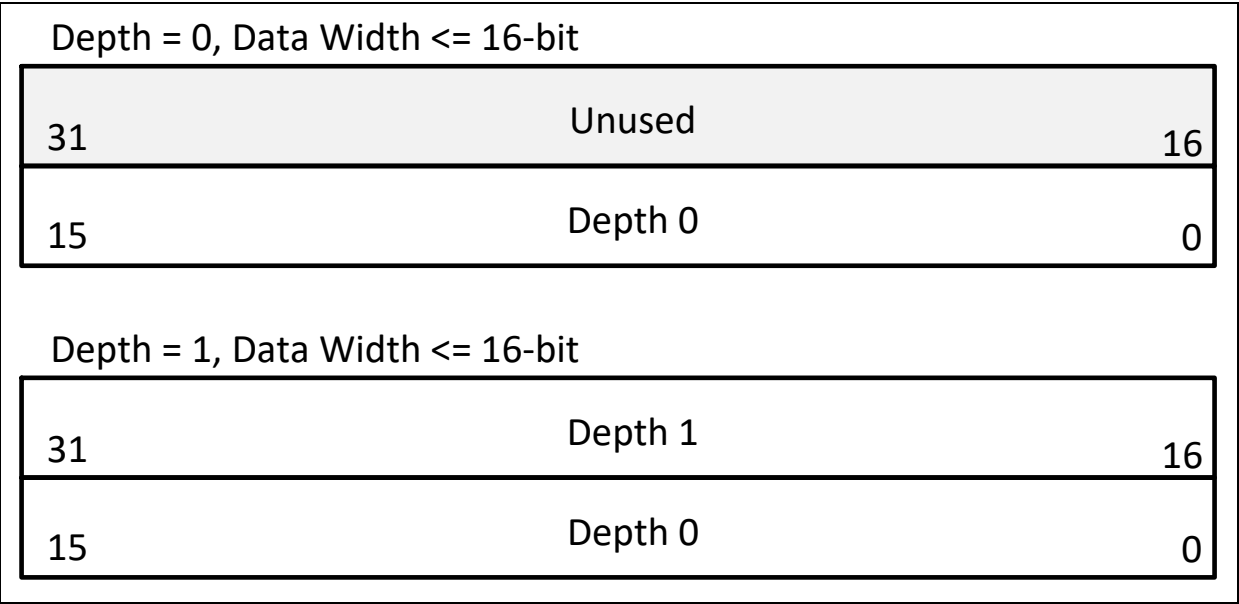

Figure 6.22-11 Data Width Between 16-bit and 8-bit

When the OUTDATWD (PSION\_DATCTL[4:0]) and INDATWD (PSION\_DATCTL[12:9]) is between 1-bit to 8-bit, the 32-bit data buffer can be sliced into four 8-bit buffer by setting OUTDEPTH[1:0](PSION\_DATCTL[25:24]) and INDEPTH[1:0](PSION\_DATCTL[29:28]).

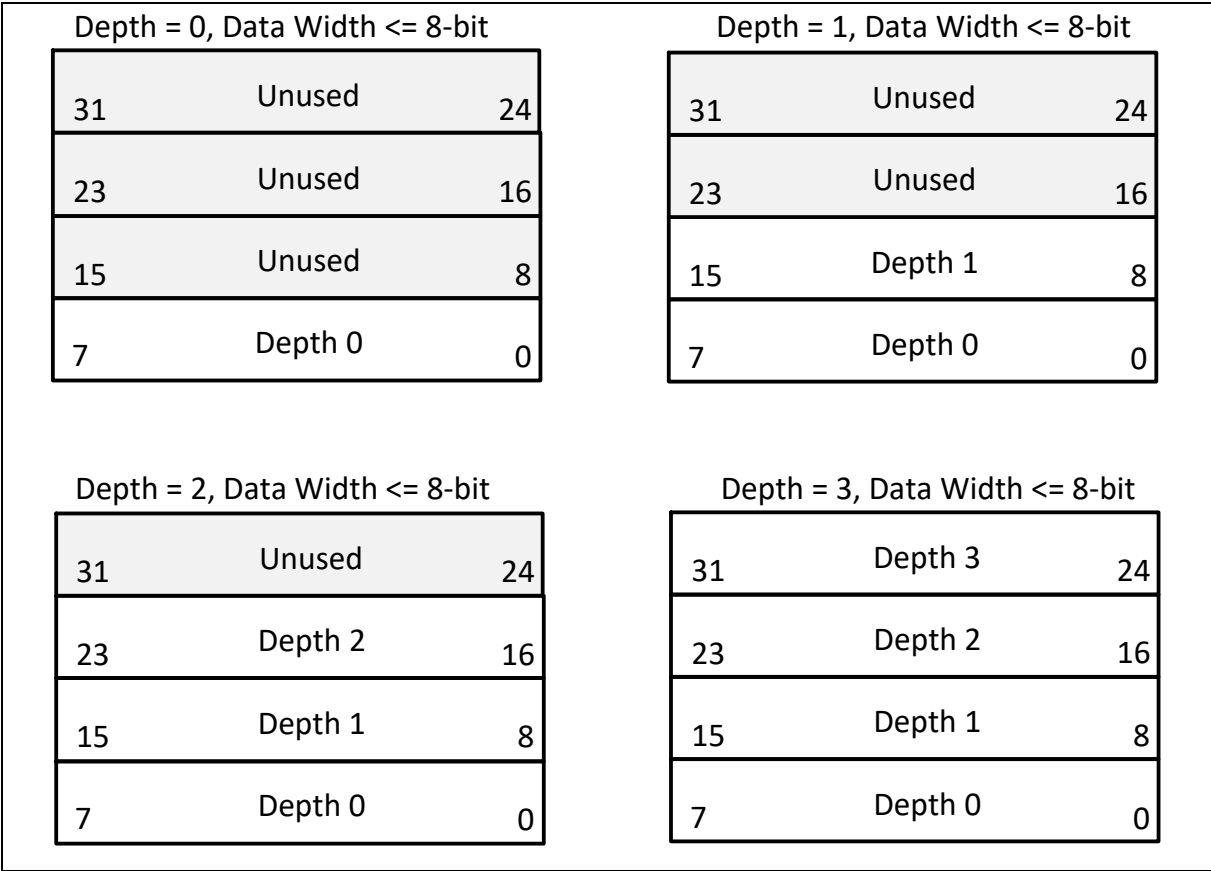

Figure 6.22-12 Data Width Smaller Than 8-bit

When PSIO outputs data, the relation of output data buffer and the empty flag is shown in Figure 6.22-13.

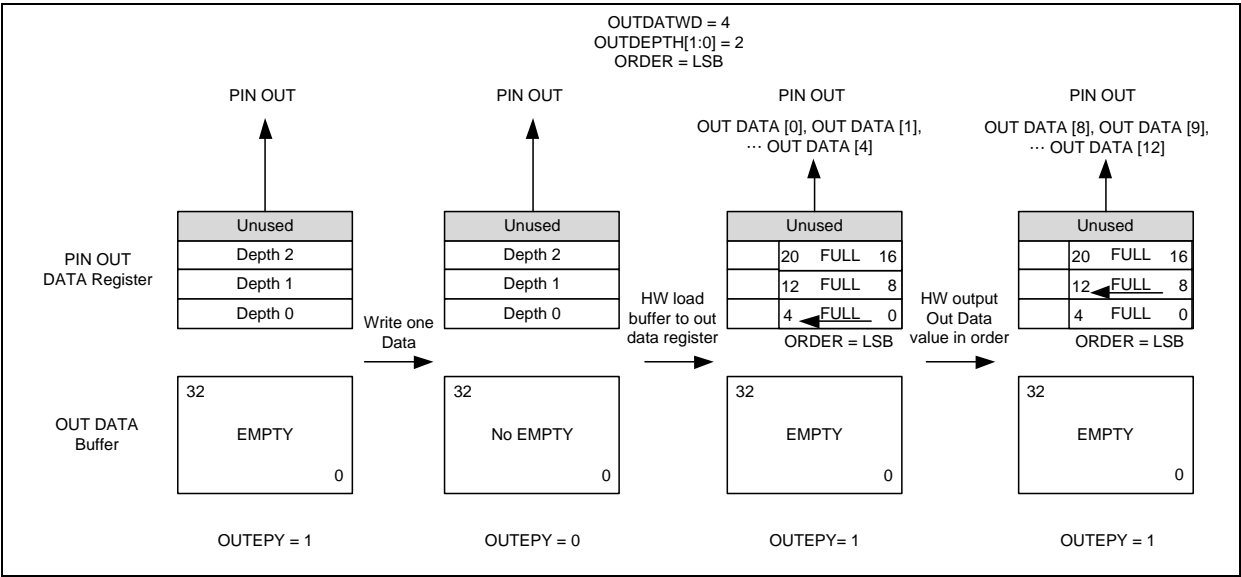

Figure 6.22-13 OUTPUT DATA Buffer Example

When PSIO inputs data, the relation of input data buffer and the full flag is shown in Figure 6.22-14.

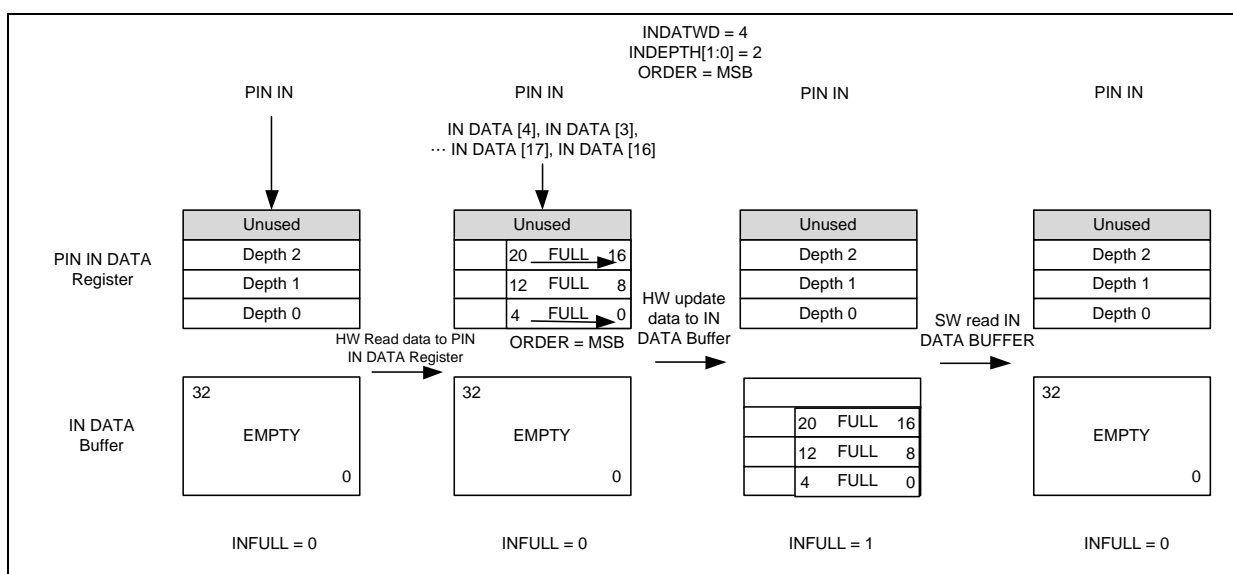

Figure 6.22-14 INPUT DATA Buffer Example

When output data underflow occurs, PSIO will output the data from the start address of output data buffer again.

After the input data overflow occurs, the pin state will not be record in the input data buffer and the current input data buffer will be keep.

6.22.6.7 Interrupt Trigger Condition

There are four kinds of interrupts in PSIO. The first kind of interrupts is configurable interrupt. User can set interrupt will be trigger at which slot end, and this interrupt trigger is also affected by repeat mode.

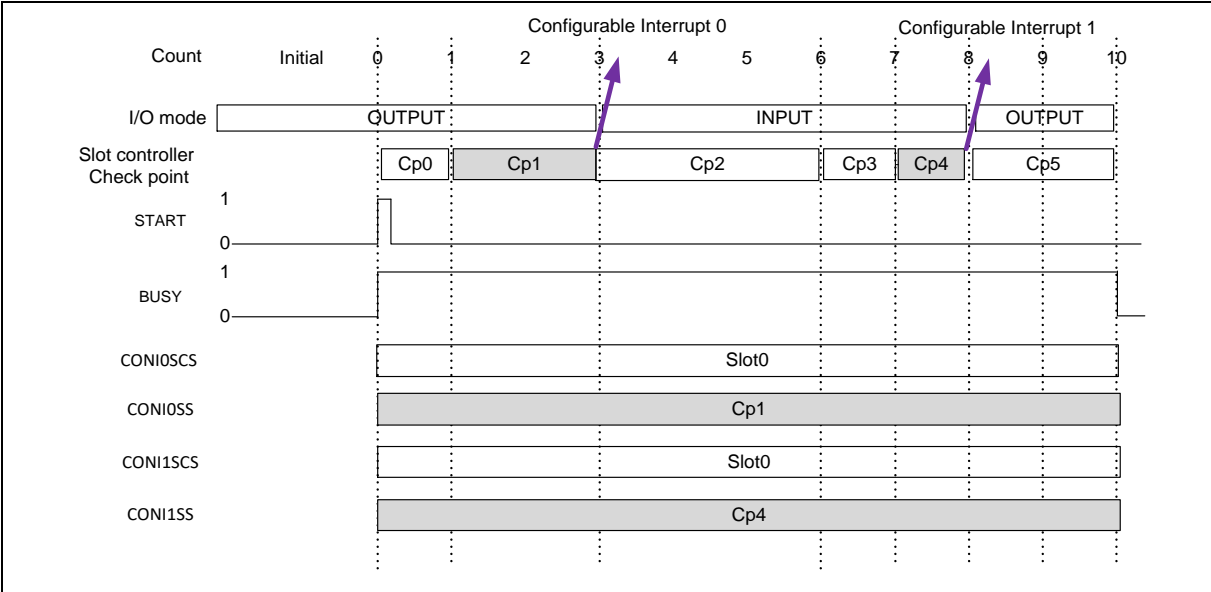

Figure 6.22-15 Configurable Interrupt Flag

The second kind of interrupts is mismatch (MISMATCH), it will be trigger only when using multiple pins transfer data with PDMA, but the date transfer rate between the slots are not consistent.

The third kind of interrupts is transfer error (TERRIF), it will be trigger when there is a transfer error like input data overflow (INOVERx) or output data underflow (OUTUFx)

The forth kind of interrupts is Slot Controller Counting Done(SCxIF), it will be trigger only when the slot controller stop counting.

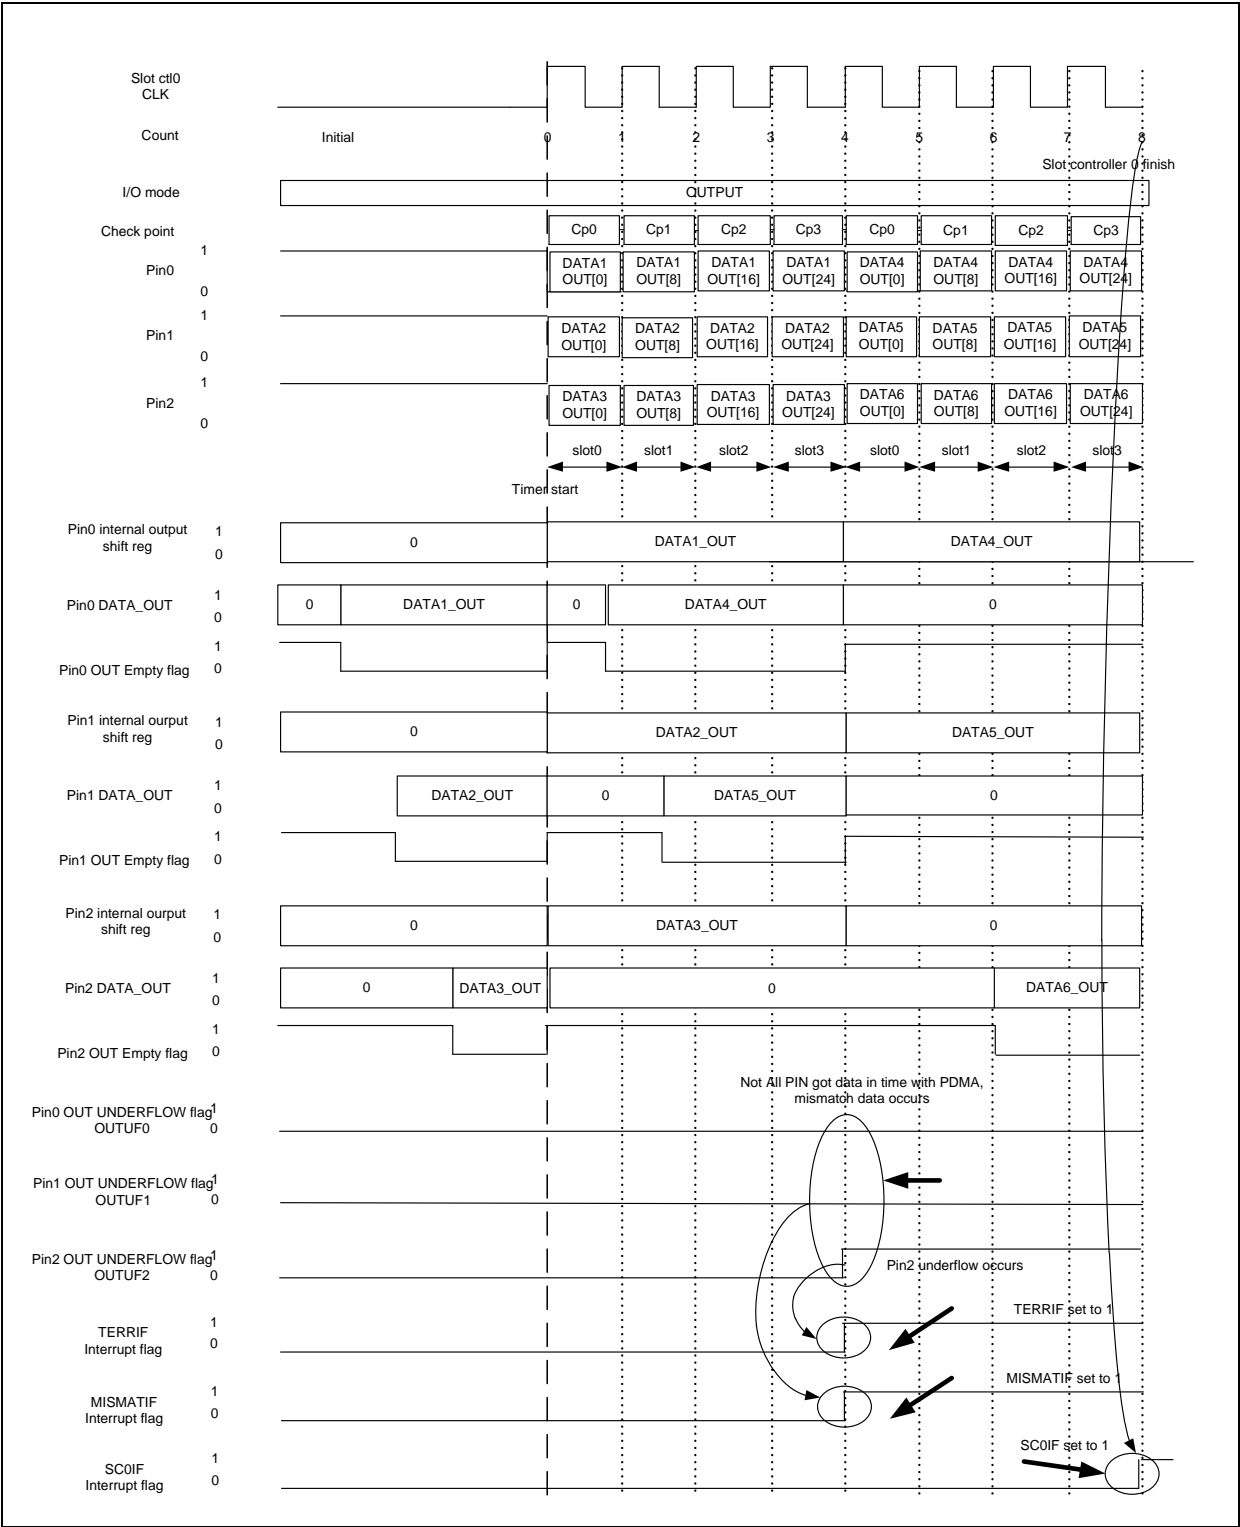

Figure 6.22-16 MISMATIF ,TERRIF and SCnIF

6.22.6.8 Data Transfer with PDMA

User can use PDMA to increase data transfer rate. Due to the PDMA cannot transfer data to the buffer

address roundly, PSIO provide a fixed address, PSIO\_PODAT and PSIO\_PIDAT, for PDMA to transfer data to data buffer of different pin roundly. After PDMA transfers data to PSIO\_PODAT or get data from PSIO\_PIDAT, PSIO will move PSIO\_PODAT to the coordinate PSIOn\_OUTDAT or move the coordinate PSIOn\_INDAT to PSIO\_PIDAT. The order of PSIO move PSIO\_PODAT to the coordinate PSIOn\_OUTDAT or move the coordinate PSIOn\_INDAT to PSIO\_PIDAT is ascending from pin0 to pin7.

When PSIO pin is in PDMA OUTPUT mode, all the enable slots in slot controller of PDMA output mode must link to the related check points in the enable pins of PDMA output mode, or the pin may stop at unexpected slot.

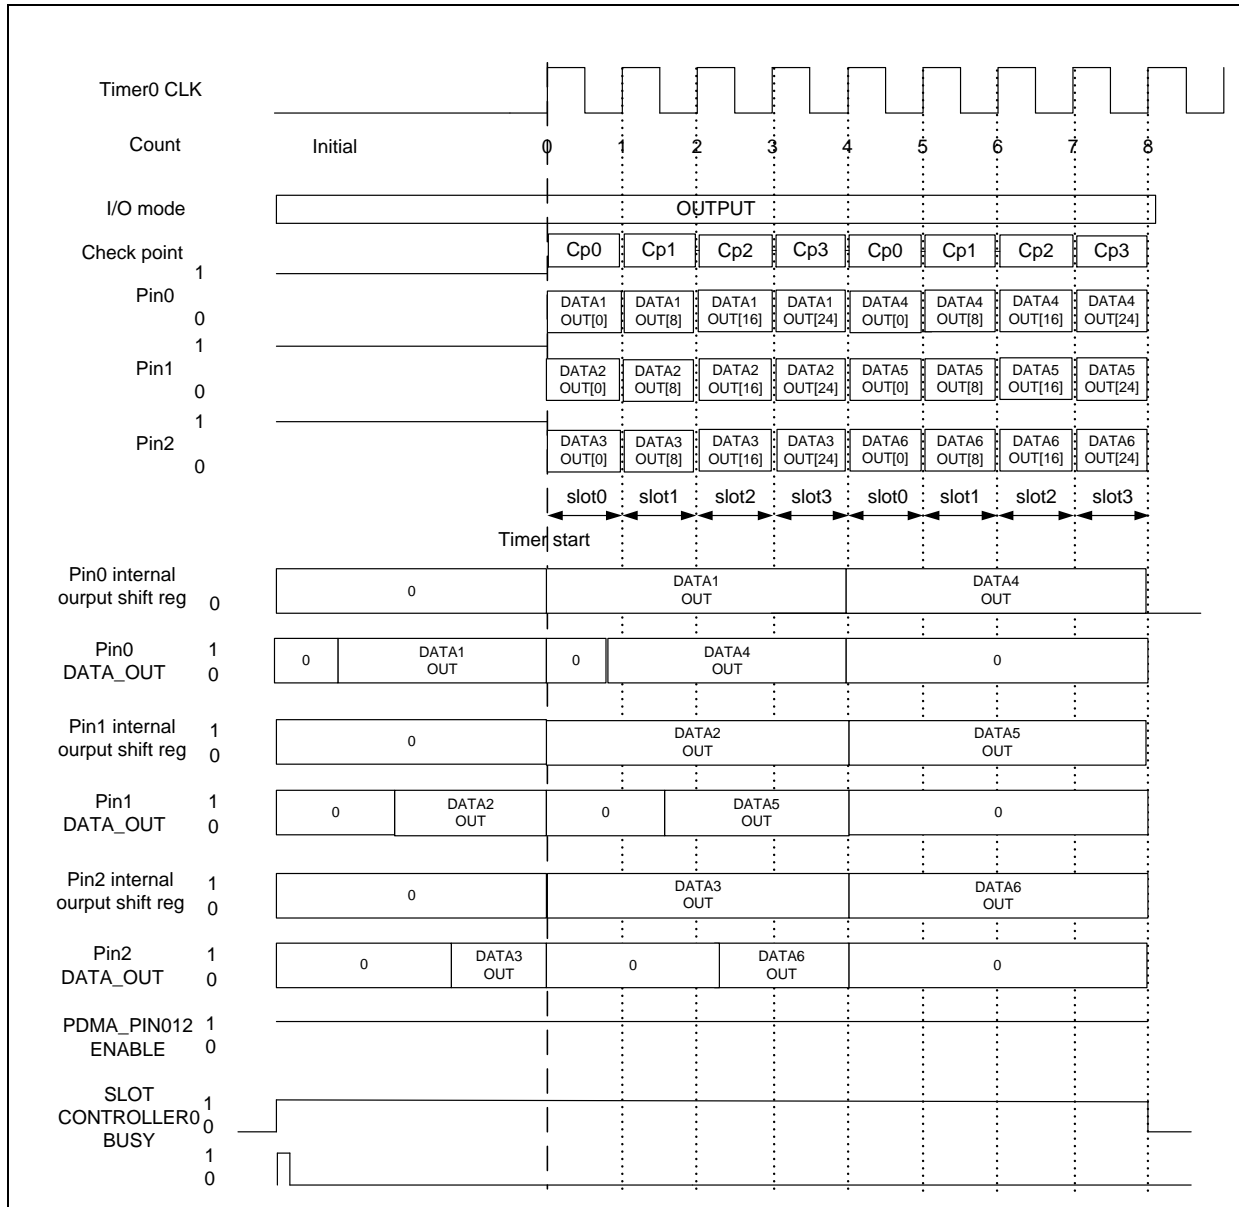

Figure 6.22-17 Data Transfer with PDMA

## 6.22.7 Programing Flow

### 6.22.7.1 Normal Programing

1. Set count of slot controller slot, repeat mask, and repeat loop count in PSIO\_SCnSLOT and PSIO\_SCnCTL
2. Set I/O switch point, I/O initial mode, initial output, interval output, and corresponding slot controller in PSIOn\_GENCTL.
3. Set the transmit data in PSIOn\_OUTDAT, order, data width and data depth in PSIOn\_DATCTL.
4. Set check point and check point act in PSIOn\_CPCTL0 and PSIOn\_CPCTL1
5. Set interrupt trigger point at which pin and check point in PSIO\_INTCTL
6. Set slot controller start counting condition at PSIO\_SCnCTL, and BUSY(PSIO\_SCnCTL) flag will be set to 1 automatically
7. When slot controller stop counting, BUSY(PSIO\_SCnCTL) flag will be cleared to 0 automatically.
8. Check PSIOn\_INDAT and PSIOn\_INTSTS if there is input data.

### 6.22.7.2 Normal Programing Example

1. Set slot0 to slot5 of slot controller 0 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC0SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 2 in SLOT1(PSIO\_SC0SLOT[7:4] = 0x2).
  - 3) Set the slot 2 length as 3 in SLOT2(PSIO\_SC0SLOT[11:8] = 0x3).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC0SLOT[15:12] = 0x1).
  - 5) Set the slot 4 length as 2 in SLOT4(PSIO\_SC0SLOT[19:16] = 0x2).
  - 6) Set the slot 5 length as 1 in SLOT5(PSIO\_SC0SLOT[23:20] = 0x1).
2. Set slot repeat function to determine the slot repeat period.
  - 1) Set repeat times as 1 in SPLCNT(PSIO\_SC0CTL[13:8] = 0x1, Slot Period Loop Count).
  - 2) Set the initial repeat slot as SLOT3 in INISLOT(PSIO\_SC0CTL[3:0] = 0x4, Initial Slot Period).
  - 3) Set the end repeat slot as SLOT4 in ENDSLOT(PSIO\_SC0CTL[7:4] = 0x5, End Slot Period).
3. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set the initial pin state as high in INITIAL(PSIO0\_GENCTL[3:2] = 0x1).
  - 2) Set the interval pin state low in INTERVAL(PSIO0\_GENCTL[5:4] = 0x0).
  - 3) Set the I/O mode will switch at CHECK POINT 1 in SW0CP(PSIO0\_GENCTL[11:8] = 0x2).
  - 4) Set the I/O mode will switch at CHECK POINT 2 in SW1CP(PSIO0\_GENCTL[15:12] = 0x3).
  - 5) Set the I/O mode will switch to INPUT mode at CHECK POINT 1 in MODESW0(PSIO0\_GENCTL[17:16] = 0x0).
  - 6) Set the I/O mode will switch to OUTPUT mode at CHECK POINT 2 in MODESW1(PSIO0\_GENCTL[19:18] = 0x4).
  - 7) Set the initial I/O mode is OUTPUT mode in IOMODE(PSIO0\_GENCTL[5:4] = 0x1).

4. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set the data order is LSB in ORDER(PSIO0\_DATCTL[16] = 0x0).
  - 2) Set the input data width is 8 bit in INDATWD(PSIO0\_DATCTL[12:8] = 0x7).
  - 3) Set the input data depth is 4 in INDEPTH(PSIO0\_DATCTL[29:28] = 0x3).
5. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be connect to the check point.
  - 1) Connect the slot1 to check point0 by configuring 0x2(SLOT1) to CKPT0(PSIO0\_CPCTL0[3:0]).
  - 2) Connect the slot2 to check point1 by configuring 0x3(SLOT2) to CKPT1(PSIO0\_CPCTL0[7:4]).
  - 3) Connect the slot3 to check point2 by Configuring 0x4(SLOT3) to CKPT2(PSIO0\_CPCTL0[11:8]).
6. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
  - 1) Set PIN0 output low at the check point0 by configuring 0x0(output low) to CKPT0ACT(PSIO0\_CPCTL1[2:0]).
  - 2) Set PIN0 record pin state to input data at the check point1 by configuring 0x4(input data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]).
  - 3) Set PIN0 output high at the check point2 by configuring 0x1(output high) to CKPT2ACT(PSIO0\_CPCTL1[10:8]).
7. Set PIN1 general control register(PSIO0\_GENCTL).
  - 1) Set the initial pin state as low in INITIAL(PSIO0\_GENCTL[3:2] = 0x0).
  - 2) Set the interval pin state low in INTERVAL(PSIO0\_GENCTL[5:4] = 0x0).
  - 3) Set the initial I/O mode is OUTPUT mode in IOMODE(PSIO0\_GENCTL[5:4] = 0x1).
8. Set PIN1 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set the data order is MSB in ORDER(PSIO0\_DATCTL[16] = 0x1).
  - 2) Set the input data width is 2 bit in INDATWD(PSIO0\_DATCTL[12:8] = 0x1).
  - 3) Set the input data depth is 4 in INDEPTH(PSIO0\_DATCTL[29:28] = 0x3).
9. Set PIN1 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Connect the slot0 to check point0 by configuring 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]).
  - 2) Connect the slot2 to check point1 by configuring 0x3(SLOT2) to CKPT1(PSIO0\_CPCTL0[7:4]).
  - 3) Connect the slot4 to check point2 by Configuring 0x5(SLOT4) to CKPT2(PSIO0\_CPCTL0[11:8]).
10. Set PIN1 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
  - 1) Set PIN1 output high at the check point0 by configuring 0x1(output high) to CKPT0ACT(PSIO0\_CPCTL1[2:0]).
  - 2) Set PIN1 output data from output data buffer at the check point1 by configuring 0x2(output data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]).

- 3) Set PIN1 output high at the check point2 by configuring 0x1(output high) to CKPT2ACT(PSIO0\_CPCTL1[10:8]).
11. Set PSIO\_INTCTL to determine when the configurable interrupt will be trigger.
  - 1) Select the slot controller 0 as the trigger slot controller of configurable interrupt by Set 0x0 (slot controller 0) to CONI0SCS (PSIO\_INTCTL[9:8]).
  - 2) Set the configurable interrupt will be trigger after slot 3 of slot controller 0 by configuring 0x4 (slot 3) to CONI0SCS (PSIO\_INTCTL[2:0]).
12. Set PSIO\_SC0CTL to start the slot controller.
  - 1) Select the trigger source is software trigger by configuring 0 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source).
  - 2) Enable slot controller 0 by set 1 to START(PSIO\_SC0CTL[16], SC0 START).

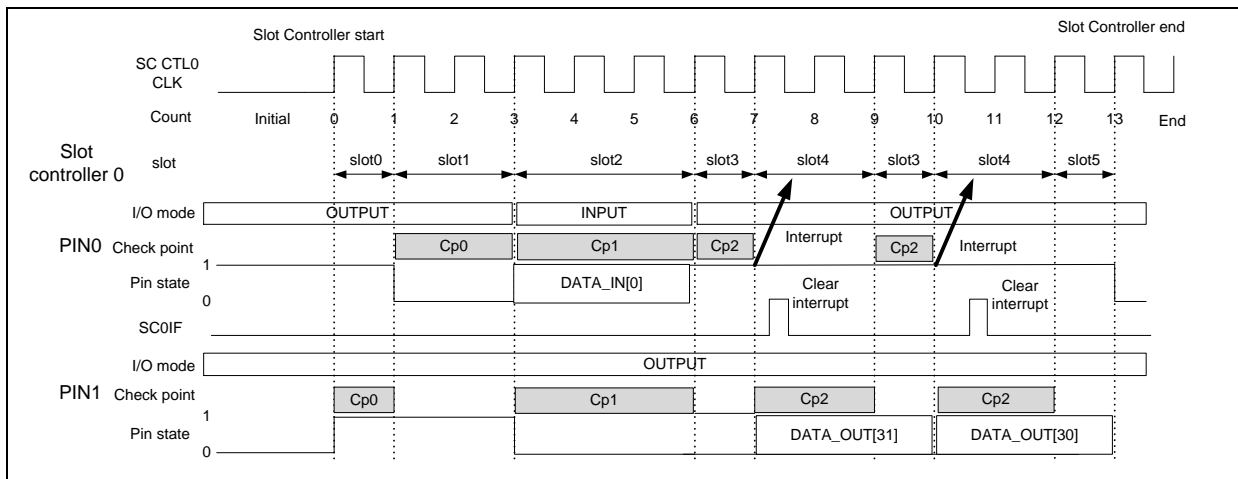

Figure 6.22-18 Normal Programing Example

#### 6.22.7.3 Programing with PDMA Repeat Mode

1. Set which pins use PDMA to transfer data in PSIO\_PDMACTL.
2. Set count of slot controller slot, repeat slots, and repeat loop count in PSIO\_SCnSLOT and PSIO\_SCnCTL.
3. Set I/O switch point, I/O initial mode, initial output, final output, and corresponding slot controller in PSIOn\_GENCTL.
4. Set the transmit data in PSIOn\_OUTDAT, order, data width and data depth in PSIOn\_DATCTL.
5. Set check point and check point act in PSIOn\_CPCTL0 and PSIOn\_CPCTL1
6. Set interrupt trigger point at which pin and check point in PSIO\_INTCTL
7. Set slot controller start counting condition at PSIO\_SCnCTL
8. When slot controller stop counting, BUSY(PSIO\_SCnCTL) flag will be cleared to 0 automatically
9. Check PSIOn\_INTSTS if there is input status, and also can check the specified SRAM address data which are transferred by PDMA.

#### 6.22.7.4 Programing Example 1 - PDMA with OUTPUT DATA and SLOT CONTROLLER REPEAT mode

1. Set slot0 to slot3 of slot controller 0 to determine the slot length

- 1) Set 1 to SLOT0(PSIO\_SC0SLOT[3:0])
- 2) Set 2 to SLOT1(PSIO\_SC0SLOT[7:4])
- 3) Set 2 to SLOT2(PSIO\_SC0SLOT[11:8])
- 4) Set 2 to SLOT3(PSIO\_SC0SLOT[15:12])
2. Set slot repeat function to determine the slot repeat mode.
  - 1) Set 1 to REPEAT(PSIO\_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode.
3. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 1 to INITIAL(PSIO0\_GENCTL[3:2]) to determine the initial pin state.
  - 2) Set 0 to INTERVAL(PSIO0\_GENCTL[5:4]) to determine the interval pin state.
  - 3) Set 0x1 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
4. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to OUTDATWD(PSIO0\_DATCTL[4:0]) to determine the output data width is 1 bit.
  - 3) Set 0x3 to OUTDEPTH(PSIO0\_DATCTL[25:24]) to determine the output data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot1 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot2 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot3 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot4 to check point3.
6. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
  - 1) Set 0x0(output 0) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to output 0 at the check point 0.
  - 2) Set 0x2(output data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to output data at the check point1.
  - 3) Set 0x2(output data) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to output data at the check point2.
  - 4) Set 0x2(output data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to output data at the check point3.
7. Set PSIO\_INTCTL to determine when the configurable interrupt will be trigger.
  - 1) Set 0x0 (slot controller 0) to CONI0SCS (PSIO\_INTCTL[9:8]) to select the slot controller 0.
  - 2) Set 0x4 (slot 3) to CONI0SCS (PSIO\_INTCTL[2:0]) to let the configurable interrupt will be trigger after slot 3 of slot controller 0.
8. Set PDMA related setting to output data from sram to PSIO
  - 1) Set 0x20000000 to PDMA\_DSCTn\_SA as source address.
  - 2) Set PSIO\_PODAT address (PSIO\_BA + 0x18) to PDMA\_DSCTn\_DA as detination address.
  - 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 2 to set PDMA transfer data to PSIO 3 times

- 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
- 5) Set 0x11 to DAINC(PDMA\_DSCTn\_CTL[11:10]) to select the destination address increment is 0.
9. Set PSIO\_SC0CTL to start the slot controller.
  - 1) Set 0 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
  - 2) Set 1 to START(PSIO\_SC0CTL[16], SC0 START) to enable slot controller by software.

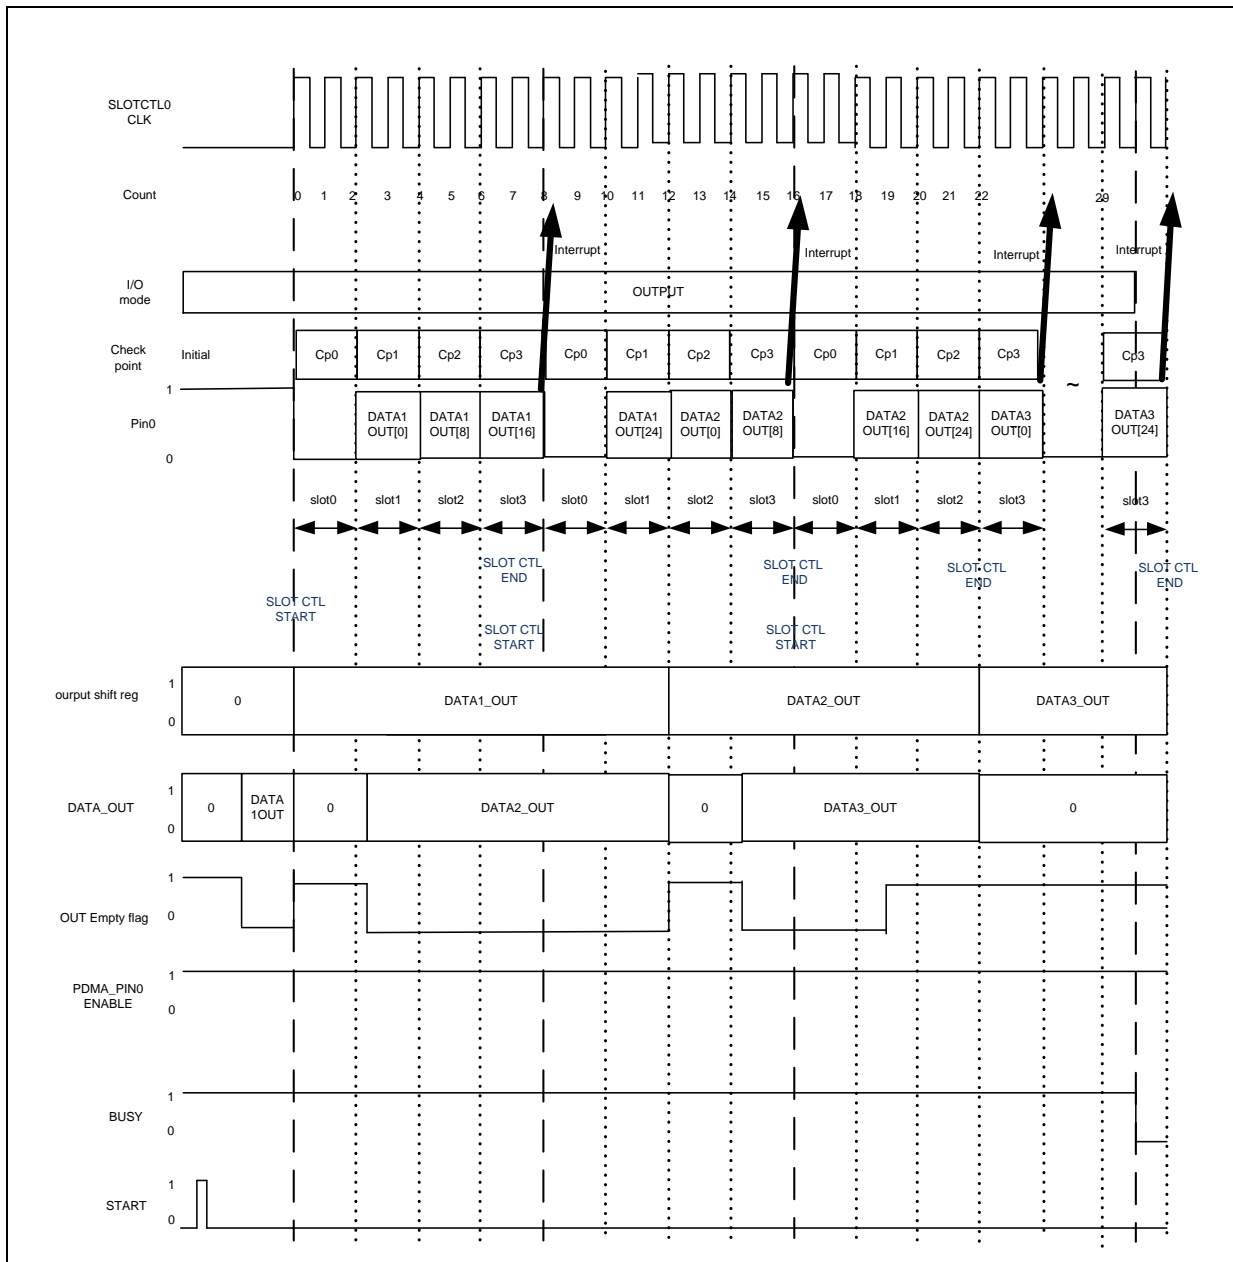

Figure 6.22-19 Programing Example with PDMA and Repeat Mode

6.22.7.5 Programing Example 2 - PDMA with OUTPUT DATA and Endless  
SLOT\_PERIOD\_LOOP\_CNT

1. Set slot0 to slot7 of slot controller 0 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC0SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC0SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC0SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC0SLOT[15:12] = 0x1).
  - 5) Set the slot 4 length as 1 in SLOT4(PSIO\_SC0SLOT[19:16] = 0x1).
  - 6) Set the slot 5 length as 1 in SLOT5(PSIO\_SC0SLOT[23:20] = 0x1).
  - 7) Set the slot 6 length as 1 in SLOT6(PSIO\_SC0SLOT[27:24] = 0x1).
  - 8) Set the slot 7 length as 1 in SLOT7(PSIO\_SC0SLOT[31:28] = 0x1).
2. Set slot period loop count to endless and determine initial slot and end slot
  - 1) Set 0b111111 to SPLCNT (PSIO\_SC0CTL[13:8], Slot Period Loop Count) let slot period with endless loop.
  - 2) Set 0x04 to INISLOT(PSIO\_SC0CTL[3:0], Initial Slot Period) let slot period start from SLOT3.
  - 3) Set 0x06 ENDSLOT(PSIO\_SC0CTL[7:4], End Slot Period) let slot period start end at SLOT5.
3. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 1 to INITIAL(PSIO0\_GENCTL[3:2]) to determine the initial pin state.
  - 2) Set 0 to INTERVAL(PSIO0\_GENCTL[5:4]) to determine the interval pin state.
  - 3) Set 0x1 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
4. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to OUTDATWD(PSIO0\_DATCTL[4:0]) to determine the output data width is 1 bit.
  - 3) Set 0x3 to OUTDEPTH(PSIO0\_DATCTL[25:24]) to determine the output data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot3 to check point3.
  - 5) Set 0x5(SLOT4) to CKPT4(PSIO0\_CPCTL0[19:16]) to link the slot4 to check point4.
  - 6) Set 0x6(SLOT5) to CKPT5(PSIO0\_CPCTL0[23:20]) to link the slot5 to check point5.
  - 7) Set 0x7(SLOT6) to CKPT6(PSIO0\_CPCTL0[27:24]) to link the slot6 to check point6.
  - 8) Set 0x8(SLOT7) to CKPT7(PSIO0\_CPCTL0[31:28]) to link the slot7 to check point7.
6. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the

check points.

- 1) Set 0x0(output 0) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to output 0 at the check point 0.
  - 2) Set 0x1(output 1) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to output 1 at the check point1.
  - 3) Set 0x0(output 0) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to output 0 at the check point2.
  - 4) Set 0x2(output data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to output data at the check point3.
  - 5) Set 0x2(output data) to CKPT4ACT(PSIO0\_CPCTL1[18:16]) to output data at the check point4.
  - 6) Set 0x2(output data) to CKPT5ACT(PSIO0\_CPCTL1[22:20]) to output data at the check point5.
7. Set PDMA related setting to output data from sram to PSIO
- 1) Set 0x20000000 to PDMA\_DSCTn\_SA as source address.
  - 2) Set PSIO\_PODAT address (PSIO\_BA + 0x18) to PDMA\_DSCTn\_DA as detination address.
  - 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 2 to set PDMA transfer data to PSIO 3 times
  - 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
  - 5) Set 0x11 to DAINC(PDMA\_DSCTn\_CTL[11:10]) to select the destination address imcrement is 0.
8. Set PSIO\_SC0CTL to start the slot controller.
- 1) Set 0 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
  - 2) Set 1 to START(PSIO\_SC0CTL[16], SC0 START) to ebable slot controller by software.

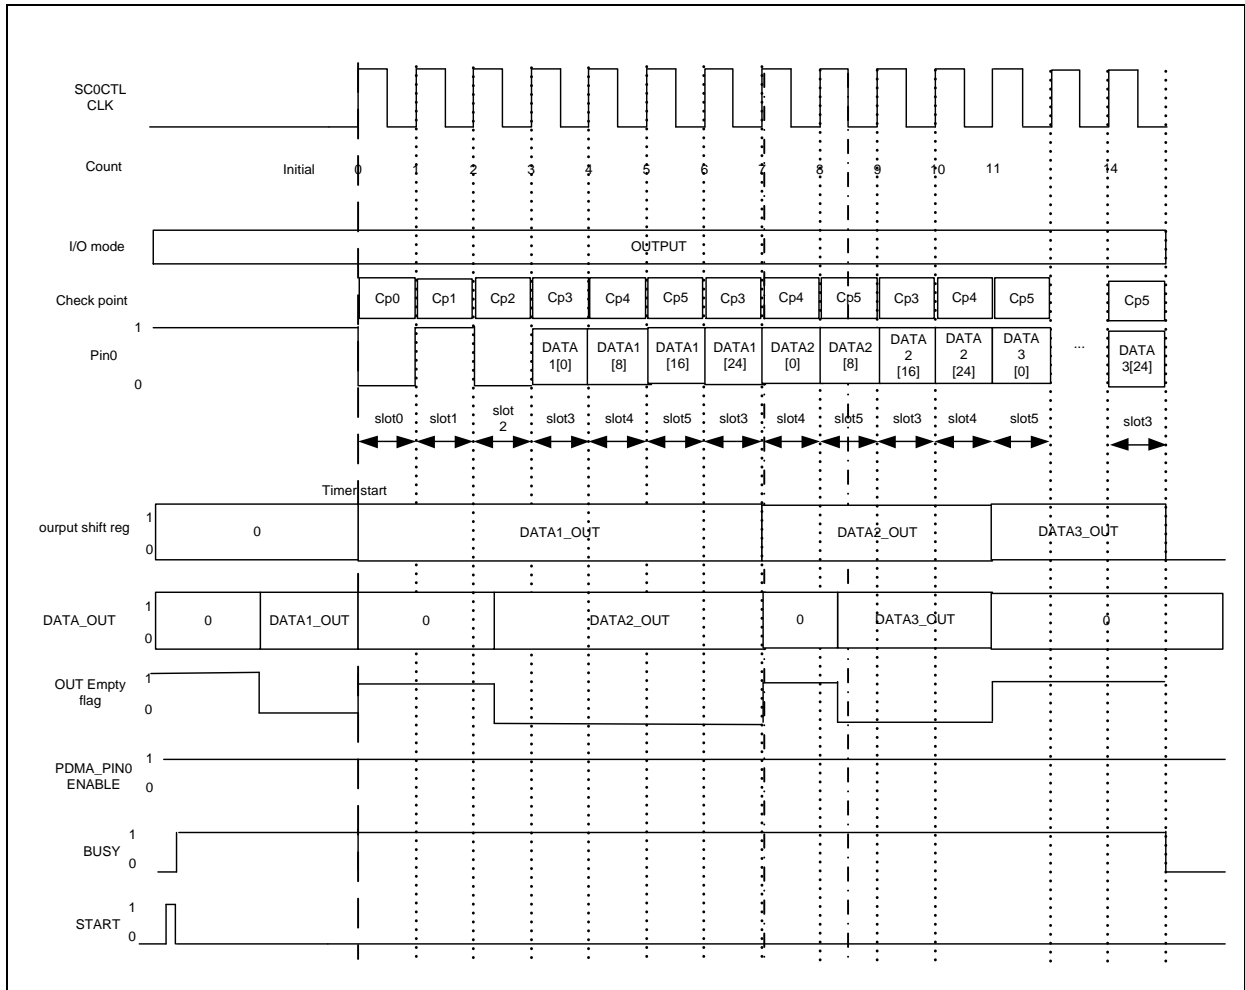

Figure 6.22-20 PDMA with OUTPUT DATA and Endless SLOT\_PERIOD\_LOOP\_CNT

#### 6.22.7.6 Programing Example 3 - PDMA with OUTPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode with 3 pins

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC0SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC0SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC0SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC0SLOT[15:12] = 0x1).
2. Set slot0 to slot3 of slot controller 1 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC1SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC1SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC1SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC1SLOT[15:12] = 0x1).
3. Set slot0 to slot3 of slot controller 2 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC2SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC2SLOT[7:4] = 0x1).

- 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC2SLOT[11:8] = 0x1).
- 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC2SLOT[15:12] = 0x1).
4. Set slot repeat function of slot controller to determine the slot repeat mode.
  - 1) Set 1 to REPEAT(PSIO\_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 0.
  - 2) Set 1 to REPEAT(PSIO\_SC1CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 1.
  - 3) Set 1 to REPEAT(PSIO\_SC2CTL[17], Whole Repeat Mode) to determine the repeat mode. of slot controller 2.
5. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 1 to INITIAL(PSIO0\_GENCTL[3:2]) to determine the initial pin state.
  - 2) Set 0 to INTERVAL(PSIO0\_GENCTL[5:4]) to determine the interval pin state.
  - 3) Set 0x1 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
6. Set PIN1 general control register(PSIO1\_GENCTL).
  - 1) Set 1 to INITIAL(PSIO1\_GENCTL[3:2]) to determine the initial pin state.
  - 2) Set 0 to INTERVAL(PSIO1\_GENCTL[5:4]) to determine the interval pin state.
  - 3) Set 0x1 to IOMODE(PSIO1\_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
7. Set PIN2 general control register(PSIO2\_GENCTL).
  - 1) Set 1 to INITIAL(PSIO2\_GENCTL[3:2]) to determine the initial pin state.
  - 2) Set 0 to INTERVAL(PSIO2\_GENCTL[5:4]) to determine the interval pin state.
  - 3) Set 0x1 to IOMODE(PSIO2\_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
8. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to OUTDATWD(PSIO0\_DATCTL[4:0]) to determine the output data width is 1 bit.
  - 3) Set 0x3 to OUTDEPTH(PSIO0\_DATCTL[25:24]) to determine the output data depth is 4.
9. Set PIN1 data controller (PSIO1\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO1\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to OUTDATWD(PSIO1\_DATCTL[4:0]) to determine the output data width is 1 bit.
  - 3) Set 0x3 to OUTDEPTH(PSIO1\_DATCTL[25:24]) to determine the output data depth is 4.
10. Set PIN2 data controller (PSIO2\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO2\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to OUTDATWD(PSIO2\_DATCTL[4:0]) to determine the output data width is 1 bit.
  - 3) Set 0x3 to OUTDEPTH(PSIO2\_DATCTL[25:24]) to determine the output data depth is 4.
11. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot1 to check point1.

- 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot3 to check point3.
12. Set PIN1 check point controller 0 (PSIO1\_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO1\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO1\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO1\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO1\_CPCTL0[15:12]) to link the slot3 to check point3.
13. Set PIN2 check point controller 0 (PSIO2\_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO2\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO2\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO2\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO2\_CPCTL0[15:12]) to link the slot3 to check point3.
14. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0x2(output data) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to output data at the check point 0.
  - 2) Set 0x2(output data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to output data at the check point1.
  - 3) Set 0x2(output data) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to output data at the check point2.
  - 4) Set 0x2(output data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to output data at the check point3.
15. Set PIN1 check point controller 1 (PSIO1\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0x2(output data) to CKPT0ACT(PSIO1\_CPCTL1[2:0]) to output data at the check point 0.
  - 2) Set 0x2(output data) to CKPT1ACT(PSIO1\_CPCTL1[6:4]) to output data at the check point1.
  - 3) Set 0x2(output data) to CKPT2ACT(PSIO1\_CPCTL1[10:8]) to output data at the check point2.
  - 4) Set 0x2(output data) to CKPT3ACT(PSIO1\_CPCTL1[14:12]) to output data at the check point3.
16. Set PIN2 check point controller 1 (PSIO2\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0x2(output data) to CKPT0ACT(PSIO2\_CPCTL1[2:0]) to output data at the check point 0.
  - 2) Set 0x2(output data) to CKPT1ACT(PSIO2\_CPCTL1[6:4]) to output data at the check point1.
  - 3) Set 0x2(output data) to CKPT2ACT(PSIO2\_CPCTL1[10:8]) to output data at the check point2.
  - 4) Set 0x2(output data) to CKPT3ACT(PSIO2\_CPCTL1[14:12]) to output data at the check

point3.

17. Set PDMA related setting to output data from sram to PSIO

- 1) Set 0x20000000 to PDMA\_DSCTn\_SA as source address.
- 2) Set PSIO\_PODAT address (PSIO\_BA + 0x18) to PDMA\_DSCTn\_DA as detination address.
- 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 5 to set PDMA transfer data to PSIO 6 times
- 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
- 5) Set 0x11 to DAINC(PDMA\_DSCTn\_CTL[11:10]) to select the destination address imcrement is 0.

18. Set PSIO\_SC0CTL to start the slot controller.

- 1) Set 0 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
- 2) Set 1 to START(PSIO\_SC0CTL[16], SC0 START) to ebable slot controller by software.

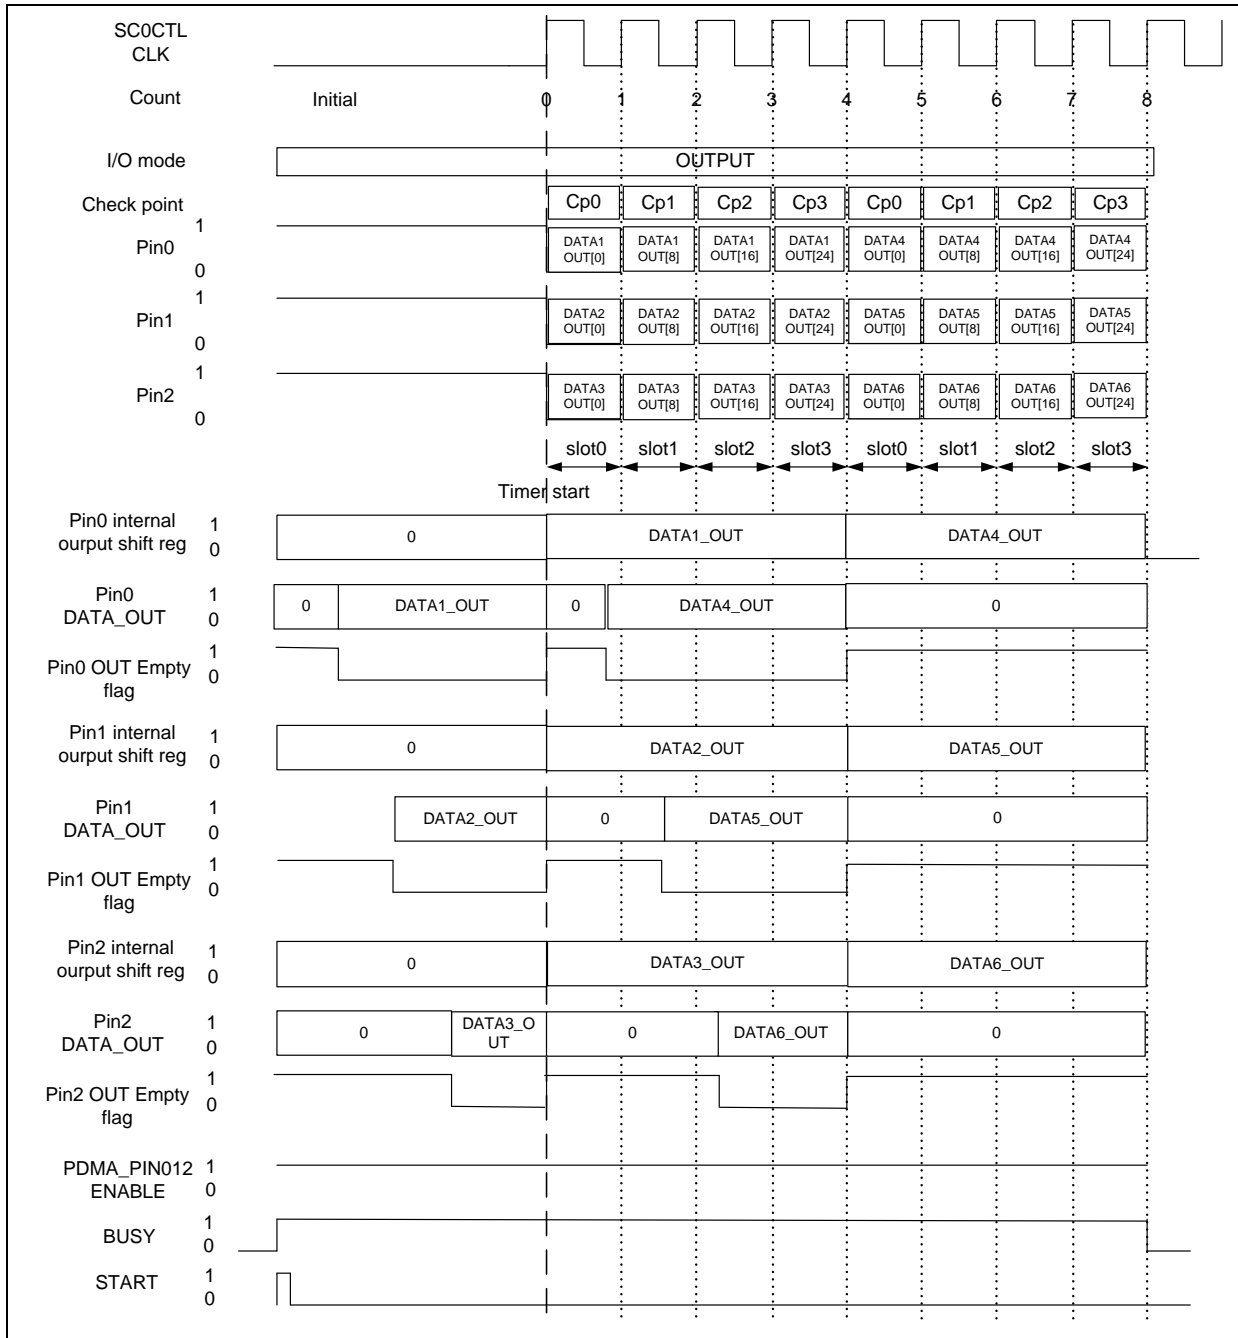

Figure 6.22-21 PDMA with OUTPUT DATA and SLOT CONTROLLER WHOLE REPEAT Mode with 3 Pins

#### 6.22.7.7 Programing Example 4: PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
  - 1) Set 1 to SLOT0(PSIO\_SC0SLOT[3:0])
  - 2) Set 1 to SLOT1(PSIO\_SC0SLOT[7:4])
  - 3) Set 1 to SLOT2(PSIO\_SC0SLOT[11:8])
  - 4) Set 1 to SLOT3(PSIO\_SC0SLOT[15:12])

2. Set slot repeat function to determine the slot repeat mode.
  - 1) Set 1 to REPEAT(PSIO\_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode.
3. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 0x00 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
  - 2) Set 0 to SCSEL(PSIO0\_GENCTL[25:24])
4. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to INDATWD(PSIO0\_DATCTL[12:8]) to determine the input data width is 1 bit.
  - 3) Set 0x3 to INDEPTH(PSIO0\_DATCTL[29:28]) to determine the input data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot3 to check point3.
6. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
  - 1) Set 0x5 (input data) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to input data at the check point 0.
  - 2) Set 0x5(input data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to input data at the check point1.
  - 3) Set 0x5 (input data) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to input data at the check point2.
  - 4) Set 0x5 (input data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to input data at the check point3.
7. Set PDMA related setting to receive data from PSIO to SRAM
  - 1) Set PSIO\_PIDAT address (PSIO\_BA + 0x1C) to PDMA\_DSCTn\_SA as source address.
  - 2) Set 0x20000000 to PDMA\_DSCTn\_DA as destination address.
  - 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 2 to set PDMA transfer data from PSIO 3 times.
  - 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
  - 5) Set 0x11 to SAINC(PDMA\_DSCTn\_CTL[9:8]) to select the source address increment is 0.
8. Set 0x1 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

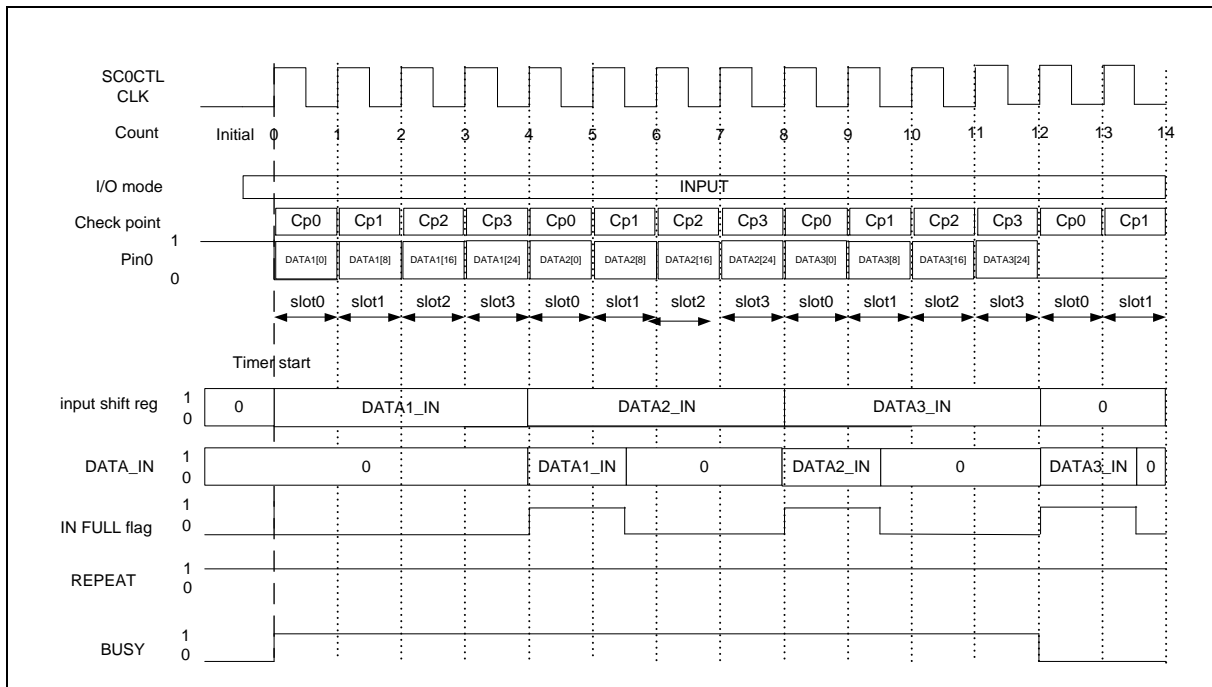

Figure 6.22-22 PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode

#### 6.22.7.8 Programing Example 5: PDMA with INPUT DATA and Endless SLOT\_PERIOD\_LOOP\_CNT

1. Set slot0 to slot7 of slot controller 0 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC0SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC0SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC0SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC0SLOT[15:12] = 0x1).
  - 5) Set the slot 4 length as 1 in SLOT4(PSIO\_SC0SLOT[19:16] = 0x1).
2. Set slot period loop count to endless and determine initial slot and end slot
  - 1) Set 0b111111 to SPLCNT (PSIO\_SC0CTL[13:8], Slot Period Loop Count) let slot period with endless loop.
  - 2) Set 0b0010(SLOT1) to INISLOT(PSIO\_SC0CTL[3:0], Initial Slot Period) let slot period start from SLOT1.
  - 3) Set 0b0101(SLOT) to ENDSLOT(PSIO\_SC0CTL[7:4], End Slot Period) let slot period start end at SLOT4.
3. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 0x00 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
  - 2) Set 0 to SCSEL(PSIO0\_GENCTL[25:24])
4. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to INDATWD(PSIO0\_DATCTL[12:8]) to determine the input data width is 1 bit.
  - 3) Set 0x3 to INDEPTH(PSIO0\_DATCTL[29:28]) to determine the input data depth is 4.

5. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot3 to check point3.
  - 5) Set 0x5(SLOT4) to CKPT4(PSIO0\_CPCTL0[19:16]) to link the slot4 to check point4.
6. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
  - 1) Set 0b101(input status) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to input status at the check point 0.
  - 2) Set 0b100(input data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to input data at the check point1.
  - 3) Set 0b100(input data) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to input data at the check point2.
  - 4) Set 0b100 (input data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to input data at the check point3.
  - 5) Set 0b100 (input data) to CKPT4ACT(PSIO0\_CPCTL1[18:16]) to input data at the check point4.
7. Set PDMA related setting to receive data from PSIO to SRAM
  - 1) Set PSIO\_PIDAT address (PSIO\_BA + 0x1C) to PDMA\_DSCTn\_SA as source address.
  - 2) Set 0x20000000 to PDMA\_DSCTn\_DA as destination address.
  - 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 1 to set PDMA transfer data from PSIO 2 times.
  - 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
  - 5) Set 0x11 to SAINC(PDMA\_DSCTn\_CTL[9:8]) to select the source address increment is 0.
8. Set PSIO\_SC0CTL to start the slot controller.
  - 1) Set 0x1 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

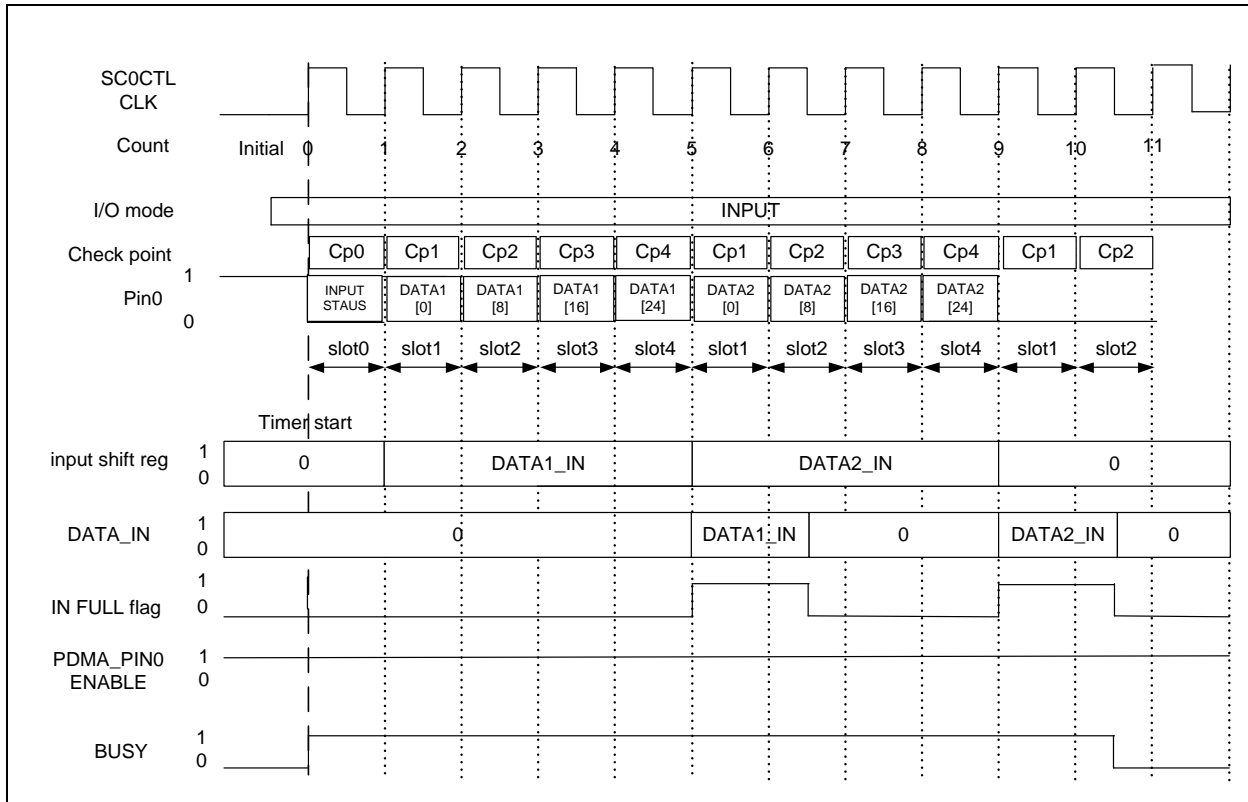

Figure 6.22-23 PDMA with INPUT DATA and Endless SLOT\_PERIOD\_LOOP\_CNT

#### 6.22.7.9 Programing Example 6: PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode with 2 pins

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC0SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC0SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC0SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC0SLOT[15:12] = 0x1).
2. Set slot0 to slot3 of slot controller 1 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC1SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC1SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC1SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC1SLOT[15:12] = 0x1).
3. Set slot0 to slot3 of slot controller 2 to determine the slot length
  - 1) Set the slot 0 length as 1 in SLOT0(PSIO\_SC2SLOT[3:0] = 0x1).
  - 2) Set the slot 1 length as 1 in SLOT1(PSIO\_SC2SLOT[7:4] = 0x1).
  - 3) Set the slot 2 length as 1 in SLOT2(PSIO\_SC2SLOT[11:8] = 0x1).
  - 4) Set the slot 3 length as 1 in SLOT3(PSIO\_SC2SLOT[15:12] = 0x1).
4. Set slot repeat function of slot controller to determine the slot repeat mode.

- 1) Set 1 to REPEAT(PSIO\_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 0.
- 2) Set 1 to REPEAT(PSIO\_SC1CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 1.
- 3) Set 1 to REPEAT(PSIO\_SC2CTL[17], Whole Repeat Mode) to determine the repeat mode. of slot controller 2.
5. Set PIN0 general control register(PSIO0\_GENCTL).
  - 1) Set 0b10 to IOMODE(PSIO0\_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
  - 2) Set 0 to SCSEL(PSIO0\_GENCTL[25:24])
6. Set PIN1 general control register(PSIO1\_GENCTL).
  - 1) Set 0b10 to IOMODE(PSIO1\_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
  - 2) Set 0 to SCSEL(PSIO1\_GENCTL[25:24])
7. Set PIN2 general control register(PSIO2\_GENCTL).
  - 1) Set 0b10 to IOMODE(PSIO2\_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
  - 2) Set 0 to SCSEL(PSIO1\_GENCTL[25:24])
8. Set PIN0 data controller (PSIO0\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO0\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to INDATWD(PSIO0\_DATCTL[12:8]) to determine the input data width is 1 bit.
  - 3) Set 0x3 to INDEPTH(PSIO0\_DATCTL[29:28]) to determine the input data depth is 4.
9. Set PIN1 data controller (PSIO1\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO1\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to INDATWD(PSIO1\_DATCTL[12:8]) to determine the input data width is 1 bit.
  - 3) Set 0x3 to INDEPTH(PSIO1\_DATCTL[29:28]) to determine the input data depth is 4.
10. Set PIN2 data controller (PSIO2\_DATCTL) to determine the data property.
  - 1) Set 0 to ORDER(PSIO2\_DATCTL[16]) to determine the data order is LSB.
  - 2) Set 0x0 to INDATWD(PSIO2\_DATCTL[12:8]) to determine the input data width is 1 bit.
  - 3) Set 0x3 to INDEPTH(PSIO2\_DATCTL[29:28]) to determine the input data depth is 4.
11. Set PIN0 check point controller 0 (PSIO0\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO0\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO0\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO0\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO0\_CPCTL0[15:12]) to link the slot3 to check point3.
12. Set PIN1 check point controller 0 (PSIO1\_CPCTL0) to determine which slot will be link to the check point.
  - 1) Set 0x1(SLOT0) to CKPT0(PSIO1\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO1\_CPCTL0[7:4]) to link the slot1 to check point1.

- 3) Set 0x3(SLOT2) to CKPT2(PSIO1\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO1\_CPCTL0[15:12]) to link the slot3 to check point3.
13. Set PIN2 check point controller 0 (PSIO2\_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO2\_CPCTL0[3:0]) to link the slot0 to check point0.
  - 2) Set 0x2(SLOT1) to CKPT1(PSIO2\_CPCTL0[7:4]) to link the slot1 to check point1.
  - 3) Set 0x3(SLOT2) to CKPT2(PSIO2\_CPCTL0[11:8]) to link the slot2 to check point2.
  - 4) Set 0x4(SLOT3) to CKPT3(PSIO2\_CPCTL0[15:12]) to link the slot3 to check point3.
14. Set PIN0 check point controller 1 (PSIO0\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO0\_CPCTL1[2:0]) to input data at the check point 0.
  - 2) Set 0b100 (input data) to CKPT1ACT(PSIO0\_CPCTL1[6:4]) to input data at the check point1.
  - 3) Set 0b100 (input data) to CKPT2ACT(PSIO0\_CPCTL1[10:8]) to input data at the check point2.
  - 4) Set 0b100 (input data) to CKPT3ACT(PSIO0\_CPCTL1[14:12]) to input data at the check point3.
15. Set PIN1 check point controller 1 (PSIO1\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO1\_CPCTL1[2:0]) to input data at the check point 0.
  - 2) Set 0b100 (input data) to CKPT1ACT(PSIO1\_CPCTL1[6:4]) to input data at the check point1.
  - 3) Set 0b100 (input data) to CKPT2ACT(PSIO1\_CPCTL1[10:8]) to input data at the check point2.
  - 4) Set 0b100 (input data) to CKPT3ACT(PSIO1\_CPCTL1[14:12]) to input data at the check point3.
16. Set PIN2 check point controller 1 (PSIO2\_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO2\_CPCTL1[2:0]) to input data at the check point 0.
  - 2) Set 0b100 (input data) to CKPT1ACT(PSIO2\_CPCTL1[6:4]) to input data at the check point1.
  - 3) Set 0b100 (input data) to CKPT2ACT(PSIO2\_CPCTL1[10:8]) to input data at the check point2.
  - 4) Set 0b100 (input data) to CKPT3ACT(PSIO2\_CPCTL1[14:12]) to input data at the check point3.
17. Set PDMA related setting to receive data from PSIO to SRAM
- 1) Set PSIO\_PIDAT address (PSIO\_BA + 0x1C) to PDMA\_DSCTn\_SA as source address.
  - 2) Set 0x20000000 to PDMA\_DSCTn\_DA as destination address.
  - 3) Set TXCNT(PDMA\_DSCTn\_CTL[31:16]) = 3 to set PDMA transfer data from PSIO 4 times.

- 4) Set 0x10 to TXWIDTH(PDMA\_DSCTn\_CTL[13:12]) to select the data width is 32 bit.
- 5) Set 0x11 to SAINC(PDMA\_DSCTn\_CTL[9:8]) to select the source address increment is 0.

18. Set PSIO\_SC0CTL to start the slot controller.

Set 0x1 to TRIGSRC(PSIO\_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

## 6.23 External Bus Interface (EBI)

### 6.23.1 Overview

This chip is equipped with an external bus interface (EBI) for external device use. To save the connections between an external device and a chip, EBI is operating at address bus and data bus multiplex mode. The EBI supports three chip selects that can connect three external devices with different timing setting requirements.

### 6.23.2 Features

- Supports up to three memory banks
- Supports dedicated external chip select pin with polarity control for each bank
- Supports accessible space up to 1 Mbytes for each bank, actually external addressable space is dependent on package pin out
- Supports 8-/16-bit data width
- Supports byte write in 16-bit data width mode
- Supports Address/Data multiplexed Mode
- Supports Timing parameters individual adjustment for each memory block
- Supports LCD interface i80 mode
- Supports PDMA mode
- Supports variable external bus base clock (MCLK) which based on HCLK
- Supports configurable idle cycle for different access condition: Idle of Write command finish (W2X) and Idle of Read-to-Read (R2R)

### 6.23.3 Block Diagram

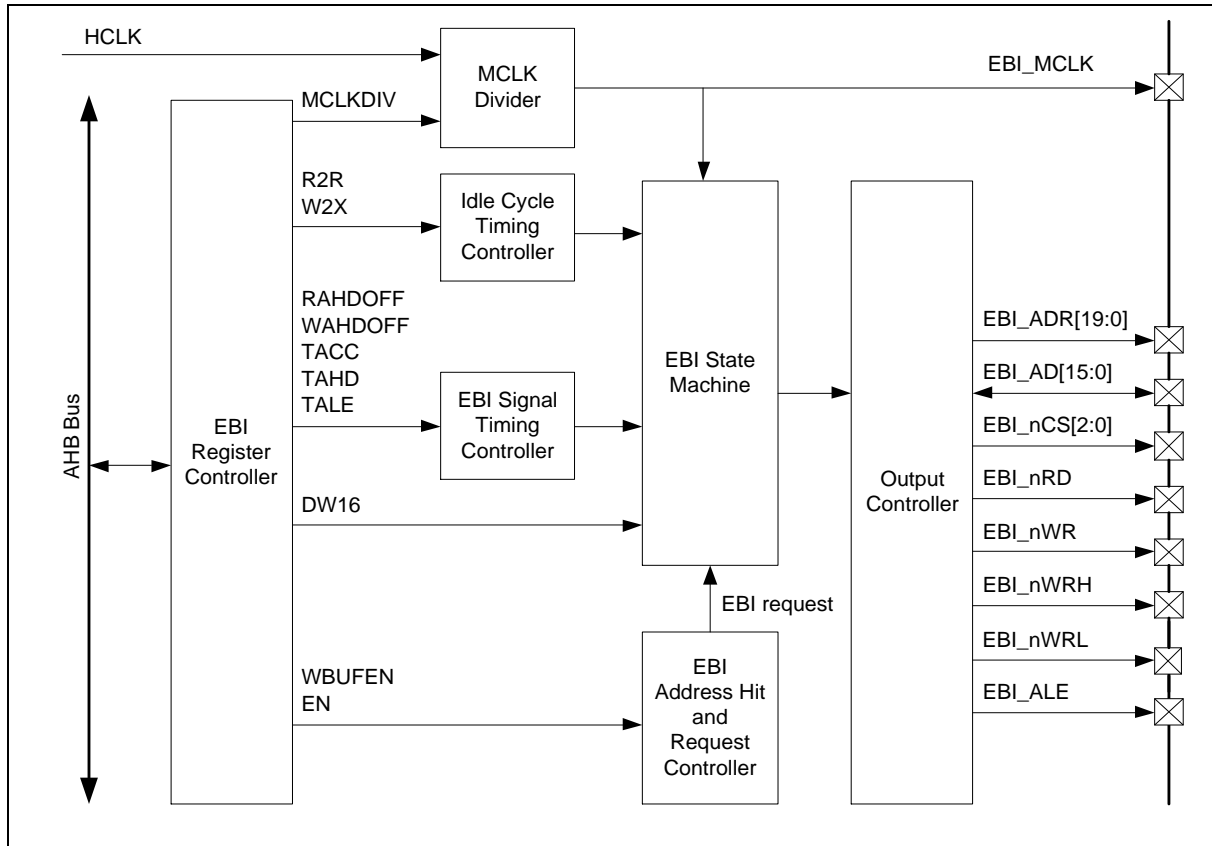

Figure 6.23-1 EBI Block Diagram

### 6.23.4 Basic Configuration

- Clock Source Configuration
  - Enable EBI controller clock in EBICKEN (CLK\_AHBCLK[3]).
- Reset Configuration
  - Reset EBI controller in SPI0RST (SYS\_IPRST0[3]).

### 6.23.5 Functional Description

#### 6.23.5.1 EBI Area and Address Hit

The EBI mapping address is located at 0x6000\_0000 ~ 0x602F\_FFFF and the total memory space is 3 Mbytes. When system request address hits EBI's memory space, the corresponding EBI chip select signal is assert and EBI state machine operates.

Chip Select	Address Mapping
EBI_nCS0	0x6000_0000 ~ 0x600F_FFFF
EBI_nCS1	0x6010_0000 ~ 0x601F_FFFF
EBI_nCS2	0x6020_0000 ~ 0x602F_FFFF

Table 6.23-1 EBI Address Mapping

To map the whole EBI memory space, it requires 20-bit address for 8-bit data width device and 19-bit

address for 16-bit data width device. For package that output less than 20-bit address, EBI will map device to mirror space. For example, the package with 18-bit EBI address, EBI will mapped external device (for Bank0/EBI\_nCS0) to 0x6000\_0000 ~ 0x6003\_FFFF, 0x6004\_0000 ~ 0x6007\_FFFF, 0x6008\_0000 ~ 0x600B\_FFFF and 0x600C\_0000 ~ 0x600F\_FFFF simultaneously.

#### 6.23.5.2 EBI Data Width Connection - Address Bus and Data Bus Multiplex Mode

The EBI supports the device whose address bus and data bus are multiplexed. For the external device with separated address and data bus, the connection to device needs additional latch device to latch the address. In this case, the pin EBI\_ALE is connected to the latch device to latch the address value. Pin EBI\_AD is the input of the latch device, and the output of the latch device is connected to the address of external device.

For 16-bit device, the EBI\_AD [15:0] is shared by address and 16-bit data, and EBI\_ADR [18:16] is dedicated for address and could be connected to 16-bit device directly. The EBI\_ADR[19] will be ignored when EBI data width is set as 16-bit width. For 8-bit device, only EBI\_AD [7:0] is shared by address and 8-bit data, EBI\_AD[15:8] and EBI\_ADR[19:16] are dedicated for address and could be connected to 8-bit device directly. Figure 6.23-2 shows the connection of 16-bit data width device and Figure 6.23-3 shows the connection of 8-bit data width device.

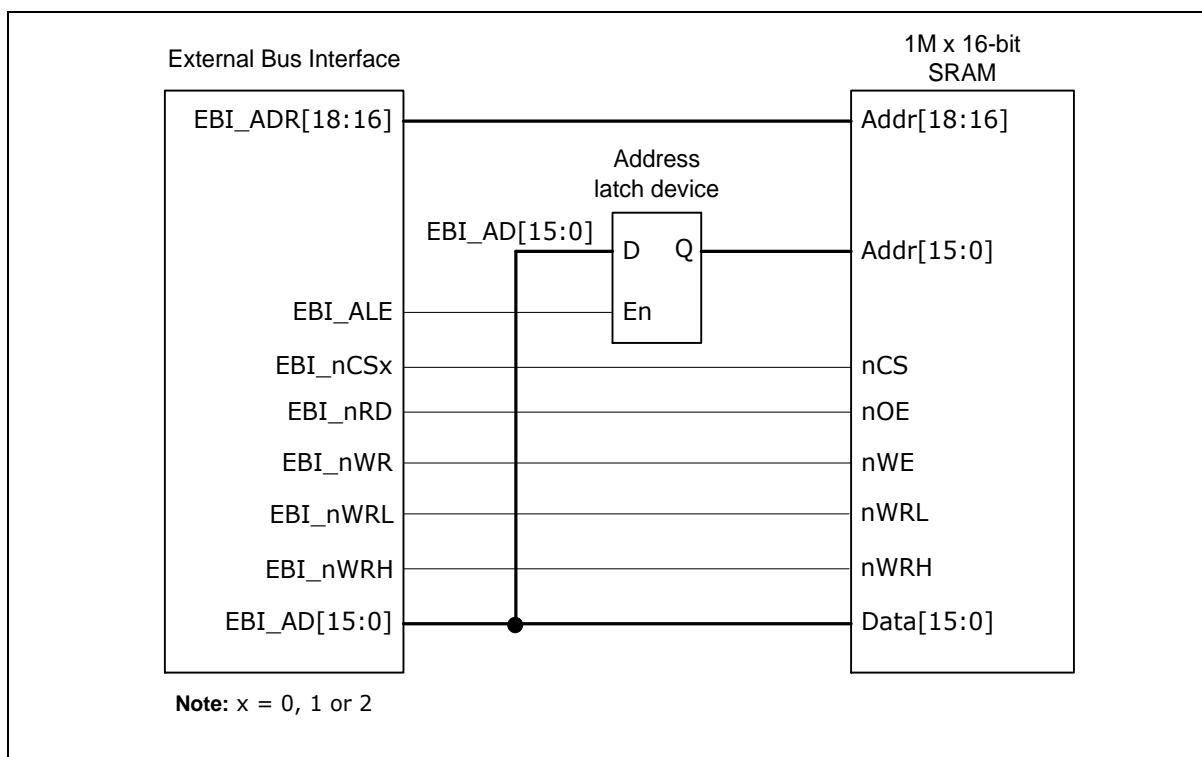

Figure 6.23-2 Connection of 16-bit EBI Data Width with 16-bit Device

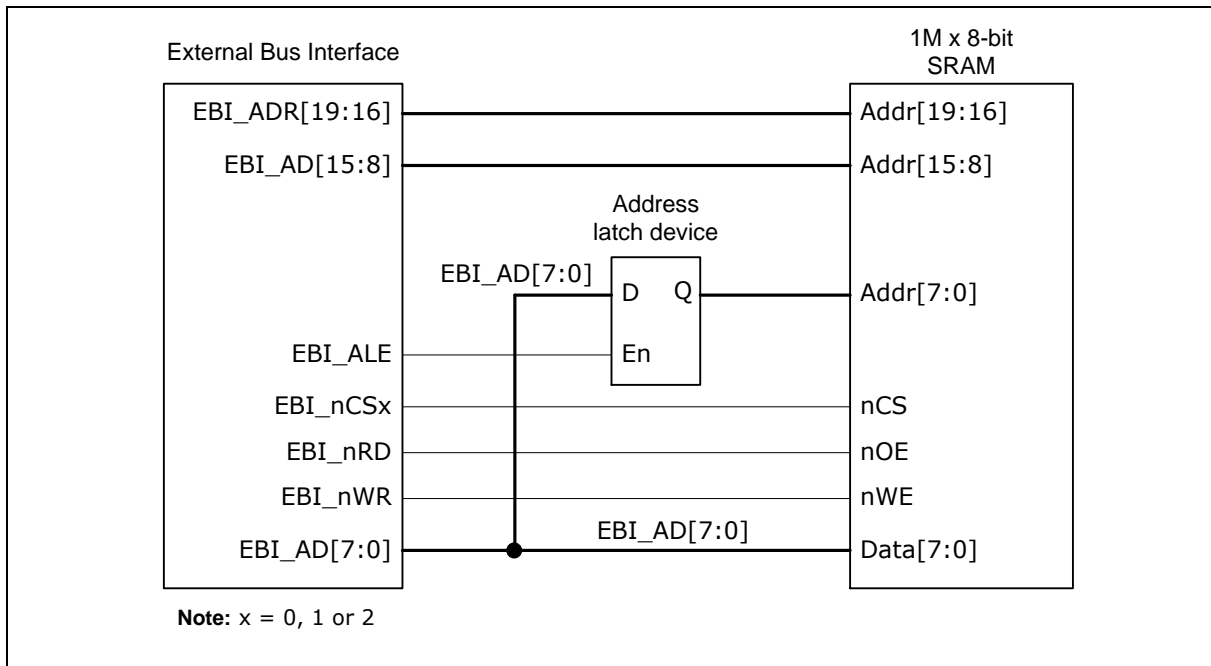

Figure 6.23-3 Connection of 8-bit EBI Data Width with 8-bit Device

When system access data width is larger than EBI data width, the EBI controller will finish a system access command by operating EBI access more than once. For example, if system requests a 32-bit data through EBI device, the EBI controller will operate accessing four times when setting EBI data width with 8-bit.

#### 6.23.5.3 EBI Operating Control

##### **MCLK Control**

In the chip, all EBI signals will be synchronized by EBI\_MCLK when EBI is operating. When chip connects to the external device with slower operating frequency, the EBI\_MCLK can divide most to HCLK/32 by setting MCLKDIV (EBI\_CTLx[10:8]). Therefore, chip can be suitable for a wide frequency range of EBI device. If EBI\_MCLK is set to HCLK/1, EBI signals are synchronized by positive edge of EBI\_MCLK, else by negative edge of EBI\_MCLK.

##### **Operation and Access Timing Control**

At the start of EBI access, chip select (EBI\_nCS0, EBI\_nCS1 and EBI\_nCS2) asserts to low and wait one EBI\_MCLK for address setup time (tASU) for address stable. Then EBI\_ALE asserts to high after address is stable and keeps for a period of time (tALE) for address latch. After latch address, EBI\_ALE asserts to low and wait one EBI\_MCLK for latch hold time (tLHD) and another one EBI\_MCLK cycle (tA2D) that is inserted behind address hold time to be the bus turn-around time for address change to data. Then EBI\_nRD asserts to low when read access or EBI\_nWR asserts to low when write access. Then EBI\_nRD or EBI\_nWR asserts to high after keeps access time (tACC) for reading output stable or writing finish. After that, EBI signals keep for data access hold time (tAHD) and chip select asserts to high, address is released by current access control.

The EBI controller provides a flexible timing control for different external device. In EBI timing control, tASU, tLHD and tA2D are fixed to 1 EBI\_MCLK cycle, tAHD can modulate to 1~8 EBI\_MCLK cycles by setting TAHD (EBI\_TCTLx[10:8]), tACC can modulate to 1~32 EBI\_MCLK cycles by setting TACC (EBI\_TCTLx[7:3]), and tALE can modulate to 1~8 EBI\_MCLK cycles by setting TALE (EBI\_CTL0[18:16]). Some external device can support zero data access hold time accessing, the EBI controller can skipped tAHD to increase access speed by setting WAHDOFF (EBI\_TCTLx[23]) and

RAHDOFF (EBI\_TCTLx[22]).

For each chip select, the EBI provides individual register with timing control except that tALE can only be controlled by EBI\_CTL0.

Parameter	Value	Unit	Description
tASU	1	MCLK	Address Latch Setup Time.
tALE	1 ~ 8	MCLK	ALE High Period. Controlled by TALE (EBI_CTL0[18:16]).
tLHD	1	MCLK	Address Latch Hold Time.
tA2D	1	MCLK	Address To Data Delay (Bus Turn-Around Time).
tACC	1 ~ 32	MCLK	Data Access Time. Controlled by TACC (EBI_TCTLx[7:3]).
tAHD	1 ~ 8	MCLK	Data Access Hold Time. Controlled by TAHD (EBI_TCTLx[10:8]).
IDLE	0 ~ 15	MCLK	Idle Cycle. Controlled by R2R (EBI_TCTLx[27:24]) and W2X (EBI_TCTLx[15:12]).

Table 6.23-2 Timing Control Parameter

Figure 6.23-4 shows an example of setting 16-bit data width. In this example, EBI\_AD bus is used for being address [15:0] and data [15:0]. When EBI\_ALE assert to high, EBI\_AD is address output. After address is latched, EBI\_ALE asserts to low and the EBI\_AD bus change to high impedance to wait device output data in read access operation, or it is used for being write data output.

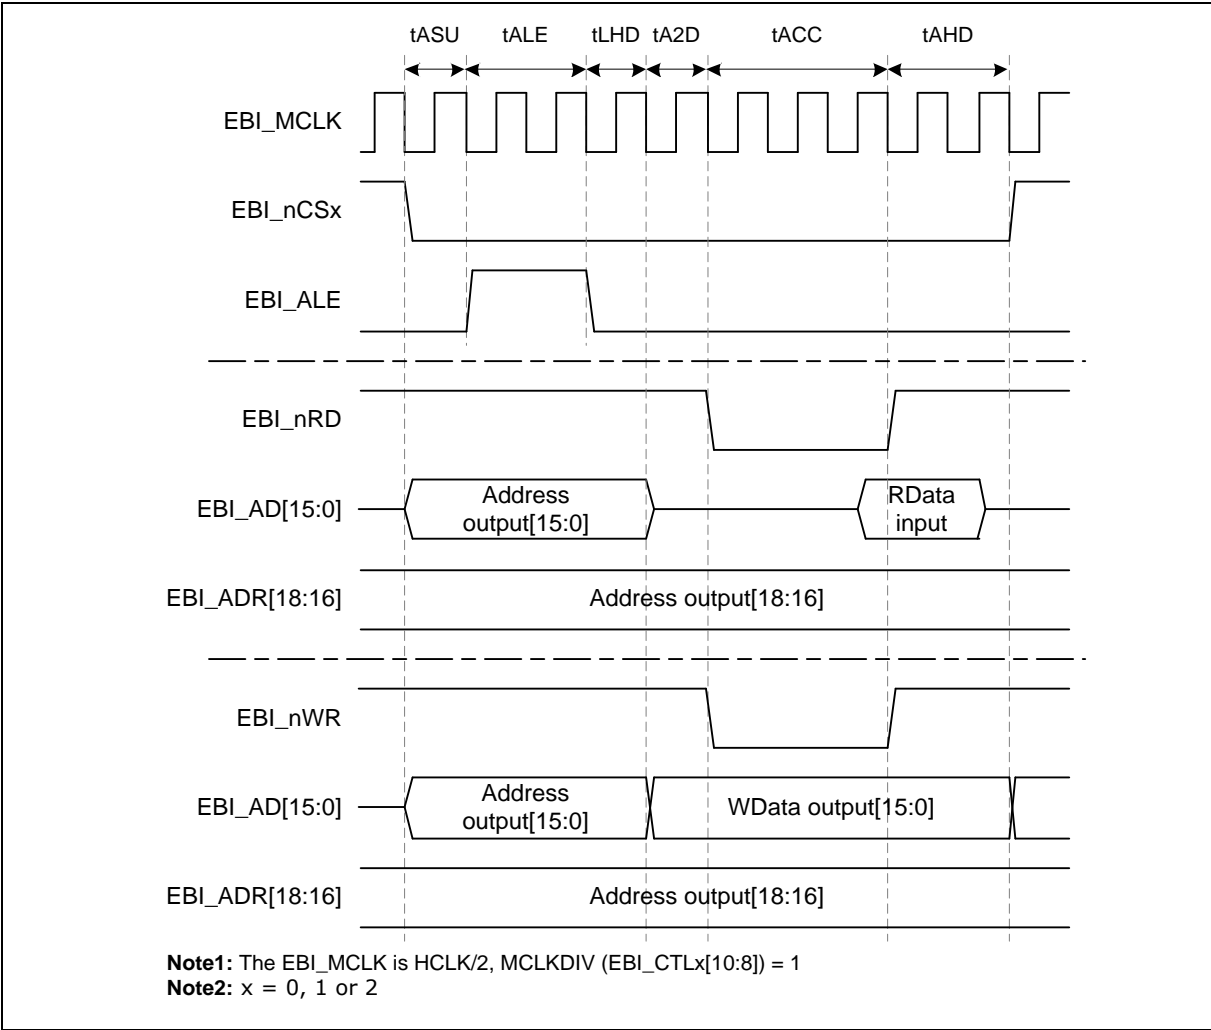

Figure 6.23-4 Timing Control Waveform for 16-bit Data Width

Figure 6.23-5 shows an example of setting 8-bit data width. The difference between 8-bit and 16-bit data width is EBI\_AD[15:8]. In 8-bit data width setting, EBI\_AD[15:8] is always Address [15:8] output so that external latch needs only 8-bit width.

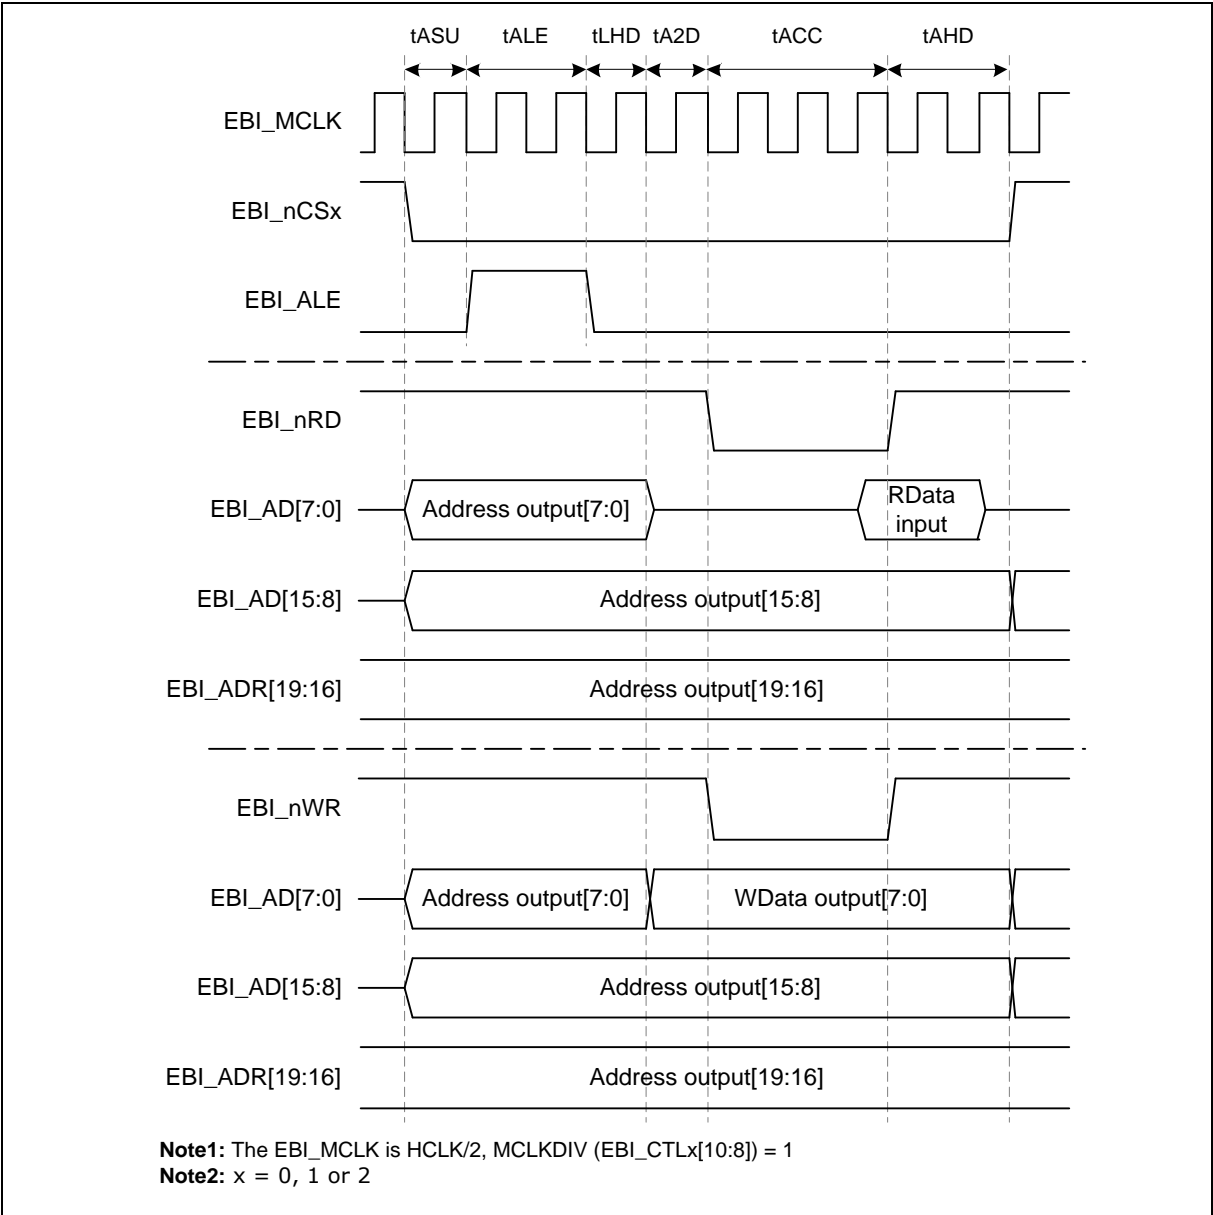

Figure 6.23-5 Timing Control Waveform for 8-bit Data Width

**Byte Access**

The EBI supports byte access when connected to 16-bit device. The pin EBI\_nWRH and EBI\_nWRL assertion indicate high byte enable and low byte enable in 16-bit data bus. Figure 6.23-6 shows the write operation of 8-bit width data in EBI\_AD[15:8] with EBI\_nWRH assertion.

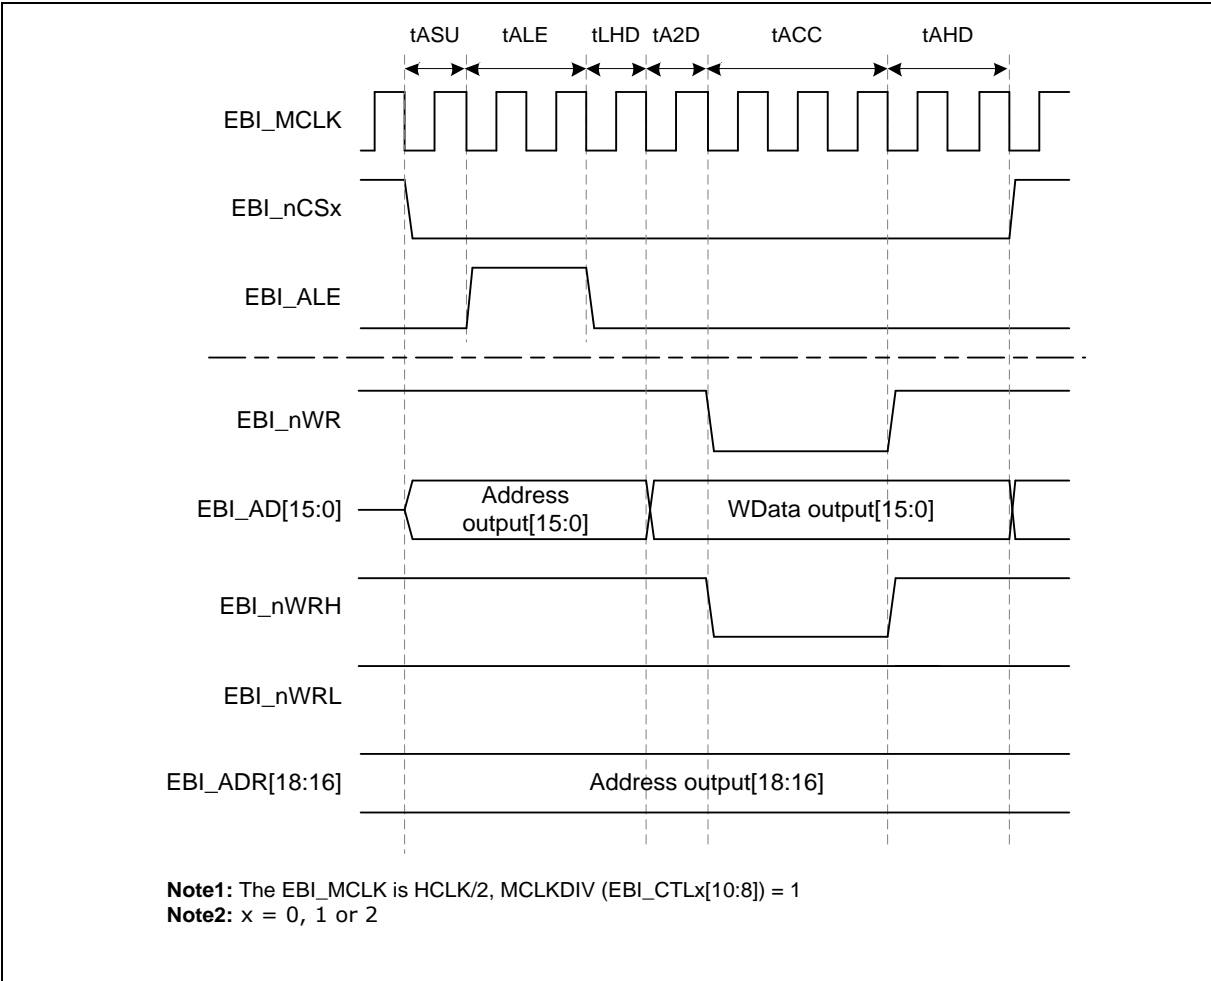

Figure 6.23-6 Timing Control Waveform for Byte Write in 16-bit Data Mode

### Insert Idle Cycle

When EBI accesses continuously, there may occur bus conflict if the device access time is much slow with system operating. The EBI controller supplies additional idle cycle to solve this problem. During idle cycle, all control signals of EBI are inactive. Figure 6.23-7 shows idle cycles.

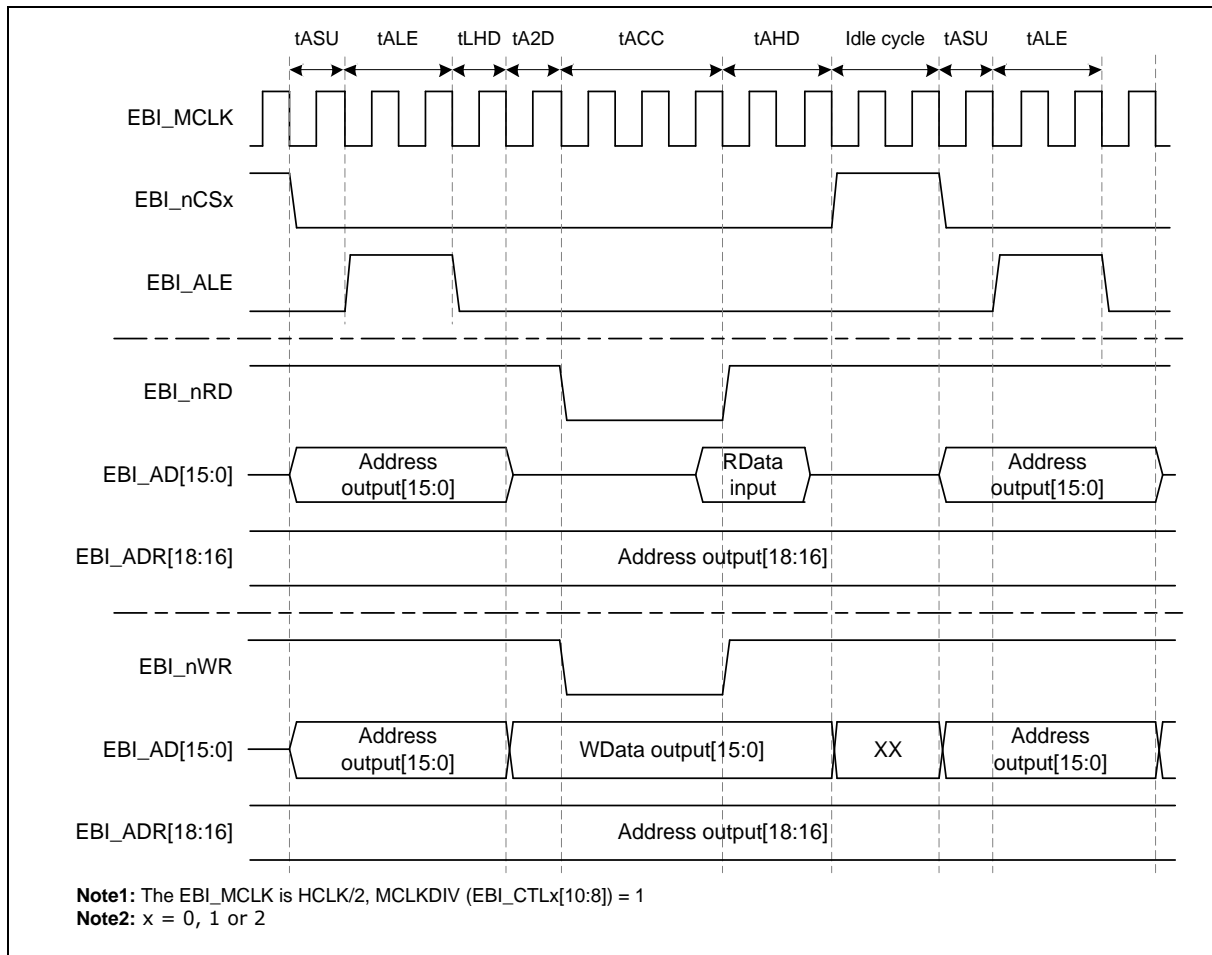

Figure 6.23-7 Timing Control Waveform for Insert Idle Cycle

There are two conditions that EBI can insert idle cycle by timing control:

1. After write access
2. After read access and before next read access (R2R idle cycle)

By setting W2X (EBI\_TCTLx[15:12]), and R2R (EBI\_TCTLx[27:24]), the time of idle cycle can be specified from 0~15 EBI\_MCLK.

### Chip Select Polarity Control

The EBI supports chip select polarity control for connecting to variable external device. When CSPOLINV (EBI\_CTLx[2]) is set to 0, the chip select pins (EBI\_nCSx) works as low active behavior. It means the external device can be access under EBI\_nCSx at low state. When CSPOLINV (EBI\_CTLx[2]) is set to 1, the chip select pin (EBI\_nCS) works as high active behavior. It means the external device can be access under EBI\_nCSx at high state.

**Write Buffer**

When user writes data to an external device through EBI bus, the EBI controller will start processing the write action immediately and the CPU is held until current EBI write action is finished. User can enable write buffer function to improve CPU and EBI access performance. When EBI write buffer function is enabled, the CPU can continuously execute other instruction during EBI controller process the write action to external device. There is one exception condition for this case. If CPU executes another data access through EBI bus when EBI process write action, the CPU will be held.

User can enable write buffer by setting WBUFEN (EBI\_CTL0[24]).

**Continuous Data Access Mode**

The EBI supports continuous data access mode for the device which needs faster data access and do not need address control interface. User can enable this mode by setting CACCESS (EBI\_CTLx[4]) for each bank. When EBI set as continuous data access mode, the tASU, tALE, tLHD cycles are ignored and EBI can access data continuously within one read or write command. There will be dummy cycle between each access command. The timing waveform is shown as Figure 6.23-8.

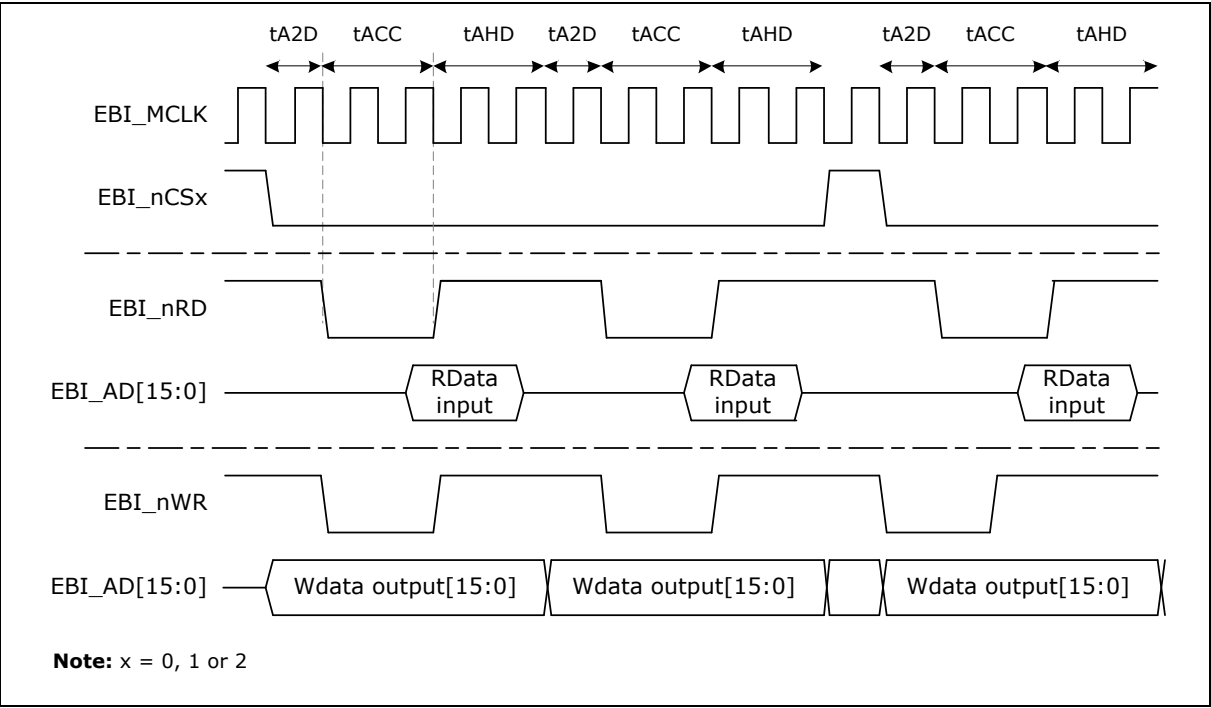

Figure 6.23-8 Timing Control Waveform for Continuous Data Access Mode

### 6.23.6 Register Map

R: read only, W: write only, R/W: both read and write

## 6.24 USB 2.0 Full-Speed Device Controller (USBD)

### 6.24.1 Overview

There is one set of USB 2.0 full-speed device controller and transceiver with BC1.2 in this device. It is compliant with USB 2.0 full-speed device specification and supports control/bulk/interrupt/isochronous transfer types.

In this device controller, there are two main interfaces: APB bus and USB bus which comes from the USB PHY transceiver. For the APB bus, the CPU can program control registers through it. There are 1 Kbytes internal SRAM as data buffer in this controller. For IN or OUT transfer, it is necessary to write data to SRAM or read data from SRAM through the APB interface or SIE. User needs to set the effective starting address of SRAM for each endpoint buffer through buffer segmentation register (USBD\_BUFSEGx).

There are 12 endpoints in this controller. Each of the endpoint can be configured as IN or OUT endpoint. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. The block of "Endpoint Control" is also used to manage the data sequential synchronization, endpoint states, current start address, transaction status, and data buffer status for each endpoint.

There are five different interrupt events in this controller. They are no-event-wake-up, device plug-in or plug-out event, USB events, such as IN ACK, OUT ACK, etc., and BUS events, such as suspend and resume, etc. Any event will cause an interrupt, and users just need to check the related event flags in interrupt event status register (USBD\_INTSTS) to acknowledge what kind of interrupt occurred, and then check the related USB Endpoint Status Register (USBD\_EPSTS0 and USBD\_EPSTS1) to acknowledge what kind of event occurred in this endpoint.

A software-disconnect function is supported for this USB controller. It is used to simulate the disconnection of this device from the host. If user enables SE0 bit (USBD\_SE0), the USB controller will force the output of USB\_D+ and USB\_D- to level low and its function is disabled. After disabling the SE0 bit, the host will enumerate the USB device again.

Battery Charging 1.2 protocol is also supported in this USB controller. It executes  $V_{BUS}$  detect, DCD detect, PD (primary detect) and SD (secondary detect) through BCDC register. Status in BCDC will tell users what port is connected.

For more information on the Universal Serial Bus, please refer to *Universal Serial Bus Specification Revision 1.1*.

### 6.24.2 Features

- Compliant with USB 2.0 Full-Speed specification
- Provides 1 interrupt vector with 5 different interrupt events (SOF, NEVWK, VBUSDET, USB and BUS)
- Supports Control/Bulk/Interrupt/Isochronous transfer type
- Supports suspend function when no bus activity existing for 3 ms
- Supports 12 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 1 Kbytes buffer size
- Provides remote wake-up capability
- Supports Battery charging 1.2 (BC12) with interrupt event (BCD)

### 6.24.3 Block Diagram

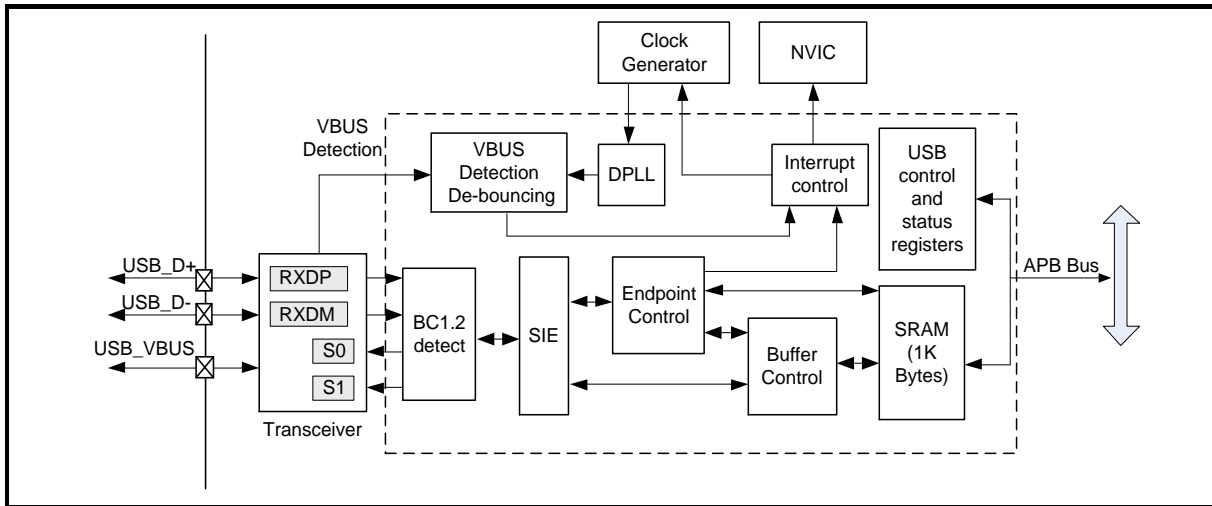

Figure 6.24.1 USB Block Diagram

### 6.24.4 Basic Configuration

The USB clock source is derived from HIRC or PLL. If user would like to achieve crystalless, HIRC must be selected as USB clock source, or user has to use the PLL related configurations with crystal before USB device controller is enabled. User can set the USBCKEN (CLK\_APBCLK0[27]) bit to enable USB clock and 4-bit pre-scaler USBDIV (CLK\_CLKDIV0[7:4]) to generate the proper USB clock rate.

**Note:** USB peripheral clock frequency needs to be greater than 15 MHz when USB receives/transmits data from/to the host.

#### 6.24.4.1 USB 2.0 Full-Speed Basic Configuration

- Clock source Configuration
  - Enable HIRC (CLK\_PWRCTL[2]) or set PLL controller (CLK\_PLLCTL)
  - Set USBSEL (CLK\_CLKSEL0[8]) to select USB clock source from HIRC or PLL
  - Select the clock divider number of USB peripheral clock on USBDIV (CLK\_CLKDIV0[7:4])
  - Enable USB peripheral clock in USBCKEN (CLK\_APBCLK0[27])
- Reset Configuration
  - Reset USB controller in USBDRST (SYS\_IPRST1[27])

### 6.24.5 Functional Description

#### 6.24.5.1 Serial Interface Engine (SIE)

The SIE is the front-end of the device controller and handles most of the USB packet protocol. The SIE typically comprehends signaling up to the transaction level. The functions that it handles could include:

- Packet recognition and transaction sequencing
- SOP, EOP, RESET, RESUME signal detection/generation
- Clock/Data separation
- NRZI Data encoding/decoding and bit-stuffing
- CRC generation and checking (for Token and Data)

- Packet ID (PID) generation and checking/decoding
- Serial-Parallel/Parallel-Serial conversion

#### 6.24.5.2 Endpoint Control

This controller supports 12 endpoints. Each of the endpoint can be configured as Control, Bulk, Interrupt, or Isochronous transfer type. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. It is also used to manage the data sequential synchronization, endpoint state control, current endpoint start address, current transaction status, and data buffer status in each endpoint.

#### 6.24.5.3 Digital Phase Lock Loop (DPLL)

The bit rate of USB data is 12 MHz. The DPLL uses the 48 MHz which comes from the clock controller to lock the input data RXDP and RXDM. The 12 MHz bit rate clock is also converted from DPLL.

#### 6.24.5.4 $V_{BUS}$ Detection De-bouncing

A USB device may be plugged-in or plugged-out from the USB host. To monitor the state of a USB device when it is detached from the USB host, the device controller provides hardware de-bouncing for USB  $V_{BUS}$  detection interrupt to avoid bounce problems on USB plug-in or unplug.  $V_{BUS}$  detection interrupt appears about 10 ms later than USB plug-in or plug-out. User can acknowledge USB plug-in/plug-out by reading USBD\_VBUSDET register. The VBUSDET flag represents the current state on the bus without de-bouncing. If VBUSDET is 1, it means the USB cable is plugged-in. If user polls the flag to check USB state, software de-bouncing must be added if needed.

#### 6.24.5.5 Interrupt control

This USB provides 1 interrupt vector with 5 interrupt events (SOF, NEVWK, VBUSDET, USB and BUS). The SOF interrupt occurs after receiving SOF packet. The NEVWK event occurs after waking up the system from Power-down mode (The power mode function is defined in system power-down control register, CLK\_PWRCTL). The VBUSDET event is used for USB plug-in or unplug. The USB event notifies users of some USB requests, such as IN ACK, OUT ACK. And the BUS event notifies users of some bus events, such as suspend and resume. The related bits must be set in the interrupt enable register (USBD\_INTEN) of USB Device Controller to enable USB interrupts.

NEVWK interrupt is only presented when no other USB interrupt events happened more than 20ms after the chip is woken up from Power-down mode. After the chip enters Power-down mode, any power change on USB\_VBUS or receiving resume event in USB suspend state can wake up this chip if USB wake-up function is enabled. If this change is not intentionally, no interrupt but NEVWK interrupt will occur. After waking up by USB, this interrupt will occur when no other USB interrupt events are presented for more than 20ms. Figure 6.24.2 shows the control flow of wake-up interrupt.

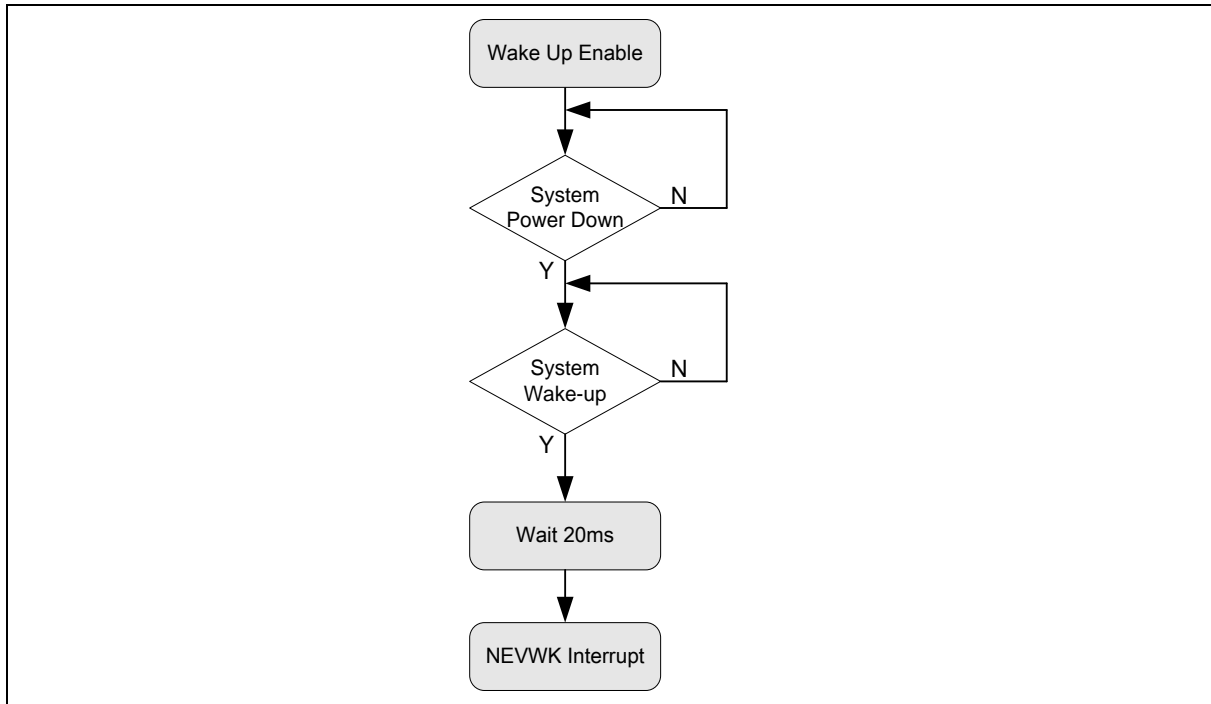

Figure 6.24.2 NEVWK Interrupt Operation Flow

The USB interrupt is used to notify users of any USB event on the bus, and user can read EPSTS (USBD\_EPSTS0 and USBD\_EPSTS1) and EPEVT11~0 (USBD\_INTSTS[27:16]) to take necessary responses.

Same as USB interrupt, BUS interrupt notifies users of some bus events, like USB reset, suspend, time-out, and resume. User can read USBD\_ATTR to acknowledge bus events.

#### 6.24.5.6 Power Saving

User can write 0 to USBD\_ATTR[4] to disable PHY under special circumstances, like suspend, to conserve power.

#### 6.24.5.7 Buffer Control

There is 1 Kbyte SRAM in the controller and the 12 endpoints share this buffer. User shall configure each endpoint's effective starting address in the buffer segmentation register before the USB function active. The "Buffer Control" block is used to control each endpoint's effective starting address and its SRAM size is defined in the USBD\_MXPLDx register.

Figure 6.24.3 depicts the starting address for each endpoint according the content of USBD\_BUFSEGx and USBD\_MXPLDx registers. If the USBD\_BUFSEG0 is programmed as 0x08h and USBD\_MXPLD0 is set as 0x40h, the SRAM size of endpoint 0 is start from USBD\_BA+0x108h and end in USBD\_BA+0x148h.

**Note:** The USBD SRAM base is USBD\_BA+0x100h.

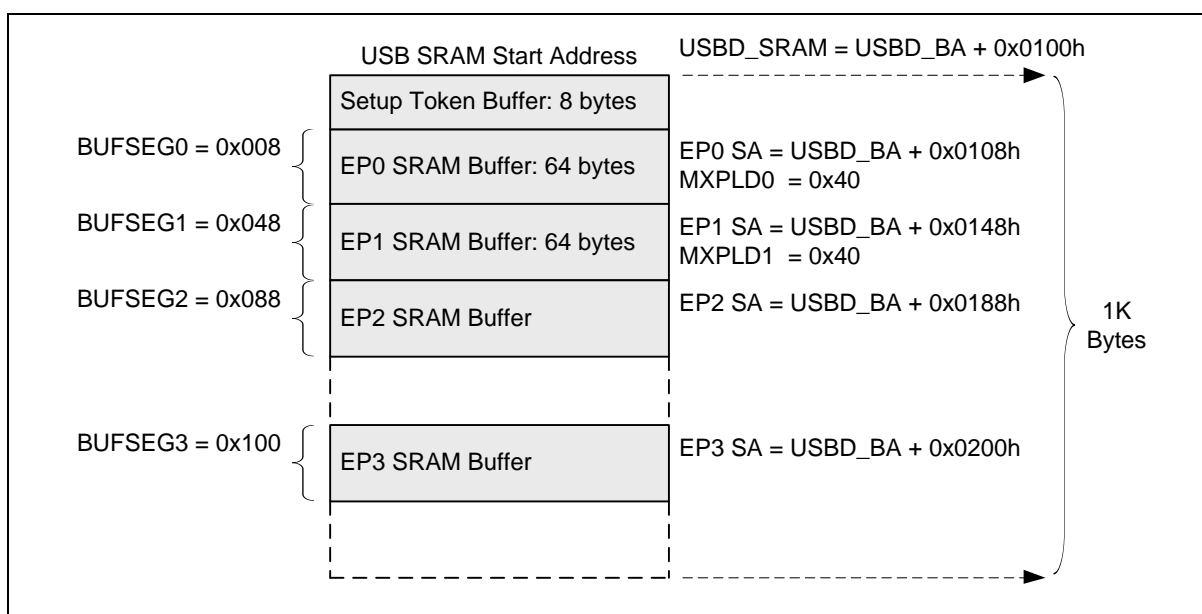

Figure 6.24.3 Endpoint SRAM Structure

#### 6.24.5.8 Handling Transactions with USB Device Peripheral

User can use interrupt or poll USB\_D\_INTSTS to monitor the USB transactions. When transactions occur, USB\_D\_INTSTS will be set by hardware and send an interrupt request to CPU (if related interrupt enabled), or user can poll USB\_D\_INTSTS to get these events without interrupt. The following is the control flow with interrupt enabled.

When USB host has requested data from a device controller, user needs to prepare related data in the specified endpoint buffer in advance. After buffering the required data, user needs to write the actual data length in the specified USB\_D\_MXPLDx register. Once this register is written, the internal signal "In\_Rdy" will be asserted and the buffering data will be transmitted immediately after receiving associated IN token from Host. Note that after transferring the specified data, the signal "In\_Rdy" will de-assert automatically by hardware.

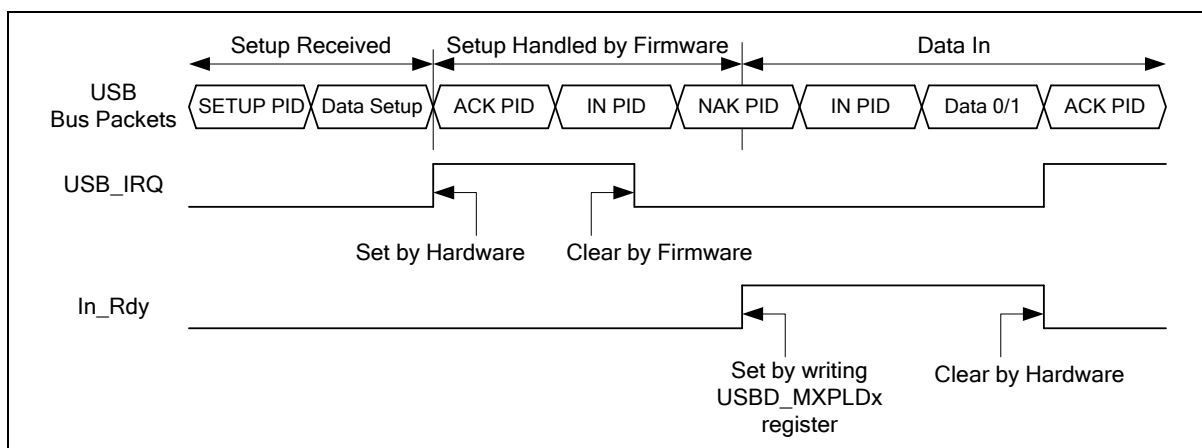

Figure 6.24.4 Setup Transaction Followed by Data IN Transaction

Alternatively, when USB host wants to transmit data to the OUT endpoint in the device controller, hardware will buffer these data to the specified endpoint buffer. After this transaction is completed, hardware will record the data length in specified USB\_D\_MXPLDx register and de-assert the internal signal "Out\_Rdy". This will avoid hardware accepting next transaction until user moves out the current

data in the related endpoint buffer. Once users have processed this transaction, the specified USBD\_MXPLDx register needs to be written by firmware to assert the signal “Out\_Rdy” again to accept the next transaction.

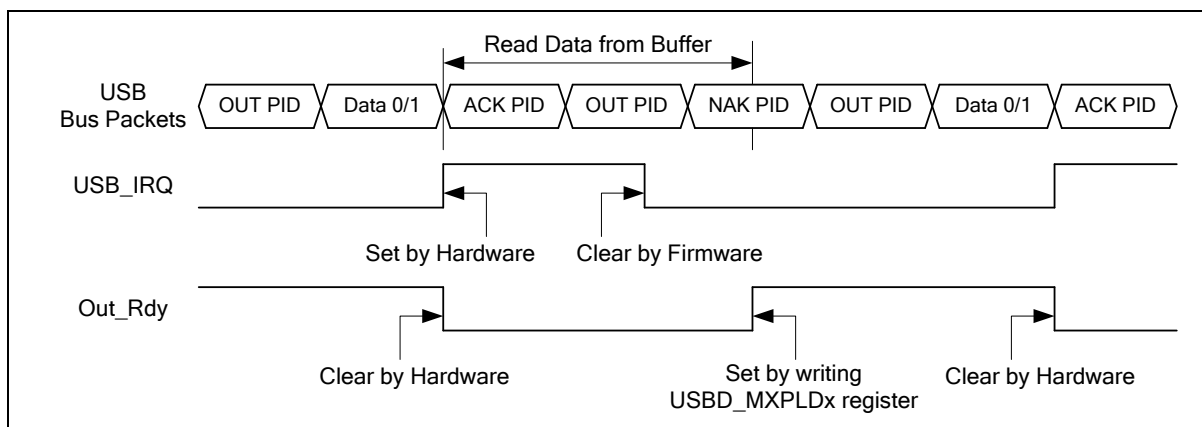

Figure 6.24.5 Data Out Transfer

#### 6.24.5.9 Link Power Management (LPM)

Link Power Management (LPM) is similar to the suspend/resume function, but has transitional latencies of tens of microseconds between power states (instead of three to greater than 20 millisecond latencies of the USB2.0 suspend/resume)

Through the LPM mechanism Host lets device state fastly from an enable state (called L0), to a new sleep state (called L1). For detailed definition of L0 and L1 state, see Table 6.24-2. The register USBD\_ATTR and USBD\_LPMATTR can let user know current power state for LPM mechanism as shown in Table 6.24-2.

LPM State	Description
L0 (On)	In this state, the port is enabled for propagation of transaction signaling traffic. A port in L0 is either actively transmitting or receiving data (L0-Active) or able to do so but not currently transmitting or receiving information (L0-Idle). While in this state Start-of-Frame (SOF) packets are issued by the host at a rate corresponding to the speed of the client device.
L1 (Sleep)	L1 is similar to L2 (below) but supports finer granularity in use. When in L1, the line state is identical to L2. Entry to L1 is started by a request to a hub or host port to transition to L1. A LPM transaction is sent to the downstream device. The requested transition can only occur if the device response with an ACK handshake. Exit from L1 is via remote wake, resume signaling, reset signaling or disconnect. L1 does not impose any specific power draw requirements (from $V_{BUS}$ ) on the attached device as L2 does. Either the host or device can initiate resume signaling when in L1. Although the signaling levels of resume are the same as L2, the duration of the signaling and transitional latencies associated with the L1 to L0 transition are much shorter.
L2 (Suspend)	This is the formalized name for USB 2.0 Suspend, Entry to L2 is nominally triggered by a command to a hub or host port to transition to suspend. The device discovers the suspend condition via observing 3ms of inactivity. The resultant line state is either Low or Full-speed idle. L2 also imposes power draw requirements (from $V_{BUS}$ ) on the attached device. Exit from this state is via remote wake, resume signaling, reset signaling or disconnect.
L3 (Off)	In this state, the port is not capable of performing any data signaling. It corresponds to the powered-off, disconnected, and disabled states.

Table 6.24-2 USB Link Power Manager (Lx) States

For the state transaction process, please refer to Figure 6.24.6, and for more information on the USB Link Power Manager (LPM), please refer to USB2.0 Link Power Management ECN (Engineering Change Notice).

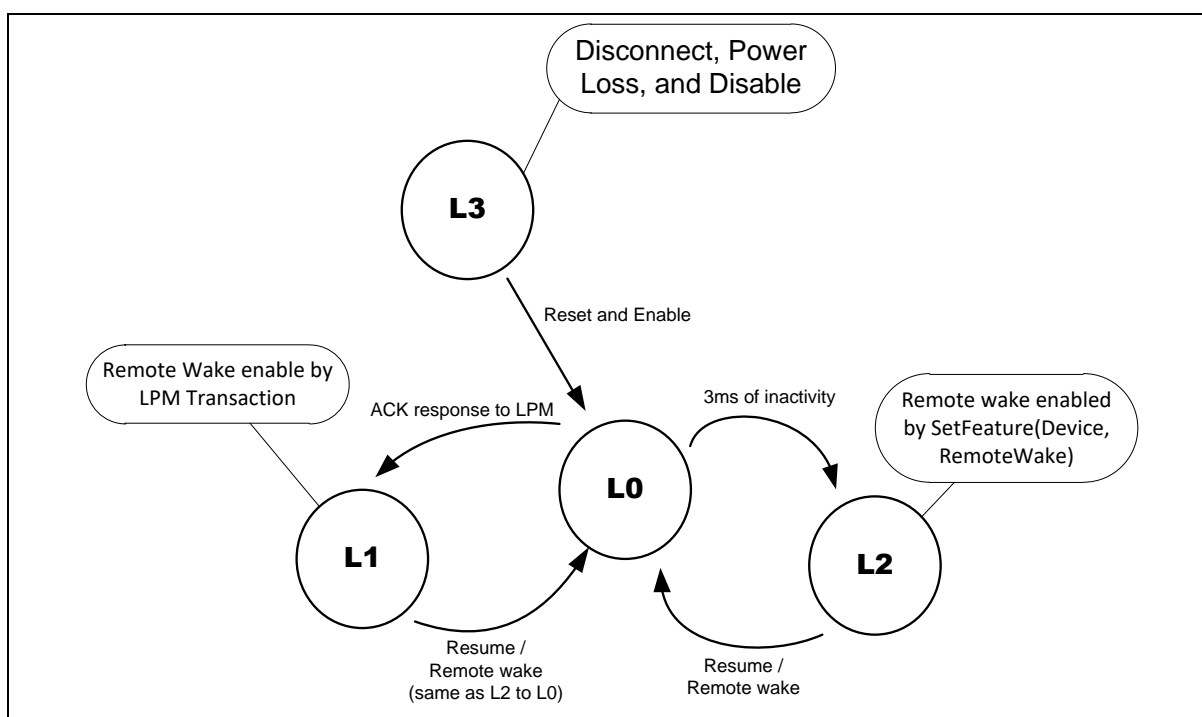

Figure 6.24.6 LPM State Transition Diagram

#### 6.24.5.10 Battery Charging Detection

Battery Charging Revision 1.2 is supported. BC1.2 detects attached port in which class. Each class can charge different current. User can detect class of attached port, then charge adequate current to battery to reduce charging time.

After battery charge is detected, user can distinguish SDP (Standard Downstream Port), DCP (Dedicated Charging Port), and CDP (Charging Downstream Port). SDP is standard downstream port in USB2.0 definition that can draw current up to 0.5A after configured. DCP is a charging port in USB that cannot enumerate and can draw current range to 0.5A~5A. CDP can enumerate and draw current range to 1.5A~5A.

User can refer to Figure 6.24.7 to control USB\_DBCDC[0:31], or refer to BC1.2 demo code. The flow includes  $V_{BUS}$  detect, DCD, PD, and SD. First check  $V_{BUS}$  attach status, check data pin contact status, and then distinguish SDP, CDP, and DCP by PD and SD.

[27]	<b>EPEVT11</b> <b>Endpoint 11's USB Event Status</b> 0 = No event occurred in endpoint 11. 1 = USB event occurred on Endpoint 11; check USBD_EPSTS1[ 15:12] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[27] or USBD_INTSTS[1].
[26]	<b>EPEVT10</b> <b>Endpoint 10's USB Event Status</b> 0 = No event occurred in endpoint 10. 1 = USB event occurred on Endpoint 10, check USBD_EPSTS1[11 :8] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[26] or USBD_INTSTS[1].
[25]	<b>EPEVT9</b> <b>Endpoint 9's USB Event Status</b> 0 = No event occurred in endpoint 9. 1 = USB event occurred on Endpoint 9, check USBD_EPSTS1[7 :4] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[25] or USBD_INTSTS[1].
[24]	<b>EPEVT8</b> <b>Endpoint 8's USB Event Status</b> 0 = No event occurred in endpoint 8. 1 = USB event occurred on Endpoint 8; check USBD_EPSTS1[3 :0] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[24] or USBD_INTSTS[1].
[23]	<b>EPEVT7</b> <b>Endpoint 7's USB Event Status</b> 0 = No event occurred in endpoint 7. 1 = USB event occurred on Endpoint 7, check USBD_EPSTS0[31:28] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[23] or USBD_INTSTS[1].
[22]	<b>EPEVT6</b> <b>Endpoint 6's USB Event Status</b> 0 = No event occurred in endpoint 6.

		1 = USB event occurred on Endpoint 6, check USBD_EPSTS0[27:24] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[22] or USBD_INTSTS[1].
[21]	EPEVT5	<b>Endpoint 5's USB Event Status</b> 0 = No event occurred in endpoint 5. 1 = USB event occurred on Endpoint 5, check USBD_EPSTS0[23:20] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[21] or USBD_INTSTS[1].
[20]	EPEVT4	<b>Endpoint 4's USB Event Status</b> 0 = No event occurred in endpoint 4. 1 = USB event occurred on Endpoint 4, check USBD_EPSTS0[19:16] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[20] or USBD_INTSTS[1].
[19]	EPEVT3	<b>Endpoint 3's USB Event Status</b> 0 = No event occurred in endpoint 3. 1 = USB event occurred on Endpoint 3, check USBD_EPSTS0[15:12] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[19] or USBD_INTSTS[1].
[18]	EPEVT2	<b>Endpoint 2's USB Event Status</b> 0 = No event occurred in endpoint 2. 1 = USB event occurred on Endpoint 2, check USBD_EPSTS0[11:8] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[18] or USBD_INTSTS[1].
[17]	EPEVT1	<b>Endpoint 1's USB Event Status</b> 0 = No event occurred in endpoint 1. 1 = USB event occurred on Endpoint 1, check USBD_EPSTS0[7:4] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[17] or USBD_INTSTS[1].
[16]	EPEVT0	<b>Endpoint 0's USB Event Status</b> 0 = No event occurred in endpoint 0. 1 = USB event occurred on Endpoint 0, check USBD_EPSTS0[3:0] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[16] or USBD_INTSTS[1].
[15:6]	Reserved	Reserved.
[5]	BCDIF	<b>Battery Charge Detect Interrupt Status</b> It supports VBUSOK DCD interrupt status When USBD_BCDIC[0] = 1, USBD_BCDIC[3:1] = 001, V <sub>BUS</sub> is detected. When USBD_BCDIC[0] = 1, USBD_BCDIC[3:1] = 010, DCD is detected. 0 = BCD event did not occur. 1 = BCD event occurred, and it is cleared by writing 1 to USBD_INTSTS[5].
[4]	SOFIF	<b>Start of Frame Interrupt Status</b> 0 = SOF event did not occur. 1 = SOF event occurred, and it is cleared by writing 1 to USBD_INTSTS[4].
[3]	NEVWKIF	<b>No-event-wake-up Interrupt Status</b> 0 = NEVWK event did not occur. 1 = No-event-wake-up event occurred, and it is cleared by writing 1 to USBD_INTSTS[3].
[2]	VBDETIF	<b>V<sub>BUS</sub> Detection Interrupt Status</b> 0 = There is not attached/detached event in the USB. 1 = There is attached/detached event in the USB bus and it is cleared by writing 1 to USBD_INTSTS[2].
[1]	USBIF	<b>USB Event Interrupt Status</b> The USB event includes the SETUP Token, IN Token, OUT ACK, ISO IN, or ISO OUT events in the bus. 0 = No USB event occurred. 1 = USB event occurred; check EPSTS0~11[3:0] to know which kind of USB event occurred, and it is cleared by writing 1 to USBD_INTSTS[1] or EPSTS0~11 and SETUP (USB_INTSTS[31]).

[0]	BUSIF	<p><b>BUS Interrupt Status</b></p> <p>The BUS event means that there is one of the suspense or the resume function in the bus.</p> <p>0 = No BUS event occurred.</p> <p>1 = Bus event occurred; check USBD_ATTR[3:0] to know which kind of bus event occurred, and it is cleared by writing 1 to USBD_INTSTS[0].</p>

Reserved							
15	14	13	12	11	10	9	8
Reserved							MXPLD
7	6	5	4	3	2	1	0
MXPLD							

Bits	Description
[31:9]	<b>Reserved</b> Reserved.
[8:0]	<b>MXPLD</b> <b>Maximal Payload</b> Define the data length which is transmitted to host (IN token) or the actual data length which is received from the host (OUT token). It also used to indicate that the endpoint is ready to be transmitted in IN token or received in OUT token. (1) When the register is written by CPU, For IN token, the value of MXPLD is used to define the data length to be transmitted and indicate the data buffer is ready. For OUT token, it means that the controller is ready to receive data from the host and the value of MXPLD is the maximal data length comes from host.

		<p>(2) When the register is read by CPU,</p> <p>For IN token, the value of MXPLD is indicated by the data length be transmitted to host</p> <p>For OUT token, the value of MXPLD is indicated the actual data length receiving from host.</p> <p><b>Note:</b> Once MXPLD is written, the data packets will be transmitted/received immediately after IN/OUT token arrived.</p>

## 6.25 Cryptographic Accelerator (CRYPTO)

### 6.25.1 Overview

The Crypto (Cryptographic Accelerator) supports AES algorithms. The AES accelerator is an implementation fully compliant with the AES (Advance Encryption Standard) encryption and decryption algorithm. The AES accelerator supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode.

### 6.25.2 Features

- AES
  - Supports FIPS NIST 197
  - Supports SP800-38A and addendum
  - Supports 128, 192, and 256 bits key
  - Supports both encryption and decryption
  - Supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode
  - Supports key expander

### 6.25.3 Block Diagram

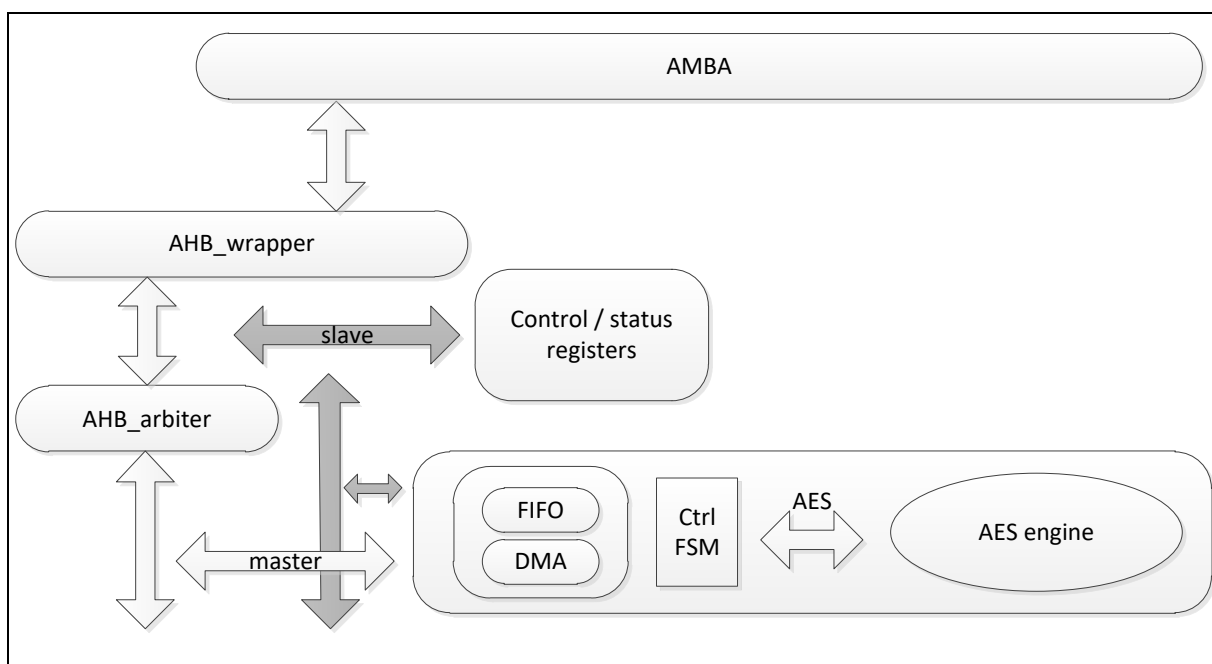

Figure 6.25-1 Cryptographic Accelerator Block Diagram

### 6.25.4 Basic Configuration

- Clock Source Configuration
  - Enable CRYPTO peripheral clock in CRYPTCKEN(CLK\_AHBCLK[12])
- Reset Configuration
  - Reset CRYPTO controller in CRYPTRST(SYS\_IPRST0[12])

### 6.25.5 Functional Description

The cryptographic accelerator supports AES algorithms. The accelerator can be used in different data security applications, such as secure communications that need cryptographic protection and integrity.

The AES accelerator is a fully compliant implementation of the AES (Advance Encryption Standard) encryption and decryption algorithm. The AES accelerator supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode. The AES accelerator provides the DMA function to reduce the CPU intervention, and supports three burst lengths, sixteen-words, eight-words, and four-words.

Software can control the data flow by enabling the CRYPTO\_INTEN, and monitor the accelerator status by checking the CRYPTO\_INTSTS status register. When any engine operation error or buffer error happened, the corresponding error flag will be set to 1 and inform to CPU if error interrupt enable bit is set to 1. If want to detail error condition, software can check status flag register of AES engine. Table 6.25-1 lists AES engine error enable bit, error flag bit and error conditions.

Engine	Error Interrupt Enable Bit	Error Interrupt Flag	Error Conditions
AES	AESEIEN (CRYPTO_INTEN[1])	AESEIF (CRYPTO_INTSTS[1])	INBUFERR(CRYPTO_AES_STS[10]) OUTBUFERR (CRYPTO_AES_STS[18]) BUSERR (CRYPTO_AES_STS[20])

Table 6.25-1 AES Engine Error Conditions and Error Flag

The cryptographic accelerator supports the following features to enhance the performance.

#### **DMA Mode**

Once DMA source address register, destination address register, and byte count register are configured by CPU, moving data from and to accelerator is done by DMA logic totally. This mode can off-load the loading from the CPU. The cryptographic accelerator embeds one hardware DMA channel for AES engine.

Engine	DMA Enable Bit
AES	DMAEN (CRYPTO_AES_CTL[7])

Table 6.25-2 DMA Enable Bit Table

#### **DMA Cascade Mode**

In the case that the data SRAM resource is tight, or another peripheral is scheduled to switch, the data source or sink needs an update, while the setting for the accelerator operation is planned to be kept. In this mode, software can update DMA source address register, destination address register, and byte count register during a cascade operation, without finishing the accelerator operation.

Engine	DMA Cascade Bit
AES	DMACSCAD (CRYPTO_AES_CTL[6])

Table 6.25-3 DMA Cascade Bit Table

#### **Non-DMA Mode**

In the case that the input data is small in size, DMA mode is not preferred. This mode can reduce the processing time for the accelerator, since no DMA related register needs a configuration, and no latency in DMA logic is introduced. Input data was feeding to cryptographic engine via writing to data input register.

##### 6.25.5.1 AES (Advanced Encryption Standard)

#### **Electronic Codebook Mode**

The Electronic Codebook (ECB) mode is a confidentiality mode that features the assignment of a fixed

ciphertext block to each plaintext block, for a given key. It's analogous to the assignment of code words in a codebook.

In ECB encryption, each block of the plaintext is applied to the forward cipher function  $CIPH_k$  directly and independently. The resulting sequence of output blocks is the ciphertext. In ECB decryption, each block of the ciphertext is applied to the inverse cipher function  $CIPH^{-1}_k$  directly and independently. The resulting sequence of output blocks is the plaintext.

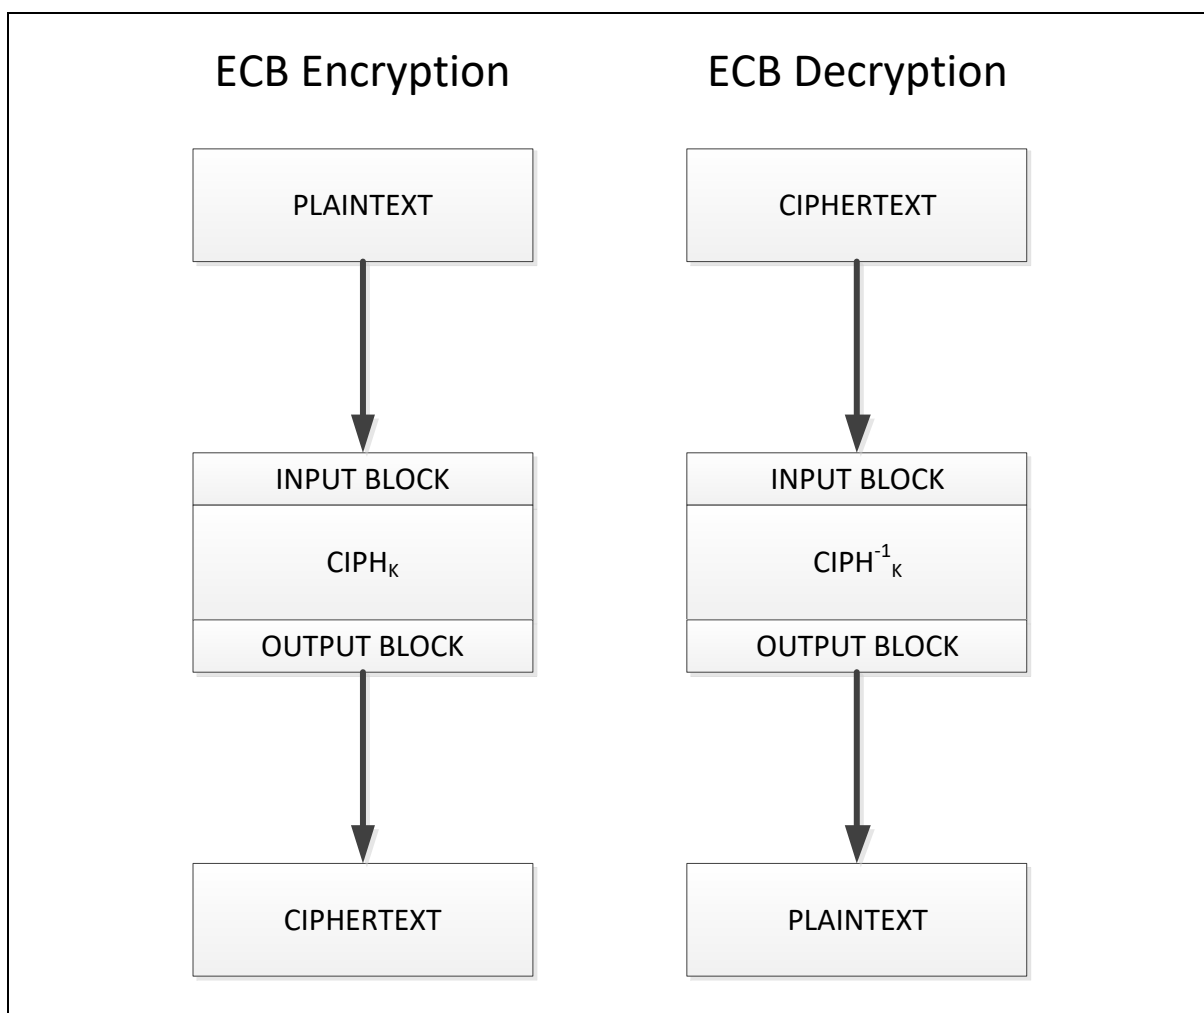

Figure 6.25-2 Electronic Codebook Mode

In ECB mode, any given plaintext block always gets encrypted to the same ciphertext block under a given key. If this property is undesirable in a particular application, the ECB mode should not be used.

#### **Cipher Block Chaining Mode**

The Cipher Block Chaining (CBC) mode is a confidentiality mode whose encryption process features the combining chaining of the plaintext blocks with the previous ciphertext blocks. The CBC mode requires an initialization vector (IV) to combine with the first plaintext block. The IV does not need to be secret, but it must be unpredictable.

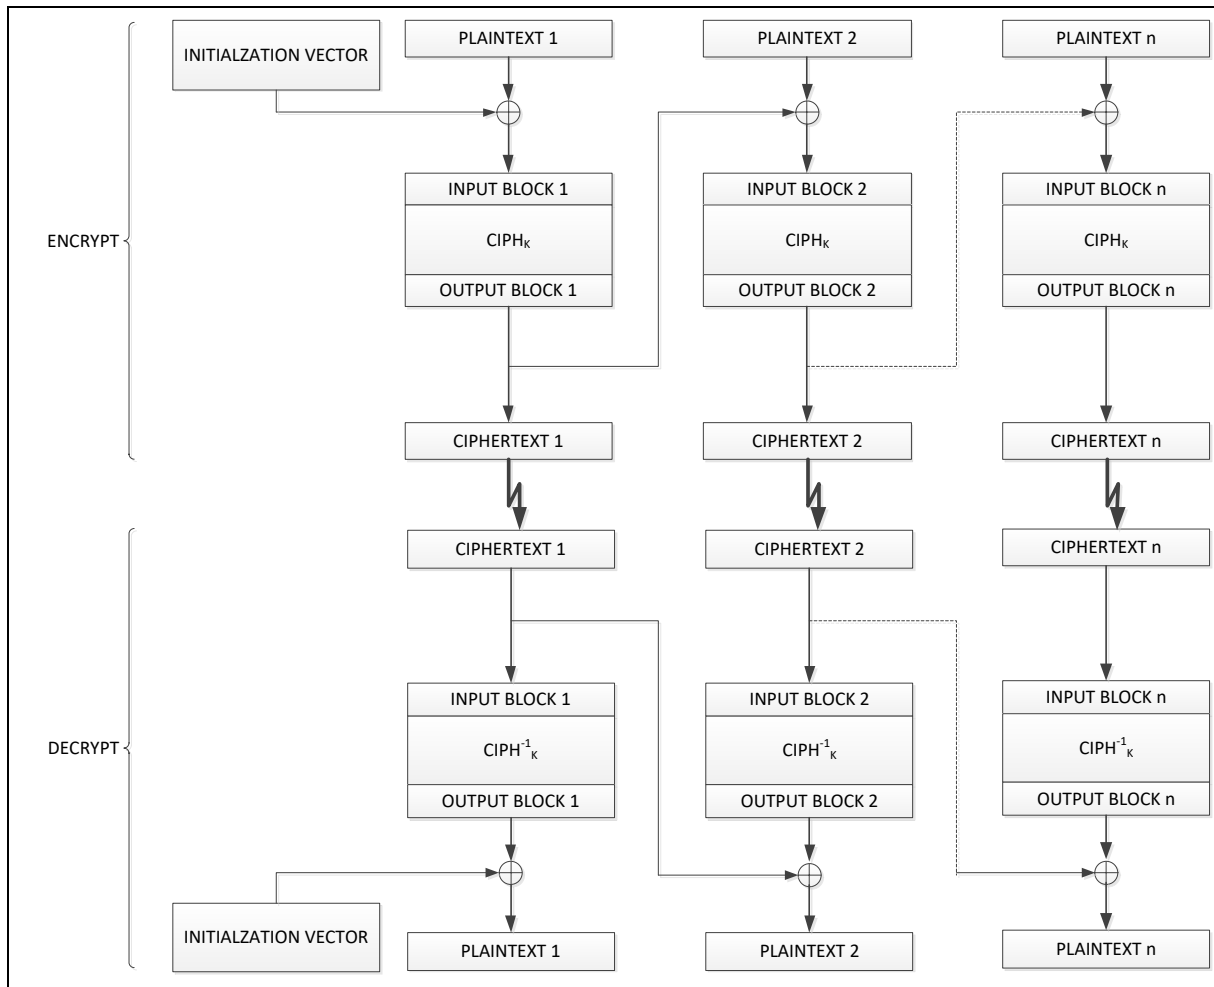

Figure 6.25-3 Cipher Block Chaining Mode

### **Cipher Feedback Mode (CFB)**

The Cipher Feedback (CFB) mode is a confidentiality mode that features the feedback of successive ciphertext segments into the input blocks of the forward cipher to generate output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The CFB mode requires an IV as the initial input block. The IV need not be secret, but it must be unpredictable. The AES only supports 128-bit segment length CFB mode.

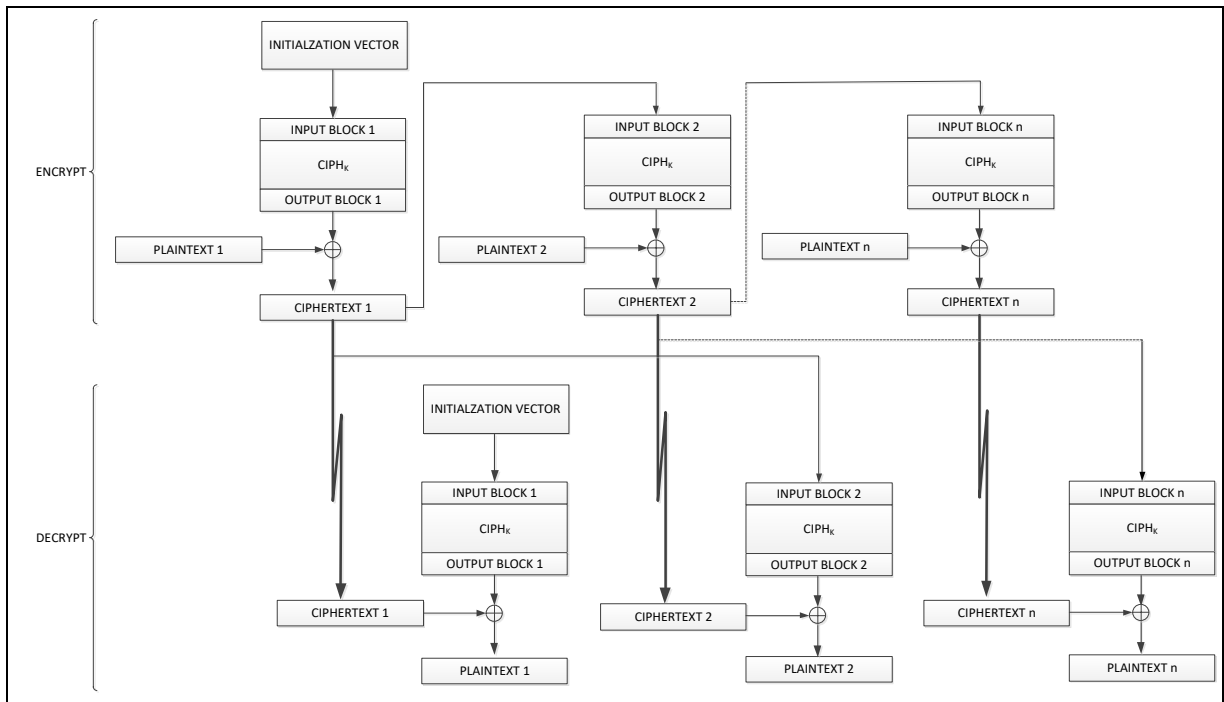

Figure 6.25-4 Cipher Feedback Mode

### **Output Feedback Mode**

The Output Feedback (OFB) mode is a confidentiality mode that features the iteration of the forward cipher on an IV to generate a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The OFB mode requires that the IV is a nonce, i.e., the IV must be unique for each execution of the mode under the given key.

The OFB mode requires a unique IV for every message that is ever encrypted under the given key. If, contrary to this requirement, the same IV is used for the encryption of more than one message, then the confidentiality of those messages may be compromised. Confidentiality may be similarly be compromised if any of the input blocks to the forward cipher function for the encryption of a message is designated as the IV for the encryption of another message under the given key.

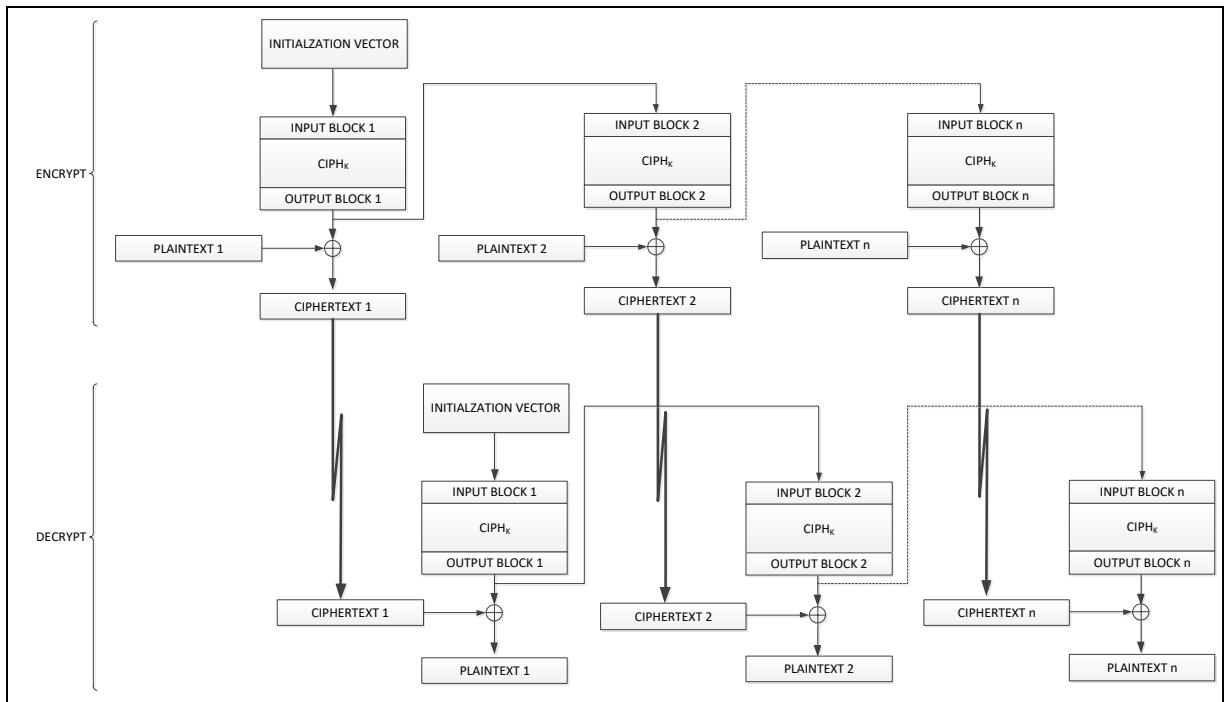

Figure 6.25-5 Output Feedback Mode

### **Counter Mode (CTR)**

The Counter (CTR) mode is a confidentiality mode that features the application of the forward cipher to a set of input blocks, called counters, to produce a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The sequence of counters must have the property that each block in the sequence is different from every other block. This condition is not restricted to a single message: across all of the messages that are encrypted under the given key, all of the counters must be distinct.

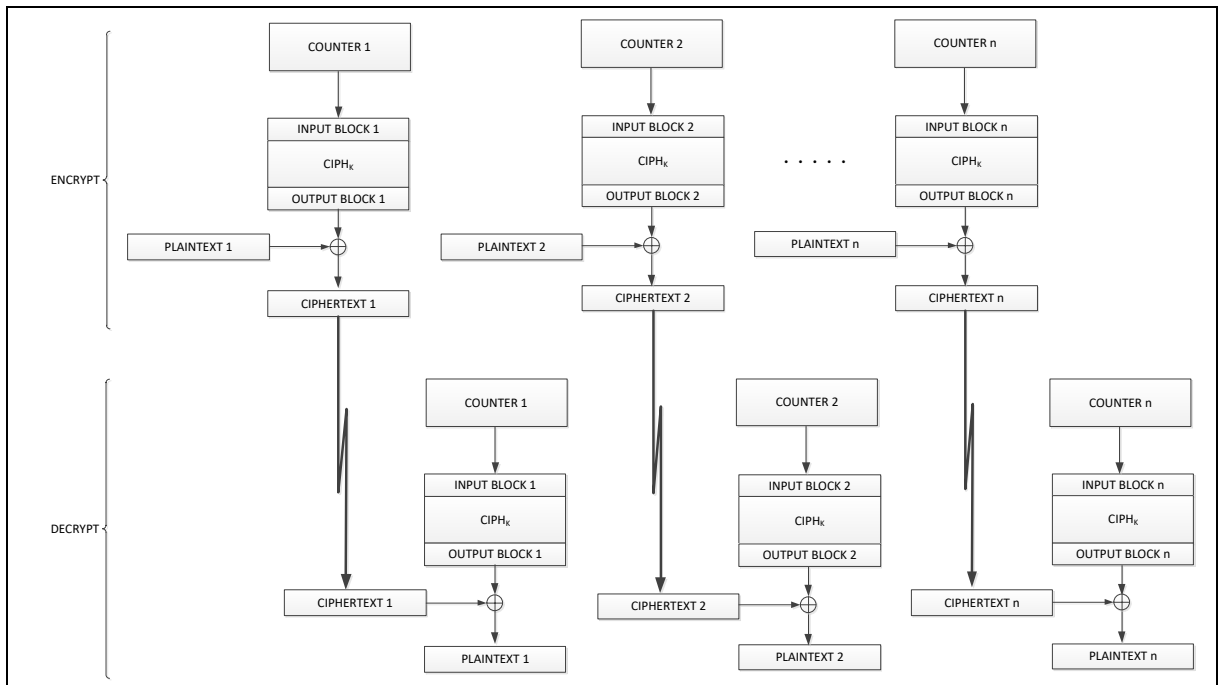

Figure 6.25-6 Counter Mode

**CBC Ciphertext-Stealing 1 Mode (CBC-CS1)**

Figure 6.25-7 illustrates the CBC-CS1-Encrypt algorithm for the case that  $P_n^*$  is a partial block. The cryptographic accelerator would append  $P_n^*$  with '0' to form a complete block  $P_n$ .

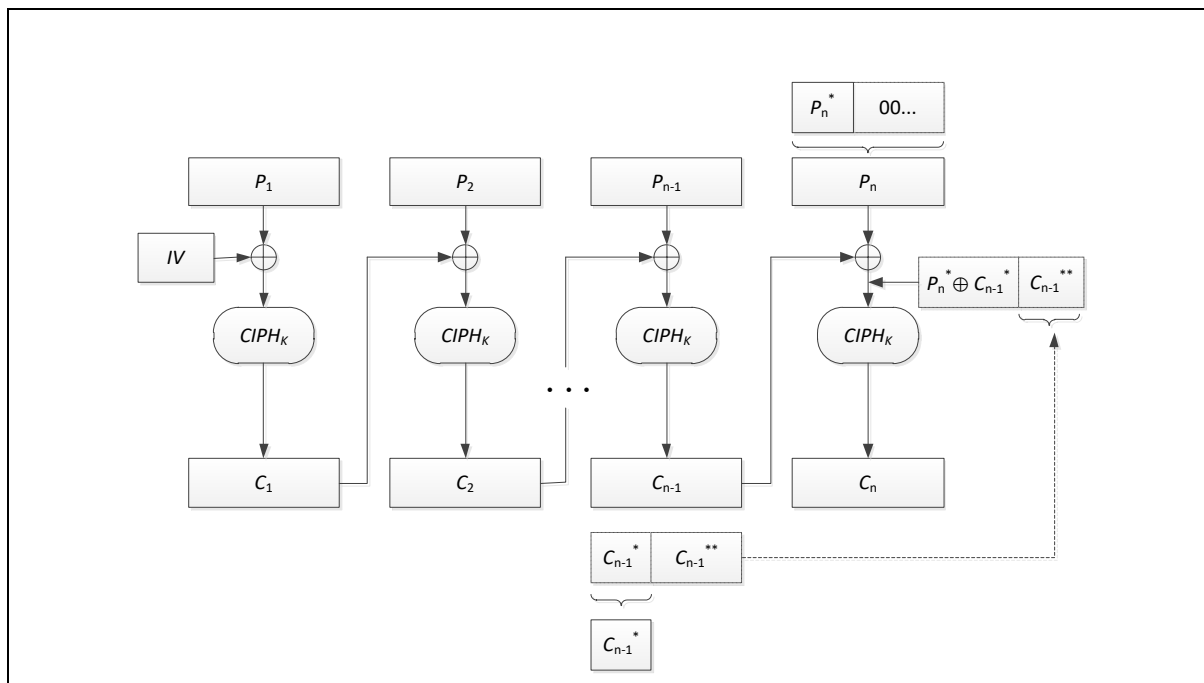

Figure 6.25-7 CBC-CS1 Encryption

Figure 6.25-8 illustrates the CBC-CS1-Decrypt algorithm for the case that  $C_{n-1}^*$  is a partial block.

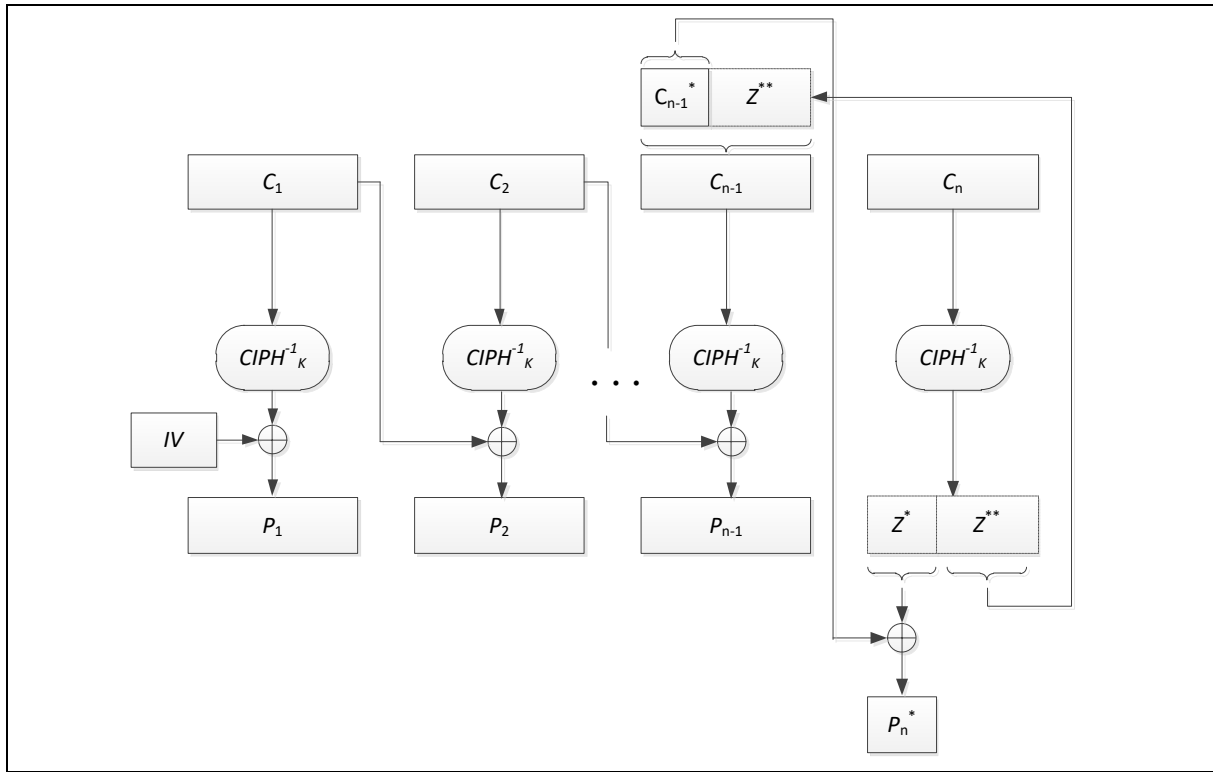

Figure 6.25-8 CBC-CS1 Decryption

#### **CBC Ciphertext-Stealing 2 Mode (CBC-CS2)**

When  $P_n^*$  is a partial block, then CBC-CS2-Encrypt and CBC-CS1-Encrypt differ only in the ordering of  $C_{n-1}^*$  and  $C_n$ .

#### **CBC Ciphertext-Stealing 3 Mode (CBC-CS3)**

$C_{n-1}^*$  and  $C_n$  are unconditionally swapped, i.e., even when  $C_{n-1}^*$  is a complete block; therefore, CBC-CS3 is not strictly an extension of CBC mode. In the other case, i.e., when  $C_{n-1}^*$  is a nonempty partial block, CBC-CS3-Encrypt is equivalent to CBC-CS2-Encrypt.

Refer to the following programming steps for how to program the AES related registers.

#### **AES DMA Mode Programming Flow**

1. Write 1 to AESIEN (CRYPTO\_INTEN[0]) to enable AES interrupt if needed.
2. Program AES key to registers CRYPTO\_AES\_KEY0 ~ CRYPTO\_AES\_KEY7.
3. Program initial vectors to registers CRYPTO\_AES\_IV0 ~ CRYPTO\_AES\_IV3.
4. Program DMA source address to SADDR(CRYPTO\_AES\_SADDR[31:0]).
5. Program DMA destination address to DADDR(CRYPTO\_AES\_DADDR[31:0]).
6. Program DMA byte count to register CNT(CRYPTO\_AES\_CNT [31:0]).
7. Configure KEYPRT(CRYPTO\_AES\_CTL[31]), INSWAP(CRYPTO\_AES\_CTL[23]), OUTSWAP(CRYPTO\_AES\_CTL[22]), ENCRYPTO(CRYPTO\_AES\_CTL[16]), OPMODE(CRYPTO\_AES\_CTL[15:8]), DMAEN(CRYPTO\_AES\_CTL[7]), and KEYSZ(CRYPTO\_AES\_CTL[3:2]).
8. Write input data to DMA source address with selected DMA byte count.
9. Write 1 to START(CRYPTO\_AES\_CTL[0]) to start AES encryption/decryption.
10. Wait for the AES interrupt flag AESIF (CRYPTO\_INTSTS[0]) be set.

11. Read output data from DMA destination address with selected DMA byte count.
12. Repeat step 8 to step 11 until all data processed if enabled DMACSCAD (CRYPTO\_AES\_CTL[6]).

**AES Non-DMA Mode Programming Flow**

1. Write 1 to AESIEN (CRYPTO\_INTEN[0]) to enable AES interrupt if needed.
2. Program AES key to register CRYPTO\_AES\_KEY0 ~ CRYPTO\_AES\_KEY7.
3. Program initial vectors to register CRYPTO\_AES\_IV0 ~ CRYPTO\_AES\_IV3.
4. Configure KEYPRT(CRYPTO\_AES\_CTL[31]), ENCRYPTO(CRYPTO\_AES\_CTL[16]), OPMODE(CRYPTO\_AES\_CTL[15:8]), and KEYSZ(CRYPTO\_AES\_CTL[3:2]).
5. Write 1 to START(CRYPTO\_AES\_CTL[0]) to start AES encryption/decryption.
6. Polling INBUFFULL(CRYPTO\_AES\_STS[9]) and OUTBUFEMPTY(CRYPTO\_AES\_STS[16]). If INBUFFULL is 0, write 32 bits input data to DATIN (CRYPTO\_AES\_DATIN[31:0]). If OUTBUFEMPTY is 0, read 32 bits data from DATOUT(CRYPTO\_AES\_DATOUT[31:0]).
7. Repeat step 6 until 128 bits data (16 bytes) are written to and read from AES engine.
8. Write 1 to DMALAST(CRYPTO\_AES\_CTL[5]) if current operation is last operation
9. Write data byte count of last operation to CNT(CRYPTO\_AES\_CNT[31:0]) if current operation is last operation.
10. Repeat steps 6 to step 9 until all data processed.

23	22	21	20	19	18	17	16
INSWAP	OUTSWAP	Reserved					ENCRYPTO
15	14	13	12	11	10	9	8
OPMODE							
7	6	5	4	3	2	1	0
DMAEN	DMACSCAD	DMALAST	Reserved	KEYSZ		STOP	START

Bits	Description
[31]	<b>KEYPRT</b> <b>Protect Key</b> Read as a flag to reflect KEYPRT. 0 = No effect. 1 = Protect the content of the AES key from reading. The return value for reading CRYPTO_AES_KEYx is not the content of the registers CRYPTO_AES_KEYx. Once it is set, it can be cleared by asserting KEYUNPRT. And the key content would be cleared as well.
[30:26]	<b>KEYUNPRT</b> <b>Unprotect Key</b> Writing 0 to CRYPTO_AES_CTL[31] and "10110" to CRYPTO_AES_CTL[30:26] is to unprotect the AES key. The KEYUNPRT can be read and written. When it is written as the AES engine is operating, BUSY flag is 1, there would be no effect on KEYUNPRT.
[25:24]	<b>Reserved</b> Reserved.
[23]	<b>INSWAP</b> <b>AES Engine Input Data Swap</b> 0 = Keep the original order. 1 = The order that CPU feeds data to the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.
[22]	<b>OUTSWAP</b> <b>AES Engine Output Data Swap</b> 0 = Keep the original order. 1 = The order that CPU outputs data from the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.
[21:17]	<b>Reserved</b> Reserved.
[16]	<b>ENCRYPTO</b> <b>AES Encryption/Decryption</b> 0 = AES engine executes decryption operation. 1 = AES engine executes encryption operation.

[15:8]	<b>OPMODE</b>	<b>AES Engine Operation Modes</b> 0x00 = ECB (Electronic Codebook Mode). 0x01 = CBC (Cipher Block Chaining Mode). 0x02 = CFB (Cipher Feedback Mode). 0x03 = OFB (Output Feedback Mode). 0x04 = CTR (Counter Mode). 0x10 = CBC-CS1 (CBC Ciphertext-Stealing 1 Mode). 0x11 = CBC-CS2 (CBC Ciphertext-Stealing 2 Mode). 0x12 = CBC-CS3 (CBC Ciphertext-Stealing 3 Mode).
[7]	<b>DMAEN</b>	<b>AES Engine DMA Enable Bit</b> 0 = AES DMA engine Disabled. The AES engine operates in Non-DMA mode. The data need to be written in CRYPTO_AES_DATIN. 1 = AES_DMA engine Enabled. The AES engine operates in DMA mode, and data movement from/to the engine is done by DMA logic.
[6]	<b>DMACSCAD</b>	<b>AES Engine DMA with Cascade Mode</b> 0 = DMA cascade function Disabled. 1 = In DMA cascade mode, software can update DMA source address register, destination address register, and byte count register during a cascade operation, without finishing the accelerator operation.
[5]	<b>DMALAST</b>	<b>AES Last Block</b> In DMA mode, this bit must be set as beginning the last DMA cascade round. In Non-DMA mode, this bit must be set when feeding in the last block of data in ECB, CBC, CTR, OFB, and CFB mode, and feeding in the (last-1) block of data at CBC-CS1, CBC-CS2, and CBC-CS3 mode. This bit is always 0 when it's read back. Must be written again once START is triggered.
[4]	<b>Reserved</b>	Reserved.
[3:2]	<b>KEYSZ</b>	<b>AES Key Size</b> This bit defines three different key size for AES operation. 2'b00 = 128 bits key. 2'b01 = 192 bits key. 2'b10 = 256 bits key. 2'b11 = Reserved. If the AES accelerator is operating and the corresponding flag BUSY is 1, updating this register has no effect.
[1]	<b>STOP</b>	<b>AES Engine Stop</b> 0 = No effect. 1 = Stop AES engine. <b>Note:</b> This bit is always 0 when it's read back.
[0]	<b>START</b>	<b>AES Engine Start</b> 0 = No effect. 1 = Start AES engine. BUSY flag will be set. <b>Note:</b> This bit is always 0 when it's read back.

Bits	Description
[31:0]	<p><b>AES Byte Count</b></p> <p>The CRYPTO_AES_CNT keeps the byte count of source text that is for the AES engine operating in DMA mode. The CRYPTO_AES_CNT is 32-bit and the maximum of byte count is 4G bytes.</p> <p>CRYPTO_AESn_CNT can be read and written. Writing to CRYPTO_AES_CNT while the AES accelerator is operating doesn't affect the current AES operation. But the value of CRYPTO_AESn_CNT will be updated later on. Consequently, software can prepare the byte count of data for the next AES operation.</p> <p>According to CBC-CS1, CBC-CS2, and CBC-CS3 standard, the count of operation data must be more than 16 bytes. Operations that are equal to or less than one block will output unexpected result.</p> <p>In Non-DMA ECB, CBC, CFB, OFB, and CTR mode, CRYPTO_AES_CNT must be set as byte count for the last block of data before feeding in the last block of data. In Non-DMA CBC-CS1, CBC-CS2, and CBC-CS3 mode, CRYPTO_AES_CNT must be set as byte count for the last two blocks of data before feeding in the last two blocks of data.</p>

## 6.26 CRC Controller (CRC)

### 6.26.1 Overview

The Cyclic Redundancy Check (CRC) generator can perform CRC calculation with four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32 settings.

### 6.26.2 Features

- Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32
  - CRC-CCITT:  $X^{16} + X^{12} + X^5 + 1$
  - CRC-8:  $X^8 + X^2 + X + 1$
  - CRC-16:  $X^{16} + X^{15} + X^2 + 1$
  - CRC-32:  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Programmable seed value
- Supports programmable order reverse setting for input data and CRC checksum
- Supports programmable 1's complement setting for input data and CRC checksum
- Supports 8/16/32-bit of data width
  - 8-bit write mode: 1-AHB clock cycle operation
  - 16-bit write mode: 2-AHB clock cycle operation
  - 32-bit write mode: 4-AHB clock cycle operation
- Supports using PDMA to write data to perform CRC operation

### 6.26.3 Block Diagram

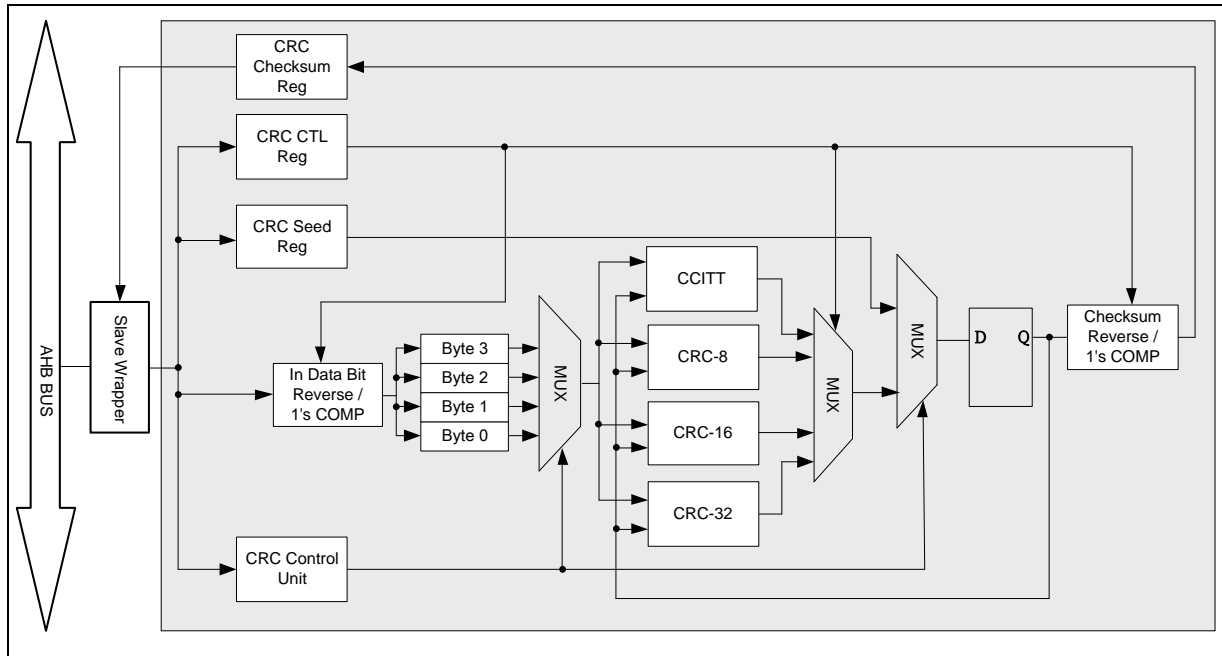

Figure 6.26-1 CRC Generator Block Diagram

### 6.26.4 Basic Configuration

- Clock Source Configuration

- Enable CRC peripheral clock in CRCKEN (CLK\_AHBCLK[7]).
- Reset Configuration
  - Reset CRC controller in CRCRST (SYS\_IPRST0[7]).

### 6.26.5 Functional Description

CRC generator can perform CRC calculation with four common polynomial settings. The operation polynomial includes CRC-CCITT, CRC-8, CRC-16 and CRC-32; User can choose the CRC operation polynomial mode by setting CRCMODE[1:0] (CRC\_CTL[31:30] CRC Polynomial Mode).

The following is a program sequence example.

1. Enable CRC generator by setting CRCEN (CRC\_CTL[0] CRC Channel Enable Bit).
  - 1) Initial setting for CRC calculation.
2. Configure 1's complement for CRC checksum by setting CHKSFMT (CRC\_CTL[27] Checksum 1's Complement).
  - 1) Configure bit order reverse for CRC checksum by setting CHKSREV (CRC\_CTL[25] Checksum Bit Order Reverse). The functional block is also shown in Figure 6.26-2 CHECKSUM Bit Order Reverse Functional Block
  - 2) .
- 3) Configure 1's complement for CRC write data by setting DATFMT (CRC\_CTL[26] Write Data 1's Complement).
- 4) Configure bit order reverse for CRC write data per byte by setting DATREV (CRC\_CTL[24] Write Data Bit Order Reverse). The functional block is also shown in Figure 6.26-3.
3. Perform CHKSINIT (CRC\_CTL[1] Checksum Initialization) to load the initial checksum value from CRC\_SEED register value.
4. Write data to CRC\_DAT register to calculate CRC checksum.
5. Get the CRC checksum result by reading CRC\_CHECKSUM register.

## 6.27 Enhanced 12-bit Analog-to-Digital Converter (EADC)

### 6.27.1 Overview

The chip contains one 12-bit successive approximation analog-to-digital converter (SAR ADC converter) with 16 external input channels and 3 internal channels. The ADC converter can be started by software trigger, PWM0/1 triggers, BPWM0/1 triggers, Timer0~3 overflow pulse triggers, ADINT0, ADINT1 interrupt EOC (End of conversion) pulse trigger and external pin (EADC0\_ST) input signal.

### 6.27.2 Features

- Analog input voltage range: 0~ $V_{REF}$  (Max to  $AV_{DD}$ )
- Reference voltage from  $V_{REF}$  pin or  $AV_{DD}$
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 16 single-end analog external input channels
- 3 internal channels, they are band-gap voltage ( $V_{BG}$ ), temperature sensor ( $V_{TEMP}$ ), and Battery power ( $V_{BAT}/4$ )
- Four EADC interrupts (ADINT0~3) with individual interrupt vector addresses
- Maximum EADC clock frequency is 16 MHz
- Up to 880 KSPS conversion rate
- Configurable EADC internal sampling time.
- Up to 19 sample modules:
  - Each of sample is configurable for EADC converter channel EADC\_CH0~15 and trigger source
  - Sample module 16~18 is fixed for EADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and battery power ( $V_{BAT}/4$ )
  - Configurable sampling time for each sample module
  - Support left-adjusted result
  - 12-bit resolution for conversion result and 16-bit resolution for accumulated conversion result
  - Conversion results are held in 19 data registers with valid and overrun indicators
  - Averaging ( $2^n$  times,  $n=0\sim8$ ) to support up to 12-bit result and over-sampling, or called Accumulation, ( $2^n$  times,  $n=0\sim8$ ) to support up to 16-bit result
- An ADC conversion can be started by:
  - Write 1 to SWTRGn (EADC\_SWTRG[n],  $n = 0\sim18$ )
  - External pin EADC0\_ST
  - Timer0~3 overflow pulse triggers
  - ADINT0 and ADINT1 interrupt EOC (End of conversion) pulse triggers
  - PWM0/1 triggers
  - BPWM0/1 triggers
- Supports configurable PDMA transfer
- Auto turn on/off EADC power at power off or operation mode with wait state(10us stable time)
- Supports digital comparator to monitor conversion result and user can select whether to

generate an interrupt when conversion result matches the compare register setting

- Internal reference voltage source: 1.536V, 2.048V, 2.560V, 3.072V, 4.096V and  $V_{REF}$  pin

- Reset Configuration
  - Reset EADC controller in ADCRST (EADC\_CTL [1]).

### 6.27.5 Functional Description

The EADC controller consists of a 19 channel analog switch, 19 sample modules and a 12-bit successive approximation analog-to-digital converter. The EADC operation is based on sample module 0~18, and each of them has its configuration to decide which trigger source to start the conversion, which channel to convert. Sample module 0~15 can be configured to EADC\_CH0~15 channel and different trigger source. It provides user a flexible means to get the over-sampling results. The sample module 0~15 are shows as follows.

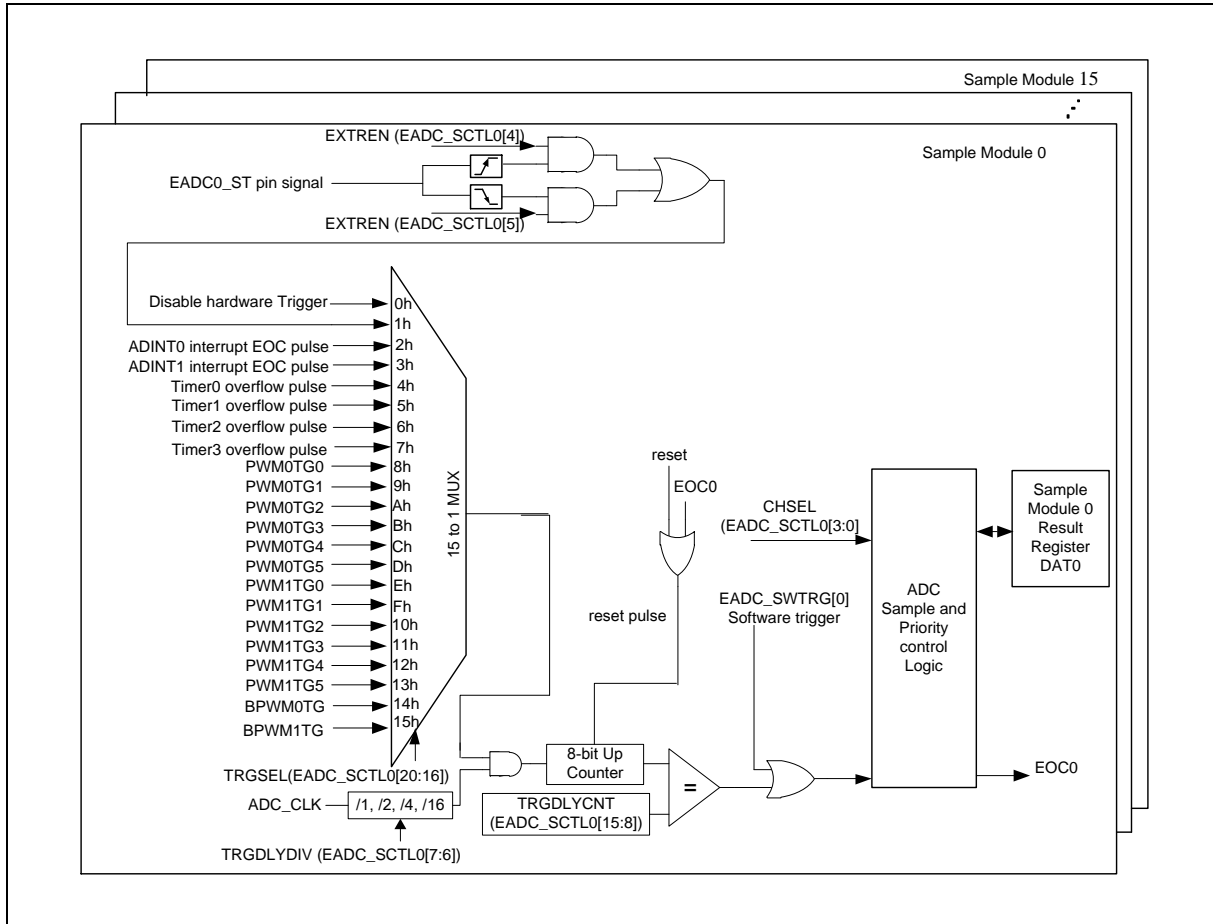

Figure 6.27-2 Sample Module 0~15 Block Diagram

Sample module 16~18 can convert internal channel ( $V_{BG}$ ,  $V_{TEMP}$ ,  $V_{BAT}/4$ ) and can be triggered by user write SWTRGn (EADC\_SWTRG[n], n = 16~18). Figure 6.27-3 shows the sample module 16~18.

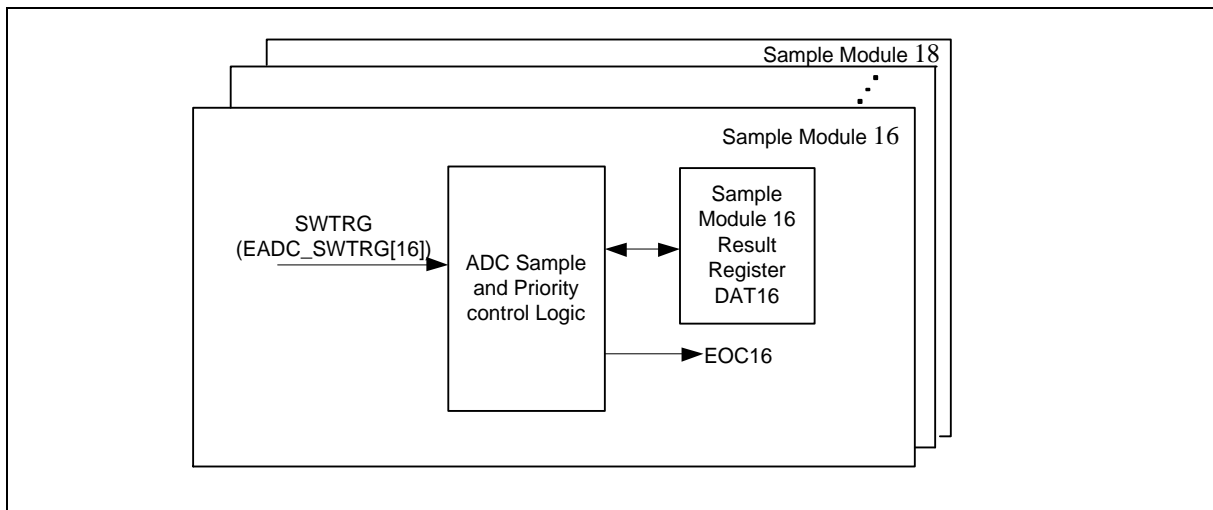

Figure 6.27-3 Sample Module 16~18 Block Diagram

The EADC conversion trigger sources in sample module 0~15 are listed below:

- Write 1 to SWTRGn (EADC\_SWTRG[n], n = 0~15)
- External pin EADC0\_ST
- Timer0~3 overflow pulse triggers
- ADINT0/1 EADC interrupt EOC (End of conversion) pulse triggers
- PWM0/1 triggers
- BPWM0/1 triggers

The ADINT0 or ADINT1 interrupt pulses are generated whenever the specific sample module ADC EOC (End of conversion) pulse is generated. ADINT0 or ADINT1 interrupt pulse triggers can be fed back to trigger another ADC conversion, and is useful if a continuous scan conversion is needed.

#### 6.27.5.1 EADC Clock Generator

The maximum EADC clock frequency is up to 16 MHz and the maximum sampling rate is up to 880 KSPS. It needs 16 EADC clocks to complete an ADC conversion by default setting.

The clock control of EADC is shown as Figure 6.27-4. The EADC peripheral clock source is from PCLK1 clock, the EADC clock frequency is divided by an 8-bit pre-scalar with the following formula:

$$\text{EADC clock frequency} = (\text{PCLK1}) / (\text{EADCDIV} (\text{CLK\_CLKDIV0}[23:16]) + 1)$$

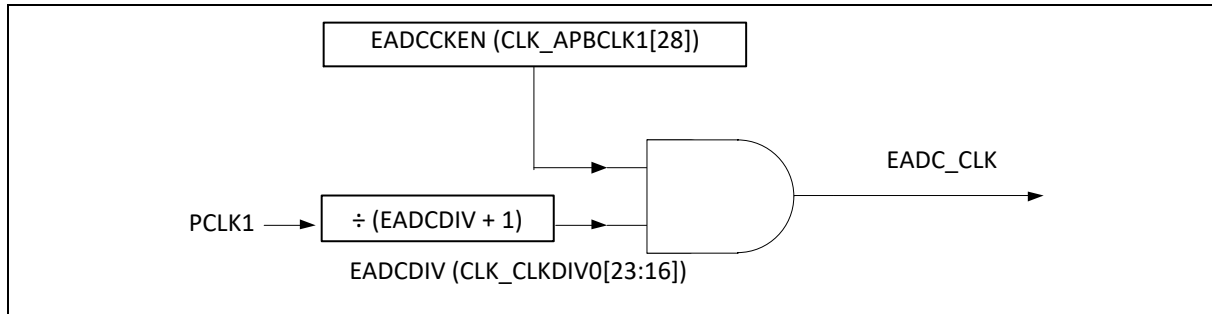

Figure 6.27-4 EADC Clock Control

#### 6.27.5.2 EADC Software Trigger Mode

When a EADC conversion is performed on the sample module specified single channel, the operations are as follows:

1. ADC conversion is started when the SWTRGn (EADC\_SWTRG[n], n=0~18) is set to 1 by user or other trigger inputs.
2. When ADC conversion is finished, the 12-bit result is stored in the EADC data register EADC\_DATn (n=0~18) corresponding to the sample module.
3. Set SPLIEn (EADC\_INTSRCm[n], n=0~18, m=0~3) to define which sample module affects ADIFn (EADC\_STATUS2[n], n=0~3) flag.
4. On completion of conversion, the ADIFn (EADC\_STATUS2[3:0], n=0~3) is set to 1 and EADC interrupt (ADINTn, n=0~3) is requested if the EADCIENn (EADC\_CTL[5:2], n=0~3) bit is set to 1.
5. The SWTRGn (n=0~18) bit remains 1 during ADC conversion. When ADC conversion ends, the SWTRGn (n=0~18) bit is automatically cleared to 0 and the ADC converter will do another pending conversion.

The timing diagram of a conversion cycle is shown in Figure 6.27-5.

Figure 6.27-5 Example EADC Conversion Timing Diagram, n=0~18

If more than one sample module is enabled to convert analog signal, the sample module specified channel with highest priority is firstly converted and other enabled sample module will be pended. The lower number sample module has higher priority. The sample module 0 is highest priority and the sample module 18 is lowest priority.

### 6.27.5.3 EADC Conversion Priority

There is a priority group converter for determining the conversion order when multiple sample module trigger flags are set at the same time, if two sample module are triggered at the same time, the sample module with lower number will start to convert EADC first.

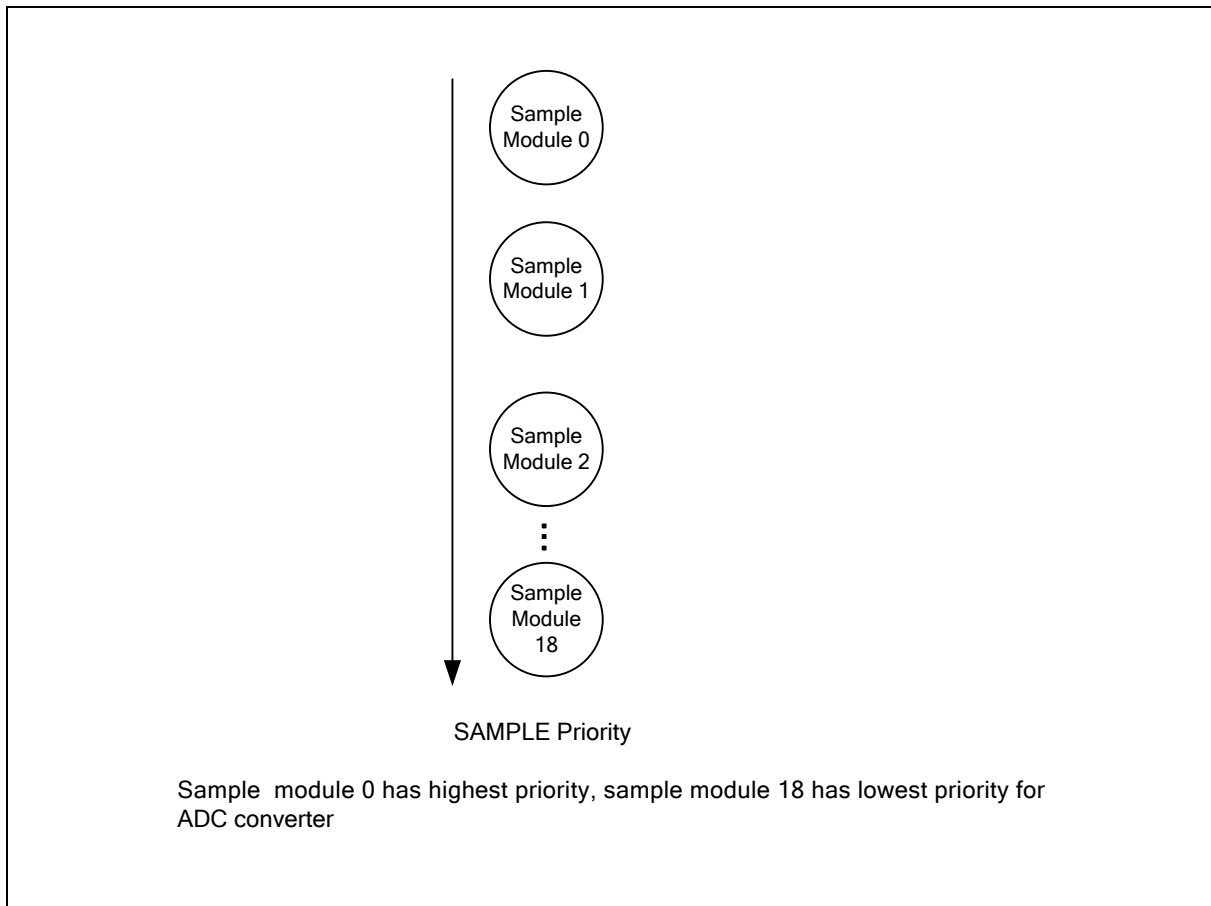

Figure 6.27-6 Sample Module Conversion Priority Arbitrator Diagram

#### 6.27.5.4 EADC Sample Module End of Conversion (EOC) Interrupt Operation

There are 4 EADC interrupts ADINT0~3, and each of these interrupts has its own interrupt vector address and ADINT0/ADINT1 can be configured to set multiple sample module EOC pulse (sample module 0~18 End of conversion pulses) as its interrupt trigger source.

When EADCIEN0 (EADC\_CTL[2]) = 1 and SPLIEn (EADC\_INTSRC0[n], n=0~18) = 1, all sample module EOC (End of conversion) pulses can cause an ADINT0 interrupt.

The ADINT0, ADINT1 interrupt pulses are generated whenever the specific sample module ADC EOC pulse is generated. The ADINT0, ADINT1 interrupt pulses can also be the sample module conversion trigger sources. The ADINT0, ADINT1 interrupt pulses can be used to do the EADC continuous scan conversion.

The example of continuous scan triggered by interrupt is as follows:

1. If EADC sample module 2 EOC2 pulse is selected as ADINT0 interrupt trigger SPLIE2 (EADC\_INTSRC0[2]) = 1 and ADINT0 is selected as sample module 0, 1, 2 hardware conversion trigger.
2. Set software trigger SWTRG2 (EADC\_SWTRG[2]) to 1 to start a sample module 2 conversion an EOC2 pulse signal. The EOC2 pulse signal is served as ADINT0 interrupt pulse at end of sample module 2 EADC conversion. ADINT0 interrupt pulse will trigger the sample module 0, 1, 2 to start the EADC conversions.
3. ADINT0 interrupt pulse repeats to trigger sample module 0, 1, 2 EADC conversions automatically.

4. Clear TRGSEL (EADC\_SCTL2[20:16]) to 0 to disable sample module 2 ADINT0 interrupt pulse hardware trigger, if needs to stop the continuous scan.

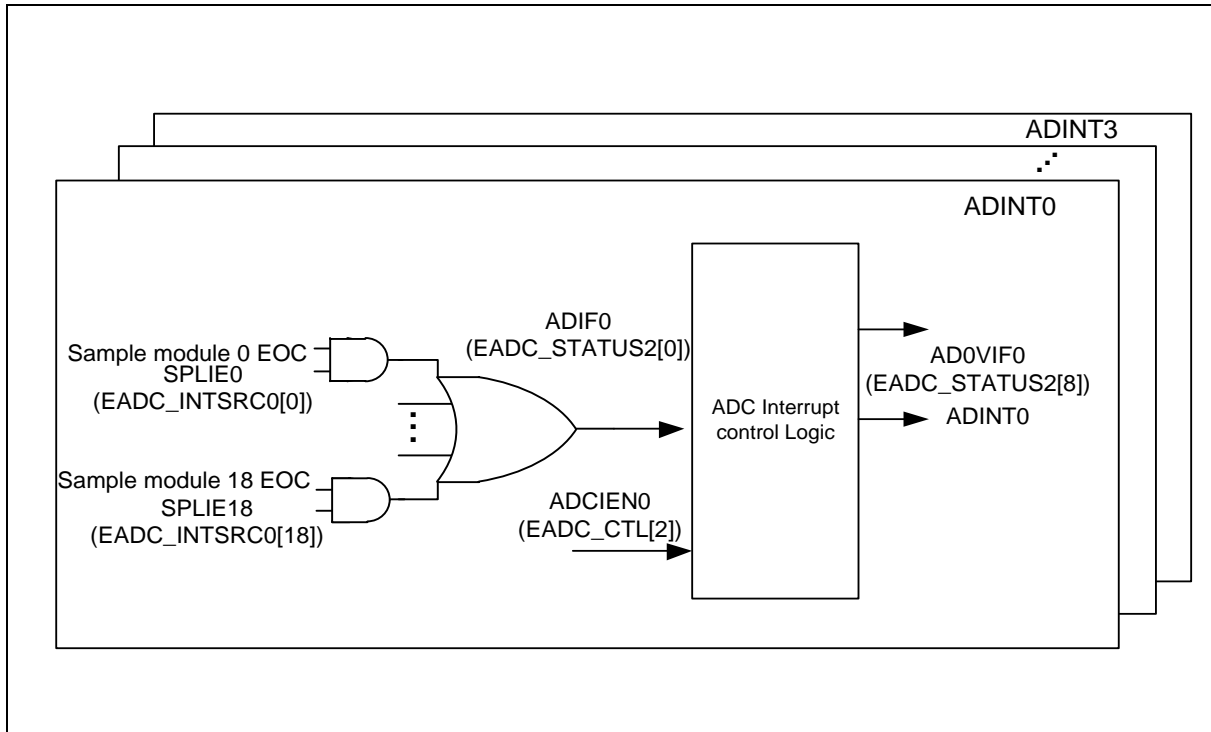

Figure 6.27-7 Specific Sample Module ADC EOC Signal for ADINT0~3 Interrupt

#### 6.27.5.5 EADC Trigger by External Pin EADC0\_ST

ADC conversion can be triggered by external pin EADC0\_ST request. Setting the TRGSEL (EADC\_SCTLn[20:16], n=0~15) to 0x01 is to select external trigger input from the EADC0\_ST pin. User can set EXTREN (EADC\_SCTLn[4], n=0~18) to enable pin EADC0\_ST trigger condition is falling or rising edge. There is a de-bounce circuit to detect falling or rising edge. If rising edge trigger condition is selected, the low state must be kept at least 2 PCLK cycles and the following high state must be kept at least 3 PCLK cycles. If falling edge trigger condition is selected, the high state must be kept at least 2 PCLK cycles and the following low state must be kept at least 3 PCLK cycles. Pulse that is shorter than this specification will be ignored. The external trigger timing is shown in Figure 6.27-8.

#### 6.27.5.6 EADC Trigger by Timer Trigger

There are 4 Timer trigger sources, TRGSEL (EADC\_SCTLn[20:16], n=0~15) bits are used to select external hardware trigger input source from Timer trigger. The detailed trigger conditions of Timer are described at TIMER0\_TRGCTL ~ TIMER3\_TRGCTL register

#### 6.27.5.7 EADC Trigger by PWM Trigger

There are 12 PWM trigger sources (rising, falling PWM edge or center point of PWM).

The TRGSEL (EADC\_SCTLn[20:16], n=0~15) bits is used to select external hardware trigger input source from PWM trigger. The detailed trigger conditions of PWM are described at PWM\_EADCTS0 and PWM\_EADCTS1 register.

#### 6.27.5.8 EADC Trigger by BPWM Trigger

There are 2 BPWM trigger sources which can be selected to configure sample module 0~15 for EADC

start trigger. The TRGSEL (EADC\_SCTLn[20:16], n=0~15) bits is used to select external hardware trigger input source from BPWM trigger. The detailed trigger conditions of BPWM are described at BPWM\_EADCTS0 and BPWM\_EADCTS1 register.

Figure 6.27-8 EADC0\_ST De-bounce Timing Diagram

6.27.5.9 EADC Trigger Delay

The device also allows user to configure the amount of delay period to EADC start after hardware detected the external trigger. User can configure the trigger delay time by setting TRGDLYCNT (EADC\_SCTLn[15:8], n=0~15) and TRGDLYDIV (EADC\_SCTLn[7:6], n=0~15). Figure 6.27-9 shows the programmable delay time for PWM-triggered EADC start conversion.

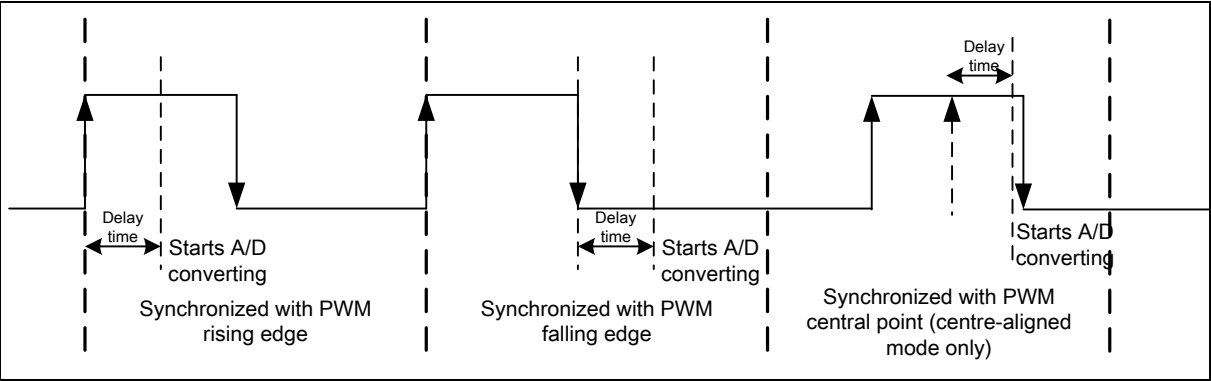

Figure 6.27-9 PWM-triggered EADC Start Conversion

Figure 6.27-10 shows the programmable delay time for other trigger source.

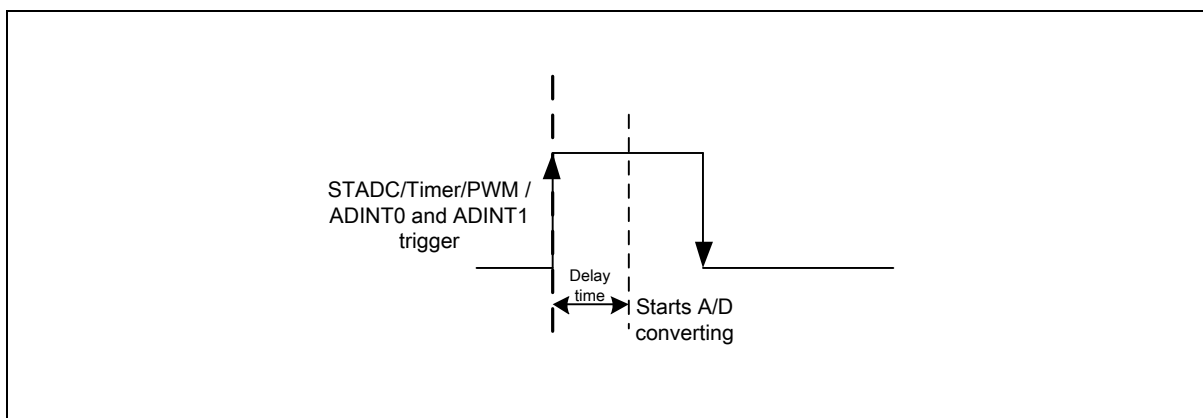

Figure 6.27-10 External triggered EADC Start Conversion

#### 6.27.5.10 Input Sampling and ADC Conversion Time

The ADC converter sample the analog input when ADC conversion start delay time ( $T_d$ ) has passed after  $SWTRG_n$  (EADC\_SWTRG[n],  $n=0\sim18$ ) is set to 1, then start conversion. Due to EADC clock is generated by PCLK divided by  $(EADC_{DIV}(\text{CLK\_CLKDIV0}[23:16])+1)$ , the maximum delay time from user write  $SWTRG_n$  to ADC start sampling analog input time is two EADC clock cycles. The start delay time is shown in Figure 6.27-11.

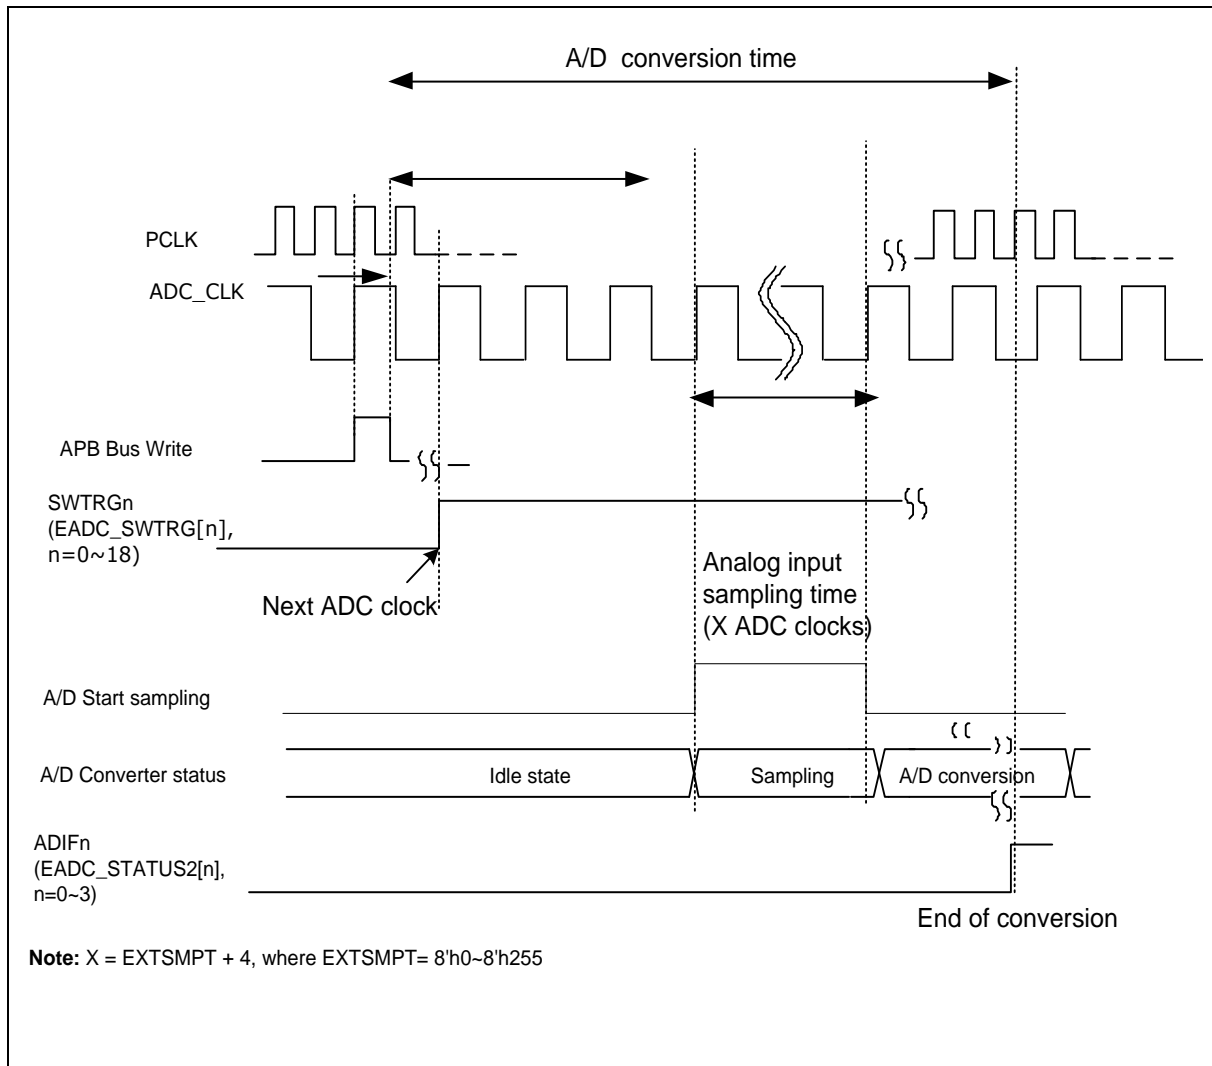

Figure 6.27-11 Conversion Start Delay Timing Diagram

#### 6.27.5.11 ADC Extend Sampling Time

When ADC operates at high EADC clock rate, the sampling time of analog input voltage may not be enough if the analog channel has heavy loading to cause fully charge time is longer. User can set extend sampling time by writing EXTSMPT (EADC\_SCTLn[31:24], n=0~15) for each sample module. The ADC extend sampling time is present between ADC controller judging which channel to be converted and ADC starting conversion. The range of extend sampling time is from 0 ~255 EADC clock. The extended sampling time is shown in Figure 6.27-12.

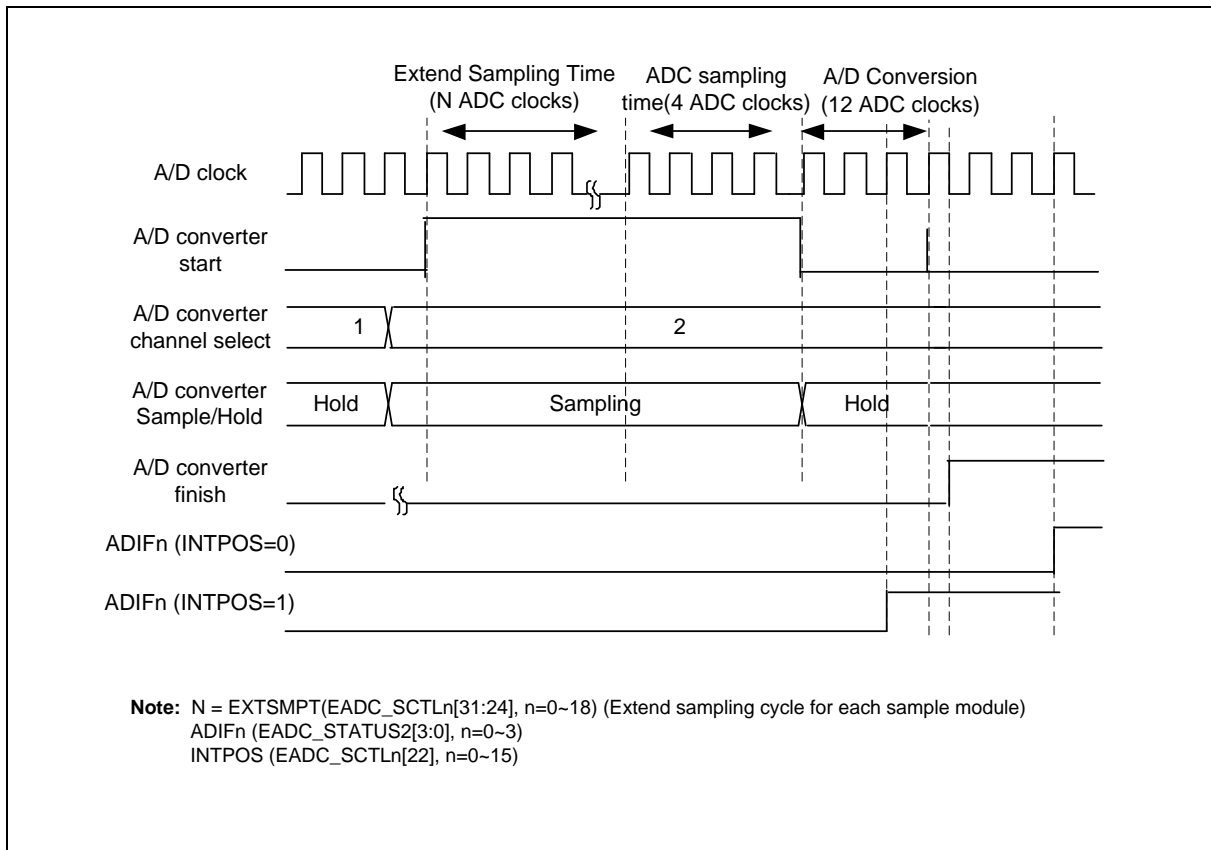

Figure 6.27-12 ADC Extend Sampling Timing Diagram

#### 6.27.5.12 EADC conversion Result Format

At the end of each conversion (when an EOC event occurs), the result of the converted data is stored in the EADC\_DATn data register which is 16-bit wide. The format of the EADC\_DATn depends on the configured data alignment and resolution. The ALIGN (EADC\_MnCTL1[0]) bit selects the alignment of the conversion result. Data can be right-aligned (ALIGN=0) or left-aligned (ALIGN=1) as shown in Figure 6.27-13. It is noted that n = 0~15.

- 12-bit left alignment: EADC conversion result is stored in EADC\_DATn[15:4] bits. EADC\_DATn[31:16] and EADC\_DATn[3:0] are ignored in EADC conversion.
- 12-bit right alignment: EADC conversion result is stored in EADC\_DATn[11:0] bits, EADC\_DATn[31:12] are ignored in AC conversion. It is noted that n = 0~15.

Figure 6.27-13 EADC\_DATn (n= 0~15) Aligned Format

#### 6.27.5.13 Accumulation

The function provides multiple consecutive conversion results to be accumulated to a final conversion result. Setting ACU (EADC\_MnCTL1[7:4], n=0~15) can determine which sample module and the number of samples to be accumulated. It is noted that when more than 16 samples are to be

accumulated, the final result after accumulating will exceed the 16-bit RESULT(EADC\_DATn [0:15], n=0~18) register size. In this case, the result is right shifted automatically to fit within the appropriate register size. It is noted that accumulation function is only effective without data left alignment.

ACU (EADC_MnCTL1 [7:4]), N=0~15	Number Of Samples To Be Accumulated	Right Shift Division Factor	Final Result Precision
0x0	1	1	12 bits
0x1	2	1	13 bits
0x2	4	1	14 bits
0x3	8	1	15 bits
0x4	16	1	16 bits
0x5	32	2	16 bits
0x6	64	4	16 bits
0x7	128	8	16 bits
0x8	256	16	16 bits

Table 6.27-2 The Setting of Accumulation and Conversion Result Precision

The result from multiple consecutive conversions can be accumulated. The number of samples can be accumulated is specified by ACU (EADC\_MnCTL1[7:4], n=0~15). When accumulating more than 16 samples, the result will be too large to match the 16-bit RESULT(EADC\_DATn [0:15], n=0~18) register size. To avoid overflow, the result is right shifted automatically to fit within the available register size. It is noted that accumulation is only effective without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Accumulated Samples	Of Automatic Factor	Division	Final Precision	Result
0x0	0x0	1	1		12 bits	
0x0	0x1	2	1		13 bits	
0x0	0x2	4	1		14 bits	
0x0	0x3	8	1		15 bits	
0x0	0x4	16	1		16 bits	
0x0	0x5	32	2		16 bits	
0x0	0x6	64	4		16 bits	
0x0	0x7	128	8		16 bits	
0x0	0x8	256	16		16 bits	

Table 6.27-3 The Setting of Accumulation and Conversion Result Precision

#### 6.27.5.14 Averaging

The function increasing the sample accuracy with reduced sampling rate and the feature is suitable in noisy operating environment for getting more stable average conversion results. According to the accumulated final result in 6.27.5.13, setting AVG (EADC\_MnCTL1[1]) can enable averaging function

as shown in Table 6.27-5. The automatic division factor is decided by the number of accumulated samples and the final result will get 12 bits precision. It is noted that averaging is only effective when accumulating two more samples without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Of Samples To Be Accumulated	Automatic Division Factor	Final Precision Result
0x1	0x0	1	1	12 bits
0x1	0x1	2	2	12 bits
0x1	0x2	4	4	12 bits
0x1	0x3	8	8	12 bits
0x1	0x4	16	16	12 bits
0x1	0x5	32	32	12 bits
0x1	0x6	64	64	12 bits
0x1	0x7	128	128	12 bits
0x1	0x8	256	256	12 bits

Table 6.27-4 The Setting of Averaging and Conversion Result Precision

Averaging is a feature that increases the sample accuracy at the cost of a reduced sampling rate. This feature is suitable when operating in noisy conditions. Averaging is done by accumulating m samples, as described in section 6.27.5.13, and dividing the result by m. The averaged result is available in the data register. The number of samples to be accumulated is specified by writing to ACU (EADC\_MnCTL1[7:4], n=0~15) as shown in Table 6.27-3. Setting AVG (EADC\_MnCTL1[1]) can enable averaging function as shown in Table 6.27-5. The division is obtained by a combination of the automatic right shift described above. It is noted that averaging is only effective when accumulating two more samples without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Accumulated Samples	Of	Automatic Division Factor	Final Precision Result
0x1	0x0	1		1	12 bits
0x1	0x1	2		2	12 bits
0x1	0x2	4		4	12 bits
0x1	0x3	8		8	12 bits
0x1	0x4	16		16	12 bits
0x1	0x5	32		32	12 bits
0x1	0x6	64		64	12 bits
0x1	0x7	128		128	12 bits
0x1	0x8	256		256	12 bits

Table 6.27-5 The Setting of Averaging and Conversion Result Precision

#### 6.27.5.15 Conversion Result Monitor by Compare Mode

The EADC controller provides four sets of compare registers EADC\_CMP0 ~ EADC\_CMP3 to monitor a maximum of four specified sample module 0~18 conversion results from ADC conversion module, as shown in Figure 6.27-14. User can select which sample module result to be monitored by set CMPSPn (EADC\_CMPn[7:3], n =0~3) and CMPCOND (EADC\_CMPn[2], where n =0~3) is used to check conversion result is less than specify value or greater than (equal to) value specified in CMPDAT (EADC\_CMPn[27:16], where n =0~3). When the conversion of the sample module specified by CMPSPn is completed, the comparing action will be triggered one time automatically. When the compare result meets the compare condition, the internal compare match counter will increase 1. If the compare result does not meet the condition, the compare match counter will reset to 0. When counter value reach the setting of (CMPMCNT (EADC\_CMPn[11:8])+1, where n =0~3) then EADCMPPn (EADC\_STATUS2[7:4], where n =0~3) bit will be set to 1, if EADCMPIE (EADC\_CMPn[1], n =0~3) is set then an ADINT3 interrupt request is generated. User can use it to monitor the external analog input pin voltage transition. Detailed logics diagram is shown in Figure 6.27-14.

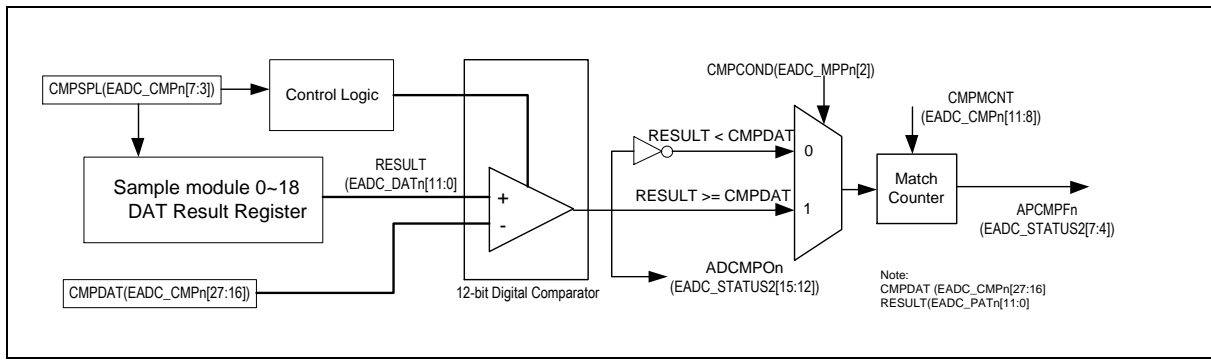

Figure 6.27-14 ADC Conversion Result Monitor Logics Diagram

The EADC controller supports a window compare mode. User can set CMPWEN (EADC\_CMP0[15]/EADC\_CMP2[15]) to enable this function. If user enables this function, EADCMPP0 (EADC\_STATUS2[4]) will be set when both EADC\_CMP0 and EADC\_CMP1 compared condition matched. EADCMPP2 (EADC\_STATUS2[6]) will be set when both EADC\_CMP2 and EADC\_CMP3 compared condition are matched.

#### 6.27.5.16 Auto Power On/Off Mode

The EADC has an automatic power management feature called auto power on-off mode. Setting AUTOFF (EADC\_PWRCTL[5]) to 1 can enable this function. AUTOFF needs combine with AUTOPDTH (EADC\_PWRCTL[23:20]) to work. When a Sample Module is finished, EADC will enter idle state. If AUTOFF(EADC\_PWRCTL[5]) is set to 1 and the interval of time in idle state is longer than AUTOPDTH, EADC will power-down ADC converter analog circuit to reduce power consumption. The EADCEN (EADC\_CTL[0]) will be set to 0 when EADC power-down and set to 1 when EADC is woken up.

The EADC will automatically wake up when a conversion is started (by software or hardware trigger). A start-up time is automatically inserted between the trigger event which starts the conversion and the sampling time of the EADC. The start-up time must be longer than 10 us that can be set by STUPT(EADC\_PWRCTL[19:8]).

#### 6.27.5.17 PDMA Request

The EADC controller supports configurable PDMA. User can config source address of PDMA channels as EADC\_CURDAT (EADC\_BA+0x4C ) and enable PDMATEN (EADC\_PDMACTL[18:0]) to decide which channel should be performed PDMA transfer. After enable PDMATEN, if any VALID (EADC\_DATn[17],n=0~18) is high, EADC controller will send request to PDMA and PDMA will read EADC\_CURDAT to get result. The EADC\_CURDAT register is a shadow register of highest priority EADC\_DAT register. The lower number sample module is higher priority. After PDMA read EADC\_CURDAT register, the VALID of the shadow EADC\_DAT register will be automatically cleared.

### 6.27.5.18 Interrupt Sources

The ADC converter generates ADIFn (EADC\_STATUS2[3:0], n=0~3) at the start of conversion or the end of conversion decide by INTPOS (EADC\_SCTLn[22], n=0~15). If EADCIENn (EADC\_CTL[5:2], n=0~3) is set then conversion end interrupt request ADINTn (n=0~3) is generated. The controller of interrupts is shown as Figure 6.27-15.

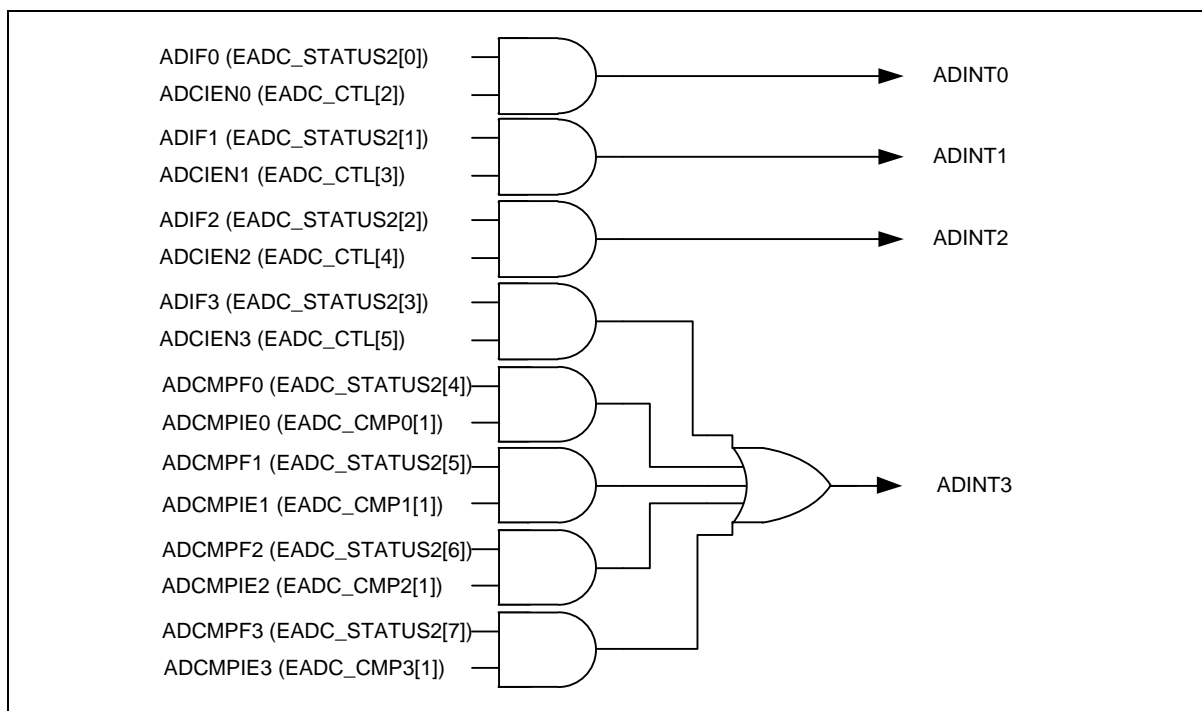

Figure 6.27-15 ADC Controller Interrupts

## 6.27.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>EADC Base Address:</b> EADC_BA = 0x4004_3000				
EADC_DAT0	EADC_BA+0x00	R	ADC Data Register 0 for Sample Module 0	0x0000_0000

## 6.27.7 Register Description

ADC Data Registers (EADC\_DAT0~EADC\_DAT18)

Register	Offset	R/W	Description	Reset Value
EADC_DAT0	EADC_BA+0x00	R	ADC Data Register 0 for Sample Module 0	0x0000_0000
EADC_DAT1	EADC_BA+0x04	R	ADC Data Register 1 for Sample Module 1	0x0000_0000
EADC_DAT2	EADC_BA+0x08	R	ADC Data Register 2 for Sample Module 2	0x0000_0000
EADC_DAT3	EADC_BA+0x0C	R	ADC Data Register 3 for Sample Module 3	0x0000_0000
EADC_DAT4	EADC_BA+0x10	R	ADC Data Register 4 for Sample Module 4	0x0000_0000
EADC_DAT5	EADC_BA+0x14	R	ADC Data Register 5 for Sample Module 5	0x0000_0000
EADC_DAT6	EADC_BA+0x18	R	ADC Data Register 6 for Sample Module 6	0x0000_0000
EADC_DAT7	EADC_BA+0x1C	R	ADC Data Register 7 for Sample Module 7	0x0000_0000
EADC_DAT8	EADC_BA+0x20	R	ADC Data Register 8 for Sample Module 8	0x0000_0000
EADC_DAT9	EADC_BA+0x24	R	ADC Data Register 9 for Sample Module 9	0x0000_0000
EADC_DAT10	EADC_BA+0x28	R	ADC Data Register 10 for Sample Module 10	0x0000_0000
EADC_DAT11	EADC_BA+0x2C	R	ADC Data Register 11 for Sample Module 11	0x0000_0000
EADC_DAT12	EADC_BA+0x30	R	ADC Data Register 12 for Sample Module 12	0x0000_0000
EADC_DAT13	EADC_BA+0x34	R	ADC Data Register 13 for Sample Module 13	0x0000_0000
EADC_DAT14	EADC_BA+0x38	R	ADC Data Register 14 for Sample Module 14	0x0000_0000
EADC_DAT15	EADC_BA+0x3C	R	ADC Data Register 15 for Sample Module 15	0x0000_0000
EADC_DAT16	EADC_BA+0x40	R	ADC Data Register 16 for Sample Module 16	0x0000_0000
EADC_DAT17	EADC_BA+0x44	R	ADC Data Register 17 for Sample Module 17	0x0000_0000
EADC_DAT18	EADC_BA+0x48	R	ADC Data Register 18 for Sample Module 18	0x0000_0000

RESULT							

Bits	Description	
[31:18]	<b>Reserved</b>	Reserved.
[17]	<b>VALID</b>	<b>Valid Flag</b> This bit is set to 1 when corresponding sample module channel analog input conversion is completed and cleared by hardware after EADC_DAT register is read. 0 = Data in RESULT[11:0] bits is not valid. 1 = Data in RESULT[11:0] bits is valid.
[16]	<b>OV</b>	<b>Overrun Flag</b> If converted data in RESULT[11:0] has not been read before new conversion result is loaded to this register, OV is set to 1. 0 = Data in RESULT[11:0] is recent conversion result. 1 = Data in RESULT[11:0] is overwrite. <b>Note:</b> It is cleared by hardware after EADC_DAT register is read.
[15:0]	<b>RESULT</b>	<b>ADC Conversion Result</b> This field contains 12 bits conversion result.

**EADC PDMA Current Transfer Data Register**  
**(EADC\_CURDAT)**

Register	Offset	R/W	Description	Reset Value
EADC_CURDAT	EADC_BA+0x4C	R	EADC PDMA Current Transfer Data Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

CURDAT							
7	6	5	4	3	2	1	0
CURDAT							

Bits	Description	
[31:19]	Reserved	Reserved.
[18:0]	CURDAT	<b>EADC PDMA Current Transfer Data (Read Only)</b> This register is a shadow register of EADC_DATn (n=0~18) for PDMA support. <b>Note:</b> After PDMA reads this register, the VALD of the shadow EADC_DAT register will be automatically cleared.

## ADC Control Register

(EADC\_CTL)

Register	Offset	R/W	Description	Reset Value
EADC_CTL	EADC_BA+0x50	R/W	ADC Control Register	0x0004_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		EADCIEN3	EADCIEN2	EADCIEN1	EADCIEN0	EADCRST	EADCEN

Bits	Description
[31:6]	<b>Reserved</b> Reserved.
[5]	<b>EADCIEN3</b> <b>Specific Sample Module ADC ADINT3 Interrupt Enable Bit</b> The ADC converter generates a conversion end ADIF3 (EADC_STATUS2[3]) upon the end of specific sample module ADC conversion. If EADCIEN3 bit is set then conversion end interrupt request ADINT3 is generated. 0 = Specific sample module ADC ADINT3 interrupt function Disabled. 1 = Specific sample module ADC ADINT3 interrupt function Enabled.
[4]	<b>EADCIEN2</b> <b>Specific Sample Module ADC ADINT2 Interrupt Enable Bit</b> The ADC converter generates a conversion end ADIF2 (EADC_STATUS2[2]) upon the end of specific sample module ADC conversion. If EADCIEN2 bit is set then conversion end interrupt request ADINT2 is generated. 0 = Specific sample module ADC ADINT2 interrupt function Disabled. 1 = Specific sample module ADC ADINT2 interrupt function Enabled.
[3]	<b>EADCIEN1</b> <b>Specific Sample Module ADC ADINT1 Interrupt Enable Bit</b> The ADC converter generates a conversion end ADIF1 (EADC_STATUS2[1]) upon the end of specific sample module ADC conversion. If EADCIEN1 bit is set then conversion end interrupt request ADINT1 is generated. 0 = Specific sample module ADC ADINT1 interrupt function Disabled. 1 = Specific sample module ADC ADINT1 interrupt function Enabled.
[2]	<b>EADCIEN0</b> <b>Specific Sample Module ADC ADINT0 Interrupt Enable Bit</b> The ADC converter generates a conversion end ADIF0 (EADC_STATUS2[0]) upon the end of specific sample module ADC conversion. If EADCIEN0 bit is set then conversion end interrupt request ADINT0 is generated. 0 = Specific sample module ADC ADINT0 interrupt function Disabled. 1 = Specific sample module ADC ADINT0 interrupt function Enabled.

Bits	Description	
[1]	EADCRST	<b>EADC ADC Converter Control Circuits Reset</b> 0 = No effect. 1 = Cause EADC control circuits reset to initial state, but not change the EADC registers value. <b>Note:</b> EADCRST bit remains 1 during EADC reset. When EADC reset end, the EADCRST bit is automatically cleared to 0.
[0]	EADCEN	<b>ADC Converter Enable Bit</b> 0 = Disabled EADC. 1 = Enabled EADC. <b>Note:</b> Before starting ADC conversion function, this bit should be set to 1. Clear it to 0 to disable ADC converter analog circuit power consumption.

## ADC Sample Module Software Start Register (EADC\_SWTRG)

Register	Offset	R/W	Description	Reset Value
EADC_SWTRG	EADC_BA+0x54	W	ADC Sample Module Software Start Register	0x0000_0000

Bits	Description
[31:28]	Reserved
[27:16]	<b>Comparison Data</b> The 12 bits data is used to compare with conversion result of specified sample module. User can use it to monitor the external analog input pin voltage transition without imposing a load on software.
[15]	<b>Compare Window Mode Enable Bit</b> 0 = EADCM PF0 (EADC_STATUS2[4]) will be set when EADC_CMP0 compared condition matched. EADCM PF2 (EADC_STATUS2[6]) will be set when EADC_CMP2 compared condition matched 1 = EADCM PF0 (EADC_STATUS2[4]) will be set when both EADC_CMP0 and EADC_CMP1 compared condition matched. EADCM PF2 (EADC_STATUS2[6]) will be set when both EADC_CMP2 and EADC_CMP3 compared condition matched. <b>Note:</b> This bit is only present in EADC_CMP0 and EADC_CMP2 register.
[14:12]	Reserved
[11:8]	<b>Compare Match Count</b> When the specified ADC sample module analog conversion result matches the compare condition defined by CMPCOND (EADC_CMPn[2], n=0~3), the internal match counter will increase 1. If the compare result does not meet the compare condition, the internal compare match counter will reset to 0. When the internal counter reaches the value to (CMPMCNT +1), the EADCM PFn (EADC_STATUS2[7:4], n=0~3) will be set.

Bits	Description	
[7:3]	<b>CMPSPL</b>	<p><b>Compare Sample Module Selection</b></p> <p>00000 = Sample Module 0 conversion result EADC_DAT0 is selected to be compared.  00001 = Sample Module 1 conversion result EADC_DAT1 is selected to be compared.  00010 = Sample Module 2 conversion result EADC_DAT2 is selected to be compared.  00011 = Sample Module 3 conversion result EADC_DAT3 is selected to be compared.  00100 = Sample Module 4 conversion result EADC_DAT4 is selected to be compared.  00101 = Sample Module 5 conversion result EADC_DAT5 is selected to be compared.  00110 = Sample Module 6 conversion result EADC_DAT6 is selected to be compared.  00111 = Sample Module 7 conversion result EADC_DAT7 is selected to be compared.  01000 = Sample Module 8 conversion result EADC_DAT8 is selected to be compared.  01001 = Sample Module 9 conversion result EADC_DAT9 is selected to be compared.  01010 = Sample Module 10 conversion result EADC_DAT10 is selected to be compared.  01011 = Sample Module 11 conversion result EADC_DAT11 is selected to be compared.  01100 = Sample Module 12 conversion result EADC_DAT12 is selected to be compared.  01101 = Sample Module 13 conversion result EADC_DAT13 is selected to be compared.  01110 = Sample Module 14 conversion result EADC_DAT14 is selected to be compared.  01111 = Sample Module 15 conversion result EADC_DAT15 is selected to be compared.  10000 = Sample Module 16 conversion result EADC_DAT16 is selected to be compared.  10001 = Sample Module 17 conversion result EADC_DAT17 is selected to be compared.  10010 = Sample Module 18 conversion result EADC_DAT18 is selected to be compared.</p>
[2]	<b>CMPCOND</b>	<p><b>Compare Condition</b></p> <p>0= Set the compare condition as that when a 12-bit ADC conversion result is less than the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one.  1= Set the compare condition as that when a 12-bit ADC conversion result is greater or equal to the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one.</p> <p><b>Note:</b> When the internal counter reaches the value to (CMPMCNT (EADC_CMPn[11:8], n=0~3) +1), the EADCMPFn bit will be set.</p>
[1]	<b>EADCMPIE</b>	<p><b>ADC Result Compare Interrupt Enable Bit</b></p> <p>0 = Compare function interrupt Disabled.  1 = Compare function interrupt Enabled.</p> <p>If the compare function is enabled and the compare condition matches the setting of CMPCOND (EADC_CMPn[2], n=0~3) and CMPMCNT (EADC_CMPn[11:8], n=0~3), EADCMPFn (EADC_STATUS2[7:4], n=0~3) will be asserted, in the meanwhile, if EADCMPIE is set to 1, a compare interrupt request is generated.</p>
[0]	<b>EADCMPEN</b>	<p><b>ADC Result Compare Enable Bit</b></p> <p>0 = Compare Disabled.  1 = Compare Enabled.</p> <p>Set this bit to 1 to enable compare CMPDAT (EADC_CMPn[27:16], n=0~3) with specified sample module conversion result when converted data is loaded into EADC_DAT register.</p>

## 6.28 LCD Controller

### 6.28.1 Overview

The LCD controller controls the device's built-in voltage/current drivers, which can drive externally connected LCD panels with up to 8 common planes (or called common electrodes, COMs) and 48 segments (SEGs). Each COM or SEG output pin of the device can supply the necessary voltage waveform to the connected LCD panels.

The LCD controller provides several setting registers, by which users can effectively control a variety of LCD panels with specific considerations for display modes, driving capability, and power consumption.

### 6.28.2 Features

- Supports the following maximum COM/SEG combinations:
  - 352 pixels (8-COM x 44-SEG)
  - 276 pixels (6-COM x 46-SEG)
  - 192 pixels (4-COM x 48-SEG)

(Note: The above numbers may differ for some devices with various package pinouts. Please refer to device datasheets for the exact numbers.)
- Supports up to 8 COM output pins, multiplexed with GPIO pins
- Supports up to 48 SEG output pins, multiplexed with GPIO pins
- Supports 3 bias levels: 1/2, 1/3, and 1/4
- Supports 8 duty ratios: 1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, and 1/8
- Supports both types A and B waveforms
- Supports a clock frequency divider, programmable from 0 to 1023, to generate the LCD operating frequency ( $F_{LCD}$ )
- Supports LCD operating voltage ( $V_{LCD}$ ) from 3.0 V to 5.2 V
- Selectable LCD operating voltage sources:
  - $V_{LCD}$  (External dedicated  $V_{DD}$  pin for LCD) power
  - $AV_{DD}$  (Analog  $V_{DD}$ ) power
  - Built-in charge pump
- A built-in resistive network to generate required bias voltages
  - Supports 2 drive modes: low-drive and high-drive modes
  - Supports voltage buffers which are active only in the low-drive mode
- Supports a programmable power-saving mode. During this mode,
  - the resistive network temporarily changes to the low-drive mode, or
  - the voltage buffers are temporarily turned off.
- At the end of every frame, a dedicated flag is set and an interrupt can be programmed to occur.
- Supports a frame counter. At the end of frame counting, a dedicated flag is set and an interrupt can be programmed to occur.
- Supports LCD blinking capability. By using the frame counter, users have more flexibility to adjust the blinking frequency.
- Selectable LCD clock sources: LIRC and LXT. LCD display or blinking can keep working

even when the chip is in Power-down mode, only if at least one of LIRC and LXT is active.

- Supports a charging timer for the charge pump, by which users can estimate the loading of the charge pump, and adjust, if necessary, its charging power.

### 6.28.3 Block Diagram

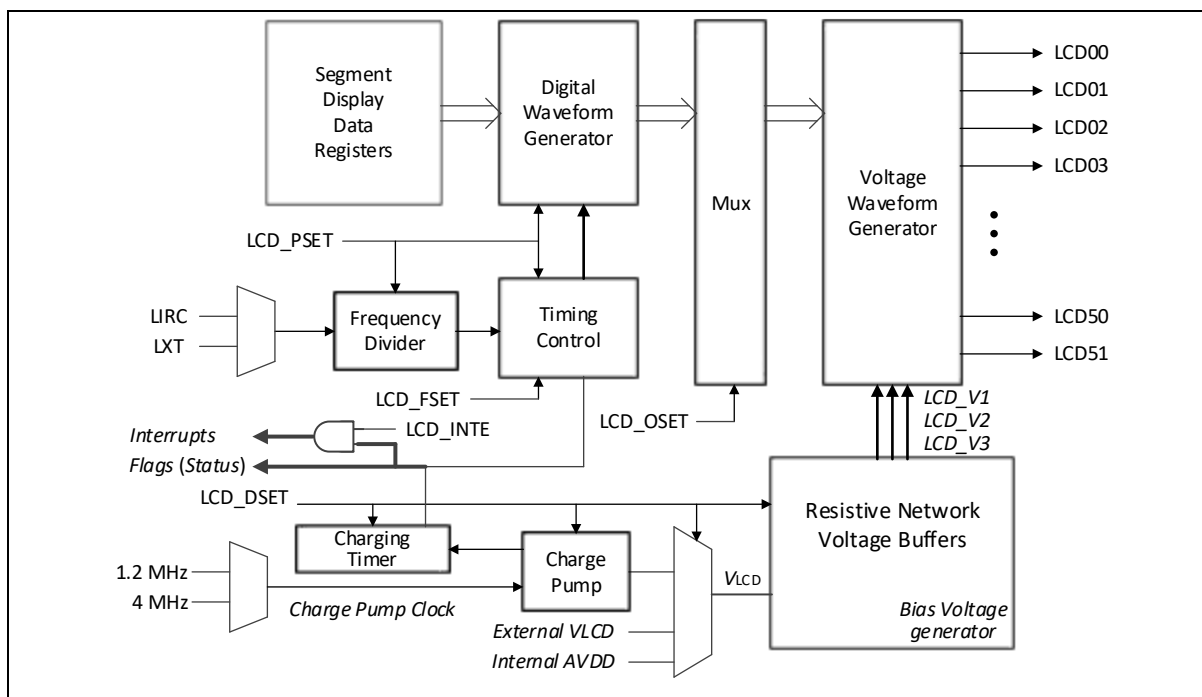

Figure 6.28-1 LCD Controller Block Diagram

### 6.28.4 Basic Configuration

- Reset Configuration
  - Reset the LCD controller by writing the register bit SYS\_IPRST2[14].
- LCD Clock (CLK<sub>LCD</sub>) Configuration
  - Enable the LCD clock by setting the register bit CLK\_APBCLK1[14].
  - Select the source of the LCD clock, i.e., LIRC or LXT, by setting the register bit CLK\_CLKSEL2[24].
- LCD Charge Pump Clock Configuration
  - Enable the LCD charge pump clock by setting the register bit CLK\_APBCLK1[15].
  - Select the LCD charge pump clock source, 1 MHz or 4 MHz, by setting the register bit CLK\_CLKSEL2[25].
- COM/SEG Output Pin Configuration

Table 6.28-1 COM/SEG Output Configuration

## 6.28.5 Functional Description

### 6.28.5.1 LCD Controller Enable/Disable

To enable the LCD controller, write 1 to the register bit LCD\_CTL[0]. The connected LCD panel starts to display.

To disable the LCD controller, write 0 to the register bit LCD\_CTL[0]. The connected LCD panel stops display after the last frame is finished. (**Note:** a frame, which is explained in more details later, is a complete period of waveform repeatedly applied to every COM and SEG) Voltages of all COM and SEG output pins will become  $V_{SS}$ .

When the LCD controller is disabled, LCD-related analog circuits (the resistive network, the voltage buffers, the charge pump, etc.) are turned off to save power consumption.

### 6.28.5.2 LCD Setup

The LCD controller should be set up before enabled. There are four aspects of settings:

- LCD panel specification
- Frame setting and control
- Driving capability and power consumption
- Output pin selection (multiplexing)

To obtain optimized display effects and power consumption, the user should fully understand the characteristics of the connected LCD panel, and properly set up the setting registers provided by the LCD controller.

### 6.28.5.3 LCD Panel Specification

Most of LCD panels have several general specifications. Those supported by the LCD controller are:

- Bias Level. The register bits LCD\_PSET[1:0] support 3 bias levels: 1/2, 1/3, and 1/4.
- Duty Ratio. The register bits LCD\_PSET[4:2] support 8 duty ratios: 1, 1/2, 1/3, ..., and 1/8.
- Waveform Type. The register bit LCD\_PSET[5] supports types A and B both.
- LCD Operating Frequency ( $F_{LCD}$ ). The register bits LCD\_PSET[17:8] provide a divider to generate a clock with frequencies about from 32 Hz to 32 kHz.
- LCD Operating Voltage ( $V_{LCD}$ ). For the built-in charge pump, the register bits LCD\_PSET[21:18] and LCD\_PSET[27:24] control the output voltage of the charge pump from 3.0 V to 5.2 V.

### LCD Clock ( $CLK_{LCD}$ )

The clock is the fundamental clock on which the timing of all LCD waveforms is based. Its source is LIRC or LXT, and the frequency is about 32 kHz.

### Frame

A frame is a period of waveform repeatedly applied to each COM/SEG while the LCD controller is enabled.

### Duty Ratio

Duty ratio is defined as  $1 / (\text{number of COMs used by the LCD panel})$ .

Assuming that the number is  $n$ . A frame can be divided into  $n$  time slots. In each time slot, only one COM is active and others are inactive. COM[0], COM[1], ..., and COM[ $n-1$ ] will become active for each time slot in turn.

### LCD Operating Frequency ( $F_{LCD}$ )

$F_{LCD}$  is programmable by using the formula:  $(CLK_{LCD} \text{ Frequency}) / (FREQDIV + 1)$ , where FREQDIV is

the value of the register bits LCD\_PSET[17:8] and ranges from 0 to 1023.

#### Waveform Type A

A frame is divided into  $n$  time slots. The length of each time slot is  $(1/F_{LCD}) \times 2$ .

#### Waveform Type B

A frame is divided into an even frame and an odd frame. Each even or odd frame is divided into  $n$  time slots. The length of a time slot is  $(1/F_{LCD})$ .

#### Frame Time

Frame time is the duration of a frame.

The frame time for type A is  $(1/(\text{Duty Ratio})) \times (1/F_{LCD}) \times 2$ .

The frame time for type B is  $(1/(\text{Duty Ratio})) \times (1/F_{LCD})$ .

#### Frame Rate

Frame rate is  $1 / (\text{Frame Time})$ , i.e., the number of frames applied per second

The frame rate for type A is  $(\text{Duty Ratio}) \times F_{LCD} \times 1/2$ .

The frame rate for type B is  $(\text{Duty Ratio}) \times F_{LCD}$

Setting a proper frame rate is important to achieve a high LCD display quality. If the frame rate is too low, flickering may occur. If the frame rate is too high, ghosting may occur and unnecessary power is wasted.

[Example] Assuming Duty Ratio = 1/6, and  $F_{LCD} = 1 \text{ kHz}$ ,

The frame rate for type A is  $1/6 \times 1 \text{ kHz} \times 1/2 \approx 83.3 \text{ Hz}$ .

The frame rate for type B is  $1/6 \times 1 \text{ kHz} \approx 166.7 \text{ Hz}$ .

**Note:** In some LCD technical document, the frame rate for type B should be  $(\text{Duty Ratio}) \times F_{LCD} \times 1/2$ , since an even or odd frame is considered as a half-frame. However, In this document, we consider an even or odd frame as a full frame.

#### LCD Operating Voltage ( $V_{LCD}$ )

$V_{LCD}$  is the maximum voltage level required by an LCD panel. The device can support LCD panels operating with  $V_{LCD}$  from 3.0 V to 5.2 V.

There are 3 possible  $V_{LCD}$  voltage sources for the device:  $V_{LCD}$  power,  $AV_{DD}$  power, and the built-in charge pump.  $V_{LCD}$  power is supplied by the external dedicated  $V_{DD}$  pin for LCD.  $AV_{DD}$  power is chip's internal dedicated power supply for analog circuits.

If  $V_{LCD}$  or  $AV_{DD}$  power is selected, users must make sure that the  $V_{LCD}$  or  $AV_{DD}$  power pin is connected to a power supply with the same voltage as  $V_{LCD}$ .

If the charge pump is selected, users can set its output voltage by programming the register bits LCD\_PSET[21:18]. Furthermore, users can fine tune this voltage by programming the register bits LCD\_PSET[27:24] to slightly increase or decrease  $V_{LCD}$ .

#### Bias Voltage

Bias voltages are intermediate voltages evenly between 0 V and  $V_{LCD}$ .

#### Bias Level

Bias level is defined as  $1/(\text{number of bias voltages used by the LCD panel} + 1)$ . Any voltage waveform applied to a COM/SEG is composed of these bias voltages.

For bias 1/2, one bias voltage is used:  $1/2 V_{LCD}$ .

For bias 1/3, two bias voltages are used:  $1/3 V_{LCD}$  and  $2/3 V_{LCD}$

For bias 1/4, three bias voltages are used:  $1/4 V_{LCD}$ ,  $2/4 V_{LCD}$ , and  $3/4 V_{LCD}$

### Segment Display Data

The LCD controller supports up to 8 COMs, therefore, every SEG can correspond to up to 8 pixels, i.e., SEG-COM0, SEG-COM1, SEG-COM2, ..., and SEG-COM7.

The display data accompanying with a SEG is consist of 8 bits. Each bit corresponds to a pixel. Bit 0 corresponds to pixel SEG-COM0, bit 1 corresponds to pixel SEG-COM1, bit 2 corresponds to pixel SEG-COM2, and so on.

A pixel appears as "Light" if its corresponding bit is 0, and "Dark" if 1. (**Note:** for some LCD panels, the light/dark status may be reversed).

All display data is stored in the LCD Segment Display Data registers from LCD\_DATA00 to LCD\_DATA11. Users can update the registers at any time, however, the LCD display cannot change until the next frame.

Figure 6.28-2 to Figure 6.28-7 show the examples of LCD output waveform. The first 3 waveforms are of type A, with bias 1/2, 1/3, and 1/4, respectively. The next 3 waveforms are of type B, with bias 1/2, 1/3, and 1/4, respectively.

All waveforms are duty 1/4. That is, only COM0, COM1, COM2, and COM3 are involved in the display. The output voltage of COM4 ~ COM7 is 0 V. According to the regularity shown in the figures, the COM waveforms for other duty ratios can be easily obtained.

Two SEG outputs are also depicted in the figures: SEG00 with 8-bit display data = (xxxx\_1101) and SEG01 with 8-bit display data = (xxxx\_0100). Only 4 COMs are involved, therefore, the 4 MSBs of segment display data are don't-care.

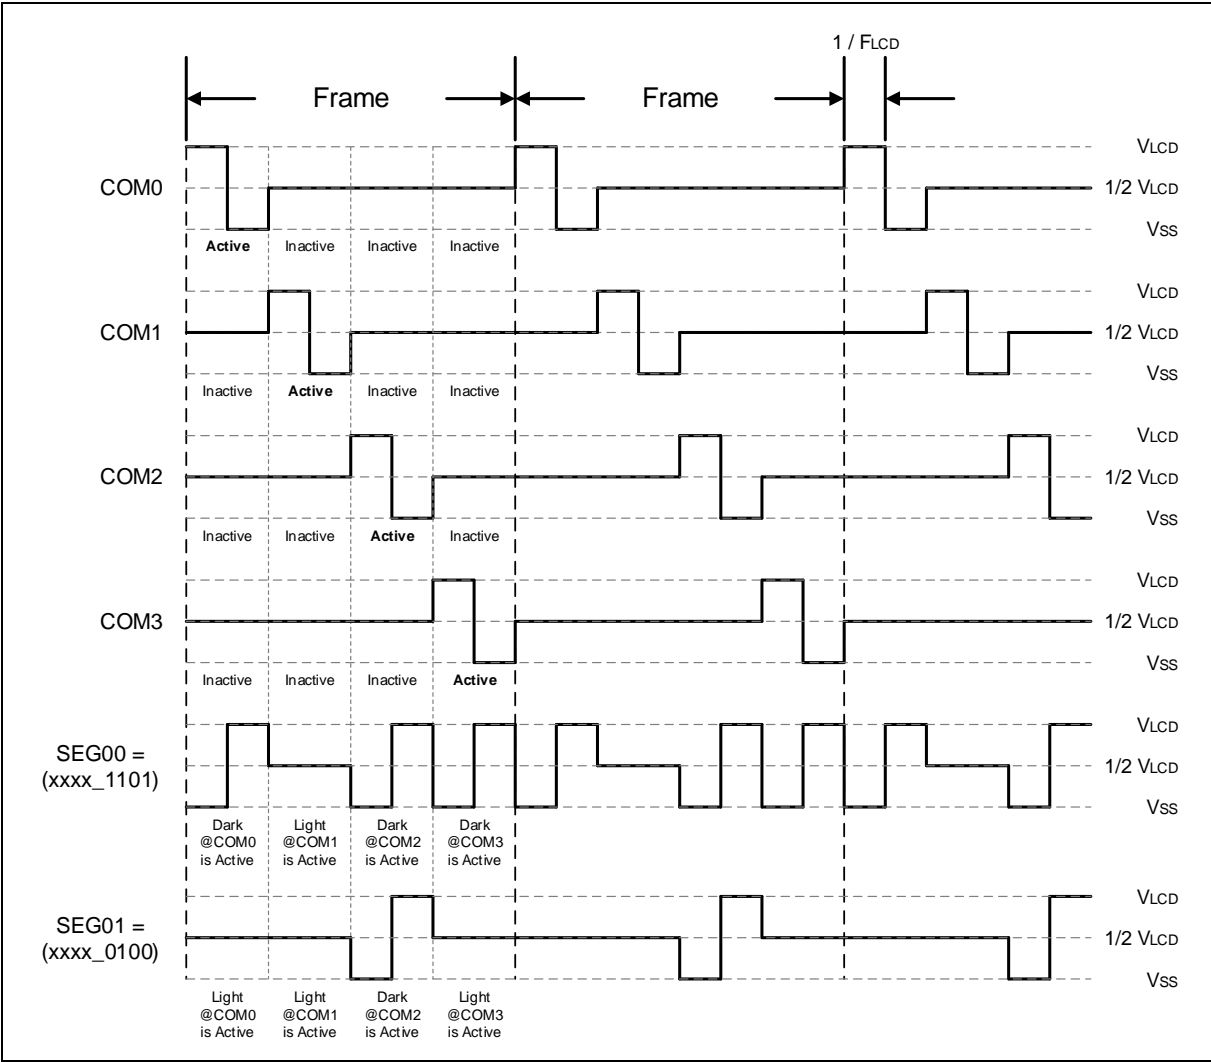

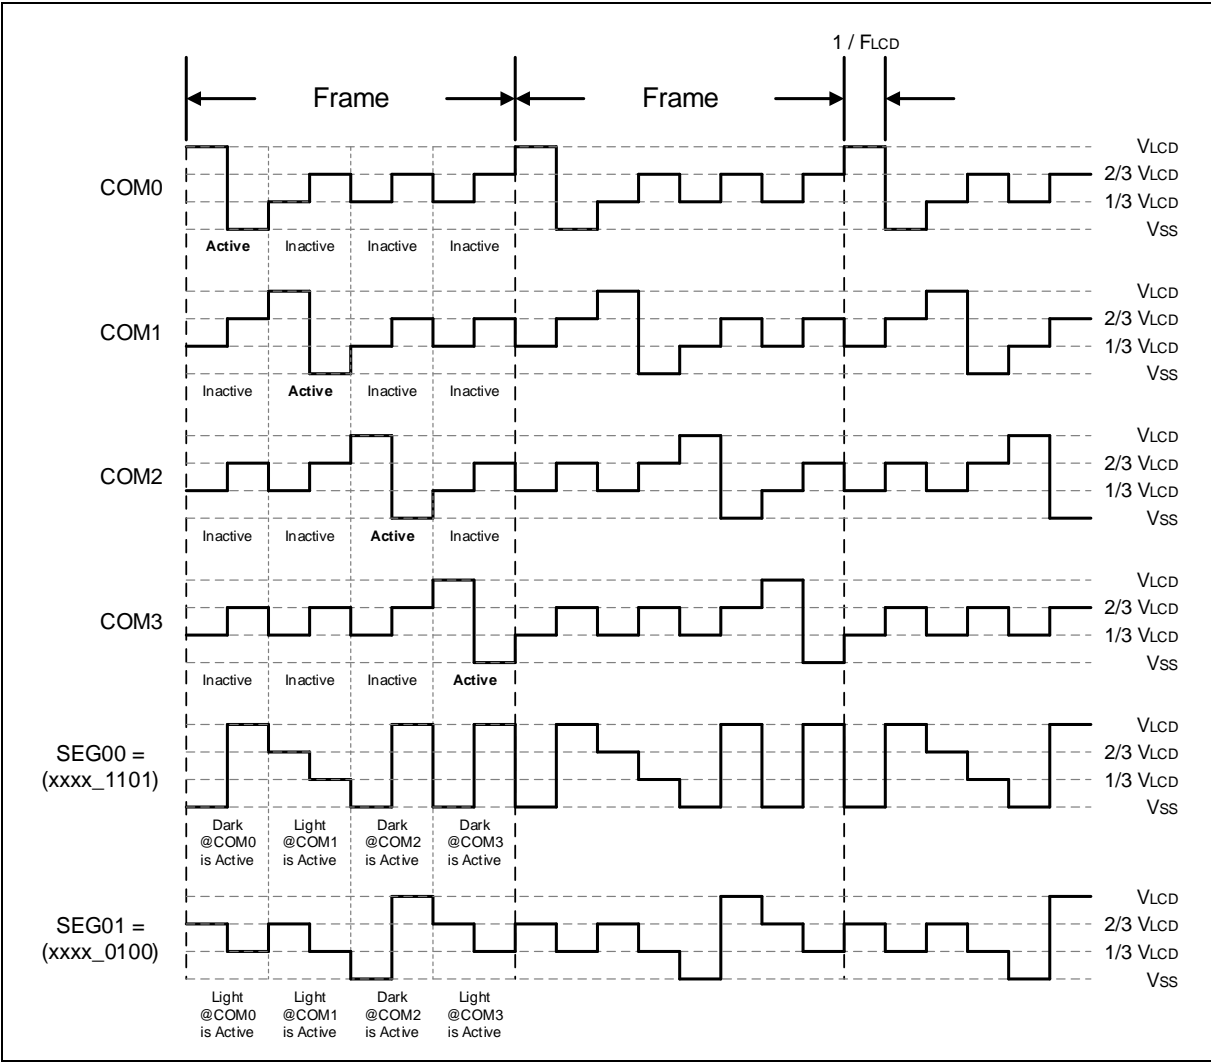

Figure 6.28-2 LCD Output Waveform of Type A, Duty 1/4, Bias 1/2

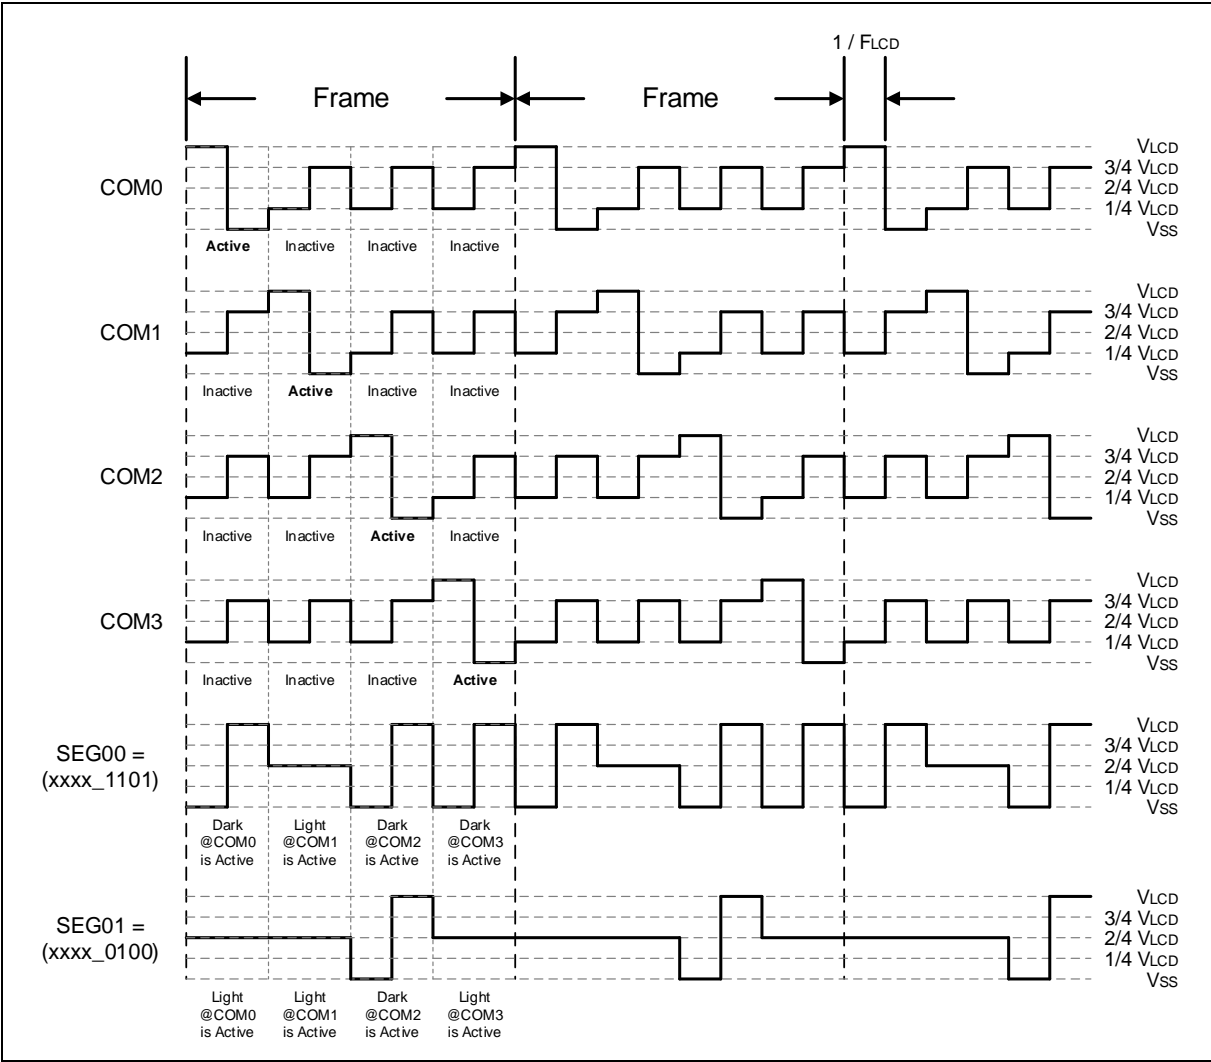

Figure 6.28-4 LCD Output Waveform of Type A, Duty 1/4, Bias 1/4

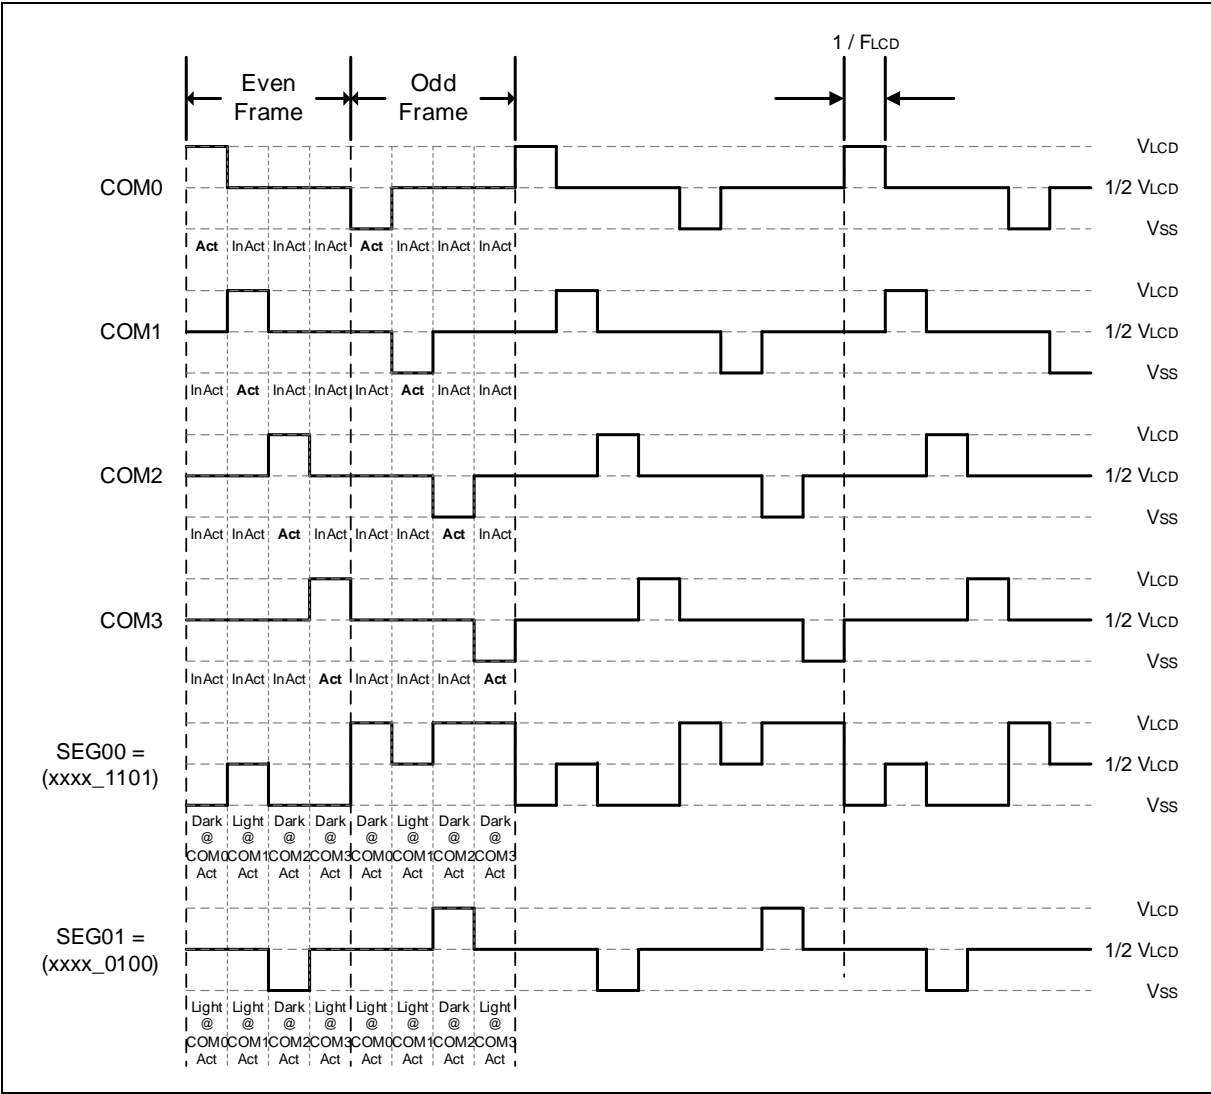

Figure 6.28-5 LCD Output Waveform of Type B, Duty 1/4, Bias 1/2

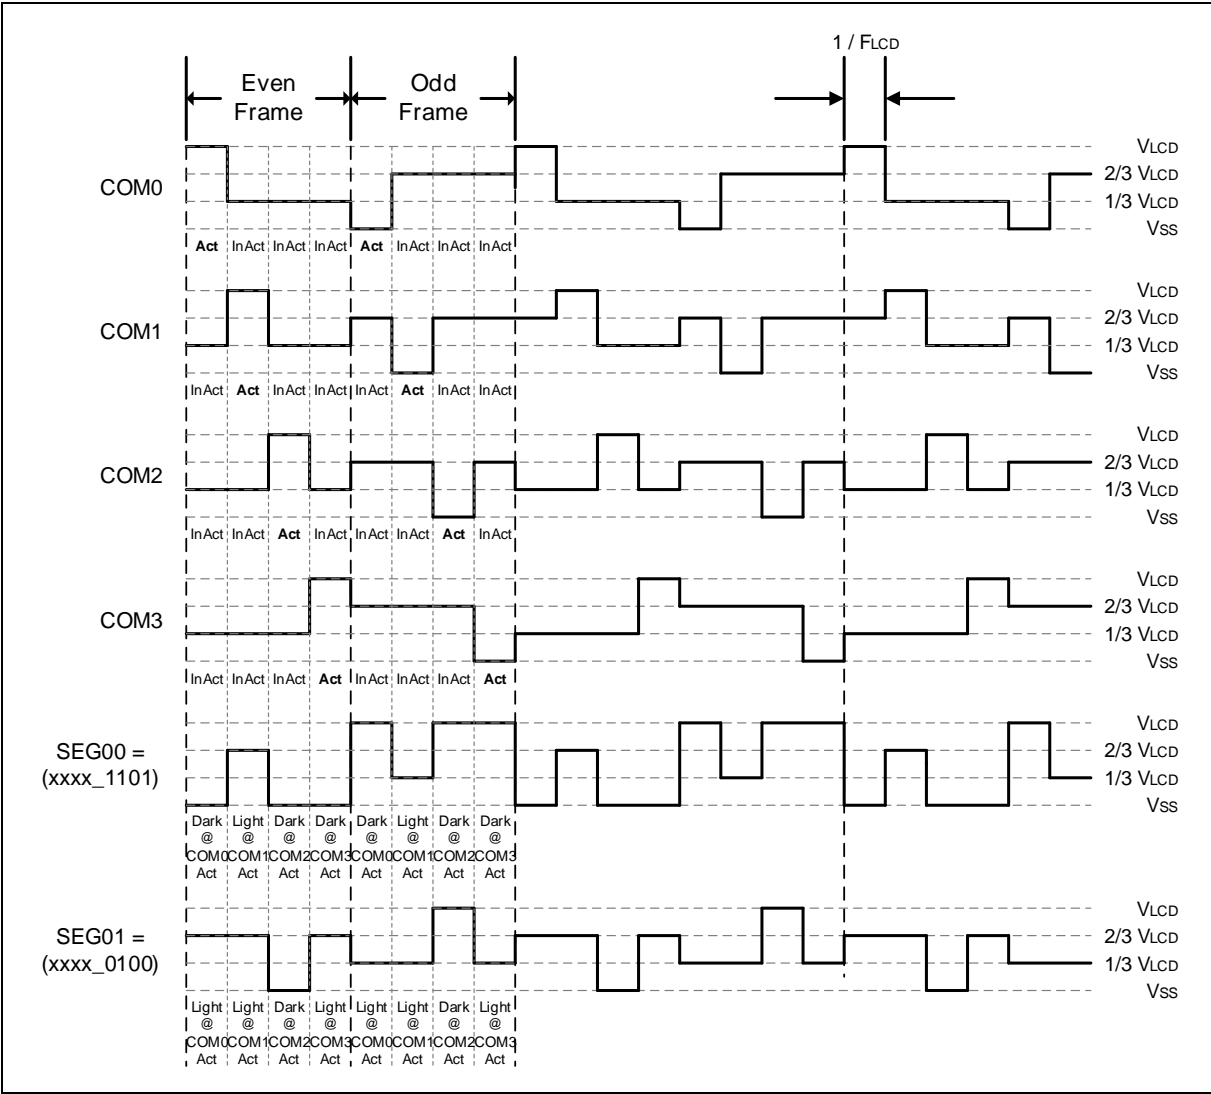

Figure 6.28-6 LCD Output Waveform of Type B, Duty 1/4, Bias 1/3

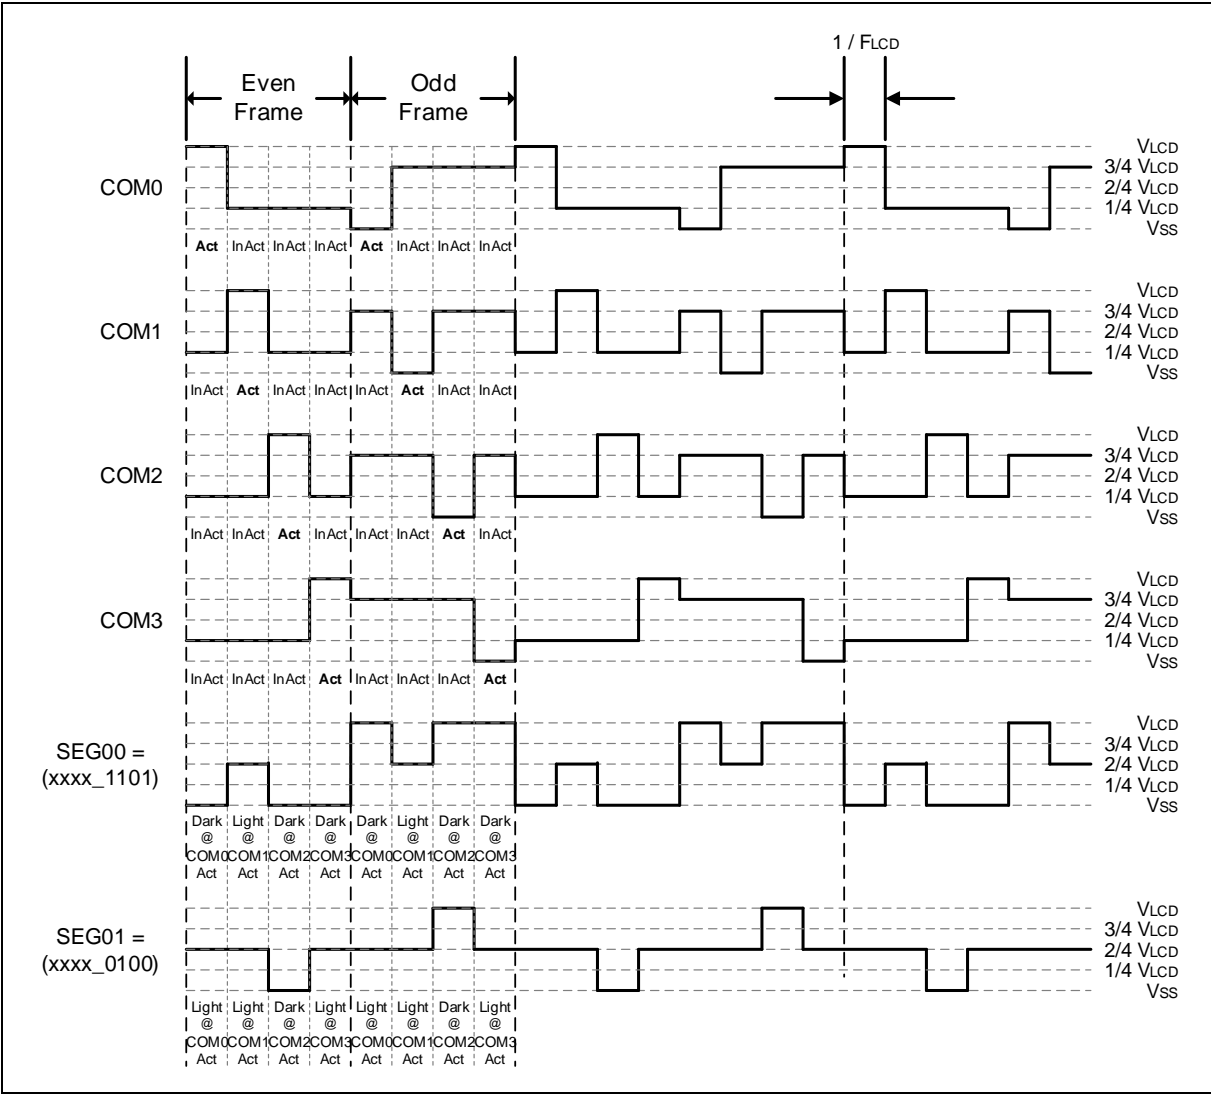

Figure 6.28-7 LCD Output Waveform of Type B, Duty 1/4, Bias 1/4

### Waveform Inverse

For some LCD panels, the display effects (brightness or contrast) or power consumption will be better if the applied waveforms are inverted. Any voltage level  $V$  in the original waveform is converted to  $(V_{LCD} - V)$ . A example of inverted waveform is depicted in the Figure 6.28-8.

To toggle the waveforms inversely, write 1 to the register bit LCD\_PSET[6].

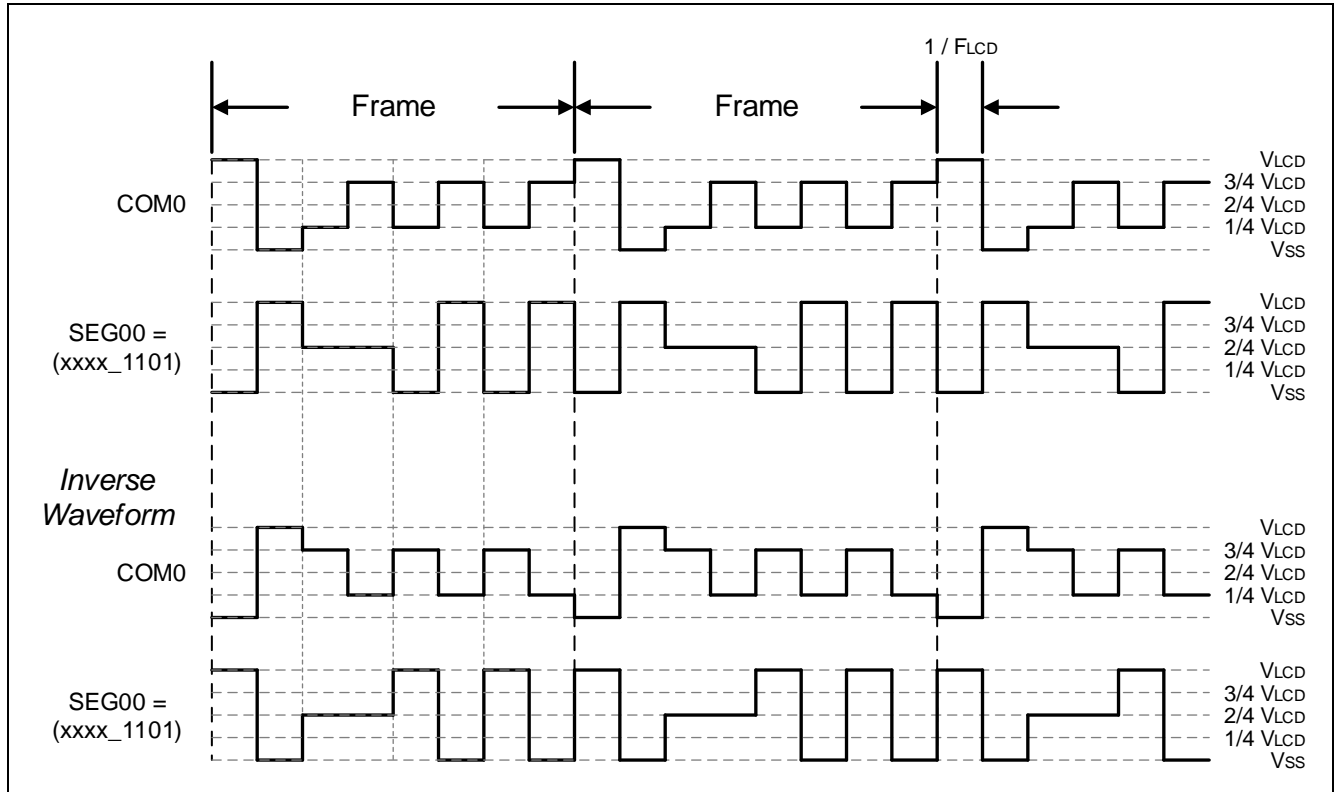

Figure 6.28-8 Waveform Inverse

#### 6.28.5.4 Frame Setting and Control

##### Frame Counter

The LCD controller provides a frame counter, which automatically increases by one at the end of every frame. When the counter reaches FCV (Frame Counting Value), it recounts from 0 at the end of the next frame.

Users can set the value of FCV in the register bits LCD\_FSET[17:8].

##### Flags and Interrupts

At the end of every frame, the hardware automatically sets a dedicated flag to 1. Users can, if necessary, trigger an interrupt when this event occurs.

At the end of frame counting, which is also an end of a frame, the hardware sets another dedicated flag to 1. Similarly, users can trigger an interrupt on this event.

Users can read these two flags from the register bits LCD\_STS[1:0]. Each individual flag can be cleared by writing 1 to this flag.

Interrupts can be enabled by setting the register bits LCD\_INTEN[1:0]. Clearing an interrupt uses the same way as clearing a flag.

Figure 6.28-9 shows the timing of frame counting in more details.

For type B waveform, these events only occur at the end of odd frames, not even frames.

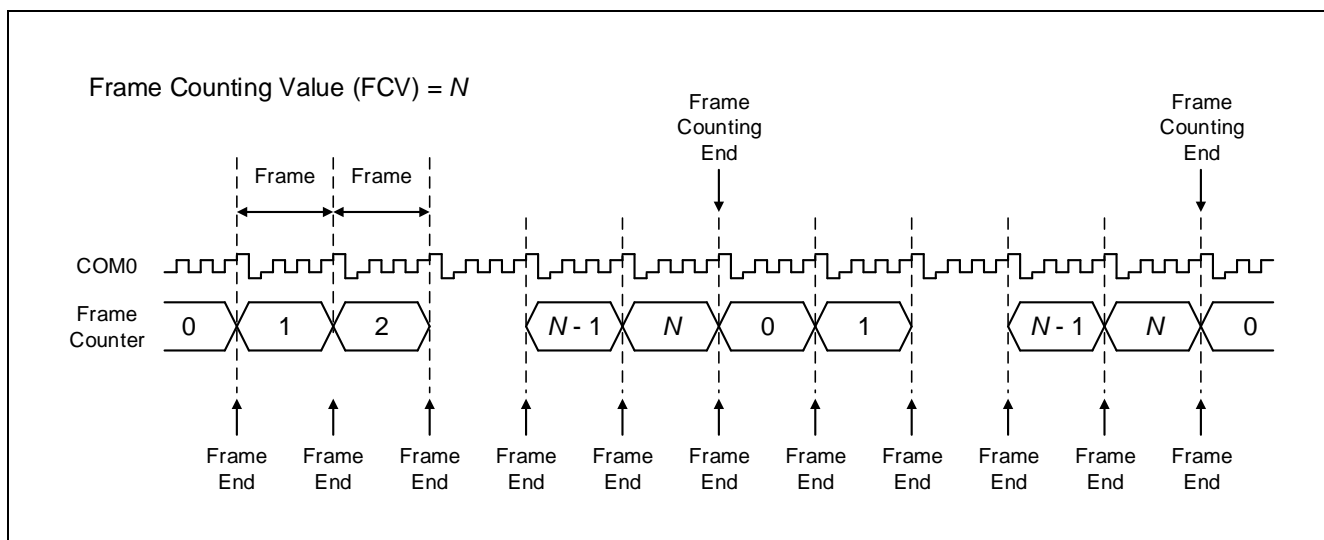

Figure 6.28-9 Frame Counting

## Blinking

The LCD controller supports the blinking feature. The LCD display switches on/off continuously at a given frequency.

The frequency is determined by the value of FCV. Figure 6.28-10 demonstrates the timing of blinking. The blinking frequency can be obtained by calculating the following formula:

$$\text{Blinking Frequency} = (F_{\text{LCD}}/2) \times (\text{Duty Ratio}) \times (1/(\text{FCV} + 1)) \times 1/2$$

The blinking feature can be enabled by writing 1 to the register bit LCD\_FSET[0].

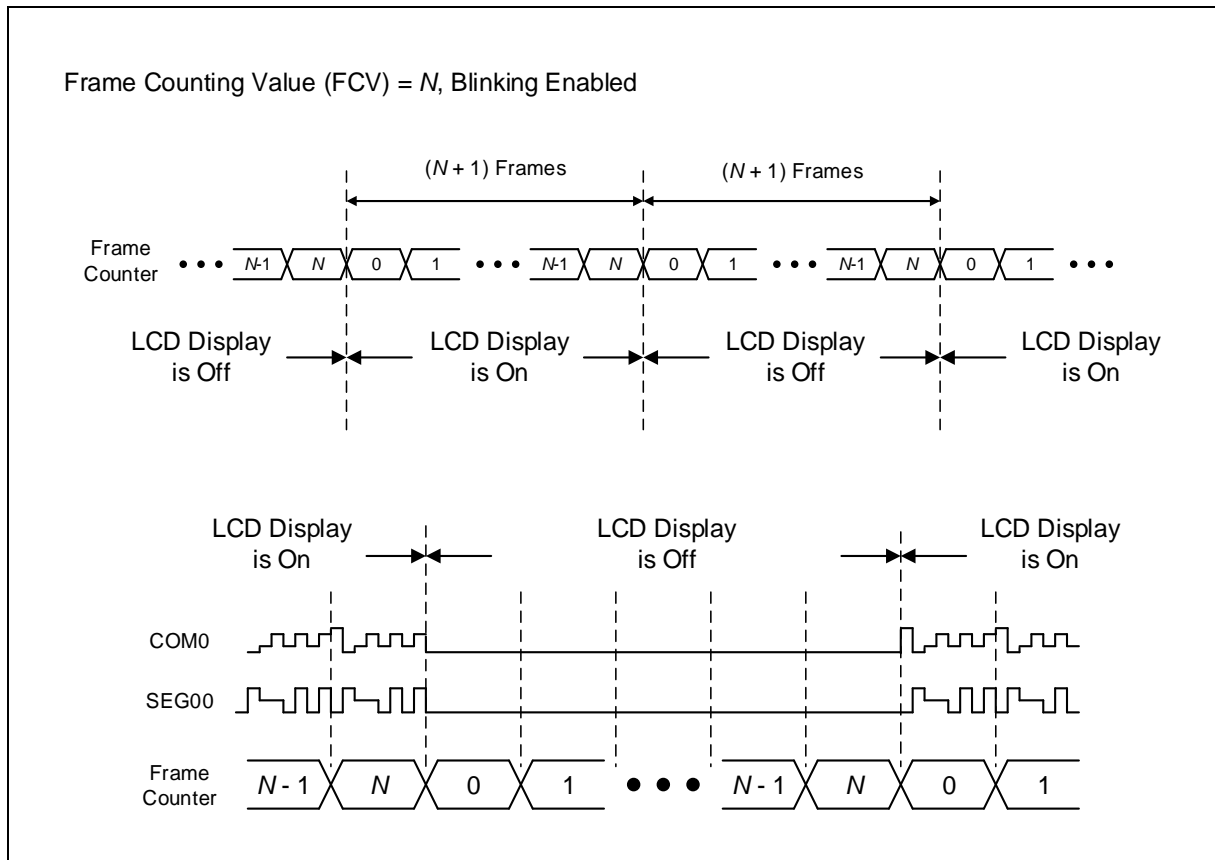

Figure 6.28-10 Blinking

### Pause Mode (Applications of LCD/Touch Key Pin Sharing)

In specific applications, both external LCD and Touch Key modules, which share some chip I/O pins, need to be activated simultaneously. To achieve this design requirement, the LCD controller should be able to regularly pause the driving of LCD drivers and give up the control of related chip I/O pins. The Touch Key controller, meanwhile, can take over the control of these chip I/O pins and execute its tasks.

There are two occasions that the LCD controller can insert the “**pause durations**”.

- Between 2 frames (In-Frame Pause Mode)
- Between 2 COM duties (In-Duty Pause Mode)

Figure 6.28-11 shows how the LCD controller inserts pause durations between frames. For the whole pause duration, the LCD drivers are turned off. Those chip I/O pins shared with Touch Key modules are controlled by the Touch Key controller, not by the LCD controller.

Figure 6.28-11 In-Frame Pause Mode

Figure 6.28-12 shows another pause type where the LCD controller inserts the pause durations between COM duties. These pause durations are shorter but more frequent.

The two pause types, In-Frame or In-Duty, can be selected by the register bit LCD\_FSET[19]. The length of a pause duration can be set at the register bits LCD\_FSET[23:20]. When LCD\_FSET[23:20] is equal to 0, the LCD controller works normally without any pause duration inserted; otherwise, pause durations will regularly occur.

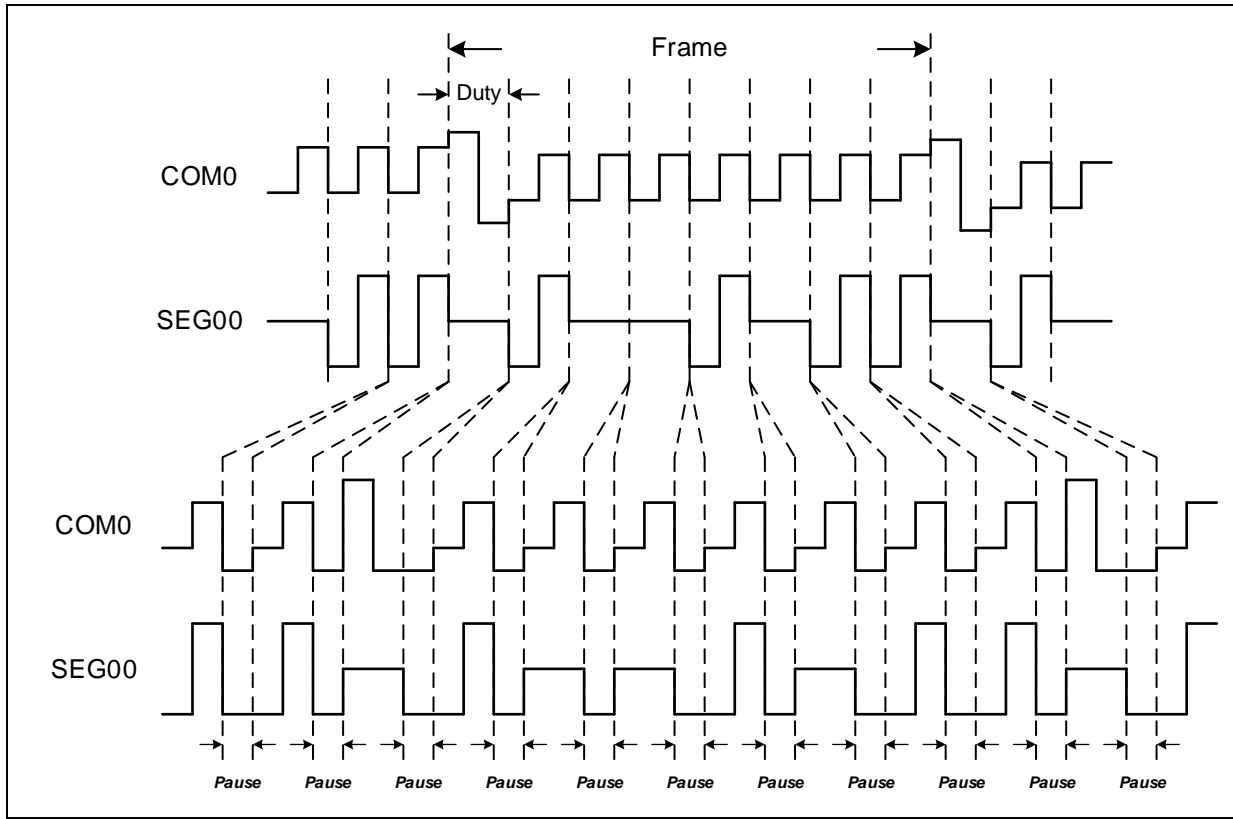

Figure 6.28-12 In-Duty Pause Mode

#### 6.28.5.5 Driving Capability and Power Consumption

##### LCD Operating Voltage Source

There are three possible sources of  $V_{LCD}$ :

- $V_{LCD}$  Power (External power supply through the  $V_{LCD}$  power pin)
- $AV_{DD}$  Power (External power supply through the  $AV_{DD}$  power pin and dedicated to the analog circuits)
- Built-In Charge Pump

Users can select the source by programming the register bits LCD\_DSET[1:0].

Whenever the  $V_{LCD}$  or  $AV_{DD}$  power is selected, the charge pump is always turned off to save power consumption.

If the  $V_{LCD}$  source is the internal charge pump, users can set its output voltage by programming the register bits LCD\_PSET[21:18].

Due to process variations, the actual  $V_{LCD}$  generated by the charge pump may have small errors. Users can fine tune this voltage by writing proper values to the register bits LCD\_PSET[27:24] to slightly increase or decrease  $V_{LCD}$ .

##### Resistive Network

All the intermediate bias voltages are generated by a built-in resistive network, as shown in Figure 6.28-13

There are two drive modes for the resistive network:

- Low-drive Mode. Only high-resistance resistors are utilized. Smaller driving current is supplied.

- High-drive Mode. Both low- and high-resistance resistors are utilized. Larger driving current is supplied.

According to the driving-current requirement for the connected LCD panel, users can select a proper mode by setting the register bit LCD\_DSET[2].

### Voltage Buffer

To cope with large capacitive loading on some large-scale LCD panels, voltage buffers associated with each intermediate bias voltage output are provided. With these buffers turned on, a more stable waveform can be obtained.

The voltage buffers can be turned on only when the resistive network is in the low-drive mode.

User can turn on the voltage buffers by writing 1 to the register bit LCD\_DSET[3]. However, when the resistive network is in the high-drive mode, the voltage buffers will be automatically turned off, and the setting of the register bit LCD\_DSET[3] will be ignored in this situation.

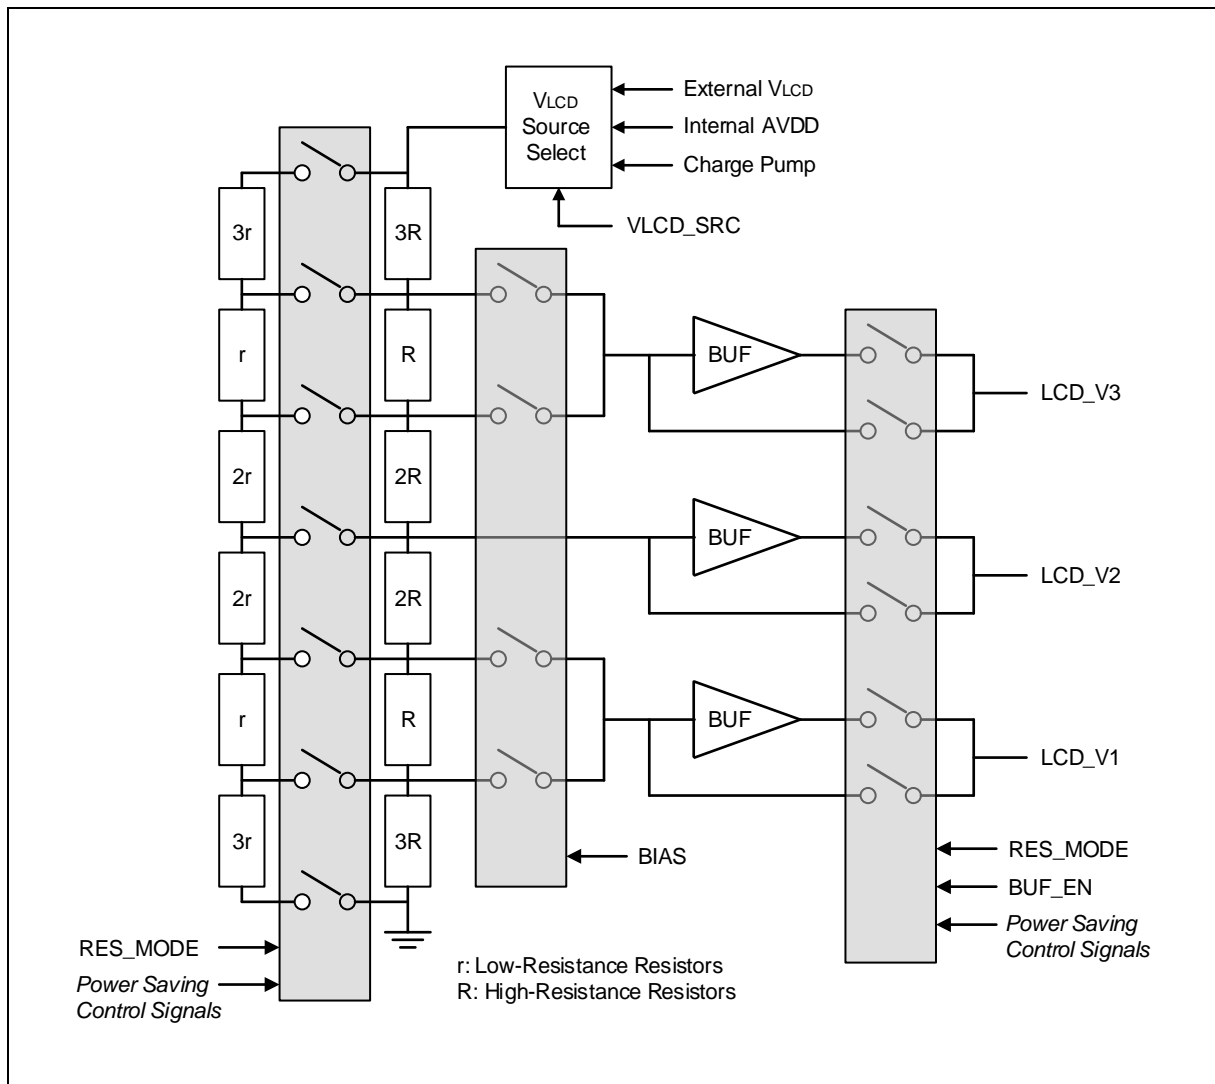

Figure 6.28-13 Resistive Network and Voltage Buffers

### Charging Timer

If the charge pump is selected as the source of  $V_{LCD}$ , the following 3 steps are executed repeatedly once the LCD controller is enabled:

1. The charge pump is turned on and continues to charge  $V_{LCD}$  until  $V_{LCD}$  reaches the voltage specified in the register bits LCD\_PSET[21:18].
2. The charge pump is turned off.
3. When  $V_{LCD}$  drops, due to driving the LCD panel, by a preset voltage, the charge pump will go to step 1 to recharge  $V_{LCD}$  again.

If the duration of step 1 is short, it means that the charge pump has sufficient charging power to drive the LCD panel.

If the duration of step 1 is very long or, even worse, endless, it means  $V_{LCD}$  is very hard to or never reaches the specified voltage. That is, the charging power is seriously insufficient to drive the LCD panel.

The LCD controller provides a charging timer, which keep counting during the charge pump being in step 1. When the charge pump goes to step 2, the timer stops. When the charge pump goes back to step 1 from step 3, the timer will restart all over again.

The LCD controller also provides a programmable timeout value for the charging timer. Once charging timer reaches the timeout value, the hardware automatically sets a dedicated flag, the register bit LCD\_STS[2], to 1. Users can, if necessary, enable a charge-timeout interrupt by setting the register bit LCD\_INTEN[2] to 1 to trigger an interrupt when this event occurs.

The charging timer stops counting when the charge pump stops charging or a timeout occurs. At this point, the value of the charging timer is recorded in the register bits LCD\_STS[28:16].

The charging timer restarts counting when the charge pump restarts charging, or the flag or interrupt is cleared.

Users can write a reasonable timeout value to the register bits LCD\_DSET[28:16]. By monitoring the occurrence of this interrupt, users can evaluate the necessity of adjusting the charging power owned by the charge pump.

### Brightness (Contrast) Enhancement

For some large-scale LCD panels, larger driving current may be required. To improve the brightness or contrast, users can adopt the following setups:

- Set the resistive network in the high-drive mode.
- Set the resistive network in the low-drive mode, with voltage buffers turned on.
- If the source of  $V_{LCD}$  is the charge pump, the charging power can be improved by switching the charge pump clock from 1 MHz to 4 MHz. The driving current supplied by the charge pump will be raised.

### Low Power Operation --- Power Saving Mode

The LCD controller also provides a power saving mode to cope with low-power operating environments. Besides enabling the power saving mode, users should also define a power-saving period. During this period,

- if the resistive network is in the high-drive mode, it is temporarily switched to the low-drive mode.
- if the resistive network is in the low-drive mode with the voltage buffers turned on, the voltage buffers are temporarily turned off.
- If the resistive network is in the low-drive mode without the voltage buffers turned on, nothing happens. The power saving mode takes no effect.

Figure 6.28-14 shows the timing of the power saving mode.

Users can enable the power saving mode by writing 1 to the register bit LCD\_DSET[4]. The periods of T1 and T2, depicted in Figure 6.28-14, are set in the register bits LCD\_DSET[11:8] and LCD\_DSET[15:12], respectively.

Sometimes reversing the timing of power saving can result in better low-power effect under some operating conditions. Users can try it by writing 1 to the register bit LCD\_DSET[5].

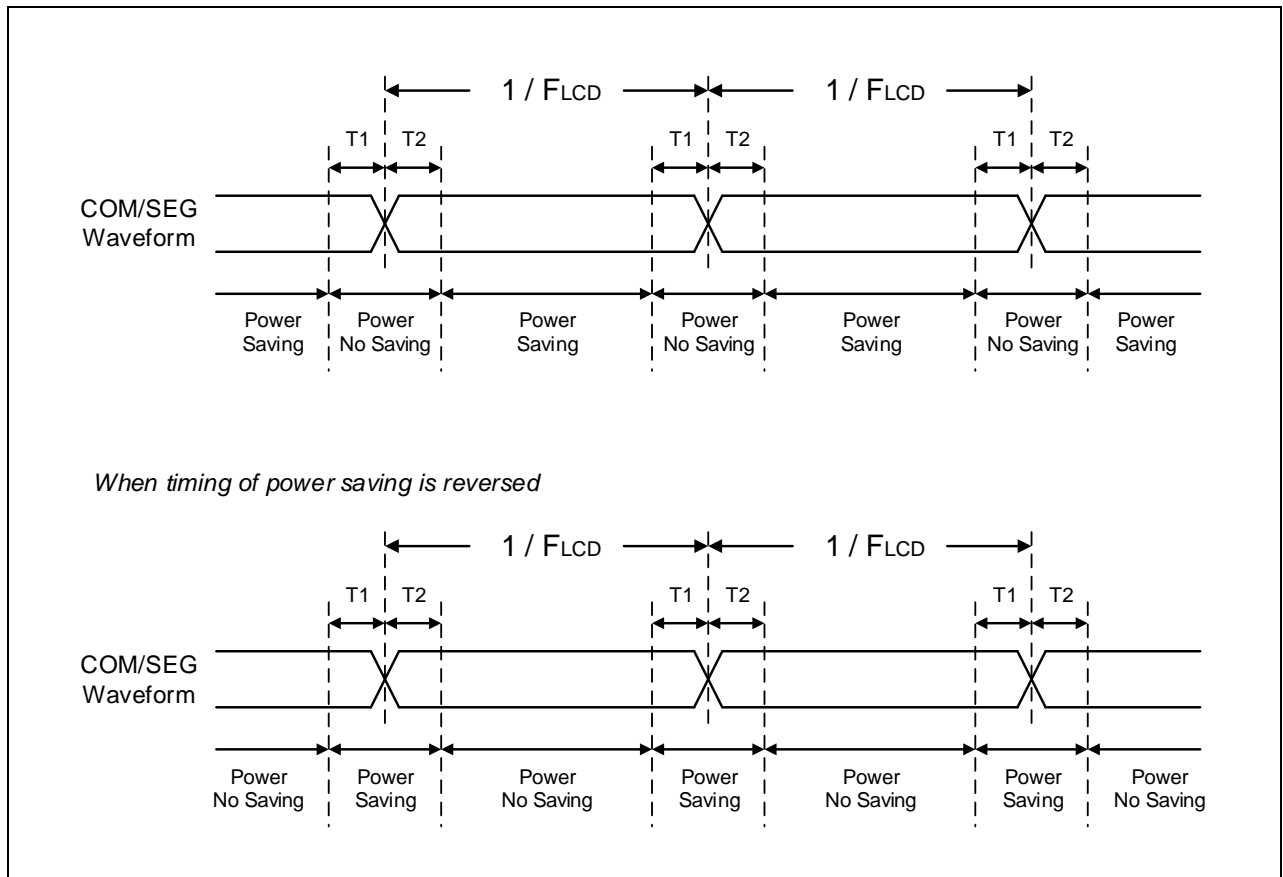

Figure 6.28-14 Power Saving Mode

### Power Down Prerequisites

Voltage waveform generated by the LCD controller and applied to LCD panels relies on  $F_{LCD}$  and  $V_{LCD}$ . The LCD controller can continue to drive the connected LCD panel even when the chip is in the Power-down modes, if  $F_{LCD}$  and  $V_{LCD}$  are available.

To make the LCD panel keep display or blinking, users must make sure that the following requirements must be met before the chip enters a Power-down mode:

- At least one of LIRC and LXT is available.
- At least one of three voltage sources,  $V_{LCD}$  power,  $AV_{DD}$  power, and the charge pump, can supply the voltage.
  - If the source of  $V_{LCD}$  is the charge pump, at least one of 1 MHz or 4 MHz clock is available.

#### 6.28.5.6 Output Pin Selection (Multiplexing)

The LCD controller supports up to 52 COM/SEG outputs, e.g., 8-COM x 44-SEG outputs or 4-COM x 48-SEG outputs. Every output is connected to a chip's I/O pin. As depicted in Table 6.28-1, some COM/SEG outputs can be connected to more than one I/O pin, and some I/O pins can be assigned to more than one COM/SEG output. Users can set up all connections and assignments by programming the register LCD\_OSET.

## 6.28.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
LCD Base Address: LCD_BA = 0x400B_B000 LCD non-secure base address is LCD_BA + 0x1000_0000.				
LCD_CTL	LCD_BA+0x00	R/W	LCD Control Register	0x0000_0000
LCD_PSET	LCD_BA+0x04	R/W	LCD Panel Setting Register	0x0000_0000

Reserved							EN

Bits	Description
[31]	<p><b>SYNC</b></p> <p><b>LCD Enable/Disable Synchronizing Indicator (Read Only)</b></p> <p>When software writes 0/1 to EN bit (LCD_CTL[0]), the LCD Controller needs some synchronizing time to completely disable/enable the LCD display function. During this time, this bit keeps at 1.</p> <p>0 = LCD display function is completely disabled/enabled.</p> <p>1 = LCD display function is not yet completely disabled/enabled.</p> <p><b>Note 1:</b> The synchronizing time to enable LCD display function is not constant. It is between one and two cycles of CLK<sub>LCD</sub>.</p> <p><b>Note 2:</b> The LCD display function cannot be disabled until the end of a frame. So the maximum synchronizing time to disable LCD display function could be as long as one frame time.</p>
[30:1]	Reserved.
[0]	<p><b>EN</b></p> <p><b>LCD Display Enable Bit</b></p> <p>0 = LCD display function Disabled.</p> <p>1 = LCD display function Enabled.</p> <p><b>Note 1:</b> When software writes 1 to this bit, the LCD Controller needs some synchronizing time to completely enable the LCD display function. Before that, the read value of this bit is still 0.</p> <p><b>Note 2:</b> When software writes 0 to this bit, the LCD Controller needs some synchronizing time to completely disable the LCD display function. Before that, the read value of this bit is still 1.</p>

Bits	Description
[31:28]	<b>Reserved</b> Reserved.
[27:24]	<b>VTUNE</b> <b>LCD Operating Voltage (<math>V_{LCD}</math>) Fine Tuning (For Charge Pump Only)</b> This field is used to fine tune the LCD operating voltage. 0 = No tuning. 1 = decrease by 1 unit of voltage. 2 = decrease by 2 units of voltage. 3 = decrease by 3 units of voltage. ... 7 = decrease by 7 units of voltage. 8 = increase by 8 units of voltage. 9 = increase by 7 units of voltage. 10 = increase by 6 units of voltage. ... 14 = increase by 2 units of voltage. 15 = increase by 1 unit of voltage. <b>Note 1:</b> a unit of voltage is about 0.04 V. <b>Note 2:</b> This field is meaningful only if the $V_{LCD}$ source is the charge pump. Otherwise, this field is ignored.
[23:22]	<b>Reserved</b> Reserved.
[21:18]	<b>VSEL</b> <b>LCD Operating Voltage (<math>V_{LCD}</math>) Select (For Charge Pump Only)</b> This field is used to select the LCD operating voltage. 0 = 3.0 V. 1 = 3.2 V. 2 = 3.4 V. 3 = 3.6 V. 4 = 3.8 V. 5 = 4.0 V.

		<p>6 = 4.2 V.  7 = 4.4 V.  8 = 4.6 V.  9 = 4.8 V.  10 = 5.0 V.  11 = 5.2 V.  Others = (Reserved).  <b>Note:</b> This field is meaningful only if the <math>V_{LCD}</math> source is the charge pump. Otherwise, this field is ignored.</p>
[17:8]	<b>FREQDIV</b>	<p><b>LCD Operating Frequency (<math>F_{LCD}</math>) Divider</b>  The field is used to divide <math>CLK_{LCD}</math> to generate the LCD operating frequency.  LCD Operating Frequency = <math>(CLK_{LCD} \text{ Frequency}) / (FREQDIV + 1)</math>.  <b>Note 1:</b> FREQDIV can be set from 0 to 1023, therefore,  the fastest LCD operating frequency is equal to <math>CLK_{LCD}</math> frequency, and  the lowest LCD operating frequency is equal to <math>CLK_{LCD}</math> frequency divided by 1024.  <b>Note 2:</b> LCD frame rate is  (LCD Operating Frequency) x (Duty Ratio) x 1/2 for type A waveform, and  (LCD Operating Frequency) x (Duty Ratio) for type B waveform.  <b>Example:</b> Assuming the LCD operating frequency is 1 kHz, duty ratio is 1/4, then the LCD frame rate is  1 kHz x (1/4) x (1/2) = 125 Hz for type A waveform, and  1 kHz x (1/4) = 250 Hz for type B waveform.</p>
[7]	<b>Reserved</b>	Reserved.
[6]	<b>INV</b>	<p><b>LCD Waveform Inverse</b>  This bit is used to set the inverse LCD waveform.  0 = COM/SEG waveform is normal.  1 = COM/SEG waveform is inverse.</p>
[5]	<b>TYPE</b>	<p><b>LCD Waveform Type Selection</b>  This bit is used to select the waveform type.  0 = Type A.  1 = Type B.</p>
[4:2]	<b>DUTY</b>	<p><b>LCD Duty Ratio Selection</b>  This field is used to select the duty ratio.  0 = 1/1 Duty.  1 = 1/2 Duty.  2 = 1/3 Duty.  3 = 1/4 Duty.  4 = 1/5 Duty.  5 = 1/6 Duty.  6 = 1/7 Duty.  7 = 1/8 Duty.</p>
[1:0]	<b>BIAS</b>	<p><b>LCD Bias Level Selection</b>  This field is used to select the bias level.  0 = Reserved.  1 = 1/2 Bias.  2 = 1/3 Bias.  3 = 1/4 Bias.</p>

Reserved		PSVREV	PSVEN	BUFEN	RESMODE	VSRC	

Bits	Description
[31:29]	<b>Reserved</b> Reserved.
[28:16]	<b>CTOUT</b> <b>Charging Timer TimeOut</b> This field is used to specify the timeout value for the charging timer. When the charging timer reaches this timeout value, a status bit or an interrupt will occur. The timeout is calculated by the following formula: Timeout = 31.25 us x (CTOUT + 1.), where 31.25 us is the cycle time of CLK <sub>LCD</sub> , whose frequency is assumed to be 32 kHz. CTOUT can be set as 0, 1, 2, ..., 8191, so the minimum timeout is 31.25 us, and the maximum timeout is 31.25 x 8192 = 256 ms.
[15:12]	<b>PSVT2</b> <b>Power Saving "On Time" Setting</b> The "On Time" of the power saving mode is calculated as "On Time" = 15.625 us x (PSV_T2 + 1.), where 15.625 us is the half-cycle time of CLK <sub>LCD</sub> , whose frequency is assumed to be 32 kHz. PSV_T2 can be set as 0, 1, 2, ..., 15, so the minimum "On Time" is about 15.625 us, and the maximum "On Time" is about 15.625 x 16 = 250 us. <b>Note:</b> In the following two cases, the power saving mode is disabled. The setting of PSV_T2 bits is ignored. 1. SV_EN = 0. 2. ES_MODE = 0 and BUF_EN = 0 (In this case, SV_EN is ignored).
[11:8]	<b>PSVT1</b> <b>Power Saving "Enable Time" Setting</b> The "Enable Time" of the power saving mode is calculated as "Enable Time" = 15.625 us x (PSV_T1 + 1.), where 15.625 us is the half-cycle time of CLK <sub>LCD</sub> , whose frequency is assumed to be 32 kHz. PSV_T1 can be set as 0, 1, 2, ..., 15, so the minimum "Enable Time" is about 15.625 us, and

		<p>the maximum "Enable Time" is about <math>15.625 \times 16 = 250</math> us.</p> <p><b>Note:</b> In the following two cases, the power saving mode is disabled. The setting of PSV_T1 bits is ignored.</p> <ol style="list-style-type: none"> <li>SV_EN = 0.</li> <li>RES_MODE = 0 and BUF_EN = 0.</li> </ol>
[7:6]	<b>Reserved</b>	Reserved.
[5]	<b>PSVREV</b>	<p><b>Power Saving Timing Reverse</b></p> <p>0 = Timing of power saving is normal.</p> <p>1 = Timing of power saving is reversed.</p> <p><b>Note:</b> When the timing is reversed, the original power-saving period becomes no-power-saving, and the original no-power-saving period becomes power-saving.</p>
[4]	<b>PSVEN</b>	<p><b>Power Saving Mode Enable Bit</b></p> <p>0 = Power Saving Mode Disabled.</p> <p>1 = Power Saving Mode Enabled.</p> <p><b>Note:</b> when RES_MODE = 0 and BUF_EN = 0, the output drivers consumes the least driving current. In this case, the power saving mode is automatically disabled. The setting of PSV_EN bit is ignored.</p>
[3]	<b>BUFEN</b>	<p><b>Voltage Buffer Enable Bit</b></p> <p>0 = Voltage Buffer Disabled.</p> <p>1 = Voltage Buffer Enabled.</p> <p><b>Note:</b> When RES_MODE = 1, the voltage buffers are automatically disabled. The setting of BUF_EN bit is ignored.</p>
[2]	<b>RESMODE</b>	<p><b>Resistive Network Driving Enable Bit</b></p> <p>0 = High-Driving Disabled.</p> <p>1 = High-Driving Enabled.</p> <p><b>Note:</b> When PSVEN = 1, the resistive low-drive is selected to drive LCD panel during power saving period.</p>
[1:0]	<b>VSRC</b>	<p><b>LCD Operating Voltage (<math>V_{LCD}</math>) Source</b></p> <p>0 = <math>V_{LCD}</math> Power.</p> <p>1 = <math>AV_{DD}</math> Power.</p> <p>2 = Built-In Charge Pump.</p> <p>3 = (None).</p> <p><b>Note:</b> Whenever the LCD controller is disabled, all <math>V_{LCD}</math> sources are automatically cut off.</p>

## 6.29 Digital to Analog Converter (DAC)

### 6.29.1 Overview

The DAC module is a 12-bit, voltage output digital-to-analog converter. It can be configured to 12-or 8-bit output mode and can be used in conjunction with the PDMA controller. The DAC integrates a voltage output buffer that can be used to reduce output impedance and drive external loads directly without having to add an external operational amplifier.

### 6.29.2 Features

- Analog output voltage range: 0~AV<sub>DD</sub>.
- Supports 12-or 8-bit output mode.
- Rail to rail settle time 8us.
- Supports up to two 12-bit 1 MSPS voltage type DAC.
- Reference voltage from internal reference voltage (INT\_VREF), V<sub>REF</sub> pin.
- DAC maximum conversion updating rate 1 MSPS.
- Supports voltage output buffer mode and bypass voltage output buffer mode.
- Supports software and hardware trigger, including Timer0~3, and external trigger pin to start DAC conversion.
- Supports PDMA mode.
- Supports group mode of synchronized update capability for two DACs.

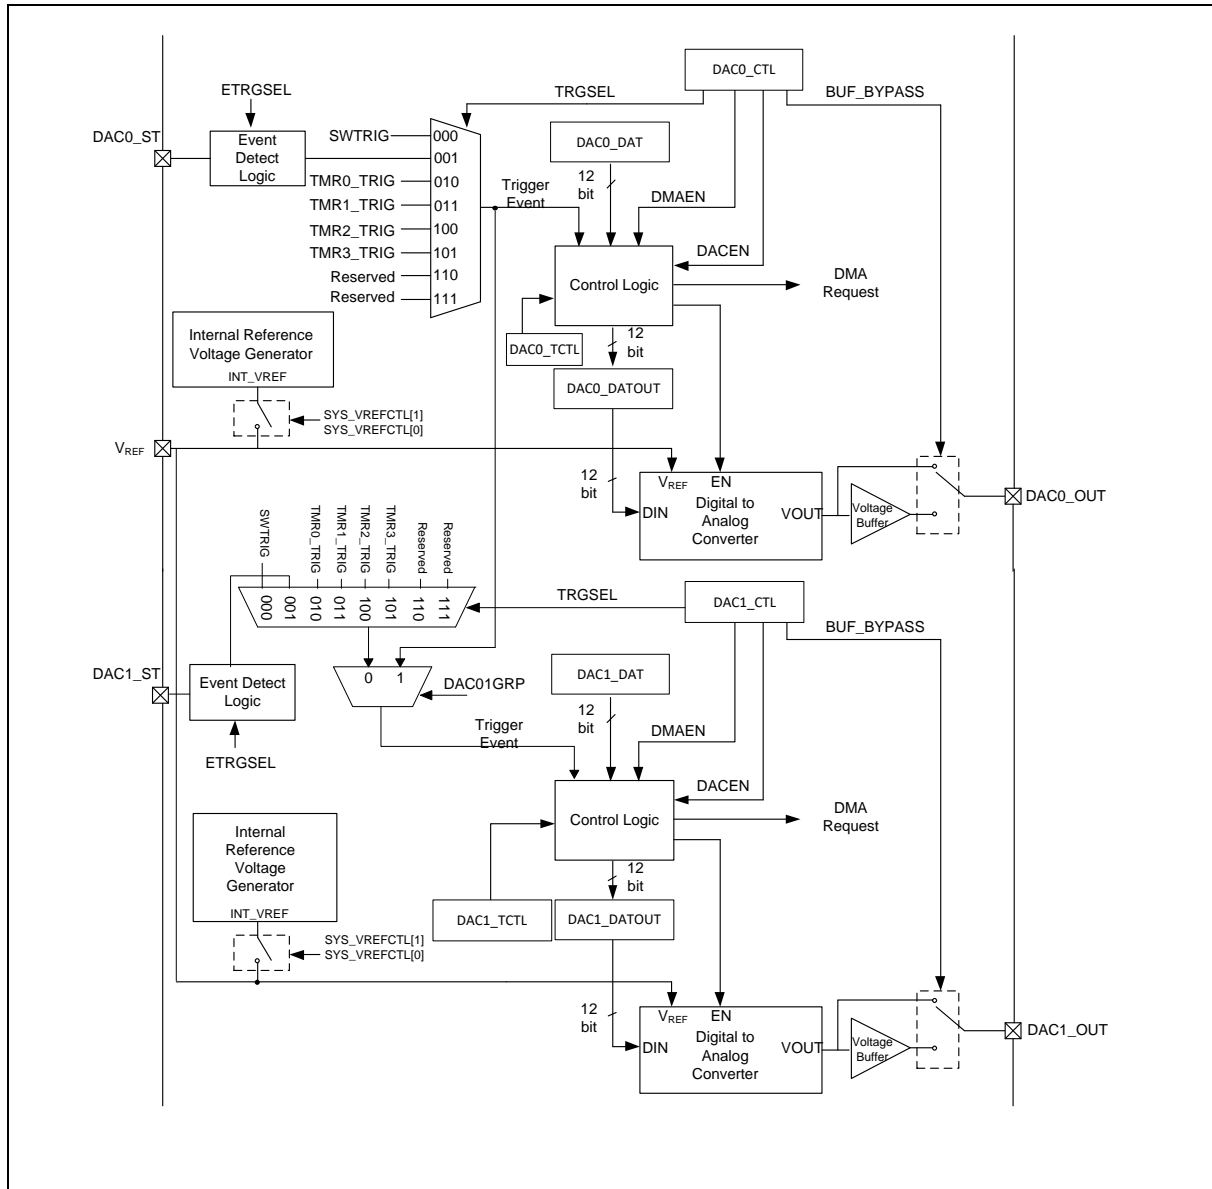

Figure 6.29-1 Digital-to-Analog Converter Block Diagram

### 6.29.4 Basic Configuration

#### 6.29.4.1 DAC0 Basic Configuration

- Clock source Configuration
  - Enable DAC0 peripheral clock in DACCKEN (CLK\_APBCLK1[12]).
- Reset Configuration
  - Reset DAC0 controller in DACRST (SYS\_IPRST2[12]).

#### 6.29.4.2 DAC1 Basic Configuration

- Clock source Configuration
  - Enable DAC1 peripheral clock in DACCKEN (CLK\_APBCLK1[12]).

- Reset Configuration
  - Reset DAC1 controller in DACRST (SYS\_IPRST2[12]).

6.29.5 Functional Description

6.29.5.1 DAC Output

The DAC is a 12-bit voltage output digital-to-analog converter and can be configured as 12-or 8-bit operation mode. The DAC integrates a voltage output buffer that can be used to reduce output impendence and drive external loads directly without having to add an external operational amplifier. The DAC channel output buffer can be enabled and disabled by BYPASS (DACn\_CTL[8]), n=0, 1. The maximum DAC output voltage is limited to the selected reference voltage source.

6.29.5.2 DAC Reference Voltage

The DAC reference voltage is shared with EADC reference voltage and it is configured by VREFCTL (SYS\_VREFCTL[4:0]) in system manager control registers. The reference voltage for the DAC can be configured from external reference voltage pin (VREF) or internal reference voltage generator (INT\_VREF).

6.29.5.3 DAC Data Format

The DAC supports conversion data left alignment or right alignment mode. Depending on the selected configuration mode, the data needs to be written into the specified register as follows:

- 12-bit left alignment: user has to load data into DACn\_DAT[15:4] bits. DACn\_DAT[31:16] and DACn\_DAT[3:0] are ignored in DAC conversion.
- 12-bit right alignment: user has to load data into DACn\_DAT[11:0] bits, DACn\_DAT[31:12] are ignored in DAC conversion.

While DAC is working in 8-bit mode, alignment setting has no effect. To enable 8-bit mode, set BWSEL(DACn\_CTL[15:14]) to 01. Otherwise, keep BWSEL as 00.

Figure 6.29-2 Data Holding Register Format

6.29.5.4 DAC Conversion

Any data transfer to the DAC channel is performed by loading the data into DACn\_DAT register. Figure 6.29-3 shows the DAC conversion started by software write operation. When user writes the conversion data to data holding register DACn\_DAT, the data is loaded into data output register DACn\_DATOUT by hardware and DAC starts data conversion after one PCLK (APB clock) clock cycle. Figure 6.29-4 shows the DAC conversion started by hardware trigger (external pin DACn\_ST, timer trigger event or EPWM timer trigger event). The data stored in the DACn\_DAT register is automatically transferred to the data output buffer DACn\_DATOUT after occurring one PCLK (APB clock) the event.

When DAC data output register DACn\_DATOUT is loaded with the DACn\_DAT contents, the analog output voltage becomes available after specified conversion settling time. The conversion settling time is 8us when 12- bit input code transition from lowest code (0x000) to highest code (0xFFFF). Two adjacent codes conversion settling time is 1us. The DAC controller provides a 10-bit time counter for user to count the conversion time period. In continuous conversion operation, user needs to write appropriate

value to SETTLET (DACn\_TCTL[9:0]) to define DAC conversion time period. The value must be longer than DAC conversion settling time which is specified in DAC electric characteristic table. For example, when DAC controller APB clock speed is 80MHz and DAC conversion settling time is 8us, the selected SETTLET value must be greater than 0x280. When the conversion is started, the conversion finish flag FINISH (DACn\_STATUS[0]) is cleared to 0 by hardware and set to 1 after the time counter counts to SETTLET. Note that n=0,1.

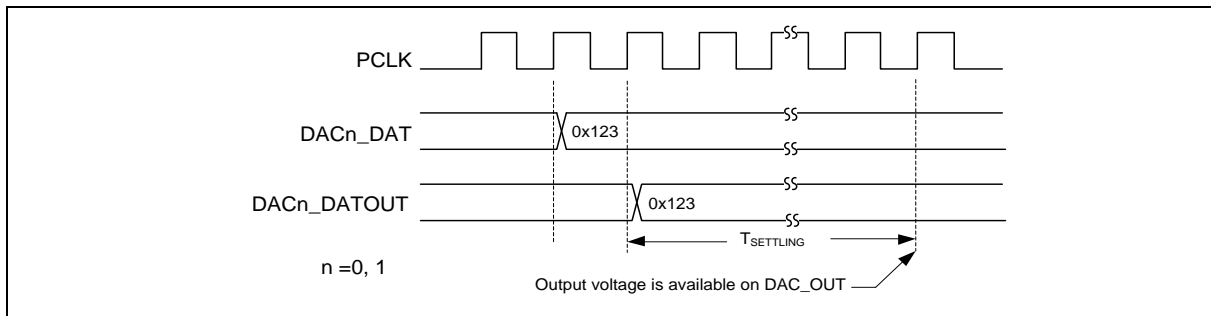

Figure 6.29-3 DAC Conversion Started by Software Write Trigger

#### 6.29.5.5 DAC Output Voltage

Digital inputs are converted to output voltage on a linear conversion between 0 and reference voltage  $V_{REF}$ . The analog output voltage on DAC pin is determined by the following equation:

$$DACOUT = V_{REF} * \frac{DATnOUT[11:0]}{4096}, n=0,1$$

#### 6.29.5.6 DAC Trigger Selection

The DAC conversion can be started by writing DACn\_DAT, software trigger or hardware trigger. When TRGEN (DACn\_CTL[4]) is 0, the data conversion is started by writing DACn\_DAT register. When TRGEN (DACn\_CTL[4]) is 1, the data conversion is started by external DACn\_ST pin, timer event. If the software trigger is selected, the conversion starts once the SWTRG (DACn\_SWTRG[0]) is set to 1. The SWTRG is cleared to 0 by hardware automatically when DACn\_DATOUT has been loaded with DACDAT content. The TRGSEL (DACn\_CTL[7:5]) determines which one of eight events is selected to start the conversion.

When DAC detects a rising edge on the selected trigger event input, the last data stored in DACDAT is transferred into the DACn\_DATOUT[11:0] and DAC starts converting after one PCLK (APB clock) clock cycle. Note that n=0,1.

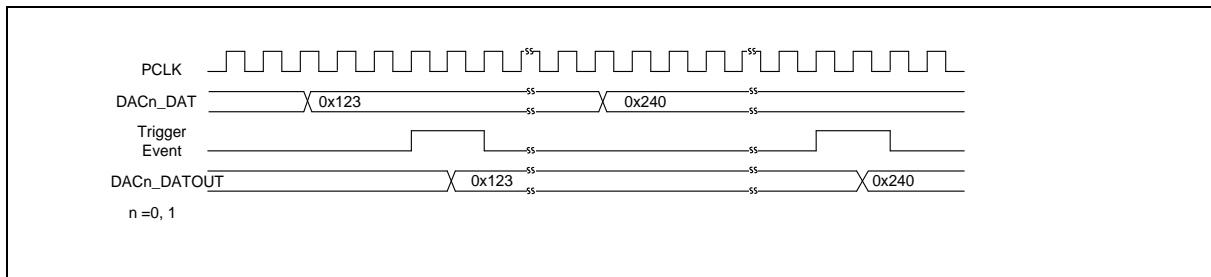

Figure 6.29-4 DAC Conversion Started by Hardware Trigger Event

#### 6.29.5.7 DAC Group Mode

The DAC0 and DAC1 can be grouped together by setting GRPEN (DAC0\_CTL[16]) to synchronize the update of each DAC output. Hardware ensures that these two DACs will be updated simultaneously in

group mode. In group mode, DAC1\_CTL and DAC1\_TCTL has no effect. DAC1's behavior is controlled by DAC0\_CTL and DAC0\_TCTL. Figure 6.29-5 shows an example of group mode and compared with normal mode.

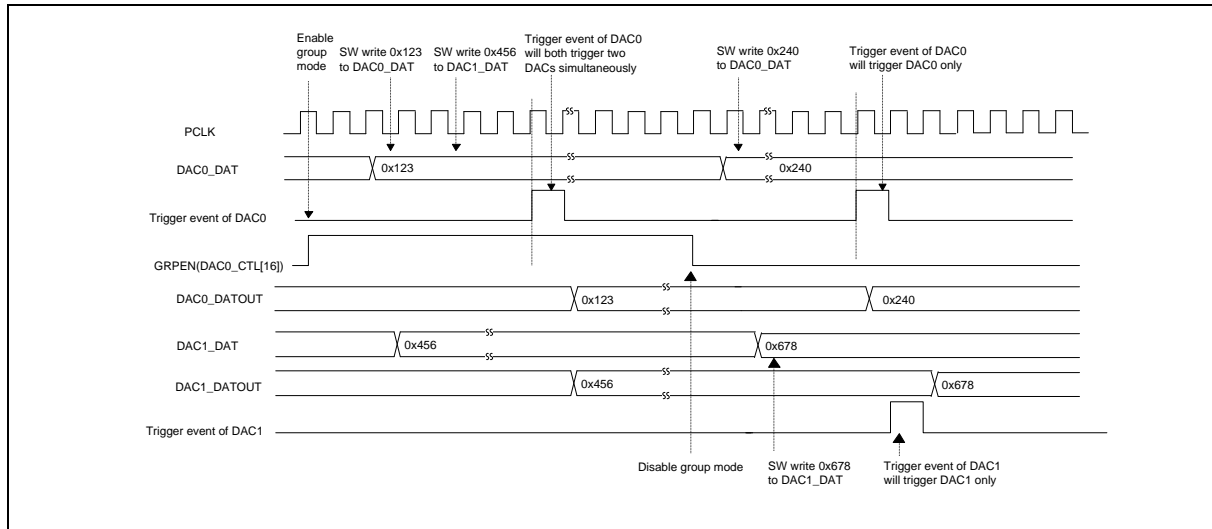

Figure 6.29-5 DAC0 and DAC1 Group and Ungroup Update Example

#### 6.29.5.8 DMA Operation

A DAC DMA request is generated when a hardware trigger event occurs while DMAEN (DACn\_CTL[2]) is set. The content of DACn\_DAT is transferred to the DACn\_DATOUT[11:0] and DAC starts data conversion after one PCLK (APB clock) clock cycle. The new transferred data by PDMA in DACn\_DAT will be converted when next trigger event arrives. Figure 6.29-6 shows the DAC PDMA under-run condition, when the second DMA request trigger event arrives before the first conversion finish, then no new PDMA request is issued and DMA under-run flag DMAUDR (DACn\_STATUS[1]) is set 1 to report the error condition. DMA data transfers are then disabled and no further DMA request is treated and DAC continues to convert last data. An interrupt is also generated if the corresponding DMAURIEN (DACn\_CTL[3]) is enabled. User has to change the trigger event frequency in timer or EPWM timer and then start DAC conversion again. Note that n=0,1.

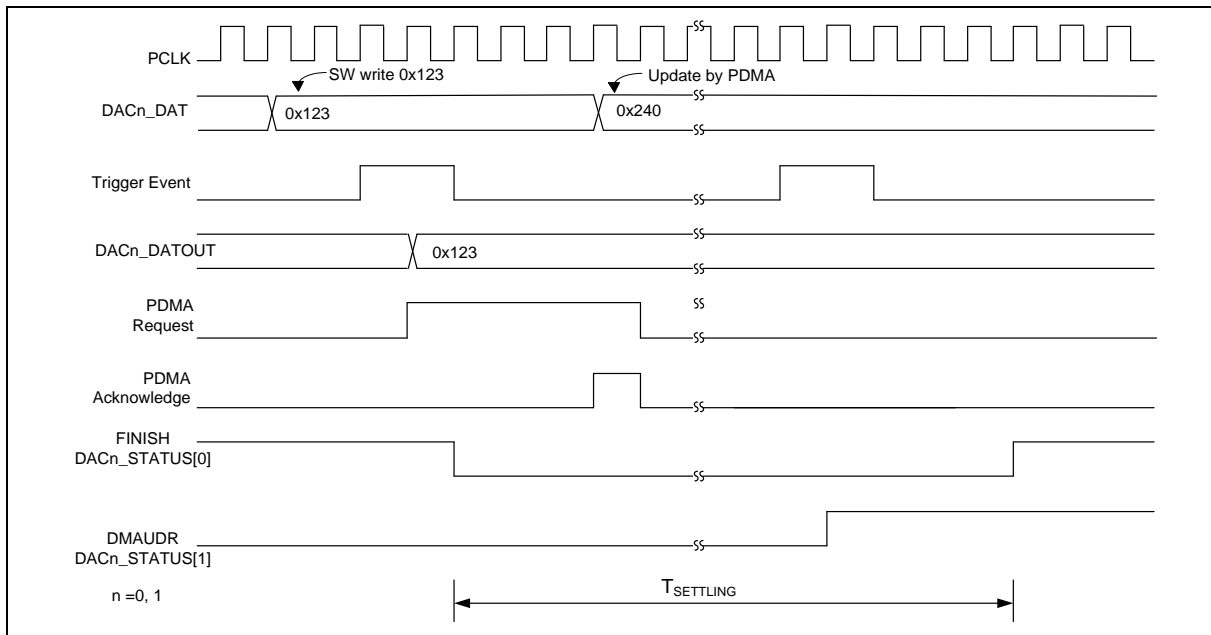

Figure 6.29-6 DAC PDMA Under-Run Condition Example

The DMA request can also be generated by software enable, user sets DMAEN (DACn\_CTL[2]) to 1 and TRGEN (DACn\_CTL[4]) to 0, DMA request is generated periodically according to the conversion time defined by SETTLET (DACn\_TCTL[9:0]) value. DAC output is updated periodically. When user clears DMAEN (DACn\_CTL[2]) to 0, DAC controller will stop issuing next new PDMA transfer request. Figure 6.29-7 provides an example of DAC continuous conversion with software PDMA mode. Note that  $n = 0, 1$ .

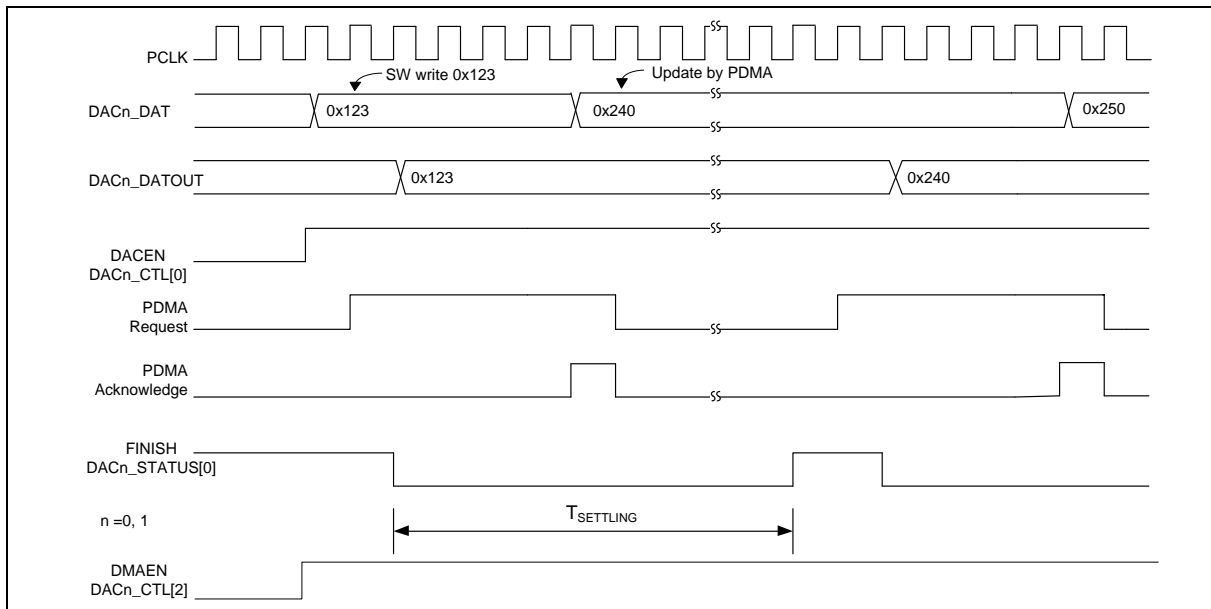

Figure 6.29-7 DAC Continuous Conversion with Software PDMA Mode

#### 6.29.5.9 Interrupt Sources

There are two interrupt sources in the DAC controller, one is DAC data conversion finish interrupt and the other is DMA under-run interrupt as shown in Figure 6.29-8. When DAC conversion is finished, the FINISH (DACn\_STATUS[0]) is set to 1 and an interrupt occurs while DACIEN (DACn\_CTL[1]) is

enabled. If a new DMA trigger event occurs during DAC data conversion period, the DMA under-run flag DMAUDR (DACn\_STATUS[1]) is generated and an interrupt occurs if DMAURIEN (DACn\_CTL[3]) is enabled. Note that n = 0,1.

Figure 6.29-8 DAC Interrupt Source

## 6.30 Analog Comparator Controller (ACMP)

### 6.30.1 Overview

The chip provides up to two comparators. The comparator output is logic 1 when positive input is greater than negative input; otherwise, the output is 0. Each comparator can be configured to generate an interrupt when the comparator output value changes.

### 6.30.2 Features

- Analog input voltage range: 0 ~  $AV_{DD}$
- Up to two rail-to-rail analog comparators
- Supports hysteresis function
  - Supports programmable hysteresis window: 0mV, 10mV, 20mV and 30mV
- Supports wake-up function
- Supports programmable propagation speed and low power consumption
- Selectable input sources of positive input and negative input
- ACMP0 supports:
  - 4 multiplexed I/O pins at positive sources:
    - ◆ ACMP0\_P0, ACMP0\_P1, ACMP0\_P2, or ACMP0\_P3
  - 4 negative sources:
    - ◆ ACMP0\_N
    - ◆ Comparator Reference Voltage (CRV)
    - ◆ Internal band-gap voltage (VBG)
    - ◆ DAC0 output (DAC0\_OUT)
- ACMP1 supports
  - 4 multiplexed I/O pins at positive sources:
    - ◆ ACMP1\_P0, ACMP1\_P1, ACMP1\_P2, or ACMP1\_P3
  - 4 negative sources:
    - ◆ ACMP1\_N
    - ◆ Comparator Reference Voltage (CRV)
    - ◆ Internal band-gap voltage (VBG)
    - ◆ DAC0 output (DAC0\_OUT)
- Shares one ACMP interrupt vector for all comparators
- Interrupts generated when compare results change (Interrupt event condition is programmable)
- Supports triggers for break events and cycle-by-cycle control for PWM
- Supports window compare mode and window latch mode

### 6.30.3 Block Diagram

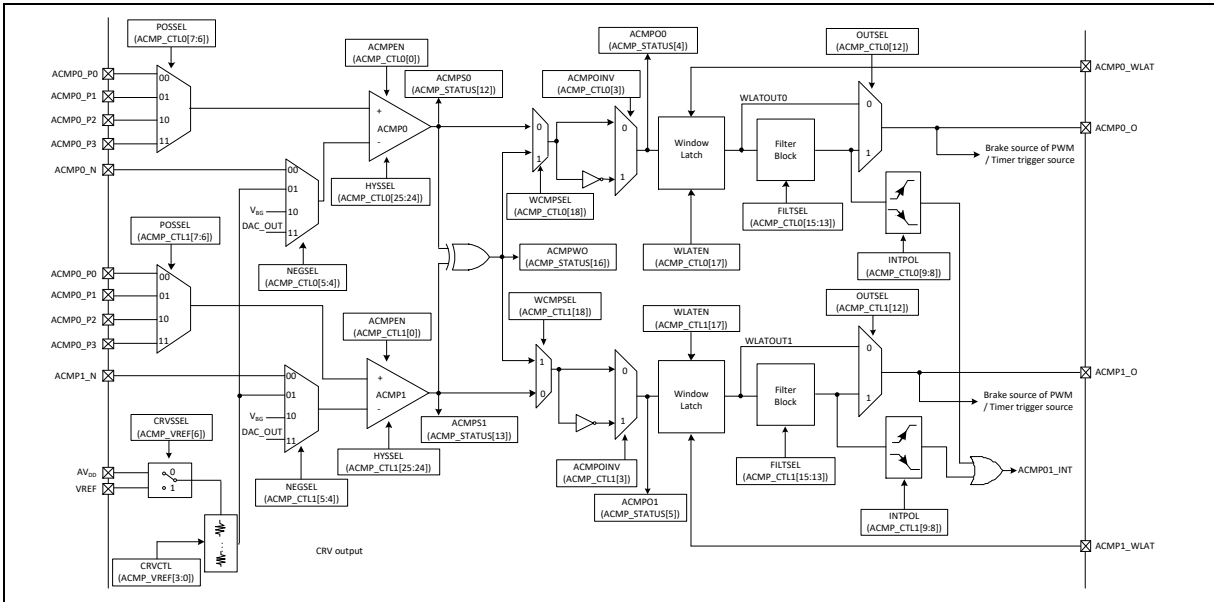

Figure 6.30-1 Analog Comparator Block Diagram

### 6.30.4 Basic Configuration

#### 6.30.4.1 ACMP0 Basic Configuration

- Clock source Configuration
  - Enable ACMP0 peripheral clock in ACMP01CKEN (CLK\_APBCLK0[7]).
- Reset Configuration
  - Reset ACMP0 controller in ACMP01RST (SYS\_IPRST1[7]).

#### 6.30.4.2 ACMP1 Basic Configuration

- Clock source Configuration
  - Enable ACMP1 peripheral clock in ACMP01CKEN (CLK\_APBCLK0[7]).
- Reset Configuration
  - Reset ACMP1 controller in ACMP01RST (SYS\_IPRST1[7]).

### 6.30.5 Functional Description

#### 6.30.5.1 Hysteresis Function

The analog comparator provides the hysteresis function to make the comparator to have a stable output transition and it can refer to Figure 6.30-2. If comparator output is 0, it will not be changed to 1 until the positive input voltage exceeds the negative input voltage by a high threshold voltage. Similarly, if comparator output is 1, it will not be changed to 0 until the positive input voltage drops below the negative input voltage by a low threshold voltage.

Figure 6.30-2 Comparator Hysteresis Function of ACMP0

#### 6.30.5.2 Window Latch Mode

Figure 6.30-3 shows the comparator operation in window latch mode. Window latch mode can be enabled by setting WLATEN (ACMP\_CTL0[17]) to 1. When window latch function enabled, ACMP0/1\_WLAT pin is used to control the output WLATOUT0/1. When ACMP0/1\_WLAT pin is high, ACMP0/1 passes through to WLATOUT0/1. When ACMP0/1\_WLAT pin is low, WLATOUT0/1 will keep last state of WLATOUT0/1.

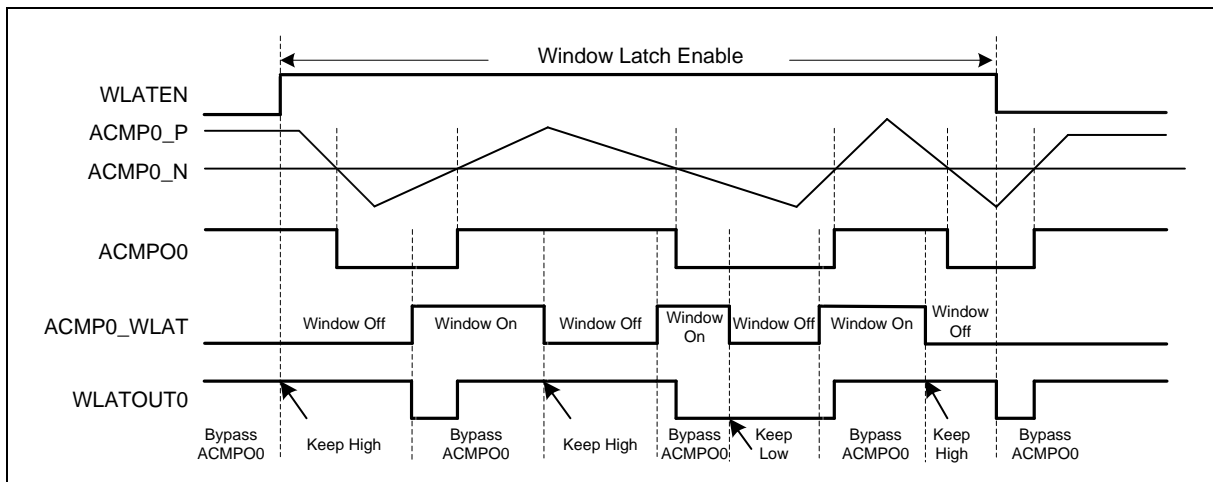

Figure 6.30-3 Window Latch Mode

#### 6.30.5.3 Filter Function

The analog comparator provides filter function to avoid the un-stable state of comparator output.

By setting FILTSEL (ACMP\_CTL0[15:13], ACMP\_CTL1[15:13]), the comparator output would be sampled by consecutive PCLKs. With longer sample clocks, the comparator output would be more stable. But the sensitivity of comparator output would be reduced.

Figure 6.30-4 shows an example of filter function of ACMP0 with FILTSEL = 3 (4 PCLK). In this example, the comparing result is sampled by PCLK. All result must keep for 4 PCLK clocks before it can be output to ACMP00. If the comparing result is shorter than 4 PCLK, it will be filtered.

Figure 6.30-4 Example of Filter Function

#### 6.30.5.4 Interrupt Sources

The outputs of ACMP0 and ACMP1 are reflected at ACMP00 (ACMP\_STATUS[4]) and ACMP01 (ACMP\_STATUS[5]) respectively. Then they are processed by window latch and filter functions. Finally, the output signal could be utilized to assert interrupts. Refer to Figure 6.30-5, if ACMPIE of ACMP\_CTL0/1 register is set to 1, the interrupt will be enabled. If the output state ACMP00/1 is changed as the setting of INTPOL (ACMP\_CTL0/1[9:8]), the comparator interrupt will be asserted and the corresponding flag, ACMPIF0 (ACMP\_STATUS[0]) and ACMPIF1 (ACMP\_STATUS[1]), will be set to 1. The interrupt flag can be cleared to 0 by writing 1.

If ACMP wake-up function is enabled and system wake-up from power down by ACMP with interrupt enabled (ACMPIE), the WKIF (ACMP\_STATUS[8], ACMP\_STATUS[9]) will be set, causing interrupt rising.

Figure 6.30-5 shows the interrupts of ACMP is coming from ACMPIF or WKIF and enabled or disabled by ACMPIE.

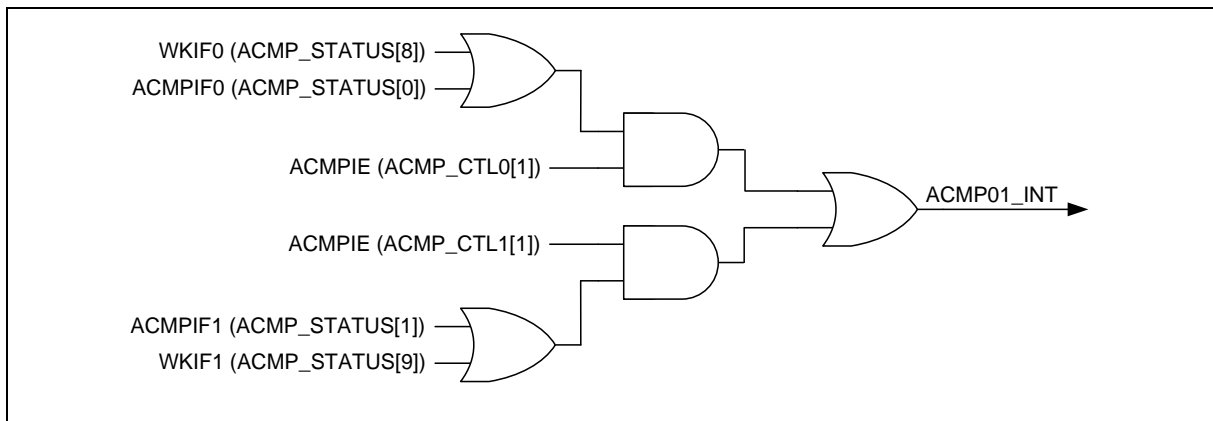

Figure 6.30-5 Comparator Controller Interrupt

#### 6.30.5.5 Comparator Reference Voltage (CRV)

The comparator reference voltage (CRV) module is responsible for generating reference voltage for comparators. The CRV module consists of resistor ladder and analog switch. User can set the CRV output voltage by setting CRVCTL (ACMP\_VREF[3:0]). The CRV output voltage can be selected as the negative input of comparator by setting NEGSEL (ACMP\_CTL0[5:4], ACMP\_CTL1[5:4]). Figure 6.30-6 shows the block diagram of Comparator Reference Voltage.

The resistor ladder will be disabled by hardware to reduce power consumption when NEGSEL (ACMP\_CTL0[5:4], ACMP\_CTL1[5:4]) is not selected to CRV module. The reference voltage of resistor ladder can be the voltage of AV<sub>DD</sub> pin or the INT\_VREF voltage which is controlled by SYS\_VREFCTL register.

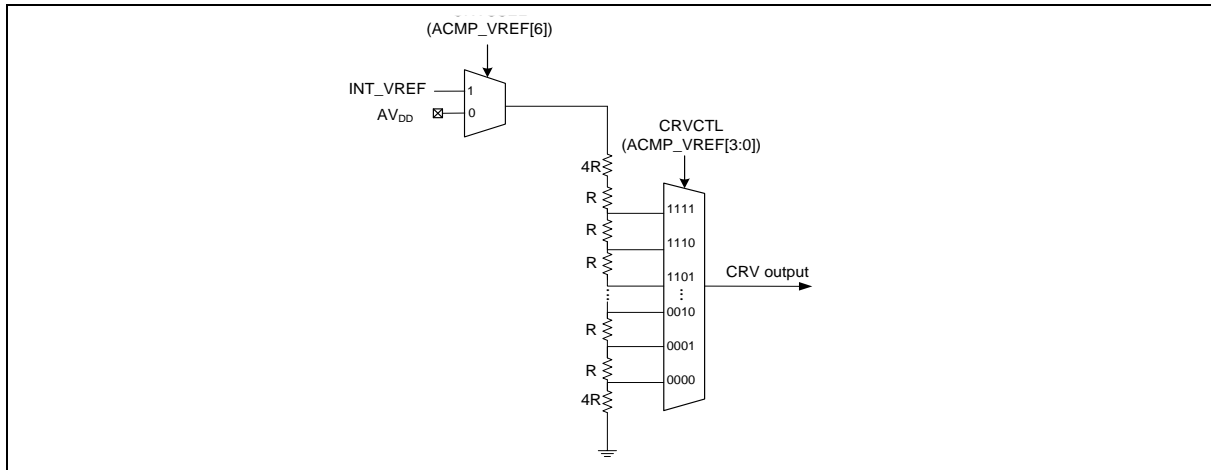

Figure 6.30-6 Comparator Reference Voltage Block Diagram

#### 6.30.5.6 Window Compare Mode

The comparator provides window compare mode. When window compare mode is enabled by setting WCOMPSEL (ACMP\_CTL0/1[18]) to 1, user can monitor a specific analog voltage source with a designated range. User can connect the specific analog voltage source to either the positive inputs of both comparators or the negative inputs of both comparators. The upper bound and lower bound of the designated range are determined by the voltages applied to the other inputs of both comparators. If the output of a comparator is low and the other comparator outputs high, which means two comparators implies the upper and lower bound. User can directly monitor a specific analog voltage source via ACMPWO (ACMP\_STATUS[16]). If ACMPWO is high, it implies a specific analog voltage source is in the range of upper and lower bound, which are called as the analog voltage is in the window.

Figure 6.30-7 illustrates an example of window compare mode. In this example, once window compare mode is selected, user can choose one of four positive input sources of each comparator and connect these two inputs together outside the chip.

If ACMP0 outputs high and ACMP1 outputs low, it means the voltage source is in the range of lower bound and upper bound, which are called as the voltage source in the window. Otherwise, the voltage source is outside the window.

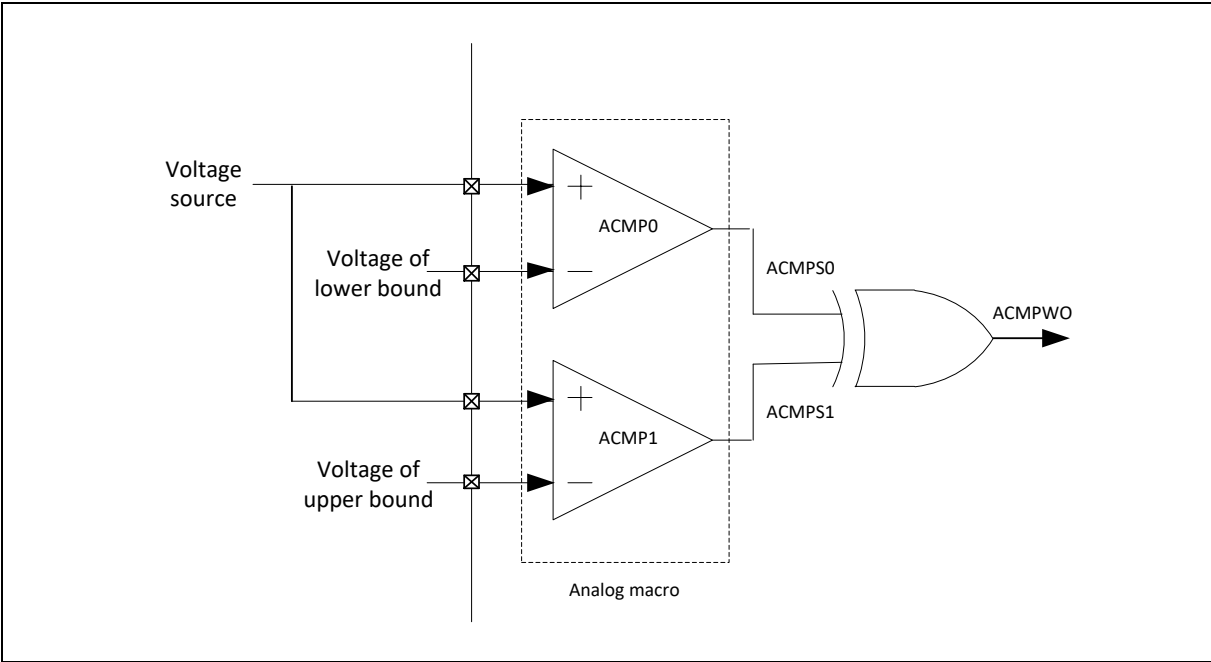

Figure 6.30-7 Example of Window Compare Mode

The comparator window output (ACMPWO) can be shown in ACMP\_STATUS[16] and the truth table of window compare logic are shown in Table 6.30-1.

ACMPS0	ACMPS1	ACMPWO
0	0	0
0	1	1
1	1	0
1	0	1

Table 6.30-1 Truth Table of Window Compare Logic

Figure 6.30-8 Example of Window Compare Mode

As shown in Figure 6.30-8, if ACMPWO equals 1, it means positive input voltage is inside the window.

Otherwise, the positive input voltage is outside the window. Therefore, ACMPWO can be used to monitor voltage transition of external analog pin. Furthermore, ACMPWO still can be applied to window latch, filter functions and interrupt of ACMP.

Note that negative inputs must choose different source. Otherwise, the function will be meaningless.

### 6.30.6 Register Map

R: read only, W: write only, R/W: both read and write

## 6.31 OP Amplifier (OPA)

### 6.31.1 Overview

This chip is equipped with one operational amplifier. The OP amplifier outputs is connected to ADC channel for measurement requirement. The OP amplifier circuit can also be used in the application of Programmable Gain Amplifier (PGA).

### 6.31.2 Features

- Analog input voltage range: 0~AV<sub>DD</sub>.
- Supports up to 1 operational amplifier
- Supports to use schmitt trigger buffer output for simple comparator function.
- Supports schmitt trigger buffer output interrupts.

### 6.31.3 Block Diagram

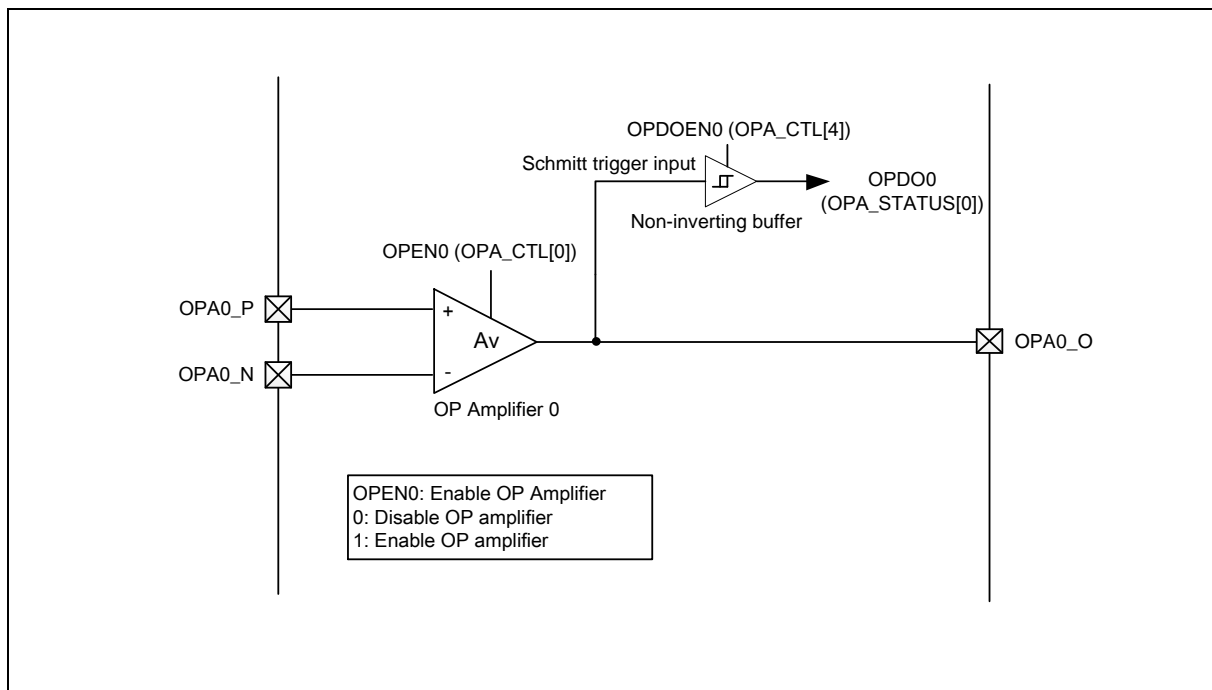

Figure 6.31-1 OP Amplifier Block Diagram

### 6.31.4 Basic Configuration

#### 6.31.4.1 OPA0 Basic Configuration

- Clock source Configuration
  - Enable OPA0 peripheral clock in OPACKEN (CLK\_APBCLK1[30]).
- Reset Configuration
  - Reset OPA0 controller in OPARST (SYS\_IPRST2[30]).

### 6.31.5 Functional Description

#### 6.31.5.1 OP Amplifier Function

The OP amplifier can be enabled by setting OPEN0 (OPA\_CTL[0]) bits for OPA0 respectively. The OPA

pin functions can refer to Figure 6.31-1 and OPA0 output is also internally connected to ADC channel for measurement requirement. Schmitt trigger buffer enable can be set by setting OPDOEN0 (OPA\_CTL[5:4]) bits. OP amplifiers digital output OPDO0 (OPA\_STATUS[0]) are set only when the output state of OP amplifiers changes and Schmitt trigger buffer enable bits are set. OP amplifier digital output is always be 0 when the Schmitt trigger buffer is disabled.

#### 6.31.5.2 Calibration Function

The OP amplifier circuit can be used in the application of Programmable Gain Amplifier (PGA), which can amplify signal by 2, 4, 8... The circuit has five trim bits that can be used to calibrate the offset voltage. The offset voltage comes from both mismatch of NMOS-type differential and PMOS-type differential input stages. Calibration can be started by setting CALTRG0 (OPA\_CALCTL[0]). After calibration, the input voltage offset can be reduced to be within  $\pm 1.6\text{mV}(\text{typ})$ . The rail-to-rail common mode input range is achieved by using an NMOS and a PMOS differential pairs connected in parallel. Reading the OPA\_CALST register can monitor calibration status, which include calibration done status, NMOS, and PMOS calibration result status. Take a brief calibration flow for example: Once OPEN0 (OPA\_CTL[0]) is enabled, hardware will automatically load default calibrated trim values to compensate offset voltage. Therefore, user can directly use OP amplifier without doing additional calibration action. If user wants to start calibration function again, the newer calibrated trim value will be updated after calibration done. Noted that every time OPEN is set, user must set CALTRG0 (OPA\_CALCTL[0]) to start calibration function getting newer offset trim values, or the OP amplifier will operate with elder offset trim values.

#### 6.31.5.3 Interrupt Sources

The OPDOIF0 (OPA\_STATUS[4]) interrupt flag is set respectively by hardware whenever digital output interrupt enable OPDOIEN0 (OPA\_CTL[8]) is set and the OPA0 Schmitt trigger non-inverting buffer output change states. The flag bit is cleared by writing 1 to it. Schmitt trigger buffer outputs of OP amplifier0 can be as one of the comparator interrupt sources.

### 6.31.6 Register Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

Register	Offset	R/W	Description	Reset Value
OPA Base Address: OPA_BA = 0x4004_6000				
OPA_CTL	OPA_BA+0x00	R/W	OP Amplifier Control Register	0x0000_0000
OPA_STATUS	OPA_BA+0x04	R/W	OP Amplifier Status Register	0x0000_0000
OPA_CALCTL	OPA_BA+0x08	R/W	OP Amplifier Calibration Control Register	0x0000_0000
OPA_CALST	OPA_BA+0x0C	R	OP Amplifier Calibration Status Register	0x0000_0000

### 6.31.7 Register Description

OPA Control Register  
(OPA\_CTL)

Register	Offset	R/W	Description	Reset Value
OPA_CTL	OPA_BA+0x00	R/W	OP Amplifier Control Register	0x0000_0000

[0]	DONE0	OP Amplifier 0 Calibration Done Status 0 = Calibrating. 1 = Calibration Done.

## 6.32 Peripherals Interconnection

### 6.32.1 Overview

Some peripherals have interconnections which allow autonomous communication or synchronous action between peripherals without needing to involve the CPU. Peripherals interact without CPU saves CPU resources, reduces power consumption, operates with no software latency and fast responds.

Table 6.31-1 Peripherals Interconnect Matrix table

### 6.32.3 Functional Description

1. From DAC/CRV/BandGap/External Pin to ACMP

#### Input voltage to ACMP

DAC/CRV/BandGap generate negative input source to ACMP. External Pins include ACMP0/1\_P0~3 generate positive input source to ACMP. External Pins include ACMP0/1\_N generate negative input source to ACMP.

The detail setting of Comparator positive /Negative Input Selection is described in section 6.30.7.

2. From External Pin to ACMP

**Input voltage to ACMP's Window Latch Mode**

When window latch function enabled, ACMP0/1\_WLAT pin is used to control the output WLATOUT0/1. When ACMP0/1\_WLAT pin is high, ACMPO0/1 passes through to WLATOUT0/1. When ACMP0/1\_WLAT pin is low, WLATOUT0/1 will keep last state of WLATOUT0/1.

The detail setting of Window Latch Mode is described in section 6.30.5.2.

3. From PWM/BPWM to BPWM

**BPWM Synchronous Start Function**

Select synchronous source from PWM0 or PWM1 or BPWM0 or BPWM1.

To start BPWM and PWM counters in the same time, user has to set the BPWM Synchronous Start Control Register (BPWM\_SSCTL[0]) to enable the channel counters which are planned to start counting together, and select the SSRC(BPWM\_SSCTL[9:8]) to choose the Synchronous Start source.

The detail setting of PWM synchronous start function is described in section 6.11.5.11.

4. From Timer to BPWM

**Timer Generates Trigger Pulses as BPWM External Clock Source**

Timer0 ~ Timer3 time-out interrupt signal or capture interrupt signal to trigger BPWM.

When timer counter value matches the timer compared value or when the TMx\_EXT pin edge transition meets setting, timer can generate a trigger pulse by setting described in section.6.7.5.6

The setting of BPWM clock source are described in section 6.11.3.

5. From Internal Analog Module/External Pin to DAC Voltage Reference Source

**DAC Voltage Reference Source**

The DAC reference voltage is shared with EADC reference voltage and it is configured by VREFCTL (SYS\_VREFCTL[4:0]) in system manager control registers. The reference voltage for the DAC can be configured from external reference voltage pin ( $V_{REF}$ ) or internal reference voltage generator (INT\_VREF) or analog power pin ( $AV_{DD}$ ).

The detail DAC voltage reference sources are described in section 6.29.5.2.

6. From External Pin to DAC

**External Pin Trigger DAC Conversion**

The DAC0\_ST pin (edge or level detected event to trigger DAC to load new data from DAC\_DAT to DATOUT) is used to trigger DAC to start the conversion.

The detail external pin trigger conditions are described in section 6.29.5.6.

7. From Timer to DAC

**Timer Trigger DAC Conversion**

The timer controller provides timer time-out interrupt or capture interrupt to trigger DAC. If TRGSSEL (TIMERx\_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger DAC. If TRGSSEL (TIMERx\_TRGCTL[0]) is 1, capture interrupt signal is used to trigger DAC.

In Timer mode, TIF interrupt flag (Timer value matches CMPDATx) and CAPIF (Timer

capture interrupt flag – rising, falling or both edge detected) are used to trigger DAC to start new conversion.

The detail Timer trigger conditions are described in section 6.7.5.6.

#### 8. From Internal Analog Module/External Pin to EADC Input Source

##### **EADC Input Source**

EADC input sources comprises external pins EADC\_CH0~15, band-gap voltage (VBG), temperature sensor (VTEMP) and Battery power ( $V_{BAT}/4$ ).

The detail EADC input sources are described in section 6.27.2 and 6.27.5

#### 9. From Internal Analog Module/External Pin to EADC Voltage Reference Source

##### **EADC Voltage Reference Source**

EADC voltage is referenced from MergePMTOP: internal reference voltage of 2.56V, 2.048V, 3.072V controlled by VREFCTL[4:0] and external pins of VREF and AVDD.

The detail EADC voltage reference sources are described in section 6.27.2.

#### 10. From External Pin to EADC

##### **External Pin Trigger EADC Conversion**

The EADC0\_ST pin (edge detected – rising or falling. Falling edge: 2 PCLK clock high + 3 PCLK clock low. Rising edge: 2 PCLK clock low + 3 PCLK clock high.) is used to trigger EADC to start the conversion.

The detail external pin trigger conditions are described in section 6.27.5.5.

#### 11. From PWM/BPWM to EADC

##### **PWM/BPWM Trigger EADC Conversion**

The chip provides two PWM/BPWM generators – PWM0/BPWM0 and PWM1/BPWM1. Each PWM/BPWM supports 6 channels of PWM/BPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit PWM/BPWM counter with 16-bit comparator. The PWM/BPWM counter supports up, down and up-down counter types. PWM/BPWM uses comparator compared with counter to generate events. These events use to generate PWM/BPWM pulse, interrupt and trigger signal for EADC to start conversion.

The detail PWM/BPWM trigger conditions are described in section 6.12.5.23 and 6.11.5.15.

#### 12. From Timer to EADC

##### **Timer Trigger EADC Conversion**

The timer controller provides timer time-out interrupt or capture interrupt to trigger EADC. If TRGSSEL (TIMERx\_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger EADC. If TRGSSEL (TIMERx\_TRGCTL[0]) is 1, capture interrupt signal is used to trigger EADC.

In Timer mode, the signals CAPIF, TIF are used to trigger the EADC to start the conversion.

In PWM mode, when counter matching zero, period, zero or period, up CMPDAT and down CMPDAT, EADC is triggered to start the conversion.

The detail Timer trigger conditions are described in section 6.7.5.6

#### 13.From LXT and USB 1.1 Device to HIRC TRIM

##### **Use LXT or USB Synchronous Mode to system auto-trim HIRC circuit**

This chip supports auto-trim function: the HIRC trim (48 MHz RC oscillator) and MIRC trim (4.032 MHz RC oscillator), according to the accurate LXT (32.768 kHz crystal oscillator) or internal USB synchronous mode, automatically gets accurate output frequency, 0.25 % deviation within all temperature ranges.

The detail of HIRC trim setting is described in section 6.2.8.

#### 14.From ACMP/Clock/BOD/CPU/PWM/External Pin to PWM

##### **PWM Brake Event**

Each PWM module has two external input brake control signals. User can select active brake pin source is from PWMx\_BRAKEy pin by BKxSRC bits of PWM\_BNF register(x=0,1, y=0,1). The external signals will be filtered by a 3-bit noise filter. User can enable the noise filter function by BRKxNFEN bits of PWM\_BNF register, and noise filter sampling clock can be selected by setting BRKxNFSEL bits of PWM\_BNF register to fit different noise properties. Moreover, by setting the BRKxFCNT bits, user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake signal.

The PWM brake event would be triggered by the signals of ACMP\_OUT from ACMP, BRAKE of external pin, HXT/LXT clock fail events, BOD event, CPU lockup and software trigger.

The detail PWM brake conditions are described in section 6.12.5.19

#### 15.From PWM/BPWM to PWM

##### **PWM Synchronous Start Function**

The synchronous start function can be enabled when SSEN0 (PWM\_SSCTL[0]) is set. User can select synchronous source which is from PWM0, PWM1, BPWM0, or BPWM1 by SSR0 (PWM\_SSCTL[9:8]). The selected PWM or BPWM channels (include channel0 to channel5 of each BPWM or PWM) will start counting at the same time once the synchronous start function is enabled and set CNTSEN (PWM\_SSTRG).

The detail PWM brake conditions are described in section 6.12.5.21.

#### 16.From Timer to PWM

##### **Cascade Timer or Generate PWM Waveform with Very Low Frequency**

PWM can generate waveform with very low frequency by the signals of TIF interrupt flag (Timer value matches CMPDATx) and CAPIF (Timer capture interrupt flag – rising, falling or both edge detected).

PWM Clock frequency can be set equal or double to PCLK frequency. Each PWM generator has three clock source inputs, each clock source can be selected from PWM Clock or four TIMER trigger PWM outputs by ECLKSRC0 (PWM\_CLKSRC[2:0]) for PWM\_CLK0, ECLKSRC2 (PWM\_CLKSRC[10:8]) for PWM\_CLK2 and ECLKSRC4 (PWM\_CLKSRC[18:16]) for PWM\_CLK4.

The detail PWM brake conditions are described in section 6.12.3.

17.From ACMP and LIRC to Timer Capture Function

**Measure the Time Interval of ACMP0/1 Output Signal or LIRC clock Speed**

Sets the timer capture source from ACMP0/1 output signal or LIRC clock and measures the time interval of the signal by using timer capture function. Users can use the results of time interval to trim LIRC through software or to get the ACMP0/1 output pulse width.

The detail of time capture function setting are described in section 6.7.5.4 and 6.7.5.5.

18.From USB to Timer Event Counting Function

**Event Counting Mode**

If ECNTSSEL (TIMERx\_EXTCTL[16]) is 1, the event counter source will generate by USB device detect the start-of-frame (SOF) packet.

The detail of event counting mode are described in section 6.7.3 and 6.7.5.3.

19.From UART/PWM to UART

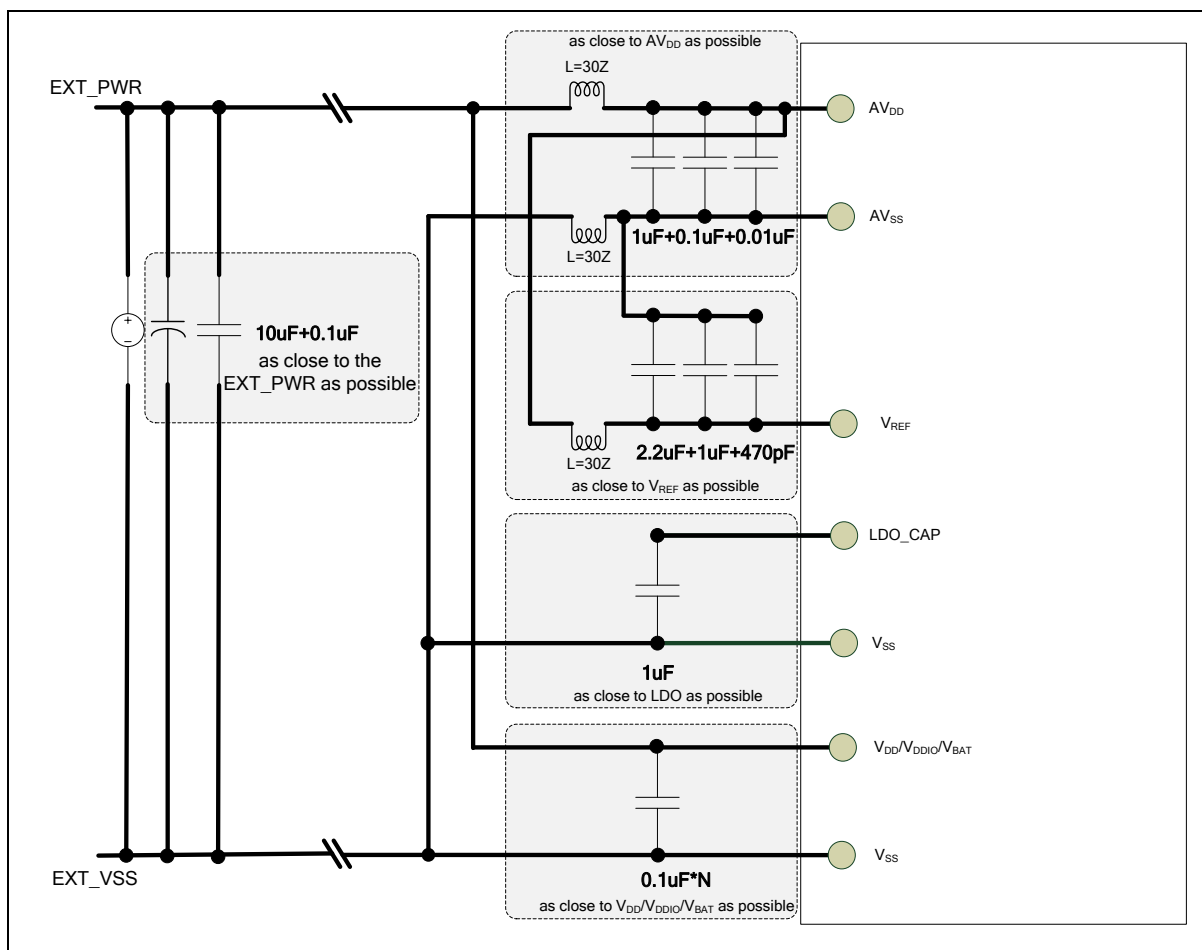

**UART0\_TXD/USC10\_DAT0 Modulation with PWM**

This chip supports UART0\_TXD/USC10\_DAT0 to modulate with PWM channel. User can set MODPWMSEL(SYS\_MODCTL[7:4]) to select which PWM0 channel to modulate with UART0\_TXD/USC10\_DAT0.

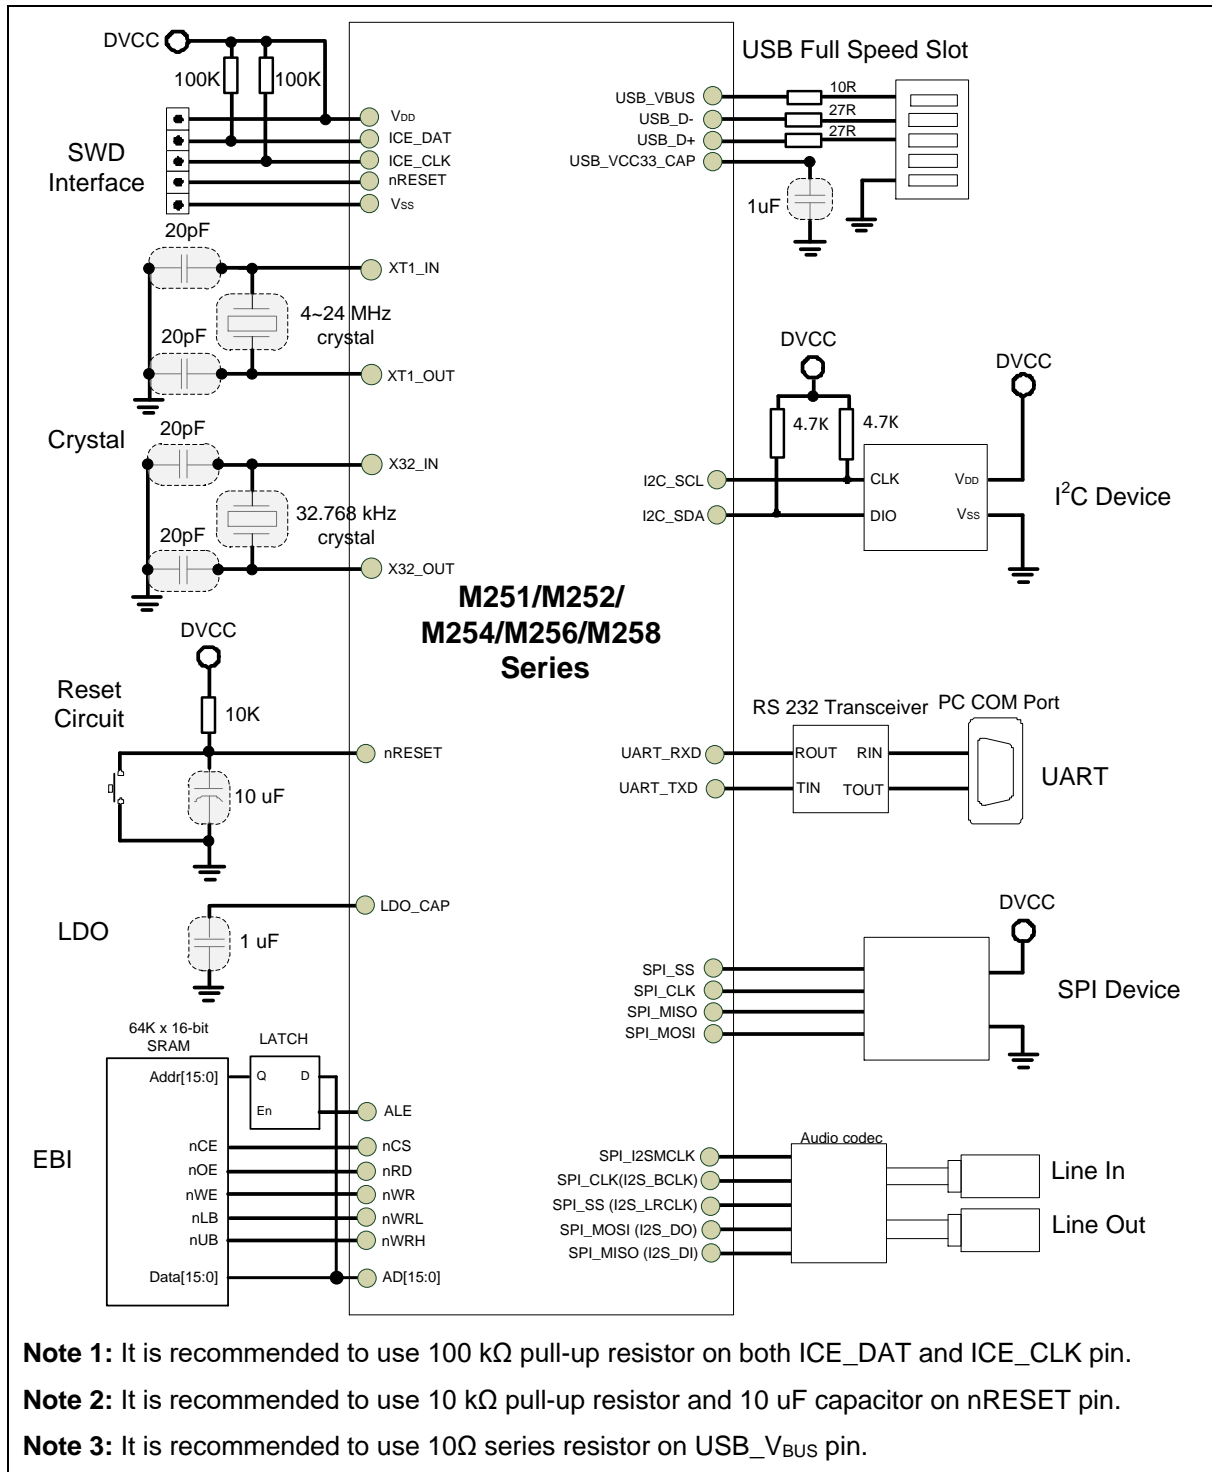

The detail setting of modulation function is described in section 6.2.9.

## 11 REVISION HISTORY

Date	Revision	Description
2019.12.23	1.00	Initial version.
2020.01.15	1.01	<ol style="list-style-type: none"> <li>1. Revised Power-down current from 1.5μA to 1.7μA in Chapter 1.</li> <li>2. Removed HIRC/MIRC deviation information in Chapter 2.</li> <li>3. Added EBI item in section 3.2.</li> </ol>
2020.03.16	1.02	<ol style="list-style-type: none"> <li>1. Reorganized Chapter 4 to list pin functions according to part number.</li> <li>2. Added notes to recommend ICE circuit on ICE_DAT, ICE_CLK and nRESET pin.</li> <li>3. Removed Pin Configuratioin in Chapter 6.</li> <li>4. Updated Power supply scheme in section 7.1.</li> </ol>
2020.07.02	1.03	<ol style="list-style-type: none"> <li>1. Revised application circuit in Chapter 7.</li> <li>2. Added a 10Ω series resistor on USB_VBUS in section 7.2.</li> <li>3. Added sample module and internal voltage reference item in Table 6.27-1.</li> <li>4. Removed EADC_OFFSETCAL register in section 6.27.</li> </ol>
2021.07.30	2.00	<ol style="list-style-type: none"> <li>1. Added new M254, M256 and M258 product lines.</li> <li>2. Revised the Comparison Table in section 3.3 and chapter 6.</li> <li>3. Revised ADC conversion rate from 880 kSPS to 730 kSPS.</li> <li>4. Revised M251 pin diagram to add V<sub>BAT</sub> pin in Figure 4.1-6.</li> </ol>
2021.11.12	2.01	Added a new M254SD3AE part number in Chapter 3 and 4.
2022.04.19	2.02	<ol style="list-style-type: none"> <li>1. Revised pin information of EINT0 ~ EINT5 in Table 6.2-9, NMIEN and NMISTS register.</li> <li>2. Added SPI1, UART3, PSIO, CRYPT, SLCD and TK in Table 6.2-9.</li> <li>3. Revised DAC pin assignment of M254/M256/M258 in chapter 4 and section 6.29.</li> <li>4. Revised 5V tolerance description to inform that DAC pin doesn't support 5V tolerance in section 3.3 and 6.5.</li> <li>5. Revised the min. USB peripheral clock frequency from 12 MHz to 15 MHz in section 6.24.4.</li> <li>6. Added a note to inform WDT counter reset condition for wake up events in section 6.8.3.</li> <li>7. Added a condition that IOCTLSEL is set by power down entry in IOCTLSEL bit register in section 6.10.7.</li> <li>8. Revised RESMODE register description to indicate High-Driving enable condition in section 6.28.7</li> </ol>

## Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.
